Hawtrey was a good producer of plays and teacher of acting. In staging farce and light comedy he showed a mastery of fine shades and the polish which belonged to the school of the Bancrofts and W. S. Gilbert; but now and then he proved himself efficient in producing more serious drama. As actor, he had the wit to make his greatest strength out of what had been the bane of his youth, his immobility of face. He learned so to charge that immobility with expression that he excelled in the characters of liars, selfish men, and erring husbands, in which imperturbability was necessary, and any break in it came with great effect. Better than any of his contemporaries he achieved by art an air of being entirely natural. He seldom attempted the pathetic; but in *One Summer's Day* he showed that his method was capable of giving a signal moment of it.

In 1901 and in 1903 to 1904 Hawtrey paid professional visits to the United States. He was knighted in 1922. He was twice married: first, in 1886 to Madeline Harriet, daughter of Thomas Sheriffe, of Henstead Hall, Suffolk, who divorced him in 1893 and died in 1905; and secondly, in 1910 to Katherine Elsie, daughter of the Rev. William Robinson Clarke, and widow of the Hon. Albert Henry Petre, son of William Henry Francis, eleventh Baron Petre. He had no children by either marriage. He died in London 30 July 1923.

Off the stage and on, Hawtrey was a charming man, and had many friends of both sexes. He was a good cricketer and golfer; but the chief interest of his life (an interest shared by his father) was horseracing. He began betting when at Eton; in 1885 he won £14,000 on a single race, and in 1885 and 1886 he had horses of his own in training.

H. H. CHILD.

HEADLAM-MORLEY, SIR JAMES WYCLIFFE (1863-1920), political historian, was born at Whorlton, near Barnard

Castle, Durham, 24 December 1863. He was the second son of the Rev. Arthur William Headlam, successively vicar of Whorlton, vicar of St. Oswald's, Durham, and rector of Gainford, honorary canon of Durham Cathedral, by his wife, Agnes Sarah, daughter of James Favell, of Normanton, Yorkshire. He was nephew of Thomas Emerson Headlam, judge advocate-general [q.v.], and cousin of Walter George Headlam, scholar and poet [q.v.]. His elder brother, Arthur Cayley Headlam, became bishop of Gloucester in 1923. In 1918 James Headlam assumed by royal licence the additional surname (and arms) of Morley, on inheriting the property of the last member of the West Riding family from which he was descended through the wife of his paternal grandfather.

Headlam was educated at Eton, where he was a King's scholar, and at King's College, Cambridge. He was placed in the first class of both parts of the classical tripos (1885 and 1887), and elected a fellow of his college in 1890, a position which he held until 1896. The dissertation on which he obtained his fellowship was 'Election by Lot at Athens', which had gained the Prince Consort prize at Cambridge in 1890 and was published in 1891 (reissued in 1933).

Headlam had meanwhile visited Germany, first staying in families in order to learn German, and then studying at the university of Berlin under Treitschke and Hans Delbrück. During this period he first met (about Christmas 1887) the lady whom he married in 1893, Elisabeth (Else), youngest child of August Sonntag, doctor of medicine, of Lüneburg, then resident at Dresden. They had a son and a daughter.

Both before and after gaining his fellowship, Headlam was engaged in writing, teaching, and lecturing, gradually turning from classical to historical studies. From 1894 to 1900 he was professor of Greek and ancient history at Queen's College, London. He served as an honorary assistant commissioner on the royal commission on secondary education which sat from March 1894 to August 1895 under the presidency of (Viscount) Bryce [q.v.]. The commission had as result the Board of Education Act of 1899 and the Education Act of 1902. From 1902 until the European War Headlam was a staff inspector of secondary schools for the Board of Education.

Before the European War Headlam had become known as an expert on German history. He had published in 1899 *Bismarck and the German Empire* in the

'Heroes of the Nations' series, and collaborated in 1914 with W. Alison Phillips and A. W. Holland in *A Short History of Germany and her Colonies*. A few days after the outbreak of the War in August 1914, the prime minister, Mr. Asquith, sent for Charles F. G. Masterman [q.v.] and instructed him to get together the nucleus of a propaganda organization, as it was already clear that the enemy was going to make full use of this weapon. As a result, the propaganda department at Wellington House came into existence. The secretary of Masterman's committee, Sir Claud Schuster, at once sent for Headlam and asked for his help; and on the first day he entered the new office Headlam began to write his book *The History of Twelve Days* (1915), which may be considered as the foundation of his future work and reputation. This is a close and detailed study, based on the diplomatic correspondence, of the political situation in Europe at the outbreak of the War, and remained by far the most valuable contribution to the history of that short and agitated period until the fuller publication of the records which became possible after the War was over.

For the next three years Headlam remained as the adviser on all historical matters to Wellington House, publishing several controversial books and pamphlets on subjects connected with the origins of the War. He served as assistant director, under Lord Edward Gleichen, of the political intelligence bureau in the Department of Information 1917-1918, and when British governmental propaganda was transferred to a separate ministry under Lord Beaverbrook in the latter year, Headlam went to the Foreign Office, becoming assistant director of a newly formed political intelligence department of the Office, where his services were found of the highest value.

In 1919 Headlam-Morley (as he had now become) went to the Peace Conference at Paris as a member of the political section of the British delegation, where he served on several of the more important committees, dealing with Belgian and Danish problems, Danzig, the Saar Valley, Alsace-Lorraine, 'Minorities', and the Eastern frontiers of Germany.

On his return to England in 1920, Headlam-Morley was appointed historical adviser to the Foreign Office (a post which was specially created for him and which did not survive his retirement in 1928) and settled down to write a history of the peace

settlement for official use. This was mostly—but not entirely—completed at the time of his death. He also composed many other memoranda on various historical subjects on which he was consulted, and a selection of these was published in 1930 under the title *Studies in Diplomatic History*.

When, in 1924, Mr. Ramsay MacDonald (whose decision was confirmed by his successor at the Foreign Office, Sir Austen Chamberlain) entrusted to Dr. G. P. Gooch and Mr. H. W. V. Temperley the publication of the complete series of British documents dealing with the origins of the War, from 1898 to 1914, the editors found that Headlam-Morley had already made a very complete collection of documents for the period immediately preceding the outbreak of war, with a view to publishing a third edition of the *History of Twelve Days*. They accordingly arranged with him to issue first what was chronologically the last (vol. xi) of the volumes of *British Documents on the Origins of the War*, and this appeared in 1920 with the title *The Outbreak of War: Foreign Office Documents, June 28th-August 4th, 1914*.

This was Headlam-Morley's last published work of importance. He retired from the public service in December 1928, received a knighthood in June 1929, and died in a nursing home at Wimbledon 6 September of the same year. He had not yet received the accolade, but his widow was allowed by royal licence to assume the style of a knight's widow.

Headlam-Morley was tall, clean-shaven, with a keen and pale intellectual face. There is a portrait of him—a photogravure by Sir Emery Walker from a photograph—at the Royal Institute of International Affairs, St. James's Square, London.

[Personal knowledge.]

S. GASELEE.

HEAVISIDE, OLIVER (1850-1925), mathematical physicist and electrician, was born 18 May 1850 at 55 King Street, Camden Town, the youngest of the four sons of Thomas Heaviside, a wood-engraver and water-colour artist. His mother was Rachel Elizabeth, daughter of John Hook West, and sister of Emma West, who married in 1847 Sir Charles Wheatstone [q.v.]. Although drawings produced by Heaviside at the age of eleven showed promise, his early inclinations were soon diverted from art to science. He went neither to public school nor to uni-

versity, but by self-training he acquired remarkable skill in the application of mathematics to electro-dynamics. From 1870 to 1874 he was in the service of the Great Northern Telegraph Company as a telegraph operator at Newcastle-upon-Tyne. Later he returned to London, where from 1876 to 1880, in a room in his father's house in Camden Town, he pursued his rigorous studies in seclusion. By athletic exercises he kept himself fit. He suffered, however, from partial deafness, a circumstance that accounts for many apparent eccentricities.

So far as is known, Wheatstone took no direct part in shaping the career of his nephew Oliver Heaviside. Charles Heaviside, an elder brother, after having been employed in Wheatstone's musical-instrument shop at 128 Pall Mall, set up business for himself at Torquay, with a branch at Paignton, where, in 1880, he invited his aged parents and Oliver to make their home. At Paignton Oliver passed many happy days; he was always willing to break off his work to play with his brother's children, and he retained enough power of hearing to find his greatest pleasure in listening to his mother playing upon the piano the sonatas of Beethoven. He was somewhat below medium height, rufous, reserved, witty, and autocratic. He never married.

Heaviside's mother died in 1804, and his father in 1806. Thereafter until 1909 he lived at Newton Abbot, Devon, and subsequently in a lonely house in Lower Warberry Road, Torquay, which afterwards became his property. Towards the end of his days he led a hermit-like existence in some discomfort. From men of science in universities and elsewhere he constantly received appeals for aid in the solution of intricate mathematical problems, and he responded generously. His financial means were restricted, but he was never destitute. He accepted a civil list pension, and there were not lacking friends who sought to assist him with funds. Their success was small, for he was hard to help. Loneliness brought with it poor health, which culminated in serious illness. At the last he was moved to a nursing home in Torquay, where on 3 February 1925 he died. He was buried in the local cemetery at Paignton.

Heaviside was a disciple of Michael Faraday [q.v.] and of James Clerk Maxwell [q.v.]. In the sequence of great electricians his place is between Maxwell and Heinrich Hertz. As early as 1868 he

was engaged upon electrical experiments. His first technical article was published in *The English Mechanic* when he was twenty-two years of age. To the *Philosophical Magazine* in 1873 and 1876 he contributed proposals for rendering duplex telegraphy practicable. It was, however, his series of papers in *The Electrician* from 1885 to 1887 which established his reputation, though there were but few mathematicians at that time who could penetrate the obscurity of his mode of presenting his ideas. Certain opponents whom he branded as 'scienticists' were sorely perplexed by his satire. His prejudices were undisguised; they were accompanied, however, by invincible logic and by mirthful wit.

In 1886 David Edward Hughes [q.v.], in an inaugural address to the Society of Telegraph Engineers and Electricians, described experiments which confirmed Heaviside's theory that when an electric current starts in a wire it begins on its boundary and is propagated inward. Thus, in the language of Heaviside, such a transient current is 'in layers, strong at the boundary, weak in the middle' [see Heaviside's *Electrical Papers*, vol. ii, pp. 170-171.] Heaviside referred to this phenomenon briefly as 'surface conduction', and in 1887-1889 Hertz gave further support to that theory. Meanwhile, by the exercise of his onomastic genius, Heaviside enriched and clarified the language of electro-dynamics. In addition, he proposed a change of electro-magnetic units, to be based upon his suggested convention that the outward flux of force due to unit charge from a closed surface in air should be unity. In his pioneer work he introduced his 'Expansion Theorem', or operational calculus, for the investigation particularly of transient phenomena such as determine the shape of transmitted waves in telegraphy. He predicted that advantage would follow from inductive 'loading' of telegraph cables, and he thus introduced a new era in their design. He discovered that by proper proportioning of the electrical resistance, capacity, inductance, and 'leakance' of an electrical circuit, it is possible to obtain 'a kind of propagation of unique simplicity' in which a wave may suffer attenuation without distortion—this being his 'distortionless' case. It proved to be of wide application in general dynamics. In 1902 he remarked, with regard to 'wireless' waves, that there might possibly be a sufficiently conducting 'layer' in the atmosphere to aid their

transmission. This useful conception, which has not yet descended from hypothesis to established reality, is known as the 'Heaviside layer'. The library of the Institution of Electrical Engineers contains a collection of Heaviside's manuscripts, books, and correspondence. Heaviside was elected a fellow of the Royal Society in 1891. He was Faraday medalist of the Institution of Electrical Engineers; he received the honorary degree of Ph.D. from Göttingen University, and was an honorary member of the American Academy of Arts and Sciences.

[O. Heaviside, *Electrical Papers*, 2 vols., 1892, and *Electromagnetic Theory*, 3 vols., 1893, 1899, 1912.] R. APPEYARD.

HERBERT, GEORGE EDWARD STANHOPE MOLYNEUX, fifth EARL OF CARNARVON (1866-1923), Egyptologist, was born at Highclere Castle, near Newbury, 28 June 1866, the only son of the statesman, Henry Howard Molyneux Herbert, fourth Earl of Carnarvon [q.v.], by his first wife, Lady Evelyn, only daughter of George Augustus Frederick Stanhope, sixth Earl of Chesterfield. He was a first cousin of Auberon Thomas Herbert, eighth Baron Lucas and eleventh Baron Dingwall [q.v.]. From his mother, who died in 1875, he inherited Brethby and other Stanhope estates, to which she had succeeded on the death of her brother, the seventh Earl of Chesterfield.

Lord Porchester—the title by which he was known during his father's lifetime—was educated at Eton, which he left early in order to study modern subjects with tutors at home and abroad, with a view to entering the army. This project, however, came to nothing, and in 1885 he proceeded to Trinity College, Cambridge. There he developed what were to be the two main interests of his life—archaeology and sport. On leaving Cambridge in 1887 he set out on a yachting cruise round the world, but he was unable to complete the full tour. He next paid visits to South Africa, Australia, and Japan. In 1890 he succeeded his father as fifth earl.

In the course of the next few years Lord Carnarvon continued to indulge his love of travel. He also took up racing, and later won some of the important races, including the Ascot Stakes, the Steward's Cup at Goodwood, and the Doncaster Cup. In 1895 he married Almina, only daughter of Frederick Charles Wombwell, fourth son of Sir George Wombwell, third

baronet; one son and one daughter were born of the marriage.

In 1901 Lord Carnarvon met with a serious motoring accident, the effects of which prevented him from entering public life and necessitated his spending his winters abroad. Accordingly, in 1903 he went to Egypt. As far back as 1889 he had been captivated by the idea of carrying out excavations, and in 1906, with the aid of Sir William Edmund Garstin [q.v.], the adviser to the ministry of public works in Egypt, he began excavating in Thebes. As an amateur, Carnarvon soon felt the need of expert advice, and on the advice of (Sir) Gaston Maspero, the director of Egyptian excavations, he approached Mr. Howard Carter, formerly an inspector-in-chief of the antiquities department of the Egyptian government at Luxor. Thenceforth, for sixteen years, the two men worked together in the closest collaboration. An account of the work accomplished by Lord Carnarvon and Mr. Carter during the years 1907 to 1912 was published by them in *Five Years' Exploration at Thebes* (1912). It included the discovery of the tomb of a 'king's son' of Dynasty XVIII (1908); a small funerary temple of Queen Hatshepsut (1909); and a rich tomb of Dynasty XII, containing a precious casket and gaming board (1910).

The outbreak of the European War in 1914 temporarily brought Lord Carnarvon's work of excavation to a close. To his great disappointment he was unable to go on active service abroad, but he and Lady Carnarvon converted their house, Highclere Castle, near Newbury, into an officers' hospital, which was subsequently transferred to 88 Bryanston Square, London.

After the end of the War Lord Carnarvon applied for, and obtained, a concession to excavate in the Valley of the Tombs of the Kings near Thebes. As soon as possible he rejoined Mr. Carter, who, in the intervals of his war work at general headquarters in Cairo, had begun preliminary investigations in the valley. Previous excavators, who had employed the system of making pits in rubbish in the hope of finding a tomb entrance, had failed in their objective. Lord Carnarvon and Mr. Carter decided to try another method. They realized that they must excavate down to actual bedrock, but in order to do this satisfactorily it was first necessary to clear away the rubbish dumps left by their predecessors. This involved the removal of some 150,000 to 200,000 tons of rub-

bish, but for some time no finds of importance were brought to light. It was not until 4 November 1922, in the first days of what Lord Carnarvon had decided should be their last season in the Valley of the Kings, that the perseverance of the excavators was rewarded by the great discovery, unique in the annals of excavation, of the tomb of King Tutankhamūn, with which Lord Carnarvon's name will always be associated.

It was actually Mr. Carter who, shortly before Lord Carnarvon's arrival from England, came upon the steps cut in the rock which led down to the tomb for which they had been searching for six years. An entrance passage, filled with stone and rubble, led to a sealed antechamber containing part of a royal funerary equipment, including statues, chariots, boxes, and vases piled in confused heaps. The fact that most of the objects bore the name of King Tutankhamūn, of Dynasty XVIII, who ascended the throne about 1350 B.C., put the identity of the occupant beyond a doubt. Leading out of the antechamber was the sealed doorway of a second chamber, which, it was surmised, contained the burial itself. In December, before the opening of this sealed chamber was undertaken, Lord Carnarvon and his daughter, Lady Evelyn Herbert, returned to England, and he was received by King George V. At the end of January 1923 they returned to Egypt in order to take part in the opening of the inner chamber, which was accomplished, in the presence of a number of officials of the Egyptian government and archaeologists, on 17 February. It was found to be almost completely filled by a vast gilded wooden shrine, which later proved to contain three other similar shrines and the coffins and mummy of the king. Out of the burial chamber an open doorway led to the store-chamber of the sepulchre; in this an extraordinary wealth of treasures of both artistic and archaeological importance was to be seen. At the end of February the tomb was closed and the entrance filled in, as it had been decided to devote the remainder of the season to the preservation and transport to Cairo of the objects removed from the antechamber, leaving the clearance of the burial chamber and store-chamber for the following season.

Early in March 1923, while he was in the Valley of the Kings, Lord Carnarvon was bitten on the cheek by a mosquito. The bite became infected, and he left for

Cairo, where later in the month erysipelas and blood-poisoning set in. Pneumonia subsequently supervened, and after several rallies he died 5 April 1923. His body was brought to England, and he was buried, as he had wished, on the top of Beacon Hill overlooking Highclere.

Lord Carnarvon was a man of great versatility, marked individuality, and much personal charm. He was succeeded as sixth earl by his only son, Henry George Alfred Marius Victor Francis (born 1898).

[*The Times*, 6 April 1923; Introduction by Lady Burghclere to Howard Carter and A. C. Mace, *The Tomb of Tut-ankh-amen*, vol. i, 1923.]

HERDMAN, Sir WILLIAM ABBOTT (1858-1924), marine naturalist, was born in Edinburgh 8 September 1858, the eldest son of Robert Herdman, R.S.A., by his wife Emma Abbott, of Maryborough, Queen's County, Ireland. He was educated at Edinburgh Academy and the university of Edinburgh. After graduating in 1879 he was chosen as one of the assistants of Sir Charles Wyville Thomson [q.v.] in working on the collections made during the voyage of the *Challenger*. Herdman took as his special study the Tunicata, a group of marine organisms, on which he became in time the leading authority. He was also interested in marine dredging and collected materials for papers on the fauna of the Firth of Forth. After being secretary of the *Challenger* expedition committee and, from 1880, demonstrator in zoology in the university of Edinburgh, he was appointed in 1881 first Derby professor of natural history in the university of Liverpool. There he devoted much attention to the co-ordination of the fishery industry with scientific research. His first step was the foundation in 1885 of the Liverpool Marine Biology Committee, which two years later opened a research laboratory at Puffin Island, off Anglesey. Herdman's enthusiasm inspired many amateur naturalists besides his own students, and led to a series of publications on the fauna of Liverpool Bay and the Irish Sea. In 1892 the station was moved from Puffin Island to a more central position at Port Erin, Isle of Man, where it was from time to time enlarged to meet the growing demands of research workers. Herdman also took a great interest in the archaeology of the Isle of Man and was largely instrumental in the foundation of the government museum at Douglas.

In 1891 the recently founded Lancashire

Sea Fisheries Committee secured Herdman's services in the organization of a marine research laboratory in the university of Liverpool; in 1897 Herdman was also instrumental in helping to establish a fish hatchery at Piel Island in Barrow Strait. The latter soon grew into a general biological station and a centre of instruction for fishermen in biology, navigation, and seamanship. Much faunistic and statistical work was carried out at Piel. Specially noteworthy were the researches into plankton which were carried out in collaboration with the Irish fishery authorities.

In 1901 Herdman went to Ceylon, at the request of the Colonial Office, in order to investigate and report on the pearl oyster fisheries of the Gulf of Manaar. His work resulted in various recommendations made to the government of Ceylon regarding the future of the fisheries, and led to the establishment of a marine research station at Trincomalee [see *Report to the Government of Ceylon on the Pearl Oyster Fisheries of the Gulf of Manaar*, 1903-1906].

Returning to his investigations in the Irish Sea, Herdman assisted the plankton survey by the use of his small steam yachts, and extended the survey northwards to the west coast of Scotland. When the European War restricted work at sea, he became chairman of the grain pests committee of the Royal Society. In 1916, with his wife, he founded the George Herdman chair of geology in the university of Liverpool in memory of his son who was killed at the battle of the Somme; and in 1919 he endowed a chair of oceanography in the same university, of which he became the holder for one year, after resigning in 1919 the chair of natural history.

Herdman was a general secretary of the British Association from 1903 to 1919, and he was president at the Cardiff meeting of 1920, when the theme of his address was a plea for a new *Challenger* expedition. He received honorary degrees from several universities, and was elected a fellow of the Royal Society in 1892, served on its council from 1898 to 1910, and was foreign secretary from 1916 to 1920. He was president of the Linnean Society from 1904 to 1908. He received the C.B.E. in 1920 and was knighted in 1922.

Apart from numerous scientific papers and the section on Ascidia in the *Cambridge Natural History*, Herdman's only published work of general interest was *The Founders of Oceanography* (1923). He

married twice: first, in 1882 Sarah (died 1886), daughter of David Douglas, bookseller and publisher, of Edinburgh, by whom he had two daughters; secondly, in 1893 Jane Brandeth (died 1922), daughter of Alfred Holt, shipowner, of Liverpool, by whom he had one son and one daughter. He died suddenly in London 21 July 1924.

[*Proceedings of the Royal Society*, vol. xcvi, B, 1925; *Proceedings of the Linnean Society of London*, October 1925, 137th session; *Annual Report of the Liverpool Marine Biological Committee*, 1919; private information.] R. N. RUDMOSE BROWN.

HESELTINE, PHILIP ARNOLD (1894-1930), writer on music, and musical composer under the pseudonym **PETER WARLOCK**, was born in London 30 October 1894, the only child of Arnold Heseltine, solicitor, of London, by his wife, Edith Covernton. His father died when the boy was two years of age. He was sent to a private school at Broadstairs when he was about nine, and thence to Eton (1908-1911). In 1910 he made the acquaintance of Frederick Delius, with whom there followed a remarkable interchange of letters, and whose music became the chief formative influence on Heseltine's own compositions. The two years after Eton found Heseltine in Germany, where he spent some months at Cologne, and at his mother's home, Cefn Bryntalech, Abermule, Montgomeryshire. He went up to Christ Church, Oxford, in the autumn of 1913, but left at the end of the summer term of 1914. Thereafter, for a few years, he lived principally in London. He had liked neither Eton nor Oxford, and liked still less the patriotic attitude to the European War. His letters to Delius about this time reveal him a brooding, melancholy, yet passionate soul, an 'apparent misfit in any surroundings'. In November 1915 Heseltine met David Herbert Lawrence [q.v.], whose personality and philosophy affected his music, and he stayed with Lawrence in Cornwall in the spring of 1916. About this time he also met Bernard van Dieren, the influence of whose music upon him was second only to that of Delius and ultimately became greater. In December 1916 he married Minnie Lucy, daughter of Robert Stuart Channing, a mechanical engineer. They had one son. From August 1917 to August 1918 he was in Dublin, and after that in London again. He first used the pseudonym 'Peter Warlock' as the signature to certain songs published in 1919. He

founded *The Sackbut* (incorporating *The Organist*), a musical journal, in May 1920, and edited it until June 1921. During these two years he was abroad for long periods in France and North Africa. He settled at Cefn Bryntalech in the autumn of 1921, but, having separated from his wife in or about the year 1923, he left Wales in 1924 and after a few months in London went to live, early in 1925, at Eynsford, Kent. There he stayed until October 1928. After returning to Wales for a short time, he went again to London and lived there till his death, which took place at Chelsea, 17 December 1930, as the result of gas poisoning. At the inquest the jury were unable to determine whether he had committed suicide.

Heseltine left about a hundred songs with pianoforte accompaniment; *The Cuckoo*, a song cycle for tenor voice, flute, cor anglais, and string quartet (1920-1922); *Serenade* for string orchestra, in homage to Delius (1923); and other instrumental compositions, besides numerous choral works and part songs. He edited a large body of Elizabethan and Jacobean music, Purcell's *Thirteen Fantasies for strings*, and transcriptions of many works by Delius. He was the author, among other books, of *Frederick Delius* (written under his own name, 1923), *The English Air* (1920), and, in collaboration with Cecil Gray, *Carlo Gesualdo, Musician and Murderer* (1920).

Heseltine's music is that of a belated Elizabethan. His best songs—described by a writer in *The Times* as 'some of the most exquisite and original songs of our day'—have unusual purity of tone, a delicate clarity of utterance, and a learned simplicity. His books are scholarly contributions to their subjects.

[Cecil Gray, *Peter Warlock: A Memoir of Philip Heseltine* (containing a complete list of his works musical and literary), 1934; private information.] E. O'BRIEN.

HEWLETT, MAURICE HENRY (1801-1923), novelist, poet, and essayist, was born at Oatlands Park, Weybridge, Surrey, 22 January 1801. His father, Henry Gay Hewlett, was of French extraction and his ancestors were in all probability Huguenot refugees. The original name was Hulotte, afterwards corrupted into Hulet. The family appears to have settled in Dorsetshire, but is to be traced in a number of other counties. Hewlett's father had the civil service appointment of keeper of His Majesty's

land revenue records. He married Emmeline Mary, daughter of James Thomas Knowles, an architect, and sister of (Sir) James Thomas Knowles [q.v.], founder and editor of the *Nineteenth Century*. They had eight children, of whom Maurice was the eldest. In 1872 his parents moved to Farningham in Kent, and Maurice became a day-boy at Sevenoaks grammar school. In 1874 he went as a boarder to Palace School, Enfield, and in 1875 to the International College, Spring Grove, Isleworth. In 1878 he joined his cousin, W. O. Hewlett, in the family law business at 2 Raymond Buildings, Lincoln's Inn. He married in 1888 Hilda Beatrice, daughter of the Rev. George William Herbert, vicar of St. Peter's, Vauxhall, by whom he had one son and one daughter. He was called to the bar by the Inner Temple in 1890, and in 1897 he succeeded his father as keeper of land revenue records, a post which he held until 1900.

The year 1898 was the turning-point in Hewlett's career, for it saw the publication of *The Forest Lovers*. The success was great and immediate, and he was now, at the age of thirty-seven, widely famous. It may be said without exaggeration that the rest of his life was spent in combating this fame which he always felt to be, in its origin and proportion, unbalanced and stultifying to his proper reputation. Hewlett now gave up his life to his writing, which may be divided into three periods. During the first, from 1898 to 1904, he produced mainly Italian and historical romances. The most important of these, after *The Forest Lovers*, are *The Life of Richard Yea-and-Nay* (1900) and *The Queen's Quair* (1904). The second period, which lasted roughly until the outbreak of war in 1914, was occupied with Regency novels and stories of modern life, such as *Rest Harrow* (1910). During the third period, from 1914 until his death at Broadchalke, Salisbury, 15 June 1923, he was in the main poet and essayist, and it was in this period that he wrote what was perhaps his greatest work, *The Song of the Plow* (1916). A typical volume of essays was *Wiltshire Essays* (1921).

Hewlett was a man of sardonic speech with an exceedingly warm heart. His own description of himself remains the best: 'If I am to deal with life it must be in my own way, for there's no escape from one's character. I may be a good poet or a bad one—that's not for me to say; but I am a poet of sorts.' It was as poet that he regarded himself, first, last, and all the

time. It was as poet that he wrote his Italian romances, his historical novels, his modern fiction, his *Song of the Plow*, his essays, and it was as poet that he made in his last years his passionate declarations of belief in the English peasantry as the only hope for England. But he had made his name as the author of romantic fiction, and the public refused to take him seriously in any other aspect. So, sardonically, humorously, and sometimes bitterly he tiraded, all his later life, against what he considered his false position. Nevertheless, in *The Queen's Quair* and *Richard Yea-and-Nay* he did great things for the English historical novel, bringing lyrical poetry into it without robbing it of its actuality and drama. And in his *Song of the Plow* he wrote one of the five epics of English poetry—a work as likely to survive as anything else in English contemporary literature. It must be said also that he was a splendid friend, fiery in his loyalty, indulgent in his patience, and a great open-air companion.

[Maurice Hewlett's *Letters*, edited by Laurence Binyon with an introductory memoir by Edward Hewlett, 1926; private information.]

H. WALPOLE.

HICKS, ROBERT DREW (1850-1920), classical scholar, was born at Aust, Gloucestershire, 29 June 1850, the eldest son of William Hicks, a head clerk in the post office at Bristol, by his wife, Frances Oldland. He was educated at Bristol grammar school, and in 1870 entered Trinity College, Cambridge, of which he was elected a scholar in 1872. He was bracketed sixth classic in the tripos of 1874, and in the same year obtained a second class in the moral sciences tripos. In 1876 he was elected fellow of his college, a position which he held until his death, and from 1884 to 1900 was lecturer in classics. Hicks married in 1894 Bertha Mary, daughter of Samuel Heath, farmer, of Thornton Curtis, Lincolnshire, and sister of Sir Thomas Little Heath and Robert Samuel Heath, the mathematicians. They had one son and one daughter. In 1900 he became blind; but, helped by his wife and by a few friends, he continued with indomitable courage to pursue his laborious and fruitful studies in the classics. In 1928 the honorary degree of D.Litt. was conferred on him by Manchester University. He died at Cambridge 8 March 1929.

In 1894 Hicks published an edition of five books of Aristotle's *Politics*, based on the edition of the German scholar, Franz

Susemihl, but including much original work of his own. In 1899 he edited, in collaboration with Richard Dacre Archer-Hind [q.v.], a volume of *Cambridge Compositions* in Greek and Latin. He contributed the section on chronology and on the later philosophical schools to the *Cambridge Companion to Greek Studies* (1905) and that on philosophy to the *Companion to Latin Studies* (1910). In 1907 appeared Hicks's chief book, a monumental edition of Aristotle's *De Anima*. In 1910 he published *Stoic and Epicurean*, and in 1925 a text and translation of Diogenes Laertius. In 1921 he prepared a *Concise Latin Dictionary* in braille type.

Hicks must be accounted one of the most learned students of Greek philosophy in his generation. His *magnum opus*, packed as it is with detailed discussions of the text and interpretation of the *De Anima*, and showing knowledge of the whole literature of the subject, would have been a remarkable achievement for any one; considered as the work of a blind man, it is much more remarkable. His other works are slighter in character, but are models of clear and judicious presentation, and worthy of the high reputation for scholarship which Hicks enjoyed. As a teacher, he would take endless trouble to deal with the difficulties of his students, and his wide reading and tenacious memory made him an oracle to whom they seldom appealed in vain. When he had become blind, he wrote out many of his favourite philosophical works in braille, and a friend relates how he found him in bed reading Aristotle with his fingers under the bed-clothes. It may be added that, although no performer, he was passionately devoted to music.

W. D. ROSS.

HILLS, ARNOLD FRANK (1857-1927), shipbuilder and philanthropist, was born at Denmark Hill, London, 12 March 1857, the youngest son of Frank Clarke Hills, a manufacturing chemist, who made a fortune, and acquired a large interest in the Thames Ironworks and Shipbuilding Company at Blackwall, by his wife, Anne Ellen, daughter of James Rawlings.

Hills entered Mr. Bushell's house at Harrow in 1871, and in 1876 went up to University College, Oxford. Both at school and at the university he was a good football player and long-distance runner. He was the captain of football at Harrow, and

he represented Oxford twice under Association rules. At the athletic sports he ran the mile twice for Oxford, and, although he did not win against Cambridge, he was amateur champion over that distance in 1878. In the following spring he won the three miles' race at the inter-university sports in creditable time. He obtained a second class in classical moderations in 1877, and a second class in modern history in 1879.

Almost immediately after taking his degree Hills joined the directorate of the Thames Ironworks. The company owned a shipyard on the Thames, and it was from this yard that the *Warrior*, the first British sea-going iron-clad battleship, had been ordered in 1859, as well as a second large vessel, the *Minotaur*, two years later. The Thames Ironworks was at one time one of the leading shipyards in the country, but at the date when Hills became associated with it competition with more modern establishments on the Clyde and the Tyne was becoming acute. The general trend of heavy industries was to Scotland or the North of England, where the necessary steel and iron could be obtained more conveniently and handled more economically. On the Thames it became more and more difficult to find work for the shipbuilding yards.

Hills was a student of social problems, and he recognized the importance of this question for the industrial population of South-East London and the riverside. For five years (1880-1885) he lived in Canning Town close by his work, devoting his days to the shipyard and his evenings to the improvement and recreation of his workpeople. Large sums were spent by the firm in organizing clubs of all kinds, and in arranging lectures, concerts, and other entertainments. Unfortunately, Hills found himself involved in disputes with the trade unions, chiefly on the subject of employing non-union labour. He maintained his right to engage whom he wished, and, although in the end his point was gained, it was only after heavy losses had been incurred through strikes. In an endeavour to improve the relations with his workmen he instituted a profit-sharing scheme, and introduced also an eight-hour day.

After the settlement of these differences a period of prosperity followed, and during the last decade of the nineteenth century the Thames Ironworks enjoyed considerable custom. At one time there were in hand four first-class battleships, including

one for the Japanese navy. To meet this pressure various steps were taken. The engine works of Messrs. John Penn and company at Greenwich were bought, so that marine engines as well as hulls could be built. The plant of the yard was modernized, the ship-repairing and civil engineering departments were extended, and an electrical department was opened. Hills also tried to re-establish a popular service of river steam-boats.

Circumstances proved too much for this activity to continue. The northern shipyards were able to undersell the Thames, and the unequal competition could not be maintained. When about 1909 the Admiralty considered placing the order for the battleship *Thunderer* with the Thames Ironworks, protracted negotiations took place before the contract was finally decided. There was a strong body of opinion against the abandonment of shipbuilding on the Thames, and no doubt weight was given to this view. The order required costly additions to the company's resources, but Hills faced these conditions with unflinching spirit. The *Thunderer* was laid down on the same slip from which the *Warrior* had been launched fifty years before, though the slip had been strengthened and lengthened in the interval. The contract was quickly and efficiently carried out, but it proved to be the last effort of the yard. Not long afterwards the Thames Ironworks was compelled to close down from lack of work. On 17 November 1911 a receiver for the debenture-holders was appointed, and the sale of the property was completed early in 1914.

This long fight in a losing cause would in any case have been worthy of notice, but it was rendered more remarkable by the fact that for some years it had been carried on by Hills under physical disability. The strain and anxiety of his incessant labours proved too severe for his strength. His health was gradually affected by an illness which made him in 1903 a complete cripple. His mind was as vigorous as ever, but he was unable to move hand or foot. He was carried about in an invalid chair, and it was from this that he continued to direct his affairs. At the launch of the *Thunderer* he spoke from his chair for half an hour with much eloquence. Outside his business as manager of a shipbuilding firm Hills had a number of other interests. He was an ardent advocate of total abstinence as well as of vegetarianism, and his philanthropic activities were many.

Hills married in 1886 Mary Elizabeth, daughter of Alfred Lafone, of Hanworth Park, Middlesex, and had one son and four daughters. He died 7 March 1927 at his home, Hammerfield, Penshurst, Kent.

[*The Times*, 8 March 1927.]

A. COCHRANE.

HOBHOUSE, LEONARD TRELAWNY (1864-1929), philosopher and journalist, was born at St. Ives, near Liskeard, 8 September 1864, the youngest of the seven children of the Rev. Reginald Hobhouse, rector of St. Ives for fifty-one years, and archdeacon of Bodmin from 1877 to 1892. His mother was Caroline, daughter of Sir William Lewis Salusbury-Trelawny, eighth baronet, of Trelawny, Cornwall. She was a gifted woman, who read French, German, and Italian with ease, and taught him Latin before he went to school. He went to a preparatory school at Exmouth and in 1877 to Marlborough, where he developed slowly and not without difficulty, though he was a clever boy. 'It was his own line of private reading that marked the future man', as one of his masters has said. He read J. S. Mill, Herbert Spencer, and Mazzini's *Essays*, and these writers confirmed his natural bent for thinking for himself. He went up to Oxford in 1883 with a scholarship at Corpus Christi College, gained first classes in classical moderations (1884) and *literae humaniores* (1887) and in the latter year obtained a prize fellowship at Merton College. In 1890 he was appointed assistant-tutor at Corpus, and in 1894 was elected a fellow of that college.

Hobhouse's chief interest at Oxford lay in philosophy, which was the subject of his teaching, but he had already enlarged his knowledge by studying science at the University Museum. In 1889 he took up the cause of the movement known as the 'New Unionism'. This brought him in contact with the world of labour, which appealed to him emotionally, as philosophy did intellectually, and he sought to combine them in the study of sociology.

In 1891 Hobhouse married Nora, daughter of George Burgess Hadwen, a mill-owner of Sowerby Bridge, who lived at Kelroyde, and entered on a happy married life. A son and two daughters were born of the marriage. In 1898 he published his first book, *The Labour Movement*; it dealt with trade unions, co-operation, and the control of industry, and went through several editions. Then he went back to

philosophy and in 1896 published *The Theory of Knowledge*. This work revealed him as an original thinker. It was opposed to the Idealism then dominant in philosophical circles at Oxford, and was coldly received. The fact increased in Hobhouse a certain restlessness, which had been growing for some time. He felt that the life of an Oxford don was too academic for him, too far removed from the real world. He wanted to go to London; but, on the invitation of Mr. C. P. Scott, he actually went in 1897 to Manchester in order to work on the staff of the *Manchester Guardian*. He had been recommended by Dr. Arthur Sidgwick, whom Scott had consulted, as 'quite the ablest of our younger Greats men and a strong liberal and progressive of the best type'.

Hobhouse's interest in politics dated from his school days, when he read Mill and became a radical with a marked tendency towards the left. It was a real interest, which lasted throughout his life until the closing years, when the turn of party politics disappointed him and he cut himself adrift from all party associations. In Manchester he remained for five years, working at a philosophical book in the daytime and writing for the *Manchester Guardian* at night. He had an extraordinary facility in writing leading articles, as in speaking; but the double work exhausted him, and in 1902 he gave it up and left Manchester for London. His association with the *Manchester Guardian* did not cease, however; he became a director of the paper in 1911, contributed frequently to it, especially from 1915 to 1925, and in 1921 acted as deputy editor.

In the meantime Hobhouse's philosophical study had been published in 1901, under the title of *Mind in Evolution*. In 1903 he took an active part in forming the Sociological Society, and thenceforward sociology was his chief pre-occupation; but he still continued his journalistic work. In the following year he published *Democracy and Reaction*, in which he protested against imperialism and the negative social policy of the liberal party. From 1903 to 1905 he was secretary of the Free Trade Union, and he acted for some time as the editor of its organ, the *Sociological Review*; for eighteen months (1906-1907) he was political editor of *The Tribune*. In 1906 his *Morals in Evolution* appeared, and marked a new departure in the study of sociology. In 1907 he was appointed the first professor of sociology in London University on the Martin White

foundation, and he held the post until his death. In 1911 he published *Social Evolution and Political Theory* and *Liberalism* (in the 'Home University Library'), and in 1913, *Development and Purpose*; he also wrote, with G. C. Wheeler and M. Ginsberg, *The Material Culture and Social Institutions of the Simpler People* (1915). During the European War he took the patriotic side, but he advocated an agreed peace in 1917. Afterwards he was made chairman of several trade boards, in the working of which he had taken a keen interest from their first formation.

In the decade following the War Hobhouse published *The Rational Good* (1921), *The Elements of Social Justice* (1922), and *Social Development* (1924); these three books developed his sociology into a complete system. He also wrote *The Metaphysical Theory of the State* (1918), and in 1927 published a revised and largely rewritten edition of his *Development and Purpose*. The death of his wife in 1925 was a heavy blow to him, and his own prolonged illness which began in 1924 increased a tendency to depression. He died 21 June 1929 at Alençon in Normandy, and was buried at Wimbledon. His sociological works were more appreciated in America than in England, and he had many requests to lecture from American universities. He received honorary degrees from the universities of St. Andrews (1919) and Durham (1913). The Hobhouse Memorial Trust, which provides for an annual lecture to be delivered in rotation at the London School of Economics, University College, King's College, and Bedford College, and also for a memorial prize to be awarded annually to a student who shows conspicuous merit in sociology, was founded in 1930.

[*The Times*, 24 and 27 June 1929; H. Carter, *The Social Theories of L. T. Hobhouse*, 1927; E. Barker, *Leonard Trelawny Hobhouse, 1864-1929*, in *Proceedings of the British Academy*, vol. xv, 1929; J. A. Hobson and Morris Ginsberg, *L. T. Hobhouse, His Life and Work*, 1931.] A. SHADWELL.

HOGARTH, DAVID GEORGE (1802-1897), scholar and traveller, was born at Barton-on-Humber, Lincolnshire, 23 May 1802, the eldest son of the Rev. George Hogarth, vicar of that parish for nearly forty years, by his wife, Jane Elizabeth, daughter of John Uppleby, of Scarborough. He was educated at Winchester, where he was a commoner from 1876 to 1881, not exerting himself in his progress

up the school, but gaining distinction as a runner (in his last year he won the mile, half-mile, and quarter-mile) and acquiring a reputation for greater ability than he cared to show. His own observation, written when he had a son at Winchester, was 'At Winchester I learned how to learn things, and that was a great deal'. In October 1881, he went up to Oxford as a demy of Magdalen College, where his career was similar. Ostensibly more interested in horse-racing and athletics, he obtained first classes both in classical moderations (1882) and in *literae humaniores* (1885), was president of junior common room, and was generally recognized as a man of outstanding ability. After taking his degree in 1885, a year of uncertainty followed, when the possibilities of fellowships, of the bar, and of the British Museum were contemplated without much enthusiasm. His chance came in 1886 when he was elected to the Craven travelling fellowship, then first instituted. By this means he embarked on the career of a travelling archaeologist, in which he made his name, and acquired the experience which was afterwards used in other fields.

Hogarth's apprenticeship to archaeology is described in the early chapters of his *Accidents of an Antiquary's Life* (1910). It included travelling with (Sir) William Mitchell Ramsay [q.v.] in Asia Minor in 1887—'an arduous apprenticeship to the best epigraphist in Europe'—excavating at Paphos in Cyprus in 1888, another journey with Ramsay in Asia Minor in 1890 and with another companion in 1891, and three seasons in Egypt, working for the Egypt Exploration Fund at Deir-el-bahri, Alexandria, and the Fayum from 1894 to 1896. In Egypt he perfected his knowledge of the technique of excavation, but he never acquired any enthusiasm for Egyptian archaeology. His taste was always distinctly classical. Meanwhile he had been elected a fellow of Magdalen in 1886, and in 1894 he married Laura Violet, daughter of Charles Uppleby, of Barrow Hall, a distant relative of his mother. They had one son.

In 1897 Hogarth was appointed director of the British School of Archaeology at Athens; but before taking up the duties of the post he had an exciting interlude as correspondent for *The Times* in Crete during the revolution and in Thessaly on the eve of the Greco-Turkish War of that year, of which he has left a lively account [see *Accidents of an Antiquary's Life*, ch. 1].

He held the directorship for only three years. He had great administrative capacity, but at this period his passion was for travel, and for a still wider field of experience. The principal episodes of his directorship were the excavation of Phylakopi in Melos, and a season at Naukratis in 1899. In 1900 he left the School, and joined (Sir) Arthur Evans in his first campaign in Crete after the revolution, in which a beginning was made on the epoch-making excavations of Knossos, while Hogarth in particular undertook the clearing of the Dictaeon cave. In the following year a season at Zakro, in the east of the island, was cut short by a disastrous flood.

After leaving Athens, Hogarth had his head-quarters at Oxford, his activities being mainly divided between literature and sporadic archaeological expeditions. He had made his name as a brilliant and picturesque narrator of travel by his little book *A Wandering Scholar in the Levant*, published in 1896; and in 1897 he published his *Philip and Alexander of Macedonia*, a subject to which he had been attracted ever since his undergraduate days. He did not take the time necessary to make it a full-scale work of research and history; but it remains a brilliant and original essay. To this same period belong *Authority and Archaeology* (1899), a collection of essays of which he was the editor, an admirable book on *The Nearer East* (1902), and *The Penetration of Arabia* (1904). He had never visited Arabia (indeed, a mission to Jiddah in 1917 was his only first-hand experience of the country on which he became a recognized authority), but he had studied the literature minutely. He was one of the discoverers and champions of Charles Montagu Doughty [q.v.], whose life he subsequently wrote; and his knowledge of the country and the people proved of vital importance to the British government during the European War.

Meanwhile, Hogarth paid another visit to Naukratis in 1903, and in 1904-1905 he conducted a campaign of excavation on behalf of the British Museum on the site of the temple of Artemis at Ephesus. It was also on behalf of the Museum that in 1908 he visited the upper Euphrates, and prospected the sites of Jerablus (Carchemish) and Tell Bashar. He visited the United States as a lecturer in the winter of 1907-1908, and again in 1909 and 1921. In 1908, however, his life as a 'wandering scholar' came to an end. Domestic reasons made a settled home and a regular income

desirable, and in that year he accepted the appointment of keeper of the Ashmolean Museum at Oxford, and he held the post until his death. His only archaeological expedition after this date was in 1911, when the plans made three years earlier for the excavation of Carchemish fructified. Hogarth planned and started this work for the British Museum, but his duties at Oxford precluded him from carrying it through, though he visited the site again in 1912 and 1914, when the work was being continued by (Sir) C. L. Woolley and T. E. Lawrence.

The life of a museum director has few outstanding details; but under Hogarth the Ashmolean grew markedly in importance, especially in the departments of Cretan and Hittite archaeology. The latter was, in fact, his own principal interest, and his contributions to the subject were substantial and important. The routine details of his office he conducted efficiently and without fuss, and he combined with his museum duties other work for the university, particularly as a delegate of the Clarendon Press, where his knowledge and his practical sense were of great value. The orderly train of a settled life in the university was, however, broken by the outbreak of the European War. Hogarth at once offered to put his knowledge of the East at the service of the government, and in 1915 he was sent out to Cairo and Athens. There, perhaps for the only time, he found full scope for his powers in work of the first importance. After various vicissitudes he was made director of the Arab Bureau at Cairo, with the rank of commander in the Royal Naval Volunteer Reserve, and in this position he was largely responsible for the difficult and delicate diplomacy which underlay the Arab campaign so brilliantly conducted in the field by his former archaeological disciple (whom he had recruited for this work), T. E. Lawrence. With Lawrence, Sir G. F. Clayton, (Sir) Wyndham Deedes, (Sir) George Lloyd, (Sir) Mark Sykes, and one or two others, he formed a loose group which probably was mainly responsible for the development of the British-Egyptian (as opposed to the British-Mesopotamian) point of view about the aims and policy of operations in Arabia, Palestine, and Syria. It was for the home government to decide how far such aims should be adopted and carried out. The details are not public property; but all concerned with the work have borne testimony to Hogarth's level-headed

ability, his patience, his knowledge, and his sound judgement of men. Here he found administrative and organizing work of a scale and importance to call forth his full powers. It is the great period of his life, but one of which little can be written. He received the C.M.G. for his services in 1918.

After the War Hogarth was a member of the British delegation at the Peace Conference at Versailles, and then returned to his work at Oxford. His health had suffered from the strain of the War, but his powers were not yet affected, and during this period he served on the hebdomadal council, and was an active member of the statutory commission on Oxford University. In 1917 he had received the gold medal of the Royal Geographical Society, and in 1925 he became its president, in which capacity he carried out much administrative work with his usual efficiency. In 1926 his health definitely began to cause alarm, and he died suddenly in his sleep 6 November 1927 at Oxford.

In person Hogarth was somewhat above middle height, well set-up, dark in colouring, with a rather sardonic expression which suited a cynicism of phrase characteristic of him. It was only a superficial and good-natured cynicism, quite compatible with readiness to serve and help others. The outstanding impression given by him was that of mastery of his work. Indeed, except during the War, he never seemed to have a task which called out his full powers. He disliked routine and a fixed employment; hence he passed from one piece of work to another, and settled down to nothing till past middle life. He was a wise adviser, because he was full of knowledge and experience without being led astray by unbalanced enthusiasm, and because he was quite free of envy or jealousy. He was not a fighter or self-assertive, but he generally succeeded in attaining his end, for he knew his own mind and was trusted. He was a vivid descriptive writer, and his books rank among the best in the literature of travel. It was in travel that he was probably happiest. He had a keen eye both for geography and for national character, and excelled in relating both to their historical background, and in interpreting history in their light.

Hogarth was elected F.B.A. in 1905, obtained the degree of D.Litt. of Oxford in 1918, and received the honorary degree of Litt.D. of Cambridge in 1924.

In addition to the works already mentioned, and not including articles in periodicals, Hogarth was the author of *Devia Cypria* (1889); *The Archaic Artemisia of Ephesus* (1908); *Ionian and the East* (1909); *The Ancient East* (1914); *Carchemish, Part I* (1914); *The Balkans* (1915); *Hittite Seals* (1920); *Arabia* (1922); *Kings of the Hittites* (1920, being the British Academy Schweich lectures for 1924); *C. M. Doughty, A Memoir* (1928, seen through the press by his son after his death); he also wrote several chapters in the *Cambridge Ancient History*, particularly on Hittite history and archaeology. He was a contributor to this *Dictionary*, and gave its editors much valuable advice and active help.

[A. H. Sayce, *David George Hogarth, 1862-1927*, in *Proceedings of the British Academy*, vol. xiii, 1927; Mrs. Courtney (Hogarth's sister) in the *Fortnightly Review*, January 1928; C. R. L. Fletcher in the *Geographical Journal*, April 1928; Hogarth's letters and writings; personal knowledge.]

F. G. KENYON.

HOLDERNESS, Sir THOMAS WILLIAM, first baronet (1849-1924), Indian civil servant, came of a Yorkshire family, of Sutton-in-Holderness, his grandfather, Thomas Holderness, being a timber merchant in Hull. His father, John William Holderness, settled for a time in New Brunswick, where he married Mary Ann Macleod and where, at St. John's, Thomas Holderness, the eldest son, was born 11 June 1849. Soon after his birth his parents returned to England, and in 1867 he was sent to Cheltenham College to be educated. The untimely death of his father two years previously (1865), left the family in straitened circumstances, but Holderness was able to maintain himself at Cheltenham by means of scholarships and prizes, and in 1869 he went as a scholar to University College, Oxford. In 1869 and again in 1870 he passed the open competitive examination for the Indian civil service, on the later occasion obtaining a place high enough to give him a choice of his province. In those days it was comparatively rare for Indian civil service probationers to pursue their university studies simultaneously with their preparation for India, but Holderness continued to read for classical honour moderations, in which he obtained a second class in 1871. Next year he obtained a second class in law and modern history.

Proceeding to India in the winter of

1872-1873, Holderness spent his first three years in the seclusion of the small stations of Bijnor, Fatehpur, and Muzaffarnagar in what were then called the North-West Provinces. As many others have done who have risen to distinction in the Indian service, he began to contribute to the press, and it was probably his writings as well as his exceptional administrative ability that attracted the notice of the lieutenant-governor, Sir John Strachey [q.v.], and led to his being called in 1876 to the provincial capital, Allahabad, for secretarial duties in the offices of the government and the board of revenue. It is a coincidence that in later years he was entrusted with the work of revising and reissuing (4th ed., 1911) Sir John Strachey's classic work on *India, its administration and progress*. As a secretary he showed a capacity so obvious and outstanding that, during the rest of his Indian career, he never, except for one short interval, returned to executive work in the districts. At Allahabad he laid the foundations of a comprehensive knowledge of the revenue systems of India and learned to appreciate their bearing on the welfare of the peasantry. After five years' apprenticeship in the provincial offices, Holderness was selected in 1881 to be under-secretary to the government of India in the revenue department, and there he remained, occasionally acting as secretary, until 1885. In this year he married Lucy Shepherd, daughter of George Robert Elsmie, C.S.I. [q.v.], a civilian of note in the Punjab, and paid a visit to England. In 1888, after being for a short time in charge of the district of Pilibhit, he was appointed director of land records and agriculture, and later, secretary to the government of the United Provinces in both judicial and financial departments.

Holderness was now recognized as marked out for a distinguished career, and his promotion was accelerated by the work which he carried through successfully in dealing with measures of relief in the disastrous series of famines with which the nineteenth century closed. The United Provinces were gravely affected as early as 1896, and Sir Antony (afterwards Lord) MacDonnell [q.v.], who, as lieutenant-governor, directed the relief operations, summoned Holderness to assist him. Owing to the experience so gained, when the distress later on spread to other provinces, he was called by the viceroy, Lord Curzon, to Simla, as adviser to the Imperial government in the emergency. For

his services he was rewarded by the C.S.I. (1898), and by the Kaiser-i-Hind gold medal (1901). In 1898 he became secretary to the government of India, revenue and agricultural department, and was now in the recognized line of succession to the headship of a province. He was, in fact, offered such a post, but in order not to continue separated from his family, then resident in England, declined.

In 1901 Holderness retired from the Indian civil service and accepted the post of secretary in the revenue, statistics, and commerce department at the India Office, where Lord George Hamilton was at the time the secretary of state. He was now in the wider stream of the world's affairs. International conferences on the sugar trade and on problems of sanitation claimed his attention, and the selection of the experts required by the great expansion of the scientific services, especially those connected with agriculture, during Lord Curzon's viceroyalty, came into his hands. In recognition of his work as secretary he was created K.C.S.I. in 1907, and in 1912, on the death of Sir Richmond Ritchie [q.v.], the permanent under-secretary of state, he was promoted to the vacant post, a unique distinction for an officer of the Indian services.

In June 1914 Holderness had reached the full retiring age of sixty-five, but he was granted an extended term of office, and after the outbreak of war his great experience and soundness of judgement made him an invaluable adviser, first in connexion with the organization of munition supplies and the utilization of civil officers for war work, and later in connexion with discussions on the Rowlett Bills and the Montague reforms. Accordingly, the further retention of his services was considered indispensable, and his term of office was extended by successive secretaries of state until 1919. To the Montague reforms he gave his cordial support, being convinced that a liberal measure of political advance should be conceded in India.

In 1917 Holderness was given the G.C.B. (having received the K.C.B. in 1914), and in 1920, after his retirement, a baronetcy was conferred on him. His mental vigour being unimpaired, he devoted his retirement to reading, writing, and business in the City, where his keenness and sound judgement impressed his new colleagues. Sanity of judgement was, indeed, his predominant trait; moreover, he had considerable literary gifts, and the works which he wrote or edited on Indian ques-

tions, in a lucid and persuasive style, commanded wide attention. He was of studious character, grave in demeanour, and simple, almost ascetic, in his habits of life.

Holderness died very suddenly 16 September 1924, while walking on the golf-links near his home at Tadworth in Surrey. He left a widow and two children, Ernest William Elsmie (born 1890), who succeeded to the baronetcy, and Helen Alice, who married C. M. Page, F.R.C.S.

Besides his edition of Strachey's *India*, Holderness wrote the official *Narratives of the Indian Famine, 1896-1897*, *Peoples and Problems of India* (1912, revised edition 1920), and *India's Arduous Journey in These Eventful Years* (1924).

J. O. MILLER.

HOLDICH, SIR THOMAS HUNGERFORD (1843-1929), Anglo-Indian frontier surveyor, was born at Dingley, Northamptonshire, 13 February 1843, the eldest son of the Rev. Thomas Peach Holdich, rector of that parish, by his wife, Susan, daughter of William Atherton Garrard, of Carisbrooke, Isle of Wight, and Olney, Buckinghamshire. He was educated at the Godolphin grammar school, Hammer-smith, whence he proceeded to the East India Company's Military College at Addiscombe, where in 1860 he gained the sword of honour. His intention had been to join the Bengal Engineers, but on the abolition of that corps he entered the Royal Military Academy at Woolwich and, passing out high, was duly commissioned in 1862 in the corps of Royal Engineers.

After completing various instructional courses, Holdich was sent out to India in 1865. At that period the government of India was sadly behindhand in its knowledge of those important terrains that lay on and beyond its borders, especially on the critical North-West Frontier, and there was almost unlimited scope for the scientifically trained surveyor of adventurous spirit. Serious political developments were afoot, and it was all-important that the government should have exact information about these regions. There were local tribal problems; more serious problems with the kingdom of Afghanistan; and the paramount problem of Russia's expansion to the east. Borders had to be explored, distant mountain ranges and rivers accurately located, and frontiers defined. For this work scientific training

was not all that was required. Men were wanted who had the taste and the physique for adventure, and could endure both the fierce heat of the desert plains and the arctic cold of the Central Asian highland; who were prepared, moreover, to face the very real danger of attacks from wild and fanatical tribesmen, and who had the tact and personality to handle delicate situations and to disarm suspicion. That Holdich possessed these qualities is amply attested by his remarkable record of service for twenty years in that rough borderland.

Holdich began his career in India as temporary assistant surveyor with the Bhutan expedition in 1865-1866. This led to his permanent appointment to the Survey Department, and in 1867 he was lent for survey work on the Abyssinian campaign. In 1878 he began his long connexion with the North-West Frontier, as a survey officer with the Southern Afghanistan field force. He served through both Afghan campaigns with distinction, being mentioned in dispatches and promoted brevet-major in 1881. Then followed some years of useful work in Baluchistan, Waziristan, and other parts of that vexed border, until in 1884 he was appointed to serve on the Russo-Afghan Boundary Commission. In spite of an inadequate staff and countless local difficulties, the results obtained were remarkable, and the frontier then laid down—admittedly based to a large extent on Holdich's advice—has been respected to this day. In 1892 Holdich, who had been promoted brevet-colonel in 1891, was appointed superintendent of frontier surveys, a post which he held until 1898. In 1895 he was once more deputed to deal with the Russo-Afghan border—this time in the remote Pamirs. In 1896, when a commission was appointed to demarcate the Perso-Baluch boundary, Holdich was chosen as chief commissioner, and his local knowledge proved highly useful. In 1897, when there was a general conflagration on the North-West Frontier, he did valuable service by supplying each column with suitable survey officers, and directing their efforts to the best advantage.

This was the close of Holdich's Indian career. But in 1902 his services were utilized for an important purpose elsewhere. A dispute between the governments of Chile and Argentina regarding their common frontier in Patagonia had been dragging on, until both parties agreed to invite the British government to appoint

a tribunal to arbitrate on the matter. Holdich was invited to be a member of the tribunal. Thanks in a great measure to his technical experience, his powers of conciliation, and his arduous examination of the actual ground, the tribunal was enabled to give an award entirely satisfactory to both sides.

One of Holdich's hobbies was painting in water-colours. A sketch-book and battered paint-box were always in his haversack. Wandering as he did in wild places, often amidst the most impressive scenery, he had unique opportunities for this pursuit, long before the days of the kodak. His talent is attested by the fact that he twice won the viceroy's cup in the Simla Fine Arts Exhibition. But the really absorbing interest of Holdich's life was geography. To him a blank space on the map was simply an incentive to go and find out and show accurately what was there. Accuracy was almost an obsession with him, and he had no sympathy with the amateur explorer and his stoppy 'intelligence'. Throughout, his work was marked by meticulous exactitude—and more than this—by broad-minded common sense. He refused to be hidebound by theoretical principles, 'believing', to use his own words, 'that the first and greatest object of a national frontier is to ensure peace and goodwill between contiguous peoples, by putting a definite edge to the national political horizon, so as to limit unauthorized expansion and trespass'.

Holdich contributed a volume, *India* (with 114 maps and diagrams, 1904) to the 'Regions of the World' series, and was also the author of *The Indian Borderland* (1901), *The Countries of the King's Award* (1904), *The Gates of India* (1909), and *Political Frontiers and Boundary Making* (1916).

Holdich was created C.B. in 1894, C.I.E. in 1897, and K.C.I.E. and K.C.M.G. in 1902. He was an active member of the Royal Geographical Society, of which he was gold medallist in 1887 and president 1916-1918.

Holdich married in 1873 Ada Maria, daughter of Captain John Heyning Vanrenen, of the East India Company's service, and had two sons and two daughters, the elder son being Brigadier-General Harold Adrian Holdich. He died at Merrow, near Guildford, 2 November 1929.

A. HAMILTON GRANT.

HOLIDAY, HENRY (1839-1927), painter and worker in stained glass, was born in London 17 June 1839, the eldest son of George Henry Holiday, teacher of classics and mathematics, by his wife, Clémène Gerber, of Mulhouse, Alsace. He was educated at home, and in 1854 began his training as an artist at Leigh's School of Art, Newman Street. At the end of 1854, at the early age of fifteen and a half, he was admitted as a student to the Royal Academy Schools, and he contributed to the Academy exhibition of 1857 two pictures, 'Darlestone Bay, near Swanage' and 'Swanage, Dorsetshire'. Holiday soon became a close friend and associate of several of the leading pre-Raphaelites: his picture 'The Burgess of Calais', exhibited at the Academy in 1859 and now in the Guildhall Art Gallery, bears striking witness to the tendencies which he developed as a result. Holiday continued to practise painting for a long time, his best-known work probably being his 'Dante and Beatrice', first exhibited in 1883 at the Grosvenor Gallery and now in the Walker Art Gallery, Liverpool; the title is not to be confused with that of an earlier picture by him of Dante and Beatrice first meeting as children, exhibited at the Academy in 1861.

From 1863 onwards, Holiday was principally active as a designer of cartoons for stained glass, having been invited at the end of 1862 to become the successor of (Sir) Edward Burne-Jones at Messrs. James Powell & Sons' glass-works at Whitefriars, London. The stained glass executed under Holiday's direction constitutes a life's work of remarkable extent, and may be studied in various buildings not only all over England but on the continent of Europe and also in the United States. Among his chief productions may be mentioned the memorial window to Lord Frederick Cavendish set up in St. Margaret's, Westminster, by the House of Commons; windows in Salisbury Cathedral, Ormskirk church, Lancashire, and St. Saviour's, Southwark; and, of examples abroad, windows in the church of the Epiphany, Washington, St. Paul's church, Richmond, Virginia, St. Luke's Hospital, New York, and the Children's Hospital, Toronto.

Although he worked with an unflinching seriousness of purpose and possessed considerable mastery of his craft, Holiday nevertheless, as an artist, lacks life and originality, remaining essentially a minor figure, tinged by academism. His

name, however, is of permanent historical importance in the annals of nineteenth-century glass-painting, and many valuable observations are contained in his book *Stained Glass as an Art* (1896). Holiday made experiments in various crafts and techniques, inventing a new form of enamel on metal in relief for the purpose of extending the use of the material to work on a large scale; he also produced a number of sculptures. He was a man of remarkably wide interests, which embraced mountain-climbing in England, music, science, social questions, female suffrage, and dress-reform; the last of these entailed the editorship of *Aglais*, the journal of the Healthy and Artistic Dress Union. He accompanied the solar eclipse expedition of (Sir) Norman Lockyer [q.v.] to India in 1871, and was otherwise widely travelled. His *Reminiscences of my Life*, published in 1914, convey a vivid impression of his exceptional personality and undoubted gifts, even if his mind cannot be described as having been either profound or original.

Holiday died 15 April 1927 at his house at Hampstead, which had long been the centre of a wide circle of devoted friends. He married in 1864 Catherine (died 1924), daughter of the Rev. Thomas Raven, incumbent of Holy Trinity, Preston, and sister of the landscape-painter, John Samuel Raven [q.v.]. She was an accomplished embroideress and talented musician, who in particular did much pioneer work towards gaining appreciation in England for the music of Wagner. They had one daughter, the violinist Winifred Holiday.

[*The Times*, 16 April 1927; Henry Holiday, *Reminiscences of my Life*, 1914; Algernon Graves, *The Royal Academy of Arts, a complete dictionary of contributors and their works*, vol. iv, 1909.] T. BORENIUS.

HOLLAND, SIR THOMAS ERSKINE (1835-1926), jurist, was born at Brighton 17 July 1835, the eldest son of the Rev. Thomas Agar Holland [q.v.], poet, and rector of Poynings, Sussex, from 1846 to 1888, who was a grandson of Thomas Erskine, first Baron Erskine, lord chancellor [q.v.]. His mother was Madalena, daughter of Major Philip Stewart. He was educated at Brighton College from 1847—the year in which the school was opened—until 1853. In 1854 he matriculated at Balliol College, Oxford, but in the following year migrated to Magdalen College with a demyship. He obtained a

second class in classical moderations in 1856 and a first class in *literae humaniores* in 1858. He was elected to a fellowship at Exeter College in 1859, and for a short time taught philosophy there. In 1860 he won the chancellor's prize for an English essay.

Holland soon turned from philosophy to law, and going to London, read in chambers with W. H. Butterworth, the special pleader, with G. De Morgan, the conveyancer, with H. T. Erskine, and with A. Kekewich (in equity). In 1863 he was called to the bar by Lincoln's Inn and joined the home circuit. After some years of practice at the bar, combined with journalism and lecturing, he was elected Vinerian reader in English law at Oxford in 1874, but later in the same year was elected to the Chichele chair of international law and diplomacy in succession to its first occupant, Mountague Bernard [q.v.]. In the following year he was elected to a fellowship at All Souls College, and held it until his death fifty-one years later. He resigned the Chichele chair in 1910, receiving the title of emeritus professor, but continued to live at Oxford, working at his subject almost to the end. He died at Oxford 24 May 1926, in his ninety-first year.

Holland won an immediate reputation in his subject by his inaugural lecture on the life and work of Alberico Gentili [q.v.], the Italian civilian who taught at Oxford in the reign of Elizabeth; he showed how much the work of Grotius owed to that of this hitherto neglected predecessor. The lecture led to a general revival of interest in Gentili, and in 1877 Holland published an edition of the text of Gentili's *De Jure Belli. The European Concert in the Eastern Question* appeared in 1885, and a volume of *Studies in International Law* in 1898. He rewrote for the Admiralty the official *Manual of Naval Prize Law* in 1888 and he prepared a handbook on the *Laws and Customs of War on Land* which was issued to the army in 1904.

From 1903 to 1905 Holland served on the royal commission on the supply of food and raw material in time of war, and in 1906 he was one of the British plenipotentiaries to the conference at Geneva at which the Geneva Convention of 1864, dealing with the sick and wounded in land warfare, was revised. He also collaborated actively for many years in the scientific work of the *Institut de droit international*, of which he became associate in 1875, member in 1878, and honorary member in 1925, and he presided over the session of

that body which was held at Oxford in 1918. But it was as a vigorous and independent commentator on contemporary events of international legal interest that Holland became best known to the public. In a long series of letters to *The Times* (first reprinted, 1881-1909, in 1909, 3rd edition, 1881-1920, in 1921 under the title *Letters to 'The Times' on War and Neutrality*) he was in the habit of contributing to the formation of a sound public opinion by exposing the true issues of a complicated situation. In later life he returned to his early interest in the history of international law, and published editions of the *Jus et Judicium Feciale* of Richard Zouche [q.v.] in 1911, and of the *De Bello, de Repræhensis, et de Duello* of Giovanni da Legnano in 1917. A volume of lectures on *International Law*, edited by T. A. Walker and W. L. Walker, was published posthumously in 1933.

It is, however, as the author of perhaps the most successful book on jurisprudence ever written that Holland's name is most familiar to many generations of law students. He first published *The Elements of Jurisprudence* in 1880, and he revised it for a thirteenth edition in 1924, when in his eighty-ninth year. It gained for him in 1894 the Swiney prize and silver cup. The book belongs to the school of English analytical jurisprudence founded by John Austin [q.v.], and attempts to construct 'a formal science of positive law' based on 'those comparatively few and simple ideas which underlie the infinite variety of legal rules'. It is free from the repetitions and inconsistencies which make Austin's own work, with all its merits, so wearisome to the reader, and is, indeed, probably in part responsible for the long-continued vitality of the Austinian tradition in English-speaking countries.

Both in its merits and in its defects the *Elements of Jurisprudence* is characteristic of all Holland's work. He wrote once of his own 'morbid hatred of disorder', and the phrase expresses, with humorous exaggeration, the salient quality of his work. It is always clear, vigorous, exact, and if its premisses be accepted its conclusions are generally irresistible. Its weakness is that the premisses are sometimes over-simplified, and the conclusions have a finality of which the subject-matter does not always admit. Moreover, Holland was not easily moved by argument or by the later researches of other students to modify a conclusion which he had once reached.

Throughout his Oxford life Holland was deeply interested in university business, and especially in the formal organization of the university, both past and present. He published a number of articles on the origins of the university, in the *Oxford Historical Society's Collectanea*, vol. ii (1890), in the *English Historical Review*, vol. vi (1891), and elsewhere. In 1884 he persuaded the university to reform its statute book by co-ordinating the recent legislation of the nineteenth century with the remnants of the Laudian code. He was assessor (sole judge) of the Chancellor's Court from 1876 to 1910, and during his tenure of the office secured a thorough reform of the then antiquated procedure of that tribunal. In current problems of university administration he hardly obtained the influence to which his learning and his industry entitled him. His natural conservatism and his disinclination to compromise even on matters which seemed unimportant to others, impaired his effectiveness in debate, and too often ranged him on the losing side.

To the end of his life Holland remained active and alert in body as well as mind. He was a great walker, and visited the Eggishorn every summer from the late 'sixties until 1925, except for the period of the European War. Behind a slightly formal manner he had a real kindliness of heart and a readiness to place the resources of his well-stored mind at the service of younger men.

Holland was one of the founders (1885) of, and a regular contributor to, the *Law Quarterly Review*. He became a K.C. in 1901, a bencher of his Inn in 1907, and was an original fellow of the British Academy. In addition to the degree of D.C.L. of Oxford University his academic honours included doctorates of Bologna, Glasgow, Dublin, and Brussels. He was knighted in 1917.

Holland was twice married: first, in 1871 to Louise Henriette (died 1891), daughter of Jean Delessert, of Passy, and by her had six sons, two of whom predeceased him, and one daughter; secondly, in 1895 to Ellen, daughter of David Edwardes, M.R.C.S., of Wimbledon, and widow of the Rev. Stephen Edwardes, fellow of Merton College, Oxford; there were no children of the second marriage.

A portrait of Holland by Hugh Goldwin Riviere was presented to him by friends at home and abroad in 1914, and is in the possession of the family.

Sir Thomas Erskine Holland, 1835-1920, in *Proceedings of the British Academy*, vol. xii, 1926; T. E. Holland, *A Valedictory Retrospect*, 1910, and *The Hollands of Conway*, privately printed, 1915.] J. L. BRIERLY.

HOLME, CHARLES (1848-1923), founder and editor of *The Studio* magazine, was born 7 October 1848 at Derby, the younger son of George Holme, silk-manufacturer, by his wife, Anne Brentnall. Educated at a private school in Derby, he was put to his father's trade, but at about the age of twenty-three he went to Bradford and set up for himself in the woollen business. His sound commercial instinct brought him material success, and it was the extension of his business to the East which developed in him an absorbing interest in art. A lecture by Robert Barkley Shaw [q.v.], the Oriental traveller, at the Bradford Chamber of Commerce about 1873, led him to exchange Bradford goods against the products of Turkestan, and later of India, China, and Japan. He was profoundly struck by the perfection of Japanese craftsmanship. When he made a tour round the world in 1880 he spent some months in Japan, and two years later he became one of the founders of the Japan Society.

Meanwhile, another potent influence in his life had been that of William Morris, into whose Red House at Bexley Heath, Kent, Holme moved in 1880. It was not long after this that Holme began the work by which he will be remembered. In 1893, having retired from business a year earlier, he founded *The Studio*, a magazine of fine and applied art. In this his primary aim was not commercial, but the illustration and furtherance of good design. Holme had remarkable taste and prescience, and in his first issue he introduced to the public the works of two young men, then unknown—Aubrey Vincent Beardsley [q.v.] and Frank Brangwyn. *The Studio* (the first few numbers of which were produced in collaboration with Gleeson White) appeared at a time when photo-process engraving was opening up new possibilities in reproduction. A cardinal principle of Holme's artistic creed was that architecture and the applied arts are not to be regarded as intrinsically inferior to the fine arts—a salutary doctrine in an age when everyday objects were so often designed in the worst taste. *The Studio* soon attained a very wide circulation and influence at home and abroad. It set itself a very high standard

of production, and Holme added lavishly illustrated special numbers, which were in effect books, and he became a respected and successful publisher. He continued to take an active part in this work until 1922, when ill-health compelled him to retire. He died at his house, Upton Grey, near Basingstoke, Hampshire, 14 March 1923.

Holme's special gift as an editor and publisher was his catholic and sensitive taste. To this he added courage, modesty, geniality, and the faculty for carrying on a business with dignity and humanity. He wrote little or nothing, and had no literary interests. He was content to exercise influence by choosing and illustrating works of art which he instinctively felt to be good.

Holme married in 1873 Clara, daughter of George Benton, brass-founder, of Birmingham, by whom he had one son and three daughters. The son, Geoffrey Holme, succeeded to the editorship of *The Studio*. An admirable portrait of Holme by P. A. de László, painted in 1908, is at present in the house of his widow.

[*The Studio*, January 1923 (portrait); private information.] H. B. GUMSDRECH.

HORNE, HENRY SINCLAIR, BARON HORNE of Stirkoke, co. Caithness (1801-1929), general, the third son of Major James Horne, of Stirkoke, by his wife, Constance Mary, daughter of Edward Warner, of Cheltenham, was born at Stirkoke 19 February 1861. He was educated at Harrow and at the Royal Military Academy, Woolwich, from which, in May 1880, he received a commission in the Royal Artillery. He was at first posted to the garrison artillery, from which in 1883 he was transferred to the mounted branch, and after serving as adjutant of artillery brigades in both branches, he was promoted captain in 1888. In September 1890 he was appointed staff captain, Royal Artillery, at Meerut, and two years later became adjutant of Royal Horse Artillery at Kirkee. Returning to England in 1896 he was soon afterwards posted to 'J' battery, Royal Horse Artillery, with which he remained until he was promoted major in 1898.

On the outbreak of the South African War in 1899 Horne was given command of an ammunition column and landed in Natal on 15 November of that year, to be soon afterwards moved to Cape Colony in order to join the cavalry division under Major-General (Sir) John French [q.v.]. With the cavalry division Horne took

part in the operations which resulted in the relief of Kimberley (15 February 1900), the occupation of Bloemfontein (13 March), and in the advance from Bloemfontein into the Transvaal. In May 1900 he was given command of 'R' battery, Royal Horse Artillery, which was attached to French's 3rd cavalry brigade, and with that battery he took part in the occupation of Johannesburg (31 May), the battle of Diamond Hill (11-12 June), and the operations in the Wittebergen, which resulted in the surrender of General M. Prinsloo (25-26 July). From that time until the end of 1901 Horne was employed with mounted columns in the Orange River Colony and Cape Colony, and from January 1902 he was in command of remount depots. For his services he was mentioned in dispatches and received the brevet of lieutenant-colonel and the queen's medal with five clasps, and the king's medal with two clasps.

After three years in charge of the artillery depot at Weedon, Horne was promoted regimental lieutenant-colonel in November 1905, and was given successively the command of field artillery and horse artillery brigades in Ireland. He was gazetted brevet-colonel in May 1906, and in the following September was appointed staff officer for horse and field artillery at Aldershot. In May 1912 he was appointed inspector of horse and field artillery with the rank of brigadier-general, and on the outbreak of the European War in August 1914 he proceeded to France as brigadier-general commanding the Royal Artillery, I Army Corps, under Sir Douglas (afterwards Earl) Haig [q.v.].

At the beginning of the retreat from Mons (24 August 1914) Horne was appointed by Haig to command his rear-guard. He rendered conspicuous service throughout the retreat, in the battle of the Marne (5-9 September), the battle of the Aisne (12-15 September), and in the first battle of Ypres (19 October-22 November). In October he was promoted major-general as a reward for distinguished service in the field, and at the end of the year he was made C.B. In January 1915 Horne was placed in command of the 2nd division of the I Corps, and he led it in the operations about Givenchy in March 1915, in the battle of Festubert (15-25 May), and in the battle of Loos (25 September-8 October). It was on his suggestion that as a result of experience gained at Festubert the system of command of the artillery was changed.

In November 1915 Horne was chosen by Lord Kitchener [q.v.] to accompany him to the Dardanelles, when the question of the evacuation of the Gallipoli peninsula was at issue. After the evacuation had been successfully carried out he was again employed by Lord Kitchener to devise a scheme for the defence of the Suez Canal, and when that task was completed he was given command in January 1916, with the temporary rank of lieutenant-general, of the new XV Corps in the northern sector of the Canal defences. In March 1916 the XV Corps was moved to France, where it joined the Fourth Army, commanded by Sir Henry (afterwards Lord) Rawlinson [q.v.], which was preparing for the battle of the Somme (1 July-30 September). The chief achievements of Horne's corps in that battle were the capture of Fricourt (2 July) and of Flers (15 September). In September he was created K.C.B., and after the capture of Flers he was promoted to the command of the First Army with the temporary rank of general.

As part of the campaign designed by General Nivelle, the commander-in-chief of the French armies, for the spring of 1917, the British army undertook the battle of Arras, in which the most important share, the assault on the Vimy ridge, fell to the First Army. In 1915 repeated attempts by French troops to capture the ridge had failed, and General Nivelle's staff was sceptical of a British success and openly critical of Horne's plans. Horne was also harassed at this critical time by the pain from a broken bone in his leg caused by a fall from his horse, but he triumphed over these difficulties and stuck to his plans, and the capture of the Vimy ridge (9-10 April), in which the Canadian Corps took the chief part, was the outstanding success won by the British army up to that time in the War. Owing to the failure of Nivelle's attack the operations on the Arras front had to be continued until well into May, several weeks beyond the period which had been proposed. Thereafter Haig began to transfer troops to his northern flank in preparation for the battles of Messines and Passchendaele, and the role of the First Army became one of attracting the attention of the Germans to itself with reduced effectives, a part which Horne skilfully played until October 1917, when the Canadian Corps was taken from him for the battle of Passchendaele.

The winter of 1917-1918 was devoted to preparations for meeting the great German attack expected in the spring. The brunt

of the German effort fell on the armies further south, but on 28 March a heavy German attack was made on the Vimy ridge and successfully beaten off. On 9 April another German attack on the Lys front fell on the Portuguese divisions attached to Horne's army, just at the time when arrangements for the relief of those divisions had been completed. The Germans broke through, and the situation again became highly critical, but the resolute stand of the 55th division of the First Army at Givenchy saved the Vimy ridge, and Horne was the only British army commander who was not forced by the German offensive to move his headquarters to the rear.

After May 1918 the German efforts were directed against the French, and the First Army was given a breathing space in which to recover and prepare for attack in its turn. After Rawlinson's victory at Amiens on 8 August, the Germans began to withdraw from the great salient which they had created in the north in the spring, and towards the end of August the First Army began an advance which was to be continuous until the signing of the Armistice on 11 November. On 2 September Horne's army, in co-operation with the Third Army on its right, broke through the Drocourt-Quéant section of the Hindenburg line. This brilliant success was followed on 27 September by the forcing of the Canal du Nord. Then in swift succession Lens (8 October), Douai (17 October), and Valenciennes (2 November) were captured, and the advance of the First Army ended with the occupation of Mons two and a half hours before the Armistice became effective.

Horne was promoted substantive lieutenant-general in 1917, and substantive general in 1919. He was created K.C.M.G. in 1918 and G.C.B. in 1919. For his services in the War he received the thanks of both Houses of Parliament, was raised to the peerage as Baron Horne of Stirkoke, and given a grant of £30,000. He also received many foreign decorations, including the legion of honour. The university of Oxford conferred on him the honorary degree of D.C.L., the universities of Cambridge and of Edinburgh that of LL.D., and the borough of Northampton made him a freeman. In 1918 he was made colonel commandant of the Royal Artillery.

Soon after his return to England Horne was appointed general officer commanding-in-chief, Eastern command, in which

capacity he was actively concerned with the problems of demobilization and of the reorganization of the army. In 1920 he was appointed aide-de-camp general to King George V. Refusing offers of governorships abroad, he retired from the army in May 1926, and in the same month he was appointed master gunner, St. James's Park. He interested himself actively in service charities, particularly in those of the Royal Artillery, the British Legion, and the National Association for the Employment of Soldiers, Sailors, and Airmen. He became governor and commandant of the Church Lads Brigade, and took a prominent part in the affairs of his county, Caithness, of which he was deputy lieutenant. In 1929 he was made colonel of the Highland Light Infantry, in which his father had served. He died suddenly while shooting on his estate at Stirkoke 14 August 1929, and was buried at Wick.

Horne married in 1897 Kate, daughter of George McCorquodale, of Newton-le-Willows, Lancashire, and Gladys, Anglesey, and widow of William John Sinclair Blacklock. They had one daughter, and the peerage became extinct on his death.

There are portraits of Horne by J. H. Lander (c. 1908) and Oswald Birley (painted during the War) at Stirkoke House, at the Royal Artillery Mess, Woolwich, and at the Harrow School War Museum, both by Oswald Birley.

[Major-General Sir H. Uniacke in the *Journal of the Royal Artillery*, October 1929; Lieutenant-General Sir Hastings Anderson in the *Army Quarterly*, January 1930; Lord Horne, *Diaries of the South African War*, privately printed, 1900.] F. MAURICE.

HOSE, CHARLES (1863-1929), civil servant in Sarawak, ethnologist, and naturalist, was born at Willian, Hertfordshire, 12 October 1863, the son of the Rev. Thomas Charles Hose, perpetual curate of Little Wymondley, Hertfordshire, by his wife, Fanny, daughter of Thomas Goodfellow, of Hall O'Wood and Tunstall, Staffordshire. He was educated at Felsted School, and in 1882 matriculated at Jesus College, Cambridge. He did not take a degree, as he left Cambridge during his second year, having been offered, through the influence of his uncle, George Frederick Hose, bishop of Singapore, a cadetship in the Sarawak civil service, under the second raja, Sir Charles Anthony Johnson Brooke [q.v.]. Hose accepted the post with enthusiasm, as likely to fulfil his keenest aspirations. Leaving England in 1884, he

reached Kuching, the capital of Sarawak, in April of that year, and his active association with the administration of that independent state lasted until his retirement from the service in 1907, by which time he had risen to the position of divisional resident and had been appointed a member of the supreme council and a judge of the supreme court of Sarawak (1904). His official connexion with Borneo did not cease entirely on his retirement, for he was appointed a member of the Sarawak State advisory council at Westminster (1919); and in 1909 he was sent on a special mission to Sarawak, with Dr. Erb, a Swiss geologist, in order to investigate the potentialities of the oil (petroleum) fields of the Miri district. From his earlier surveys he had felt confident of the oil-yielding capacity of these fields, and the renewed investigations amply justified his predictions.

During the period of his official administrative work, mainly in the Baram district, Hose held positions of much responsibility; he was appointed officer-in-charge in 1888 and resident (2nd class) in 1891, and resident (1st class) in 1904. The area was occupied by warlike natives, who had not as yet been brought under effective control. Raiding and head-hunting were still rife, and constant local feuds prevailed. Interference by an intrusive government was not welcomed and was frequently opposed with vigour. Hose was the right man to deal with the situation. By his tact, fairness, and sympathetic understanding of their customs he succeeded in establishing friendly relations with the natives. His firmness, constancy, and determination impressed them no less than his physical powers, pluck, and endurance. As resident, he had from time to time to organize punitive expeditions and penetrate far into disturbed areas, largely unexplored; but the expeditions, though successful, were usually carried through without bloodshed, and many of the more turbulent chiefs became his loyal friends. Head-hunting was gradually suppressed and a state of peace was inaugurated, with recognition of the beneficent intentions of the raja's administration. When Hose retired from the service in 1907, he left the areas of his administration settled and peaceful with a developing trade. A visit which he paid in 1920 to the scenes of his official labours, accompanied by his wife and children, became a veritable triumphal progress up the Baram river, when he was welcomed by hosts of

natives, many of whom had travelled hundreds of miles to greet their old administrator.

In the course of his official work in Sarawak, Hose was able to pursue his lifelong hobby, natural history, a keen taste for which he had inherited from his father. In addition to his general field observations, he enriched zoological and botanical records with many new species and subspecies, and, at least, three new genera. The British national collections benefited greatly from his enthusiasm and success as a scientific collector. Early in his period of residence in Borneo he became interested in the perplexing problem of the cause of the dreaded disease, beriberi, which was very prevalent in Malaysia and Japan, and frequently fatal. He studied closely the habits of the natives, paying special attention to their diet and to the effects of rice upon its consumers under varying conditions. He noted the effects produced by freshly husked home-grown rice, and by the milled imported rice, the latter being liable to become mouldy in the trade bags, and infected by a minute fungoid growth; and he ascertained that there was a far higher incidence of the disease among consumers of the imported cereal. Hose himself contracted the disease and recovered from it, and his personal experience helped to confirm his views. His researches, together with those of other investigators, finally established the fact that the principal cause was to be found in the milled or 'polished' rice, and that the complete elimination of the husk, or pericarp, which was found to contain important vitamins, was the prime causative factor in the genesis of beriberi.

Most important of all Hose's scientific works was ethnographical research among the tribes of Sarawak. He made full use of his opportunities. Owing to his success in winning the confidence of the natives to an unusual extent, he gained a valuable knowledge of their ethnological relationships and culture. No one has done more for the study of Bornean anthropology; and his researches have proved not only of value to ethnological science, but have a practical bearing upon the administration of native affairs. The knowledge which Hose acquired at first hand was freely placed at the disposal of others. Much of the material contained in H. L. Roth's *The Natives of Sarawak and British North Borneo* (1896), and W. H. Furness's *The Home-Life of Borneo Head-Hunters, its Festivals and Folk-lore* (1902), was

derived from Hose; while the assistance which he gave to the Cambridge Anthropological expedition in 1898-1899 resulted in his co-operating with (Professor) William M'Dougall in the production of a valuable monograph upon *The Pagan Tribes of Borneo* (1912), a standard work of high merit. Early training in surveying equipped Hose for another noteworthy achievement, namely the making of the first reliable map of the whole of Sarawak (scale, 1/500,000), showing, besides the geographical features, the distribution of the tribes. Much of the area had previously been unsurveyed.

Hose's varied activities brought him recognition from many different sources. He received the order of the White Falcon of Saxe-Weimar for his zoological researches (1890), the order of merit of the Netherlands government (1893), and the order of the Prussian crown (1896), and he was elected officier de l'Académie Française (1898). For his survey work he was awarded the Cuthbert Peck grant by the Royal Geographical Society in 1893. His researches into the cause of beriberi were recognized by the award of the Emperor's cup by the Japanese government in 1900. Cambridge University conferred on him the honorary degree of Sc.D. in 1900, and he was elected an honorary fellow of Jesus College, Cambridge, in 1926. He was also made a freeman of the City of London in 1920.

Hose married in 1905 Emilie Ellen, daughter of John Peter Rayn, and had one son and one daughter. He died, after an operation, in a nursing-home at South Croydon 14 November 1929. A full list of his published works is given in an appendix to his book, *Fifty Years of Romance and Research* (1927). To that list should be added two other books, *Natural Man. A record from Borneo* (1926) and *The Field-Book of a Jungle Wallah* (1920).

[*The Times*, 15 November 1929; Charles Hose, *Fifty Years of Romance and Research*, 1927.]

H. BALFOUR.

HOSIE, SIR ALEXANDER (1853-1925), diplomatist and Chinese explorer, was born at Inverurie, Aberdeenshire, 16 January 1853, the elder son and second child of Alexander Hosie, by his wife, Jean, daughter of James Anderson. He came of farmer stock on both parents' sides. His father's farm did not prosper, and the family moved to Aberdeen, where the elder Alexander Hosie was accidentally killed when his elder son was sixteen years

old. Together with his mother, to whom he was devoted, young Hosie set himself to keep the household and to bring up his younger brother. He was educated at Old Aberdeen grammar school and at King's College, Aberdeen. He worked his way through the university by taking pupils, graduated in 1872, and was appointed sub-librarian of the university. His eyes, however, were turned to the East. In 1876 he joined the Chinese consular service, and sailed for China in company with a young man who was to be his lifelong friend and future chief, Sir John Newell Jordan [q.v.].

Hosie's first post, after he had finished his student interpretership at Peking, was in Shanghai, where he met General Gordon and was given the task of tabulating for the official archives his numerous memoranda and suggestions to the legation on British policy in China. At that time Edward Colborne Baber [q.v.] was the chief consular traveller of innermost China; and at his suggestion Hosie was sent in 1882 on special service to Chungking. Isolated and lonely in this far western province of Szechwan, he soon realized the need, and the opportunity, of devoting himself to some absorbing preoccupation. At much risk, he set out on a series of travels in the interior, making full notes as he journeyed of the geography and products of the country. This resulted in his first book, *Three Years in Western China* (1889), which passed through two editions. In it he described for the first time the trade and showed the potentialities of those little-known regions. He next saw service in Canton, Wenchow, Chefoo, Amoy, Tamsui, Wuhu, and in 1894 went north to take charge of the consulate at Newchwang during the difficult days of the Chinese-Japanese War. In 1897 he was sent south to Pagoda Anchorage and then Wuchow, a port the trade of which was much harassed by river-pirates. After the Boxer Rising (1900), during which he was on home-leave, he went north to take charge again at Newchwang. He travelled extensively in the Three Provinces of Manchuria, and in 1901 produced his book *Manchuria: Its People, Resources, and Recent History*, which also passed through two editions. His official duties were concerned with the defence of British trade in Manchuria against the diplomatic and military inroads on Chinese sovereignty of Russia and Japan; but he was always proud that he on one occasion received the thanks of the Chinese government for his

effective defence of the Chinese maritime customs on behalf of China, at a time when Chinese officials had fled before Japanese troops.

In 1908 Hosie was appointed first consul-general at Chengtu in Szechwan. The boat which took him up the Yangtsze-kiang was wrecked, he narrowly escaped with his life, many of his goods were lost, and his books had ten days' soaking at the bottom of the river. He used his term at Chengtu to compile an invaluable 'white paper' on the products of the province, which in 1922 he republished in book form as *Szechwan: Its Industries and Resources*. He journeyed to the verge of the forbidden land of Tibet, and brought to official notice the boundary-stone which was to figure largely in the tripartite boundary *pourparlers* at Darjeeling in 1914. From 1908 to 1912 Hosie was given the rank of consul-general at Tientsin, but did not proceed to that post; and from 1905 to 1909 was retained as acting commercial attaché to the legation at Peking, in which post he did much pioneer work on behalf of trade.

In 1908 the government of India offered to stop the export of opium to China *pari passu* with the abandonment by China of the cultivation of the opium poppy. Hosie was appointed commissioner to arrange proceedings, and in 1909 was British delegate at the Shanghai International Opium Commission, where the Chinese delegates admitted that 'the annual production of opium in China was eight (or more) times the quantity annually imported from India'. This led to his being sent in the following year, at the request of the Indian government, to visit the chief opium-growing provinces of China in order to discover whether the Chinese were fulfilling their part of the bargain. During these long overland journeys he underwent many hardships, made daily copious notes in his diary, and published an account in his book, *On the Trail of the Opium Poppy* (2 vols., 1914), which included much information on agricultural and other economic products. He found that certain provinces, notably Shansi and Szechwan, had signally succeeded in their task, but others still lagged behind. It may be added that since 1913 India has ceased to export opium to China.

Hosie retired in 1912, having travelled in each of the twenty-two provinces of China, except Sinkiang. He settled at Sandown, Isle of Wight, where he was active in public affairs. In 1919 he revisited China on a trade commission, and

was retained as special attaché in Peking till early in 1920. In 1922, as a result of his many hardships, his right foot was amputated. Aided by his second wife, herself a writer on China, he edited Phillips's *Commercial Map of China*, published in 1922, the authoritative economic map of China, a work of great accuracy and research.

Tall, broad-shouldered, deep-chested, Hosie was a man of striking appearance and personality. Gifted with extraordinary powers of observation, unfailing patience and industry, he was *facile princeps* in his knowledge and presentation of the possibilities of Chinese trade, and his trade reports are models of their kind. He contributed numerous articles to learned journals. Interested in botany, he sent thousands of specimens to Kew, Hongkong, and Singapore especially from Szechwan. About 1905 or 1906 the Kew authorities requested Sir Ernest Satow, then minister in Peking, that his services might be specially requisitioned for this work, and they named an order, *Ormosia Hosiei*, after him. He lectured in 1880 before the Royal Geographical Society; in 1885 he had been proposed as the recipient of its medal, which was, however, awarded to H. M. Stanley, who found Dr. Livingstone in that year. He was knighted in 1907. In 1913 Aberdeen University conferred on him the honorary degree of LL.D.

Hosie was twice married: first, in 1887 to Florence (died 1907), daughter of John Lindsay, corn factor, of Aberdeen; secondly, in 1913 to Dorothea, daughter of the Rev. William Edward Soothill, missionary first of the United Methodist Church at Wenchow, then president of the Government University at Shansi, and afterwards professor of Chinese at Oxford University. One son was born of the first marriage. Hosie died at Sandown 10 March 1925.

[Hosie's published works; private information; personal knowledge.] W. E. SOOTHILL.

HOWARD, Sir EBENEZER (1850-1928), originator of the garden city movement and founder of Letchworth and Welwyn garden cities, was born at 62 Fore Street in the City of London 29 January 1850, the third child and only son of Ebenezer Howard, confectioner, who owned several shops in and near the City, by his wife, Ann Tow, of Colsterworth, Lincolnshire. He was educated from the age of four to the age of fifteen

at private boarding schools, first at Sudbury, Suffolk, then at Cheshunt, Hertfordshire, and finally at Ipswich. After leaving school, he earned his living as a clerk in the City of London, obtaining a varied experience in the offices of a firm of stock-brokers, a firm of merchants, and two firms of solicitors. He taught himself shorthand in his spare time. He was employed for a short period as private secretary by Dr. Joseph Parker [q.v.], the well-known Congregationalist preacher (afterwards of the City Temple, Holborn), whose powerful personality exercised a considerable influence on Howard.

In 1872, at the age of twenty-two, Howard sailed for New York. After spending a few months working on a farm in Howard county, Nebraska, he went to Chicago and joined the staff of the official stenographers to the Law Courts. The religious outlook of the society in which he found himself, the outcome of the teaching of R. W. Emerson, J. R. Lowell, Walt Whitman, and other unprofessional religious teachers, had great influence on his life, helping him greatly, to quote his own words, 'to a clear perception that all values, to be rightly estimated, must be assessed mainly by their influence on the spiritual elements of our nature: thus only can material conditions be widely and permanently improved'.

In 1877 Howard returned to England and obtained employment as a shorthand writer from Gurney & Sons, the official reporters to the Houses of Parliament: in addition to his work in parliament, he carried on a business of his own as shorthand writer in the Law Courts. A few years later he became a partner of William Treadwell, with an office near the Law Courts, and upon the termination of that partnership he continued to carry on the business and office until his retirement in 1920.

In 1898 Howard read Edward Bellamy's *Looking Backward*, which had been published in America ten years previously. This book describes the experiences of a Bostonian who falls into a trance and wakes up in the year 2000 to find the United States transformed into an ideal community under a system of state socialism. It made a strong appeal to Howard, and he determined to take such part as he could in helping to bring into being a new civilization, based on service to the community, and not on self-interest. As a first step he wrote *Tomorrow. A Peaceful Path to Real Reform*. Parts of this book he

circulated among friends, and he lectured about it, chiefly in London. But it was only with the help of £50 given him by a friend that he was able to publish it in October 1898. The book was republished in 1902 under the title *Garden Cities of Tomorrow*.

The aim which Howard set before himself was to find a remedy, on the one hand for the overcrowding and unhealthy conditions which were produced by the excessive growth of large cities, and on the other hand for the depopulation of the countryside. Believing access to the country-side and to nature to be necessary for the full development of man's moral and spiritual qualities, he regarded the conditions under which large sections of the British nation were living in the towns as no less harmful to their moral and spiritual life than it undoubtedly was to their physique. He saw that the evils arising from the existing system of urban development were due to such development being left to the unregulated enterprise of landowners working for private profit. He proposed to remedy this, not by legislating against landowners, but by the building of new towns, not for the profit of individuals, but in the interest of their inhabitants. Such towns, which were to be both residential and industrial, were to be well planned, of limited size, and surrounded by a rural belt, so as to place within reach of the inhabitants the advantages alike of a civilized town life and of access to and knowledge of the country and of nature. The population of the rural belt would also benefit by having a market for their produce close to their farms and easy access to the advantages of the town. He called the towns which he proposed to create 'garden cities', not so much on account of their open development, as because, being surrounded by a rural belt, each town would be set in a garden.

An essential part of Howard's scheme was that the town should directly or indirectly own the land on which it was situate. He suggested that trustees should purchase the land with borrowed money, and should hold it in trust in the first place to pay interest on and fulfil the other obligations of the loans, and, subject thereto, in trust for the community. He believed that the value of the land would rapidly increase, and at an early date would produce a surplus applicable to purposes beneficial to the town. In order that the town should obtain the benefit of the increased value, he proposed that

the land should be leased, and that ground rents should be revised at short intervals.

After publishing his book, Howard set to work to obtain backing in order to carry his proposals into effect. In 1899 he formed the Garden City Association. Although a poor man, possessing neither social nor financial influence, he had by 1903 obtained enough support to form a company with the object of creating a garden city and with sufficient capital to buy and to begin the development of a large estate at Letchworth in Hertfordshire. While some of his proposals were modified to meet practical requirements, his general principles were maintained. The principle that the town should directly or indirectly own the land was adopted in a modified form in the provision that the dividends on the shares of the developing company are limited to a cumulative dividend not exceeding 5 per cent. per annum and that any surplus is applicable to purposes of benefit to the town. Although its growth was less rapid than Howard anticipated, Letchworth developed into a thriving residential and industrial town with a population exceeding in 1934 15,000 persons. Since the year 1923 the company has paid each year the full authorized dividend on its shares, but a considerable sum is still due for arrears of dividend accruing in the early years of the company.

In 1919 Howard, learning that an estate at Welwyn, also in Hertfordshire, which he had noted as a suitable site for a garden city, was about to be put up to auction, hastily collected sufficient money from a few friends to pay the deposit, attended the sale, and bought the property. A company was formed to take over the estate and to develop it as a garden city. In twelve years Welwyn Garden City was transformed from a purely agricultural estate into a flourishing town of nearly 10,000 inhabitants.

A further stage in the garden city movement was reached when the corporation of the city of Manchester decided to develop the Wytenshawe estate as a satellite town in accordance with Howard's principles. Wytenshawe differs from Letchworth and Welwyn Garden City in two important respects. It is financed and managed by a powerful city corporation and not by a company; and its cottages are being provided by the city corporation as part of its housing operations for the people of Manchester. Although active development was begun in 1931 only, the population in 1934 exceeded 20,000.

Garden Cities of Tomorrow was translated into many languages, and societies for the purpose of encouraging the formation of garden cities were established in many countries in Europe and in the United States of America. In 1909 the International Garden Cities and Town Planning Association was formed with Howard as president, a position which he held until his death. So-called garden cities have been built in many countries. Generally speaking, they consist of specially planned suburbs of existing towns, which have few of the characteristics of Howard's garden city, except open development. The town of Radburn, New Jersey, however, is being built definitely in accordance with Howard's principles, with the interesting modification that it is specially planned to minimize the danger and inconvenience arising from motor traffic.

After the European War of 1914-1918, London and other great cities grew with unprecedented rapidity, and the objections which Howard urged against the indefinite growth of large cities became increasingly apparent. Successive governments consequently considered the possibility of guiding some of the development into garden cities. Provisions were inserted in the Housing (Additional Powers) Act (1919) and in subsequent housing and town planning Acts in order to facilitate the establishment and development of garden cities, and a departmental committee appointed by the minister of health is now (1934) sitting to consider whether further measures can or should be taken for the purpose of encouraging the establishment of garden cities or satellite towns.

Howard's influence was not limited to the formation of garden cities: it has had important effects on the more general problem of town planning. His teaching drew people's attention to the haphazard growth of existing towns, and provided a stimulus to the increasing demand that all urban development should be planned. Letchworth and Welwyn Garden City demonstrated the benefits obtainable from planning, and it was obvious that many of their features could be adopted with advantage in the new development of existing towns. Hence Howard's influence can be traced in many town planning schemes, both at home and abroad. In particular, the spacious lay-out and the character of the buildings of many municipal cottage estates erected since the War derived their inspiration from Letchworth.

It is given to few idealists to see during their lifetime such practical results from their ideas as Howard did. His ultimate object, however, the provision of a new form of urban development, which would put a stop to and take the place of the continuous growth of large cities, has not yet been attained. This failure has been due in the main to two difficulties, neither of which Howard foresaw: the first is that of attracting residents and industries to an entirely new town; the second is that of financing the development of a garden city during its early stages. The example of the Manchester corporation in developing Wythenshawe points to a more hopeful method than those adopted in the case of Letchworth and Welwyn Garden City; but it is improbable that the local authorities of many large cities will accept the responsibility of establishing satellite towns.

Howard remained a poor man all his life. The fees which he received from his directorships of the Letchworth and Welwyn schemes were inconsiderable, and he continued until the age of seventy to practise his profession of shorthand writer in order to meet the modest needs of himself and his family. Money presented little attraction to him, and he was singularly free from personal ambition or self-seeking. Being absolutely convinced of the rightness of his ideas, he was animated by an ardent enthusiasm. He had a remarkable gift of inspiring other people: his zeal infected them and his transparent honesty of purpose gave them complete confidence. He was neither a professional town-planner nor a financier, but he convinced town-planners and financiers that his ideas were practical, and had the modesty and good sense to accept their advice when carrying his ideas into practice. His public work and his profession allowed him little leisure for other interests. As a young man he spent much time in inventing improvements to the typewriting machine, and during the last years of his life he was engaged in constructing a typewriter for shorthand writing. The international side of his work brought him into touch with many foreigners. This led him to study Esperanto, in which he became proficient. As a young man he enjoyed watching cricket at Kennington Oval. In later life he was a fair chess player.

In recognition of his public services Howard was made O.B.E. in 1924 and was knighted in 1927. He married twice: first, in 1879 Elizabeth Ann (died 1904), daughter of Thomas Bills, of Nuneaton,

by whom he had one son and three daughters; she helped him indefatigably in his early schemes; secondly, in 1907 Edith Annie, daughter of William Knight Hayward, of Highfield House, Wellingore, Lincoln, who survived him. He died 1 May 1928 at his home in Welwyn Garden City. His height was about 5 feet 5 inches, his hair and complexion fair, and his eyes blue and animated. A good portrait of him by Spencer Pryse belonging to Lady Howard is deposited on loan at the Letchworth Museum.

E. BONHAM CARTER.

HUDSON, SIR ROBERT ARUNDELL (1864-1927), political organizer, was born at Lapworth, Warwickshire, 30 August 1864, the eldest son of Robert Hudson, of Lapworth, by his wife, Jessie, daughter of John Kynoch, of Peterhead. He was a delicate boy, and his education at Ludlow grammar school was cut short at the age of sixteen, when he was sent to South Africa for his health. A year later (1881) he was put to an office in Birmingham, where it is supposed that he came under the spell of Bright and Chamberlain. He obtained at eighteen a post in the National Liberal Federation, which had been founded in Birmingham five years earlier. Hudson quickly attracted the notice of the secretary, Francis Schnadhorst [q.v.], and was appointed assistant secretary in 1886, in which year, as a result of the defection of Chamberlain, and therefore of Birmingham, on the Home Rule question, the offices of the Federation were transferred to London. Here Hudson was intimately associated with the left-wing liberals, notably Sir Arthur H. D. Acland [q.v.], who in 1892 became vice-president of the Committee of Council on Education, Thomas Edward Ellis, later chief whip, and Mr. J. A. Spender, afterwards editor of the *Westminster Gazette*. Hudson had a share with these men in planning the social legislation advocated (1891) in the Newcastle 'programme'. Succeeding Schnadhorst in 1893 he became secretary both of the Federation and of the Liberal Central Association. These institutions had offices under one roof in Parliament Street, and their joint-secretary was the link between the confidential organization of the parliamentary party and the autonomous machine which represented the liberalism

of the constituencies. In this capacity Hudson was influential in guiding the party through the many troubles of the next twelve years. His chief coadjutors were Herbert (afterwards Viscount) Gladstone [q.v.], who became chief whip in 1890, and successive presidents of the federation, Robert Spence Watson [q.v.], and Augustine Birrell. Although himself a strong churchman, he came to be regarded as keeper of the nonconformist conscience. After the liberal triumph of 1906 the labour of years was recognized; Hudson was hailed as the 'organizer of victory', and was knighted. The liberal organization maintained its efficiency in power, as the two elections of 1910 showed.

In 1914 Hudson offered his services to the Red Cross, and became chairman of the joint finance committee of the British Red Cross Society and the Order of St. John of Jerusalem. This brought him into co-operation with Lord Northcliffe [q.v.], and made him responsible for *The Times* fund for the British Red Cross, and so ultimately for the collection and administration of nearly £17,000,000 subscribed to relieve the sick and wounded. In 1916 he was offered high office by Mr. Lloyd George, an offer which he at once refused. In 1918 he was given the G.B.E. and the legion of honour.

On returning to party politics in 1919 Hudson continued to act with the independent liberals under Mr. Asquith; but not even he could make bricks without straw, and in 1927 he resigned.

Both in his political work before the War, and in his war-work Hudson's success was complete. In 1906 it was officially declared that in twenty-five years of political work he had made 'countless friends and no enemies'. For the Red Cross he earned the reputation of an irresistible beggar and an impeccable administrator. He was a man of great energy and practical ability. One of the secrets of his political success was his extraordinary knowledge of the persons and local conditions in every constituency. An acute observer wrote that he had 'more common sense and a shrewder judgement of men than any one I ever met'. But by general consent the greatness of his achievement was due less to his intellectual powers than to his qualities of character; to a rare union of strength and sweetness, which found expression in his keen, hard features, lit up by an unforgettable smile. He was a man of varied interests; religion, philanthropy, sport, travel, and society all had a share in

his time. The number of his friends and acquaintance was enormous. But it did not seem possible to exhaust his sympathy or his inventive kindness.

Hudson was twice married: first, in 1880 to Ada (died 1895), daughter of Henry Hammerton, of Coventry, by whom he had one daughter; secondly, in 1923 to Mary Elizabeth, widow of Viscount Northcliffe, who survived him without issue. He died in London 25 November 1927.

[J. A. Spender, *Sir Robert Hudson, a Memoir*, 1930; personal knowledge.]

R. W. CHAPMAN.

HUDSON, WILLIAM HENRY (1841-1922), naturalist and writer, was born 4 August 1841 at Quilmes, ten miles from Buenos Aires. His paternal grandfather came from Clyst Hydon, Devonshire. He was the third son in the family of six children of Daniel Hudson, who was born at Marblehead, Massachusetts, about 1804, by his wife, Catherine Kemble, of Maine, U.S.A., a descendant of one of the pilgrim fathers. Daniel Hudson, being threatened with tuberculosis, migrated with his wife to the Argentine. William Henry Hudson was brought up on the farms and ranches of the Rio de la Plata. His schooling was haphazard. In his own words, he 'ran wild in a wild land'. His father was a generous and hospitable man, but unbusiness-like and, in the choice of tutors for his children, limited by the conditions of the country to a very narrow field. A first tutor was dismissed owing to his violent temper; a second tutor was ignorant and idle; a third tutor was a clever ne'er-do-well. Hudson was allowed to ride his own pony at will when he was six years old and to spend hour after hour watching the bird life of the great plains. He grew up a strong boy; but his career was entirely changed at the end of his fifteenth year by an attack of typhus fever after a holiday spent in Buenos Aires. Before he had fully recovered from this attack he caught rheumatic fever. His heart was affected. He could do no active work, and was told by doctors that his case was hopeless. His physical weakness, and the passivity of his life in surroundings where nearly every one was engaged in hard outdoor work, affected a mind already filled with the exaggerated consciousness and fear of death common to many men of great artistic sensibility and love of external nature. He read a great deal, and, before he was twenty-one, endangered his sight by overstrain. His first

apprehension of the Darwinian theory of natural selection, which was supported by his own acute observation, left a lasting and, in a sense, a saddening impression upon his mind. After some years of wandering from place to place in South America, he went to England in 1869, and never saw the pampas again. One of the reasons which kept him from going back to his home in later life was his belief that the increase of immigration, especially the immigration of Italians, had been destructive of the bird life which he had studied with such care and passion.

Hudson lived in London for some years in poverty and loneliness. For a time he was secretary to Chester Waters, an archaeologist who was often without money to pay an assistant. In 1876 he married Emily Wingrave (died 1921), a woman some fifteen years older than himself. His wife kept a boarding-house at 11 Leinster Square until 1884, when the house failed. The Hudsons then moved to another boarding-house in Southwick Crescent. In 1886, after a second failure, they gave up boarding-house keeping, and lived in lodgings in Ravenscourt Park. Finally they settled at 40 St. Luke's Road, Westbourne Park, in a house left to Mrs. Hudson by her sister. This period was one of continual worry over the needs of existence, with little or no chance of leading the kind of life for which Hudson's temperament was suited. A description given of him about the year 1880 shows a man peculiarly unfitted for the drabness of London boarding-houses. He was six feet three inches in height, broad-shouldered, of great muscular strength, though sallow in complexion and with a slight stoop of the head. His eyes were hazel in colour, keen and deeply set, under a heavily ridged brow and well-marked eyebrows.

During these years Hudson wrote a great deal, but he did not find a wide public. One of his best books, *The Purple Land that England Lost: Travels and Adventures in the Banda Oriental*, was published in two volumes in 1885. His first book on bird life was an *Argentine Ornithology*, written in collaboration with Dr. P. L. Selater, and published in two volumes in 1888-1889. In 1887 Hudson published anonymously his Utopian romance, *A Crystal Age*. This book, like Richard Jefferies's *After London* and William Morris's *News from Nowhere*, was a reaction against the dreary and unsatisfying life of a great city. Jefferies was almost savagely content to see the destruction of the ugly

houses and the return of the trees; Morris soon left his socialist propaganda to take delight in a dream of untroubled summer; but Hudson followed a curious speculation suggested by his scientific reading and observation, and took as the theme of his book a belief that there could be no rest or peace in human society until the sexual impulse had burned itself out over a long period of time. The book attracted little attention at the time, and has received little notice since.

The first of Hudson's works to bring him into prominence was *The Naturalist in La Plata* (1892). This book, which was praised by Alfred Russel Wallace and other well-known naturalists, was written a year before Hudson's first essays on bird life in England, *Birds in a Village* (1893). Thenceforward his books had an increasing sale; but the demand for them was still comparatively small. As late as 1900 a member of parliament (probably Sir Edward Grey, afterwards Lord Grey of Falldon), finding that Hudson had not enough money to allow him to travel even in his own frugal way over the wild country in the south and west of England, suggested to Mr. Balfour that Hudson might be given a civil list pension. A pension of £150 a year was awarded him in 1901. Thenceforward Hudson was able to leave London for long periods and to write the series of books and articles on birds and the descriptions of country life which followed in rapid succession from 1902 until his death. Mr. Edward Garnett, whom Hudson met in 1901, also helped a great deal towards making his work known. There was a break in Hudson's writing about 1910 owing to a return of heart trouble, and in 1911 owing to the long illness of his wife. In 1918, during the European War, while he was being nursed in a convent hospital at Brighton, Hudson wrote what is probably his best and certainly his most interesting work, *Far Away and Long Ago: a history of my early childhood*. Hudson's own view was that the interest of the book lay only in its 'feeling for nature and wild life, and that only appeals to those who have it in them, in whom it is a passion and more to them than interest in human character and affairs'.

After 1918 there was a continuous decline in Hudson's strength, although he went on writing books and articles. The War had perhaps less effect upon him than upon most men of his sensitiveness. His life and interests were entirely remote from politics. A sudden reversion to violence

was neither perplexing nor numbing to a man whose childhood had been spent among men quick to use the knife in moments of anger, and among stories of recent South American warfare. Hudson's own philosophy of life was based upon observation of the animal world, and took account of the biological importance of conflict and even of fear. He notices, for example, the part played by awareness of danger in keeping birds healthy and alert. He was too much absorbed by the external world to understand that his view of war as a natural purge and purification did not apply to the conditions of a modern European battle-field.

Hudson described himself as 'a naturalist in the old, original sense of the word, one who is mainly concerned with the "life and conversation of animals"'. He wrote a great deal; his collected works (published in 1923) fill twenty-five volumes, and he was a quick and frequent letter-writer. In later life he destroyed as many of his letters as he could find. The greater part of his writings deal with animal life, and particularly with the life of birds; he was hardly less interested in snakes. He did not care overmuch for domestic animals. He had lived in a country where dogs ran wild, and where horses were taken for granted as among the necessities of life. His eyes and ears were too sharp for him to miss anything which came within his view or hearing. His curiosity was unspoiled by premature bookishness, and kept to the end a certain naïve and child-like quality. Hudson's experience of the natural life of two widely different countries gave him unusual opportunities for comparison, although in other respects his experience was limited. He could describe natural scenery with great vividness; but he knew little of mountains or great woods; and while he wrote of the sea in a business-like way, it remained to him literally the 'gannet's home', never the most moving sight in the world.

Hudson's stories of romance and adventure fill several volumes. They were written at different periods of his life, but their theme shows little variation. For the most part they are nature stories in which human figures appear. The women are more living than the men because Hudson himself was at his best in describing the wisdom of instinct or the charm of physical beauty. The plots are always simple, and in nearly every case belong to the imaginative history of his South American life. There is a certain Spanish influence in his

work, particularly in the earlier romances. Hudson had a low opinion of his own tales; he wrote of *Green Mansions* (1904): 'the story doesn't move—it simmers placidly away.' A few unsuccessful experiments in verse, and one three-volume novel, *Fan* (1892), may be ignored in an estimate of his work.

Hudson's style is simple and direct, though at times a little clumsy. One of his critics has said that he 'wrote like a peasant'. Another critic has blamed the 'dead level' of his work; a third is nearer to the mark in pointing out that he wrote 'always like a provincial, without regard for the fashion of his time'. How, then, is his popularity, long in coming, but very wide in his last years, to be explained? It may be said that, while the times were favourable in 1900 for Hudson's nature books, the public was unprepared for them twenty years earlier. By 1900 the great cities, especially London, had increased enormously in size. Access to the country was becoming yearly more difficult for the large middle-class public which formed the bulk of Hudson's readers; the motor-car had not yet made 'unspoiled' and sparsely inhabited districts easily accessible. On the other hand, the changes in the educational system had awakened in town-bred people a new interest in nature and in a natural life from which they seemed to be irrecoverably cut off save for a few weeks of holiday in the year. After 1900 a turn in literary fashion and the beginning of the revolt against reason which was to develop in strength twenty years later, helped the popularity of Hudson's romances and of his studies of the life and thought of country folk. The background of Hudson's early life, and the setting of his stories were so very different from the environment of most professional literary men that Hudson was able without effort to 'add strangeness to beauty' in his work.

These factors gave Hudson the success which never came to him in the different popular moods of the eighteen-eighties; they would not have been enough if he had himself not been a man of strong imaginative power as well as a talented observer of bird and animal life. The best appreciation of Hudson's peculiar gifts has been made by Lord Grey of Fallodon in a preface (in the collected edition of Hudson's works) to *Dead Man's Plack* (first published 1920). Grey mentions Hudson's fine taste in reading and great literary knowledge, and notices his 'gift for pure observation . . . the power of being moved

to think and feel, without any desire to interfere'. Hudson 'belonged to no class and to no one country'. He was 'a man of high culture, but people of little culture felt no reserve with him'. Foreigners would not notice in talk with him any of the barriers of nationality. 'This absence of class feeling, political prejudice, national traditions, gave him an absolute freedom of spirit and detachment', qualities rarely combined with great sensitiveness and receptivity. To this analysis must be added Hudson's almost mystical sense of natural beauty.

No philosophical terms actually fit Hudson's view of the world, since his philosophy was not worked out in logical phrases or the language of the schools. He used the word animism to describe the intensity of his love of the visible world. He knew that he was more sensitive than most men to the many colours and forms of life, although he was wise enough to realize that the difference between himself and others was one of degree rather than of kind. He hated cruelty, and disliked 'sport' as much as he disliked 'specimen-collectors', but there was nothing of the pathetic fallacy about his attitude towards the natural world. Hudson, who read Fabre with pleasure, thought Maeterlinck unreal. 'For me Maeterlinck makes his bees human and all false.' Yet he found and, in an age of religious disintegration, confirmed in the minds of many of his readers a belief in the ultimate value and significance of life. He once wrote, apparently to Grey at a moment of great political trouble, that he was sure that 'his friend would be able to find the central peace subsisting at the heart of endless agitation'. This sense of the 'everlasting rightness' of things distinguished Hudson's writings, and his faithfulness to this central theme is the measure of his artistic attainment and of the permanence of his finest work.

Hudson died in London 18 August 1922. A bird sanctuary, with decorative work by J. Epstein, was established in Hyde Park as a memorial to him in 1925.

[W. H. Hudson, *Far Away and Long Ago*, 1918; Edward Garnett, *A Hundred and Fifty Three Letters from W. H. Hudson*, 1923, republished as *Letters from W. H. Hudson to Edward Garnett*, 1925; Morley Roberts, *W. H. Hudson: A Portrait*, 1924.]

E. L. WOODWARD.

HÜGEL, FRIEDRICH VON, Baron of the Holy Roman Empire (1852-1925), theologian. [See VON HÜGEL.]

HULTON, Sir EDWARD (1869-1925), newspaper proprietor, was born at 4 Fir Street, Hulme, Lancashire, 8 March 1869. He was the second son of Edward Hulton by his wife, Mary Mosley. The elder Hulton, who started the business with which his son's name is associated, began his career as a compositor on the *Manchester Guardian*. In 1871 he went into the newspaper trade on his own account, and established the *Sporting Chronicle*, a daily issue. This was followed by the *Athletic News* (1875), a weekly periodical, and the *Sunday Chronicle* (1885). In later life he lived at Oakfield House, Ashton-on-Mersey, and he died in 1904, leaving a considerable fortune.

Edward Hulton, the son, was educated at St. Bede's College, Manchester. He was taken away from school when he was sixteen, and set by his father to learn the business of newspaper management. After serving an apprenticeship in the various departments of his father's offices, he was able by the time he was twenty-five to relieve his father of a large share of control. As soon as he became an active partner in the concern he set about enlarging its activities. In 1897 he founded a new halfpenny evening paper in Manchester called the *Manchester Evening Chronicle*. This was an immediate success, and he followed it in 1900 with the *Daily Dispatch*, a general morning paper.

Five years after his father's death Hulton produced the *Daily Sketch* (1909), an illustrated morning paper. This enterprise, like his earlier ventures, originated in Manchester, but as it was found that London was a better centre for news of pictorial interest, the paper was transferred to Fleet Street, and succeeded in establishing itself there after some initial difficulties. Later, Hulton started the *Illustrated Sunday Herald* (1915), and made further additions to his newspaper interests, including the purchase and development of the *Evening Standard* in 1915.

Hulton's health was for many years unsatisfactory, but he was reluctant to give up the personal direction of his business, and it was not until 1923 that he acted upon medical advice and decided to retire. In that year the Hulton periodicals, fourteen in all, were taken over by a company called Allied Newspapers Limited. It is stated that the price which Hulton obtained for his trade properties amounted to £6,000,000.

Hulton's interests as a newspaper proprietor were purely commercial. In an age

when the political influence of large press syndicates is so marked this limitation may perhaps be considered rather to his credit than otherwise. His newspapers, if they were without literary merit, were at least free from the charge of political interference. He recognized that the public wanted news, and set himself to supply it in its simplest form, garnished with prize competitions, puzzles, serial stories, and other harmless aids to popularity. He was always ready to lend the aid of his newspapers in raising money for public causes.

Apart from his business occupations Hulton was interested in racing and coursing. In 1906 he registered his colours on the turf under the name of 'H. Lytham', and laid out large sums in the purchase of yearlings, chiefly on the advice of Richard Wootton, whom he appointed his trainer. He never won the Derby, but in 1916 he carried off the Newmarket race substituted, during the war years, for the Derby, and in 1924 he won the Oaks with Strait-lace, a filly which won upwards of £25,000 in stakes. In coursing he won the Waterloo Cup in 1908 and 1918.

Hulton was created a baronet in 1921. About the time that some of his newspaper business was transferred to London, he went to live in the south of England, and in his patent he is described as of Downside, Leatherhead. Hulton was twice married: first to Miss Turnbull, the daughter of a Manchester solicitor; she obtained a divorce, and he married, secondly, Millicent, daughter of John Warriss. Hulton died at his home near Leatherhead 23 May 1925, and the baronetcy became extinct.

[*The Times*, 25 May 1925.]

A. COCHRANE.

HUTTON, WILLIAM HOLDEN (1860-1930), historian and dean of Winchester, was born at Gate Burton, Lincolnshire, 24 May 1860, the younger son of the Rev. George Hutton, rector of Gate Burton, by his wife, Caroline, daughter of Robert Holden, of Nuttall Temple, Nottinghamshire. His mother was sister to Sophia Holden, wife of the Hon. and Rev. Alfred Curzon, grandfather of George Nathaniel Curzon, first Marquess Curzon of Kedleston. Although belonging to different generations, William Hutton and George Curzon were almost exact contemporaries and lifelong friends.

William Hutton was rather a delicate boy. He was sent to a well-known preparatory school at Bengoe in Hertfordshire,

but for reasons of health to no public school, and began his secondary education only when he matriculated at Magdalen College, Oxford, in 1879. He came, however, of a family which was both clerical and 'bookish', and his rooms in Oxford were adorned with portraits of several be-wigged divines, and a fine collection of leather-bound volumes of eighteenth-century literature, theological and historical. He was not, as was natural from his physique, one of the prominent undergraduate members of what was then an athletic rather than a 'reading' college; he found his friends outside Magdalen, among those who were interested in literature and history. He was one of the original members of the society of young students of history founded by (Bishop) Stubbs, regius professor of modern history, in 1880. Nearly every member of Stubbs's little flock achieved distinction in one way or another. Hutton obtained the Stanhope essay prize in 1881—the subject was 'The political disturbances which accompanied the early period of the Reformation in Germany'—and was placed, as all his friends expected, in the first class of the honour school of modern history in December 1882. In 1884 he was elected to a fellowship at St. John's College, which he was destined to hold for nearly forty years (until 1923). He was ordained deacon in 1885 and priest in 1886. For twenty-five years he taught modern history at St. John's to an ever-increasing number of pupils, and for seven years (1913-1920) was university reader in Indian history. He had the advantage of a personal knowledge of India from a long stay which he made with his cousin, George Curzon, the viceroy, when the latter was at the height of his career.

Hutton's beautiful, if somewhat secluded, rooms in the little side-quadangle of St. John's were the centre of a happy group of literary friends, mostly of the conservative way of thinking; still more so was the splendid Queen Anne house at Burford—capable of sheltering many guests—which he acquired in 1895. He became a specialist in local Cotswold history, and the many traditions which he acquired at Burford from old residents took permanent shape in two of his pleasant books of essays—*By Thames and Cotswold* (1903) and *Burford Papers* (a series of letters from Cotswold worthies, 1905)—and occasionally in magazine articles, always of the most attractive kind.

Considering that Hutton was in full

university work for twenty continuous years—he was proctor in 1891-1892, examiner in the modern history school 1892-1895 and 1908-1910, and select preacher in 1898-1900—his literary output was prodigious. Among other works he produced histories of *St. John Baptist College* (1891 and 1898), lives of *The Marguess of Wellesley* (1893), *Sir Thomas More* (1895), and *William Laud* (1895), a study of *Philip Augustus* ('Foreign Statesmen' series, 1896), a monograph on *Hampton Court* (1897), a study of *Constantinople* (1900), *A Short History of the Church in Great Britain* (1900), *The English Church from the Accession of Charles I to the death of Anne, 1625-1714* (vol. vi of W. R. W. Stephens and W. Hunt, *The History of the English Church*, 1903), and *The Church and the Barbarians* (1906). In addition he wrote many articles and reviews for learned periodicals. The only regret of his friends was that his works, though full of research, were of moderate dimensions, for he never set himself to produce a *magnum opus*: yet all his books were well-rounded and complete units.

When the venerable Dr. James Bellamy [q.v.], after holding the presidency of St. John's College for thirty-eight years, resigned in 1909, there was a general expectation among those who did not belong to that college that Hutton would be elected as his successor. But a younger race of fellows had grown up in the twentieth century, mostly of a less conservative mentality than that of Bellamy and Hutton, and he was not chosen. In 1909 he gave up the history tutorship which he had held for just twenty years, and two years later (1911) was appointed archdeacon of Northampton and canon residentiary of Peterborough Cathedral—posts for which his tried administrative work in Oxford as well as his literary distinction recommended him. To the grief of his friends in the university he had to give up the beautiful house at Burford which all of them knew so happily, and to remove to a close in the Fenland. Peterborough is not a literary centre, nor very accessible to Oxford residents. His administration of the archdeaconry was exact, and his sermons drew the townsfolk to the cathedral—as might have been expected from one who had been select preacher at Oxford, Cambridge, and Dublin, and who had filled St. Mary's with his Bampton lectures of 1903 on 'Lives and Legends of the English Saints' (published as *Lives of the English Saints* the same year).

In 1919 Hutton was promoted to the deanery of Winchester—one of the few posts which would satisfy his historical and ecclesiastical aspirations. In the beautiful old deanery he dwelt for eleven years (1919-1930), much visited by friends of his old Oxford circle, as well as by many other literary acquaintances. The panelled rooms, the long Caroline library, and the garden with its rushing stream were a perfect setting for his later years, and those who remember him think of him always as installed in surroundings even more appropriate to his genial temperament than those of The Great House at Burford. In 1928 he began to be troubled with rheumatic and nervous complaints, which gradually sapped his activity and vitality, and after a prolonged illness he died while under medical treatment at Freiburg im Breisgau 24 October 1930. He was unmarried, and at his death his valuable collection of books and works of art was dispersed—some by bequest to his own college and friends, others among his numerous but distant relatives.

[Personal knowledge.] C. W. C. OMAN.

ILBERT, SIR COURTENAY PEREGRINE (1841-1924), parliamentary draftsman, was born at Kingsbridge, Devonshire, 12 June 1841, the eldest of the six sons of the Rev. Peregrine Arthur Ilbert, rector of Thurlestone, Devonshire, by his wife, Rose Anne, daughter of George Welsh Owen, of Lowman Green, Tiverton. The Ilberts are an old Devonshire family, who acquired the estates of Bowringsleigh and Horswell at the end of the seventeenth century.

Ilbert was sent to Marlborough in 1852, and was there for eight years, under the headmasterships of George Edward Lynch Cotton and George Granville Bradley. He and T. L. Papillon, his contemporary at Marlborough, both won scholarships at Balliol College, Oxford, in 1859. Going up to Oxford in 1860, Ilbert had a brilliant university career. He won the Hertford, Ireland, and Craven scholarships in 1861, 1862, and 1864 respectively, as well as the Eldon law scholarship in 1867. He obtained first classes in classical moderations (1862) and in *literae humaniores* (1864). He was elected a fellow of Balliol in 1864, and for a few years (1871-1874) was bursar of the college. He became an intimate friend of Benjamin Jowett, master of Balliol, and acted as his literary executor.

Ilbert was called to the bar by Lincoln's Inn in 1869. It was about this time that

the arrangements for drafting parliamentary bills were revised, and a special department was formed for the purpose. The head of his department was Sir Henry (afterwards first Baron) Thring [q.v.], with the title of parliamentary counsel to the Treasury. Thring availed himself of the assistance of Ilbert, whose wide study of legal systems and principles enabled him to render valuable services as a parliamentary draftsman. He had a large share in preparing the Statute Law Revision Act of 1881 and the Civil Procedure Act of 1883. In this way he obtained experience in a department of which he was to become in later years a principal official.

In 1882 Ilbert was offered by Lord Hartington, secretary of state for India, the position of law member of the governor-general's council. He was at first doubtful about accepting this appointment, for his practice was increasing and his position at the bar favourable. But the prospect of work in India attracted him, and finally overcame his hesitation.

The first Marquess of Ripon [q.v.] had succeeded the first Earl of Lytton as viceroy of India when Mr. Gladstone's second ministry took office in 1880. A man of advanced opinions, Ripon was inclined to deal with Indian affairs upon principles for which the time was not yet ripe. Many years were to pass before the idea of extending self-government to India took practical shape. The viceroy raised the dangerous question of the jurisdiction of Indian judges over Europeans, and early in 1883 it fell to Ilbert, as law member, to propose and to pilot through the council a measure to remove from the code at once and completely every judicial disqualification based merely upon race distinctions. Ilbert himself, while approving of the principle, doubted the expediency of introducing this Bill, owing to the state of Anglo-Indian feeling and the bitter racial dispute which it was certain to arouse. The result fully justified these forebodings. A storm of opposition arose, and the cleavage between English and educated Indian opinion was acute. The conditions, from being unpleasant—for Government House was boycotted and Indian administration was threatened with disastrous divisions—became obviously impossible. There was no other course open to the council but to withdraw, and a compromise was effected under which the main principles of the measure were given up.

Ilbert was also responsible for the Bengal Tenancy Act, a measure which reviewed the relations between landlord and tenant, and was the subject of much discussion. Upon the annexation of Burma in 1885 he prepared for Lord Dufferin, who had succeeded Lord Ripon as viceroy, a general system of law and procedure for the new province.

At the end of 1886 Ilbert returned to England and was appointed assistant parliamentary counsel to the Treasury. He proved himself a first-rate parliamentary draftsman, with an unfailing grasp of law and legal principles. He retained his interest in Indian legislation, and in 1898 published *The Government of India*, an attempt to codify Indian law from the time of Warren Hastings. This book has thrice been reprinted with additional matter. Upon the death of Sir Henry Jenkyns in 1899 Ilbert became head of the department; but he only held the office of parliamentary counsel to the Treasury a short time, for in 1902 he exchanged it for that of clerk of the House of Commons. He was popular in this position, for members found him courteous and considerate, while his knowledge of procedure was great. Upon his resignation in 1921 he received the special thanks of the House for his services.

In addition to his book on Indian legislation, Ilbert wrote *Legislative Methods and Forms* (1901), a short work on *Parliament, its history, constitution, and practice* (1911), and *The Mechanics of Law-making* (1914). He was created K.C.S.I. in 1895, K.C.B. in 1908, and G.C.B. in 1911. He married in 1874 Jessie, daughter of the Rev. Charles Bradley, and niece of his old headmaster at Marlborough and of Francis Henry Bradley [q.v.]. Lady Ilbert died only a few months before her husband. There were five daughters of the marriage. He died at his country home, Troutwells, Penn., Buckinghamshire, 14 May 1924.

Ilbert was a man of intellectual gifts, a master of his own subjects and able to express himself clearly about them in writing. An inclination to examine questions from every point of view made him as a rule reluctant to press his own opinions, and it was curious that circumstances should have caused his name to be associated with a bitter political controversy.

[Sir Frederick Pollock, *Sir Courtenay Peregrine Ilbert, G.C.B., 1841-1924*, in *Proceedings of the British Academy*, vol. xi, 1924-1925; private information.] A. COCHANE.

IMAGE, SELWYN (1849-1930), artist, was born at Bodiam, Sussex, 17 February 1849, the second son of the Rev. John Image, vicar of Bodiam, by his wife, Mary Hinds. The family had emigrated from France on the revocation of the Edict of Nantes in 1685. Image was educated at Marlborough, and proceeded to New College, Oxford, as an exhibitioner in 1868, graduating B.A. in 1872, and M.A. in 1875. For the rest of his life he worked in London.

At Oxford Image became an enthusiastic disciple of John Ruskin, who in 1870 was appointed the first Slade professor of fine art, and studied drawing under him. His artistic bent had already shown itself at school. He was ordained deacon in 1872, and priest in the following year. He was successively curate of All Hallows, Tottenham (1872-1877), and of St. Anne's, Soho (1877-1880). In taking orders he had suppressed the desire, strong in him at Oxford, to become a professional artist: in 1883 this desire was fulfilled, and he relinquished his orders. Image's interest was in design of all sorts, but he became best known by his designs for stained glass, remarkable for their austere dignity and a rare feeling for the capacities and limitations of the medium. The west window of St. Luke's, Camberwell, four archangels in a window of Morthoe church, Devon, two windows in Marlborough College chapel, and one in memory of Bishop Lancelot Andrewes in Gray's Inn chapel, are his most important works in this kind. He also designed decorative panels for the Century Guild, founded by his friend A. H. Mackmurdo in 1883, which undertook the designing of houses and furniture, and published a magazine, *The Century Guild Hobby-Horse*, for which Image designed the cover (1886) and to which he contributed tail pieces as well as poems and essays. During the eighteen-nineties he designed a number of decorative title-pages and covers for books. In 1892-1893 he designed a fine Greek type for Messrs. Macmillan, the publishers.

In later life Image gave much time to lecturing on art; also to landscape drawings and water-colours. He found his favourite motives in Epping Forest, which he also frequented on moth-hunting expeditions, for he was an ardent entomologist and made a collection of British butterflies, exquisitely arranged and labelled, now in the Hope Collection at Oxford. In 1894 he published *Poems and Carols*, and he continued writing occasional poems, of a simple grace and direct-

ness, until his death. In 1900 he was elected master of the Art Workers' Guild, and in 1910 Slade professor of fine art at Oxford, holding the latter post until 1916. He was happiest in lecturing on English artists, such as Thomas Bewick and Thomas Rowlandson, for whom he had an especial admiration.

Image would have produced more original work had he not always been at the service of his friends and ready to undertake labours of love. A selection of his *Poems* and a selection of his *Letters* were published in 1932, after his death, both edited by A. H. Mackmurdo, and both containing a photographic portrait. His beautiful penmanship added to the charm of his letters. In conversation the wisdom and sweetness of his nature, his zest in life, and the fervour of his convictions, were even more intimately revealed. There was choiceness and a sense of beauty in all he wrote, said, and produced. Drawings by him are in the British, the Victoria and Albert, and the Ashmolean museums: cartoons for stained glass are in public collections at Birmingham, Glasgow, Newcastle, Nottingham, Bristol, Dublin, and Melbourne.

Image married in 1901 Janet, youngest daughter of Thomas Hanwell, of London, and had no children. He died at his home in Holloway 21 August 1930.

A portrait bust of Image by W. H. Frith belongs to the Art Workers' Guild.

[Private information; personal knowledge.]
L. BINYON.

IVEAGH, first EARL OF (1847-1927), philanthropist. [See GUINNESS, EDWARD CECIL.]

JACKSON, Sir CYRIL (1863-1924), educationist, was born at Highgate 6 February 1863, the elder son of Laurence Morris Jackson, of South Park, Bodiam, Sussex, a member of the Stock Exchange, by his wife, Louisa Elizabeth Craven. He was educated at Charterhouse and at New College, Oxford, where he obtained second classes in classical moderations (1883) and in *literae humaniores* (1885).

Inspired by home influence and by the Oxford movement for a university settlement in London, Jackson took up residence at Toynbee Hall in 1885, soon after its establishment. Here he remained until 1895. In the life of an industrial community, as a member of the London School Board (1891-1896), as secretary of the

Children's Country Holiday fund (1888-1896), and particularly at his boys' club at Northey Street School (now the Cyril Jackson School), moulding Limehouse street boys into self-respecting citizens, he found congenial and absorbing work.

In 1890 Jackson accepted an invitation to go to Western Australia as inspector-general of schools and permanent head of the education department. Between 1890 and 1903 he reorganized the system so completely that it was soon recognized throughout the Commonwealth as equal to, if not, the best system in Australia. To himself the concession of the 'right of entry' to schools of all denominations was especially gratifying. He returned to England in 1903 as chief inspector in the Board of Education, a post which he resigned in 1906.

On the one hand, Jackson now acted as investigator for the poor law commission (1906) and served on numerous commissions and committees (often as chairman) on unemployment, relief works, and boy labour, and also as vice-chairman, under the Prince of Wales, of the statutory committee on war pensions (1916-1917). On the other hand, he became immersed in municipal work as elected member of the London County Council, Limehouse division, 1907-1913, alderman (1913-1916 and 1919), twice chairman of the education committee (1908-1910 and 1922), leader of the municipal reform party, and later chairman of the Council (1915).

When war broke out in August 1914 Jackson took full charge of, and responsibility for, the Council. A week later he was appointed chairman of the emergency committee. He served also on the senate of London University (1908-1921), on the Port of London Authority (1915-1916 and 1919), on the royal commission on the superior civil services in India (1923), and as member of the memorial committee which presented to London the King Edward park in Shadwell in 1922.

Unceasing work, regardless of health, resulted in inevitable break-downs. At such times Jackson suffered much from insomnia and was not easy to get on with. He sought relief in sea voyages. Possessed of a quick mind, he was instant in puncturing defective proposals or arguments. In municipal politics he was in advance of his party, whose feelings towards him were perhaps more those of admiration than of affection. An economist, an Anglican churchman, and a believer in voluntary agencies, he opposed unnecessary expendi-

ture, and supported non-provided schools. More than any one else he was responsible for co-operation between existing institutions in the medical treatment of school children, and for the creation of care committees of voluntary workers in London. While he was chairman of the education committee, the London County Council adopted a far-reaching scheme for reducing the size of elementary school classes, and established central schools. He gave enthusiastic support to the reorganization of evening education and to the compulsory day continuation system.

Jackson was called to the bar by the Inner Temple in 1893 but never practised. He was created K.B.E. in 1917. He died unmarried at his beautiful home, Ballards Shaw, Limpsfield, 3 September 1924.

Jackson did not wear his heart on his sleeve: he never talked about the motive of his work; but his papers clearly confirm the impression left by the record of his work—namely, that he regarded life as definitely service and renunciation of self.

Jackson published the following books: *Unemployment and Trades Unions* (1910), *Outlines of Education in England* (1913), and *The Religious Question in Public Education* (1911, jointly with (Sir) Michael Sadler and Mr. Athelstan Riley).

[Private information; personal knowledge. Portrait, *Royal Academy Pictures*, 1917.]
R. BLAIR.

JACKSON, SIR FREDERICK JOHN (1860-1920), explorer, naturalist, and administrator, was born at Oran Hall, Yorkshire, 17 February 1860, the only son of John Jackson, of Oran, by his wife, Jane Outhwaite. He was educated at Shrewsbury School and Jesus College, Cambridge (1879-1881). He rowed for his college, but he took no university degree. After leaving Cambridge, he went on shooting expeditions, first to Kashmir and in 1884 to East Africa. He spent nearly two years in the region of Lamu, with occasional trips to Zanzibar, and during his wanderings learned much about native life which stood him in good stead later on. In 1886 he organized a hunting and collecting expedition to the Kilimanjaro region. This period of sport and collecting was, however, shortly afterwards interrupted, when serious financial losses, among other reasons, made Jackson decide to embark upon a career of public service.

In 1888 Jackson joined the service of the newly incorporated Imperial British East Africa Company, and early in 1889

was dispatched with Ernest Gedge, James Martin, and Dr. Archibald Donald Mackinnon to explore the hinterland of the company's territory, to establish friendly relations with the various tribes, and if possible to make contact with (Sir) Henry Morton Stanley [q.v.], who was returning from his expedition to Lake Albert Nyanza for the relief of Emin Pasha. Upon reaching Mumias, Jackson received an appeal from Mwanga, the kabaka or, as some styled it, 'king', of Uganda, asking for his support in the civil war against his brother Kalema and his Mohammedan supporters. Jackson was reluctant to accede to the request, having had instructions not to enter Uganda; he therefore proceeded north in order to explore Mount Elgon and to obtain news of Stanley. During his absence, the notorious German agent, Dr. Karl Peters, arrived from the coast in February 1890 with an expedition the ostensible object of which was the relief of Emin Pasha, but the real object the acquisition of territory for Germany. Having rifled Jackson's mail at Mumias and found a further appeal from Mwanga, Peters hurried into Uganda and persuaded Mwanga to conclude a treaty by which the country was placed within the sphere of German influence. Becoming aware of these proceedings on his return to Mumias in March, Jackson took immediate steps to safeguard British interests in Uganda, and fortunately the activities of Peters were brought to nought by the Anglo-German Agreement of 1 July 1890.

In June 1894 the kingdom of Uganda was declared a British Protectorate, and in July Jackson was appointed by the Foreign Office as a first-class administrative assistant in that country. He was successively vice-consul (1895), deputy commissioner (1896), and was on occasion acting commissioner at Entebbe for the Protectorate. While he was stationed at Eldama Ravine in 1897, a serious mutiny of the Sudanese troops, which had been employed in Uganda since 1892, took place. At great personal risk Jackson tried, without avail, to persuade the troops to return to duty, and thereafter assisted Major (afterwards Sir) James Ronald Leslie Macdonald [q.v.] to collect a force of Zanzibaris and to beat back the mutineers near Lubwa's Station. During the fighting which ensued Jackson was seriously wounded (10 October). In 1900 he acted as political officer in the operations against the Nandi tribe.

In 1902 Jackson was appointed deputy

commissioner of the East Africa Protectorate under Sir Charles N. E. Elliot. It was not a happy period of his service, for unfortunately he did not see eye to eye with his chief on questions of policy relating to the Masai tribe and white colonization. The natures of the two men were antipathetic; but the position was relieved by Elliot's resignation in 1904. Three years later (1907) Jackson became lieutenant-governor of the Protectorate, and in 1911 he was appointed governor of Uganda, a position which he held until his retirement in 1917. His governorship was not marked by any striking reforms, but the general prosperity of Uganda was well maintained during the period of the European War, and Jackson was justly popular with all sections of the people. He received the C.B. (1898) for his services in the Uganda mutiny; in 1902 he was awarded the C.M.G. and in 1913 was promoted K.C.M.G.

Second only to his official duties were Jackson's interests as a naturalist. He studied mammals, butterflies, and birds, but as time went on concentrated his attention on birds. He was handicapped by short sight, yet there can have been few field observers possessed of such powers of acute perception. His collection of birds numbered over 12,000 specimens, representing 774 species. From 1888 onwards he contributed articles to *The Ibis* on his bird collections. In 1897 he wrote the East African section of the volume of the 'Badminton library' on *Big Game Shooting*. In 1926 he published *Notes on the Game Birds of Kenya and Uganda*, and at the time of his death he had practically finished a complete history of the remaining avifauna of those countries. In 1930 a book of reminiscences dealing with the earlier part of his service, entitled *Early days in East Africa*, was published posthumously.

Jackson was a man of engaging personality and had a large circle of friends; he was blessed with many natural gifts, but was often too diligent to make the best of them. He had a wide influence for good, and was an energetic, wise, and sympathetic administrator both of native races and of white colonists.

In 1904 Jackson married Aline Louise, daughter of William Wallace Cooper, a Dublin barrister. He had no children. He died 3 February 1929 at Beaulieu-sur-Mer, and was buried there.

[Sir F. J. Jackson, *Early Days in East Africa*, 1930; official publications; private information.] C. W. HOBLEY.

JACKSON, Sir HENRY BRADWARDINE (1855-1929), admiral of the fleet and pioneer of wireless telegraphy, was born at Barnsley 21 January 1855, the eldest son of Henry Jackson, farmer, of Cudworth, Yorkshire, by his wife, Jane, daughter of Charles Tee, of Barnsley. He was educated at Chester and at Stubbing-ton House, Farcham, and joined the royal navy at the age of thirteen in December 1868. From the outset Jackson was interested in the more scientific aspects of his work, and at first specialized in navigation. In 1878-1879 he was junior lieutenant on board the *Active* on the African station, and took part in the Zulu War. In 1881 he was appointed to H.M.S. *Vernon*, torpedo-school ship at Portsmouth, and became intensely interested in the mechanism of the torpedo, finally qualifying as a torpedo lieutenant. He served in the *Vernon* for three and a half years. In January 1890 he was promoted to the rank of commander, and in the same year he conceived the idea of employing wireless waves to announce to a capital ship the approach of a friendly torpedo boat. Opportunities to experiment were few and progress was very slow until 1895 when, while in command of the *Defiance*, Jackson became aware of the experiments of Dr. Jagadis Chunder Bose on coherers. Jackson made, and experimented with, many types of coherer, the form finally adopted for his comparatively long distance experiments consisting of a tube of metal filings between two metal plugs. The coherer was tapped by hand and the receiving circuit was a simple loop of wire. With such a receiver Jackson succeeded in effecting communication by electromagnetic radiation from one end of the *Defiance* to the other, the signals transmitted over the length of the ship being sufficiently intense to ring an electric bell of high resistance inserted in the receiving circuit. Tapping the coherer with the bell was the next development, and towards the end of 1896, using the ship's inductance coil, which under favourable conditions gave a spark of two inches, he succeeded in receiving strong signals over distances of several hundreds of yards.

In June 1896 Jackson was promoted to the rank of captain, and in September of the same year he met Signor Guglielmo Marconi at a conference at the War Office. These two pioneers had been working on parallel lines, but whereas Marconi was aiming at long distance wireless communication over land and sea, Jackson's main

objective was to improve the efficiency of the communication service of the fleet. In 1897 Jackson was appointed naval attaché in Paris, and in 1899 was given command of the torpedo depot-ship *Vulcan*, in which he continued his wireless experiments. He felt well rewarded for his labours when in 1900 a contract was placed with the Marconi Company for the supply of wireless installations to many ships of the royal navy, an event which was regarded by Jackson's friends as the culmination of his strenuous efforts to introduce this new means of communication into the service.

In 1901 Jackson's scientific work was recognized by his election as a fellow of the Royal Society, and in 1902 he communicated his most important scientific paper to the *Proceedings* of that body. The title of this was *On Some Phenomena Affecting the Transmission of Electric Waves over the Surface of the Sea and Earth*, and the paper described signalling experiments at sea over distances up to 140 nautical miles. Intervening land of any kind was found to reduce the signalling range between two ships by a distance which varied with the height, thickness, contour, and nature of the land. Jackson observed the disturbing effect of lightning flashes, and particularly noted that whenever any electrical disturbances were present in the atmosphere the travel of the wireless waves was affected, the intensities of received signals being from 30 to 80 per cent. of those obtained in fine weather. He appears to have been the first to observe the mutual interference of two wireless waves of the same wave-length arriving at the same point with varying phase difference. His own words were: 'The phenomenon manifests itself by the gradual weakening and occasionally by the total cessation of signals as the distance between the two ships (one transmitting and the other receiving) increases, up to a certain point, and then reappears as the distance is still further increased.' At that time Jackson could only assign the effect to a want of synchronism in the oscillatory discharge between the spark balls of the transmitter; many years later he remarked that had he had the advantage of cathode ray receivers his conclusions might have been very different.

In 1902 Jackson was appointed assistant director of torpedoes at the Admiralty, and in 1904 captain of the *Vernon*. In February 1905 he was appointed third sea lord of the Admiralty and controller of the navy. He stood then, as always, for the applica-

tion of science to the practical work of the navy, and it was during his years of control that recommendations were approved for building the first turbine battleship, *Dreadnought*, and the famous *Invincible* class of battle-cruiser. Among other types of warships designed under the general direction of Jackson were the *Probisier* and *Hawkins* class. He served as controller until 1908, when he was appointed to command the third (afterwards known as the sixth) cruiser squadron in the Mediterranean. In 1910 he represented the Admiralty at the International Conference on Aerial Navigation in Paris, and in 1911 he assumed the direction of the newly created Royal Naval War College at Portsmouth, where he had the task of training the first War Staff officers. In February 1913 he was appointed chief of the War Staff of the Admiralty.

When the European War broke out in August 1914 Jackson had been nominated to be commander-in-chief in the Mediterranean, but instead of taking over that command, he was retained at the Admiralty. Among his other duties were those of president of a sub-committee of the Committee of Imperial Defence which, in co-operation with the War Staff, developed schemes of attack on German colonial possessions. On the resignation of Lord Fisher from the post of first sea lord in May 1915, Mr. Arthur (afterwards Earl of) Balfour, then first lord of the admiralty, selected Jackson to succeed him. It was a period of great anxiety, largely caused by Germany's adoption of ruthless submarine warfare, and Jackson, by reason of his high scientific achievements, his intimate knowledge of the technical services, and his absolute fearlessness in all matters, was obviously well suited for the post. A new mining policy was initiated and an attack on the mole of Zeebrugge was planned, but the latter had to be abandoned owing to the difficulty, at that time, of setting up an effective smoke screen. Means of combating the submarine menace were under constant survey, but the destruction of merchant shipping continued to increase, and in December 1916 Jackson was appointed president of the Royal Naval College at Greenwich and Admiral (afterwards Earl) Jellicoe became first sea lord. During Jackson's period of office as first sea lord the battle of Jutland (31 May 1916) was fought, and he afterwards stated that the evidence which had convinced him that the German high fleet was coming out for action was the result of obser-

vations made by a radio direction-finding station, a change of five degrees being shown in the angular position of a German warship. Jackson filled his new post as president of the Royal Naval College with great distinction, and did not vacate it until July 1919, when he was advanced to the rank of admiral of the fleet. From 1917 to 1919 he was first and principal naval aide-de-camp to King George V. In July 1924 he retired from the navy.

In 1920 Jackson was appointed the first chairman of the Radio Research Board of the Department of Scientific and Industrial Research. The task of once more taking up experimental work in wireless telegraphy was most welcome to him. Under his guidance experiments were carried out dealing with the propagation of wireless waves, the nature of atmospherics, radio direction-finding, and precise radio frequency measurements. It was during his tenure of office that methods were developed for determining the height of the Kennelly-Heaviside layer [see *HEAVYSIDE*, *OLIVER*]. He gave his personal attention to the work, spending much time in visiting the laboratories and discussing aspects of the investigations with the staff. Under his guidance more than a hundred important papers were published, but his modesty was such that he always disclaimed credit for any of the results obtained. In 1926 the Royal Society awarded him the Hughes medal in recognition of the great merit of his work; although many honours came his way, it is probable that Jackson prized this one the most highly. He was secretary, and later chairman, of the British National Committee on Radio Telegraphy formed in connexion with the International Union for Scientific Radio Telegraphy, and he regularly attended the meetings of the general assemblies of the Union. It is no exaggeration to say that British prestige in the scientific aspects of radio telegraphy owes much to his guidance.

Among the numerous honours which Jackson received were the K.C.V.O. (1906), the K.C.B. (1910), and the G.C.B. (1916). He also received honorary degrees from the universities of Oxford, Cambridge, and Leeds. Of foreign honours he received the grand cross of the Spanish order of naval merit in 1909, the Japanese order of the Rising Sun, and the Russian order of the White Eagle (first class), and he was a grand officer of the legion of honour. He was a member of the Institution of Electrical Engineers and honorary vice-president of the Institution of Naval Architects. He

was also vice-president of the Seamen's Hospital Society. He died at his home, Salterns House, Hayling Island, 14 December 1929, and is buried in the neighbouring churchyard.

Jackson married in 1890 Alice Mary Florence, eldest daughter of Samuel Hawksley Burbury, F.R.S. [q.v.]: they had no children. Many of Jackson's early experiments were carried out in co-operation with Burbury's son, H. H. T. Burbury, who was also an enthusiastic investigator in radio telegraphy.

[*The Times*, 16 December 1929; *Proceedings of the Royal Society*, vol. lxx, A, 1901-2, and vol. cxxvii, A, 1930; *Nature*, 11 January 1930; personal knowledge.] F. E. SMITH.

JACKSON, SIR THOMAS GRAHAM, first baronet (1835-1924), architect, the only son of Hugh Jackson, solicitor, of Hampstead, by his wife, Eliza, daughter of Thomas Graham Arnold, M.D., of Stamford, was born at Hampstead 21 December 1835. He was educated at Brighton College and matriculated at Corpus Christi College, Oxford, in 1854, but in the same year was awarded a scholarship at Wadham College. He graduated in 1858 with a third class in *literae humaniores*. He was elected to a non-resident fellowship at Wadham in 1864 and was made an honorary fellow in 1882.

Jackson entered the office of (Sir) George Gilbert Scott [q.v.] in 1858, and, having served his articles, set up as an architect in London in 1862. Among his earlier designs is the Ellesmere monument on Walkden Moor, the commission for which he won in competition in 1868. No other man has altered the appearance of Oxford in modern times so greatly as Jackson, and there is much of his work at Cambridge and at numerous public schools. His Oxford employment began with his success in a competition limited to five architects for the design of the New Examination Schools, the foundations of which were laid in 1876. He was architect of the High School for Girls in 1879, of the High School for Boys in 1881, and later designed the Grove Buildings at Lincoln College (1882), the new buildings at Trinity College (1883-1887), the restoration of the chapel at Oriel College (1884), the annexe at Corpus Christi College (1884-1885), the new buildings at Brasenose College (1886-1889 and 1909-1911), the offices for Non-Collegiate students 1887-1888, new buildings at Hertford College (1887-1890 and 1903-1913, including the

new chapel finished in 1908), the remodeling of the spire of St. Mary's church (1893-1896), the refitting of All Saints church (1896), additions to the Acland nursing home (1897), the restoration of Wadham College (1900-1903), the Schools of Rural Economy and Forestry (1907-1908), and the Electrical Laboratory (1910). He also designed a Tutor's House in Mansfield Road for Balliol College, the circular tower in the grounds of the Radcliffe Observatory, and a small block of buildings at Somerville College. Of these buildings the New Examination Schools is the largest, the chapel of Hertford College that which he is said himself to have preferred, and the front of Brasenose College that which has met with most general approval. In various parts of the country he built about a dozen churches, and added to or restored many more. He designed the campanile of Zara Cathedral in Dalmatia (1892), and his numerous restorations of old buildings include his collaboration with Sir Francis Fox [q.v.] in the underpinning and stabilizing of Winchester Cathedral (1905-1912).

Early associated with the Arts and Crafts movement, Jackson soon became recognized as an accomplished adapter of ornament, and in the many buildings he designed throughout his career it is the ornament that is likely to entitle them to any permanent esteem. In middle life he gave particular attention to the re-use of Renaissance detail, although he constantly returned, upon appropriate occasions, to the Gothic of his training and first practice. In either style he was wont to employ unusual processes and materials: Hornblotton church, Somerset (1872-1873), is decorated internally with sgraffito plaster work, the town hall at Tipperary has some coloured decoration externally, and the new buildings at Brighton College have flint walling mingled with terra-cotta dressings which are imitated from Sutton Place. In the chapel of Giggleswick School—his outstanding achievement in buildings connected with schools—very many different processes and materials are characteristically combined.

Jackson had little skill as a planner, and was unsuccessful in the important public competitions for which he entered, notably those for the Admiralty and War Office, for the Imperial Institute, for the Queen Victoria Memorial, and for the London County Hall. He was a good draughtsman, and in an age when architecture was commonly regarded as an art of stylistic

decoration, deserved and won many distinctions. He was elected R.A. in 1896, received the royal gold medal for architecture in 1910, and in 1913 was created a baronet. The universities of Oxford and Cambridge conferred upon him honorary degrees in 1911 and 1910 respectively.

Jackson's reception of the royal gold medal was the sign of a reconciliation between him and the Royal Institute of British Architects, on the recommendation of which the medal is awarded. Distrusting professionalism in architecture, he had taken a prominent part in the secession from the Institute in 1891 of those who opposed the policy of official registration for which the Institute was then pressing. As time went on, however, his opposition abated. In his first attacks upon the policy of the Institute he was associated with many of his most distinguished confrères, and was joint-editor with Richard Norman Shaw [q.v.] of a volume of protesting essays entitled *Architecture, a Profession or an Art?* (1891).

Jackson had already written several books when he embarked, at the age of seventy-seven, upon a series of architectural histories, of which he lived to complete seven volumes: *Byzantine and Romanesque Architecture* (2 vols., 1913, 2nd ed., 1920), *Gothic Architecture in France, England, and Italy* (2 vols., 1915), and *The Renaissance of Roman Architecture* (3 vols., 1921-1922).

Jackson married in 1880 Alice Mary (died 1900), daughter of William Lambard, J.P., D.L., of Sevenoaks, and had two sons. He died in London in his eighty-ninth year 7 November 1924, and was succeeded as second baronet by his elder son, Hugh Nicholas (born 1881).

[*Builder*, 14 November 1924; *Architects' Journal*, 10 November 1924; *Journal of the Royal Institute of British Architects*, 22 November 1924 and 26 June 1926; private information.] H. S. GOODHART-RENDEL.

JEBB, EGLANTYNE (1876-1928), philanthropist, was born 25 August 1876, at Ellesmere, Shropshire. She was the third daughter and fourth child in a family of seven of Arthur Trevor Jebb, of Ellesmere, by his wife, Eglantyne Jebb (who was a distant cousin of her husband), and niece of Sir Richard Claverhouse Jebb [q.v.]. She was educated at home, and in 1895 she went up to Lady Margaret Hall, Oxford, where she obtained a second class in the honour school of modern history in 1898. On leaving college Miss Jebb spent

a year at Stockwell training college in order to prepare for teaching in an elementary school, and in 1899 she went to St. Peter's church school, Marlborough, remaining there rather more than a year. She was obliged to give up this post for reasons of health, and returned to live with her mother, who had settled in Cambridge after her father's death in 1894. There she immediately interested herself in social work, and compiled a register of the charities of the town, which was published and became a model survey.

From 1900 until 1914 Miss Jebb was busy with charitable work, with poetry, and with travel. She visited Egypt and spent several winters in Italy, always taking a close interest in the people of the country. In 1913, after the second Balkan War, she went to Macedonia in order to do relief work among the peasants, and on her return threw herself into the task of speaking and collecting for the Macedonian relief fund. In these years, too, she was actively associated with her sister, Mrs. Roland Wilkins, in the work of the Agricultural Organization Society for the encouragement of small holdings.

During the European War Miss Jebb helped another sister, Mrs. C. R. Buxton, in editing weekly 'Notes from the Foreign Press' in the *Cambridge Magazine*. As she studied the war news she came to realize more clearly the ruthless effects of war upon the defenceless and innocent in belligerent countries, and when, after the Armistice, it became evident that there were between four and five millions of children in Europe who were literally starving, she felt that it was impossible to remain inactive. With Mrs. Buxton she started an organization for investigation and propaganda called the 'Fight-the-Famine' Council. This led in 1919 to the initiation of the 'Save the Children' Fund, to the work of which Miss Jebb devoted the rest of her life. At the time of the formation of the fund there was much prejudice and opposition; but she broke her way through every obstacle, and forced her movement upon the notice of the world. It rapidly spread into forty countries, while the sums contributed rose to five and a half millions. In 1919 Miss Jebb was received in special private audience by Pope Benedict XV.

During the years between 1919 and 1922 the 'Save the Children' International Union became responsible for an immense amount of detailed relief administration, the problems of which extended

from the daily feeding of hundreds of thousands of children in Greece, Bulgaria, Rumania, Armenia, Poland, and Russia, to the provision of hospitals, educational facilities, and the care of blind and crippled orphans. 'Often', said Miss Jebb, 'we were tempted to shrink back from the magnitude and complexity of the problems . . . but . . . we learnt to realize how marvellous is the response when a little love and a little money go with a well-thought-out plan.'

In this great international work many persons took a share; but Eglantyne Jebb was in a real sense the inspirer of them all. Her constructive imagination and her intensity of passion led the movement into ever wider fields; and after the emergency of the post-War period she turned the work into permanent channels. The vast problems of child life in non-European lands, child labour, child marriage, and child suffering all the world over made an irresistible appeal to her, and the work of child protection seemed to her the most productive and most necessary of all social tasks.

'Every generation of children', she wrote to a friend, 'offers mankind a new possibility of rebuilding this ruin of a world.' With this hope and inspiration she worked out in 1923 the text of the 'Children's Charter', based upon the principle that 'every child is born with the inalienable right to have the opportunity of full physical, mental, and spiritual development'; and at the meeting of the Assembly of the League of Nations on 26 September 1924 the charter was unanimously adopted under the name of the Declaration of Geneva. It is printed in the *International Handbook of Child Care and Protection*. Upon this international agreement Miss Jebb at once began to build the lasting work of the 'Save the Children International', and a year later she was made an assessor to the League of Nations advisory council for the protection of children. Thenceforth much of her work was done from Geneva. In the years which followed she spared no personal effort to raise support and money for the development of the children's movement, and worked for it without ceasing. But the sensational period of horrors and emergencies was over, and the task was very hard. She was herself, moreover, exhausted and weakened by the strain of all the suffering which she had witnessed, and felt about so keenly. She toiled as hard and as bravely as ever; but she wore her-

self out. In July 1928 she fell ill, and she died at Geneva 17 December 1928.

There is a monument to Miss Jebb's name in the Save the Children Fund's model village in Albania which was called after her, Xheba; but the best memorial, and the one which most truly expresses the value of her life and work, is the international movement for the care of children which she founded and inspired.

[*The Times*, 19 December 1928; Mrs. C. R. Buxton and Edward Fuller, *The White Flame*, 1931; private information.] R. STRACHIEY.

JENKINS, Sir LAWRENCE HUGH (1857-1928), Indian judge, was born at the Priory, Cardigan, 22 December 1857, the younger son of Richard David Jenkins, solicitor, of Cilbronnau, Cardiganshire, and the only issue of his second marriage with Elizabeth, daughter of Thomas Lewis, of Machynlleth, a surgeon in the royal navy. He was educated at Cheltenham College and University College, Oxford, obtaining a first class in the honour school of jurisprudence in 1881. In 1883 he was called to the bar by Lincoln's Inn and practised on the chancery side until 1896, when he accepted a judgeship of the high court at Calcutta. In 1899 he was promoted to be chief justice of the high court of judicature, Bombay. During his tenure of this office he was an active member of the committee, which, under Sir Henry Erle Richards, successfully revised and re-drafted the code of civil procedure, the new draft receiving legislative approval in 1908. In that year, at Lord Morley's invitation, Jenkins returned to England to take his seat on the Council of India. On the Council his strong liberal sympathies gave him an exceptional position in the confidence of his chief, and he had a large share in the drafting of the Morley-Minto reforms of 1909. He returned to India in that year as chief justice of Bengal at the earnest request of the viceroy, Lord Minto.

Shortly after Jenkins's appointment as chief justice, there was a serious recrudescence of revolutionary terrorism and outrage in Bengal. Very difficult and complicated conspiracy cases came before him, and in view of his well-known sympathy with constitutional reform, his judicial conduct did not escape both ignorant criticism and undiscerning praise. But it is to his honour that he was always anxious to temper justice with mercy, particularly to youthful offenders, whom he felt were often but the tools of older men. A con-

spicuous example of this was the Khulna conspiracy case (1911), in which he released on probation some schoolboys and university students who had been convicted of an offence more serious than those for which such a course was provided in the criminal procedure code. There can be little doubt that the initiative on this occasion came from Jenkins, though that fact does not appear in the report. When government, alarmed at the impossibility of getting convictions in face of the terrorization of witnesses, took powers under the Defence of India Act to intern suspects without trial, it applied to Jenkins for the services of a high court judge to advise on the evidence which appeared in confidential reports; but this course Jenkins steadily refused to permit, holding that it would compromise the judicial office. At the same time he realized that judicial criticism of the executive might be very unjust to officials who from the circumstances cannot be heard in their own defence. A notable example of this may be seen on comparing Jenkins's judgment with those of his two brother judges in the Musalmanpara bomb case (1915). In this case the police evidence, which all three judges legitimately suspected, but the other two unsparingly condemned, was subsequently shown to be substantially true. Jenkins enjoyed, indeed throughout this period the personal confidence of thoughtful men of all shades of opinion and in all positions from the governor downwards.

In 1915 Jenkins retired, and in 1916 was appointed, though without allowances, to a seat on the Judicial Committee of the Privy Council. In the work of that tribunal he took but little part, and the judgments of the board delivered by him are disappointingly few. But he usually attended the autumn session of the committee, and his judicial eminence received public recognition in 1924 when he was selected to be a member of the board, under Lord Dunedin, to which was referred the delimitation of the boundary between Northern Ireland and the Irish Free State. Failing health and the fogs of London made him more and more prefer the occupations of a country gentleman at his home in Cardiganshire, where he was elected chairman of quarter sessions. He died at Ealing 21 October 1928.

Jenkins's legal equipment when he first went to India was a keen dialectical mind, a thorough grasp of English equity principles, and a power of expressing himself in clear and forcible English. To this he

soon added a mastery of Indian law and custom astonishing in one who did not visit India till his twenty-ninth year, and then served only in Presidency towns; many of his finest judgments enlighten dark questions of Hindu law. The same power to acquire rapidly a complete grasp of unfamiliar legal principles was again exemplified when the outbreak of war in 1914 brought before him a large crop of cases in prize. His unpublished official opinions as chief justice on proposals for improvement of the law and similar topics are also noteworthy. He was business-like in the administrative side of his duties; and the men whom he singled out for high responsibility justified his choice. A man of strong social tastes and a keen freemason, Jenkins also devoted himself with success to breaking down the barriers which at that time separated Englishmen and Indians, especially in the Presidency towns. He thus came to know intimately the leading Indian politicians, and sympathized with their aims. It was his advice which led the national congress to elect (Lord) Sinha [q.v.] to its presidency in 1915.

Jenkins married in 1892 Catherine Minna, daughter of Andrew Brown Kennedy, sugar planter, of Sea Cow Lake, Natal. She survived him with one son who died unmarried in 1930: a daughter had died in infancy. His official honours were few: a knighthood on becoming chief justice of Bombay in 1899, and the K.C.I.E. in 1903. His masonic honours included the district grand masterships of Bengal and Bombay.

[*The Times*, 3 October 1928; *Calcutta Weekly Notes*: notes portion, April 1911 and November 1928, reports, 1915, vol. xix, p. 923; private information.] S. V. FITZGERALD.

JENKINSON, FRANCIS JOHN HENRY (1853-1923), librarian, born at Forres, Morayshire, 20 August 1853, was the elder son of John Henry Jenkinson, younger brother of Sir George Samuel Jenkinson, eleventh baronet, of Hawkesbury, Gloucestershire, by his wife, Alice Henrietta, daughter of Sir William Gordon Gordon-Cumming, second baronet, of Altyre and Gordonstown, Elginshire, and sister of Rounaleyn George Gordon-Cumming [q.v.], the African lion-hunter. Jenkinson was educated at a private school at Woodcote, near Henley-on-Thames, and at Marlborough, and entered Trinity College, Cambridge, as a minor scholar in 1872. After obtaining a first class in the classical

trips of 1876, he was elected a fellow of his college in 1878, becoming lecturer in classics (1881) and assistant tutor (1882). He was also curator in zoology in the university from 1878 to 1879, for he was all his life an expert on *Lepidoptera*.

Jenkinson soon came, however, under the influence of the university librarian, Henry Bradshaw [q.v.], and entered upon the bibliographical studies, with extensions into liturgy, palaeography, archaeology, and Celtic philology, to which he was to devote the remainder of his life. Bradshaw died in 1886; and, after a three years' tenure of the librarianship by William Robertson Smith [q.v.], Jenkinson succeeded to the post in 1889 and held it until his death thirty-four years later.

Jenkinson began to specialize about this time in the study of *Incunabula*, in which he was much encouraged by his friendship and interchange of ideas with two younger men who were working on Bradshaw's methods, Edward Gordon Duff and Robert Proctor [q.v.]. The 'natural history method', as Bradshaw called it, of studying these books, that is, their classification according to their fount and the names of their printers, towns, and countries of origin, as opposed to mere descriptive cataloguing, appealed especially to one whose other great interest was the identification and scientific arrangement of *Lepidoptera*. The acquisition of fifteenth-century books for the University Library, and the analytical study of them when acquired, remained Jenkinson's chief professional pursuit: his hawk-like vision was unerring in seizing, remembering, and comparing early types; and little as he published, he was an acknowledged master of this study, and the inspirer of many who afterwards pursued and systematized the subject.

Few librarians excel both as scholars and administrators, and Jenkinson cared less for the administrative side of his work; but he was much loved by all his assistants, and adequately carried on the duties of the librarianship during what may be termed a period of consolidation—acquiring and cataloguing books in an old-fashioned but perfectly satisfactory manner, as yet untroubled by problems of collection and storage which later made new and enlarged accommodation a necessity. He died, after an operation, in a nursing home at Hampstead 21 September 1923.

Jenkinson's literary output was small. In 1889 he edited Bradshaw's *Collected Papers*, and in 1908 published an edition

of the *Hisperica Famina*, a curious and extremely difficult low-Latin poem, probably of Irish origin, of about the sixth century, on which Bradshaw had been at work at the time of his death. His writings, bibliographical and entomological, were contributed to periodicals (a list of them is given in the memoir cited below), but the lecture on the early Cologne printer, Ulric Zell, which he delivered as Sanders reader in bibliography in 1907-1908, is still unprinted.

A character of extraordinary sweetness and charm, Jenkinson will be remembered for the help, often amounting to inspiration, which he gave to other scholars during three generations, as well as for his lasting influence on the developing study of early printing, and for his extension of the collections of the University Library. After books and flies, his chief interest lay in music, of which he was an accomplished connoisseur. He was tall and handsome, and there is an admirable portrait of him by J. S. Sargent, painted in 1915, in the Fitzwilliam Museum at Cambridge.

Jenkinson married twice: first, in 1887 Marian Sydney (died 1888), daughter of Champion Wetton, of Joldwynds, Surrey, a sister-in-law of Sir Charles Villiers Stanford [q.v.]; secondly, in 1902 Margaret Clifford, daughter of Surgeon-General Ludovick Charles Stewart, of Drummie. There were no children by either marriage.

[Rev. H. F. Stewart, *Francis Jenkinson* (containing a bibliography of his writings), 1926; personal knowledge.] S. GASELEE.

JEROME, JEROME KLAPKA (1850-1927), novelist and playwright, was born at Walsall 2 May 1850, the younger son of Jerome Clapp Jerome, a colliery proprietor and nonconformist preacher, by his wife, Marguerite Jones, elder daughter of a Swansea solicitor. The colliery business proving unsuccessful, Jerome's father left Walsall and set up as a wholesale ironmonger in the East end of London. Jerome was educated at Marylebone grammar school until, at the age of fourteen, he began to make his own way. He obtained work, first as a railway clerk, and later as a schoolmaster; then he went on the stage, and finally took to journalism. It was his experience as an actor which led to the publication in 1888 of his first book, *On the Stage and Off*. In 1889 followed *The Idle Thoughts of an Idle Fellow* and *Three Men in a Boat*. Both these achieved considerable success; the latter has been translated into a great number of languages

and, curiously enough, had an enormous circulation in Russia. The blending of farcical humour with somewhat naïve sentiment, and of pretty descriptive writing with simple philosophizing, suited the taste of the period, and brought Jerome immediate popularity.

In 1892, with Robert Barr and George Brown Burgin, Jerome founded *The Idler*, an illustrated monthly magazine which owing to its humour and originality had for some years a remarkable success. With the exception of Bret Harte, Mark Twain, and W. L. Alden the contributors were nearly all young men, notably Israel Zangwill [q.v.], Eden Phillpotts, and W. W. Jacobs. Features of the magazine were the informal discussions of the 'Idlers' Club', and *The Idler* monthly teas, where the editors met their contributors—an innovation at that time regarded as imperilling the sanctity of editorship. In 1893 Jerome founded a twopenny weekly paper, *Today*, in which with characteristic vigour he constantly attacked Kaiser Wilhelm II and warned his readers to beware of his over-weening ambition. Jerome's connexion with this publication was ended in 1897 by a costly lawsuit.

After producing several volumes of tales and sketches, Jerome published in 1900 *Three Men on the Bummel*, a humorous account of a tour in Germany, and in 1902 *Paul Kelver*, a long autobiographical novel which he himself thought his best work.

Jerome had always been anxious to write for the stage, and an early play of his, *Barbara*, was accepted by Sir Charles Hawtrey and produced at the Globe Theatre in London 19 June 1886. It was not, however, until 1908 that he won fame as a dramatist by *The Passing of the Third Floor Back*, produced at the St. James's Theatre with Sir Johnston Forbes-Robertson playing the chief part. This has several times been revived. His other plays include *Miss Hobbs* (1890), *Fanny and the Servant Problem* (1908), *The Master of Mrs. Chilvers* (1911), on the woman suffrage problem, and *The Great Gamble*, a study of German life produced shortly before the outbreak of war in 1914. He wrote many other novels, plays, and sketches, and in 1920 published a volume of reminiscences, entitled *My Life and Times*.

Jerome, who was a good rider and oarsman, served during the European War as driver of a French motor ambulance on the Western front. During the last years of his life he lived at Belsize Park. In

1927, although in failing health, he decided to make a long motoring tour through England; he was taken ill, and died in Northampton general hospital 14 June 1927. His body was cremated, and his ashes subsequently buried in the churchyard of Twelme, Oxfordshire. A tablet to his memory has been placed on the house at Walsall where he was born.

Jerome married in 1888 Georgina Henrietta Stanley, daughter of Lieutenant Nesza, of the Spanish army. They had one daughter.

[*The Times*, 15 June 1927; J. K. Jerome, *My Life and Times*, 1926; Alfred Moss, *Jerome K. Jerome: his Life and Work*, 1929.]

G. B. BURGIN.

JOHNSON, WILLIAM PERCIVAL (1854-1928), archdeacon of Nyasa, was born at St. Helen's, Isle of Wight, 12 March 1854, the third son of John Johnson, solicitor, of Ryde, by his second wife, Mary Percival. He was educated at Bedford grammar school where he won an appointment to the Indian civil service, and at University College, Oxford, of which he was an exhibitor. In 1874 and in 1875 he stroked his college boat to the head of the river. As an undergraduate Johnson became the firm friend of Chauncy Maples, afterwards second bishop of Nyasaland, and in 1874 he determined to renounce his prospects of a career in India, and to join the Universities' Mission to Central Africa under Bishop Edward Steere [q.v.]. He therefore abandoned his Oriental studies, and after obtaining a second class in the honour school of theology in 1876 sailed for Zanzibar in August of the same year.

Johnson was ordained deacon in September 1876 by Bishop Steere at Zanzibar, and priest two years later; but it was not until 1881 that he reached Lake Nyasa on the waters and by the shores of which he worked unremittingly for the next forty-seven years. His cool courage in meeting attacks of wild beasts and wilder men became proverbial, and his undaunted struggles against difficulties were heroic. A violent attack of ophthalmia in 1884 rendered him totally blind for a time, and although an iridectomy performed in London gave partial sight to one eye, he could thenceforward read only in a strong light through the narrow slit formed by putting two fingers together. Yet to the end he remained a keen student, and his translations formed the beginning of a literature in several African languages.

Johnson's most considerable work as a

translator was done in Nyanja, into which language he translated the whole of the Bible including the Apocrypha, the Book of Common Prayer, *The Pilgrim's Progress*, commentaries on the Acts and other portions of the New Testament, a short church history, and a short life of Mohammed. After he was fifty he began work in Mpoto, Manda, and Pangwa, and produced translations of considerable portions of the New Testament in all three languages.

The two mission steamers *Charles Janson* and *Chauncy Maples* were both the result of Johnson's efforts and the means of much of his work, the *Chauncy Maples* serving for a time as a floating theological college under his care. He was appointed archdeacon of Nyasa in 1896. In 1911 he received the honorary degree of D.D. from the university of Oxford, and in 1926 he was made an honorary fellow of his college. After a five weeks' illness he died at Liuli on the shores of Lake Nyasa 11 October 1928. His two books *Nyasa the Great Water* (1922) and *My African Reminiscences* (1924) recount much of the early history of Nyasaland: he had seen the end of the East African slave-trade, the advent of ordered government, and the development of missionary pioneering into an organized diocese; but he always looked back rather regretfully to the early days of difficulty and danger when he was laying the foundations on which others might build.

[B. H. Barnes, *Johnson of Nyasaland*, 1933; A. E. M. Anderson-Morhead, *History of the Universities' Mission to Central Africa*, 1909; personal knowledge.] E. F. SPANTON.

JOHNSTON, SIR HARRY HAMILTON (1858-1927), explorer and administrator, was born at Kennington 12 June 1858, the third son of John Brookes Johnston, secretary of the Royal Exchange Assurance Company, by his second wife, Esther Lætitia, daughter of Robert Hamilton, of Bloomfield, Norwood, formerly a jewel merchant in India. Both his parents came of gifted Scottish families. At four years of age Johnston became engrossed in drawing and in bird-life. His early education by very intelligent and enlightened women (his grandmother, mother, and schoolmistresses) stimulated his interests in natural history, art, and humanity. When ten years old he was given a year's rest from school work, and spent the time in pursuing freely his own tastes in reading, in learning to paint at the Lambeth School of Art, in studying animals at the Zoological Gardens, and in

frequenting the British Museum. These precocious adventures of a very intelligent and attractive boy brought him into early contact with several men of distinction in the world of natural science, whose interest and friendship he retained in later life.

From 1870 to 1875 Johnston was a day scholar at Stockwell grammar school, where the headmaster and staff allowed and encouraged him to follow the bent of his scientific and linguistic interests. In 1875 he entered King's College, London. There he worked at modern languages (he did not, however, take a degree) while qualifying himself for a studentship in painting at the Royal Academy Schools, and continuing to study zoology in Regent's Park and anatomy in the museum of the Royal College of Surgeons. Meanwhile he travelled adventurously, and sketched in Majorca, Spain, and France.

In 1879, in consequence of fears for his health, Johnston spent eight months in Tunis. Here, while painting and exploring, he learnt Arabic and came into contact with the problem, in its early stages, of the partition of Africa. He began a life-long connexion with English journalism by means of illustrated contributions which he sent to the *Graphic*, and articles in the *Globe* on the subject of French designs on Tunis; in appreciation of the latter he received from the Bey of Tunis his first political decoration, the order of the Nizam.

Increasingly interested in the international problem of Africa and in the extension of British influence in that continent, Johnston abandoned his aim of making a career as an artist, and, in 1882, on the recommendation of W. A. Forbes, prosecutor of the Zoological Gardens, joined the seventh Earl of Mayo in an expedition through Southern Angola. Thence Johnston penetrated alone, with great intrepidity and resource, into the Congo basin, where in 1883 he won the friendship and encouragement of (Sir) Henry Morton Stanley [q.v.], who was then engaged in organizing the Congo Free State. On the strength of his reports on his observations, Johnston was invited, in 1884, on behalf of the Royal Society, to undertake a scientific mission to explore Mount Kilimanjaro and its surroundings. The mission had also covert political objects; and Johnston was accredited by the Foreign Office to (Sir) John Kirk [q.v.], the British agent and consul-general at Zanzibar. On this expedition he made

valuable contributions to scientific knowledge, and effected treaties with the chiefs of local native tribes by which they accepted British protection. These treaties formed the basis of the subsequent foundation of the British East Africa Protectorate (1895), now represented by Kenya Colony and Uganda.

In 1885 Johnston entered the service of the Foreign Office and was appointed vice-consul in Cameroon and the Niger Delta. Here he not only displayed and perfected his great natural talent for conciliatory dealing with African natives, but did valuable service in helping to open the navigable mouths of the Niger to legitimate trade. His action in inducing the chief, Ja Ja, of Opobo, who had established armed control of these waterways, to submit himself to a trial by the British admiral on the station, which resulted in Ja Ja's deportation, was sharply attacked in parliament. The case was made the subject of an official inquiry, and Johnston was absolved of all blame. His name was thus brought into public notice, and Lord Salisbury, impressed by the energy and ability of his work in East Africa and Cameroon, employed him in 1889 to assist in the (abortive) negotiations at Lisbon for a settlement of the respective spheres of influence of Great Britain and Portugal in South Central Africa. In this connexion Johnston had already formed a friendly alliance with Cecil Rhodes [q.v.] in the endeavour to secure an 'all-red' (British) route 'from the Cape to Cairo'—a phrase of which Johnston claimed to be the author.

On his return from Lisbon in 1889 Johnston was appointed to Mozambique as British consul in Portuguese East Africa. Scottish settlers were already established in the Shire Highlands and at the south end of Lake Nyasa. They were at that time in armed conflict with Arab slavers. In 1889 a Portuguese force entered the Highlands, and its commander, Major Serpa Pinto, laid claim to the country; but after he had been defeated in an encounter with native forces, a British protectorate was proclaimed over the Shire Highlands. Johnston, with the help of his vice-consul, T. Buchanan, (Sir) Alfred Sharpe, Captain Alfred J. Swann, and Cecil Rhodes (who provided funds), repressed the Arab slavers, made treaties with many native tribes, and within twelve months extended the British Protectorate to include Nyasaland, the greater part of what is now Northern Rhodesia, and the country ad-

joining Lake Tanganyika (with Mount Kilimanjaro) which was subsequently (1890) ceded to Germany.

In 1891 Johnston was appointed British commissioner for South Central Africa, and he remained in Nyasaland till the end of 1896—six fruitful years of good government, restoration of peace, suppression of slave-raiding, and economic development. During this period he gave offence to Cecil Rhodes by declining to co-operate with him in an attack upon the Portuguese, in the course of Rhodes's attempt to overrun Manika-land (lying south of the Mozambique Company's territory between the coast and what is now Southern Rhodesia). Rhodes never forgave Johnston for this, and withdrew the financial help which he had promised to Johnston for the completion of the campaign against the Arab slavers.

Fever having impaired his health, Johnston, who had been created K.C.B. in 1896, was transferred to Tunisia as consul-general in 1897. Here he actively pursued his archaeological, linguistic, and anthropological studies. In 1899 he was sent to Uganda as special commissioner. The country was distracted by political and religious faction-fighting, and the Sudanese armed police had mutinied. Johnston handled this difficult situation with great ability, and in 1901 left the Protectorate pacified, contented, and friendly to the British connexion, as it has ever since remained. During his administration he gained the personal friendship of the leading men of this progressive African state, and succeeded in his work largely by reason of his tact and sympathetic understanding of the people with whom he had to deal. But in the land settlement which he made for the protection of native property against European land-grabbing, he fell into the error of vesting in the personal ownership of the chiefs and about two thousand minor landlords exclusive rights in lands which were traditionally the common endowment of their tribes—a mistake which has sown the seeds of later difficulties. He explored Mount Ruwenzori, and added considerably to recorded knowledge of the flora, fauna, and ethnology of all that part of Africa. He discovered two animals new to British zoology—the okapi and the five-horned giraffe, and he made interesting studies of the pygmies of the Congo forest. His book, *The Uganda Protectorate* (1902), profusely illustrated by himself, is one of the most notable of his many valuable works dealing with African

regions. He was created G.C.M.G. in 1901, and retired from the consular service in 1902.

From 1904 to 1906, at the request of the government of Liberia and with the encouragement of the secretary of state for foreign affairs, the Marquess of Lansdowne, Johnston was principally occupied in elaborating, in concert with President Barclay of Liberia, a promising scheme for improving and strengthening, by the employment of British officials, the financial, judicial, and defensive administration of that republic. This beneficent project was supported by (Sir) Austen Chamberlain, then chancellor of the Exchequer, but under French pressure the whole scheme was jettisoned by Sir Edward Grey when he became foreign minister, and the affairs of Liberia relapsed into anarchy. During three visits Johnston explored the country, and embodied in a valuable book, *Liberia* (1906), his observations of the sociology of the cannibal tribes which formed the uncivilized mass of its population.

Subsequently, in 1908 at the invitation of President Theodore Roosevelt, he visited the United States in order to study the development in that country of the transplanted Africans and their descendants. This work he extended by travelling through Haiti, the West Indies, Cuba, Central America, and Brazil, and on the results of his observations produced his last important volume, *The Negro in the New World* (1910)—a document of great penetration and admirable humanitarian intelligence.

After his retirement from the consular service Johnston twice stood for parliament in the liberal interest, in 1903 and 1906, but was defeated. He wrote five novels and an autobiography, was ceaselessly active, especially in connexion with African interests, and completed for the Oxford University Press his important *Comparative Study of the Bantu and semi-Bantu Languages* (1919-1922).

Johnston married in 1896 the Hon. Winifred, daughter of Florence George Henry Irby, fifth Baron Boston. He died at Woodsetts House, near Worksop, 31 August 1927, leaving no issue. He was awarded the gold medal of the Royal Geographical Society in 1904, and received the honorary degree of D.Sc. of Cambridge University in 1902, and many other distinctions. He was president of the African Society in 1902-1903.

Johnston was a man of small stature, of

extraordinarily active and versatile intelligence, untiring industry, and great personal energy and courage. He was a witty talker, with acute powers of observation and lucidity of exposition. He was actively instrumental in adding about 400,000 square miles of the African continent to the British Empire, and in suppressing the curse of slavery and laying the foundations of good government in the new protectorates. Nearly fifty volumes, many of them profusely illustrated, attest his abilities as a researcher and writer. Many of his paintings have been exhibited at the Royal Academy.

A bust of Johnston was executed by Henry Pegram in 1904.

[Sir Harry Johnston, *The Story of my Life*, 1923; Alexander Johnston, *The Life and Letters of Sir H. H. Johnston*, 1929; private information; personal knowledge.] OLIVIER.

JONES, Sir HENRY (1852-1922), philosopher, born at Llangernyw, Denbighshire, 30 November 1852, was the eldest son of Elias Jones, by his wife, Elizabeth, daughter of William Williams. His father, the village shoemaker, was a man of unusual qualities, uniting deep and tender religious feeling with gaiety of humour and firmness of character. His lineaments, physical and moral, appeared again in his son; and certainly his influence was one of the strongest in Jones's life.

Jones left school at twelve years of age, to be apprenticed to his father. But after some four years the general ferment of the Welsh religious life of the time awakened new ambitions within him, so that in 1869 he returned half-time to school. He had nearly two years of desperate and doubting preparation, working most nights for half the hours of sleep, until in November 1870 he qualified for admission to the Bangor Normal College. His course showed no special distinction; but without difficulty he gained his 'teacher's certificate'. In 1873 he was appointed master of the Ironworks School at Brynamman, in South Wales; there in two years he raised the numbers of the school from 200 to 400 pupils, and left a vivid and long-enduring impression both upon his pupils and upon the town. At this time also he was received as a preacher into the Calvinistic Methodist denomination, and was encouraged to prepare himself for the regular vocation of the ministry. In 1875, therefore, after a summer of hard study, he matriculated, with a Dr. Williams scholarship, in the university of

Glasgow. His interests lay chiefly in the field of philosophy, to which John Nichol [q.v.] and especially Edward Caird [q.v.]—by far the strongest intellectual influence of Jones's life—introduced him. On graduation he won the G. A. Clark fellowship, which gave him four years of leisured study in Germany and in Glasgow. In 1882 he married Annie, daughter of James Walker, manufacturer, of Kilbirnie, Ayrshire.

By this time, under Caird's guidance, Jones had decided to seek a career in philosophical teaching. In 1882 he was appointed to a lectureship in philosophy at the University College, Aberystwyth. Two years later, he was elected to the professorship of philosophy and political economy in the new University College of North Wales at Bangor; thence in 1891 to the chair of logic, rhetoric, and metaphysics at St. Andrews; and finally, in 1894, to succeed Caird in the chair of moral philosophy in Glasgow, which he held until his death.

In principle, Jones's doctrine did not depart from the Hegelian idealism which he had received from Caird. He called himself a 'spiritual realist'. But his own philosophical position was reached from an analysis rather of the postulates of moral experience than of the conditions of knowledge; and the fundamental groundwork of all his thinking was a faith in the reality and reliability of moral values. From that premiss he deduced the permanent significance of the individual subject of experience, and of his contribution to historic progress; and correspondingly he controverted those renderings of Idealism which assigned a 'static' perfection to the Absolute. The fullest statement of his metaphysic is given in his last volume, *A Faith that Enquires* (1922), the substance of the Gifford lectures delivered at Glasgow in 1920 and 1921. But his earlier writings had developed one or other of the several aspects of his view. His studies of Browning (1891) and of Lotze (1895) were critical interpretations of two Idealist teachers, the former from the point of view of religion and ethics, the latter from that of logic and epistemology. In later books, *Idealism as a Practical Creed* (1909)—a series of lectures delivered in the university of Sydney in 1908, *Philosophical Landmarks* (1917)—lectures given at the Rice Institute, Houston, Texas, in 1912, *The Working Faith of a Social Reformer* (1910), *Social Powers* (1913), and the *Principles of Citizenship* (1919)—a book written for the

soldiers' classes in France during the War, he expounded especially the ethical and political consequences of his philosophy. With Professor J. H. Muirhead he wrote *The Life and Philosophy of Edward Caird* (1921); and in the last few months of his life, in *Old Memories* (edited by Thomas Jones, 1923), he gave an account of his own youth. He published also a large number of papers and pamphlets on philosophical and public questions; and he was at all times an eager and helpful correspondent. But his greatest contribution to contemporary philosophy was undoubtedly his own teaching. His rich and radiant personality gave him a remarkable influence over his students; and in the years between 1900 and 1915 he was unmistakably the dominant force in the speculative life both of the west of Scotland and of Wales.

Apart from his professorial work, Jones was profoundly interested in educational reform. He took a leading part in the movement which culminated in the Welsh Intermediate Education Act of 1889. He was a member of the royal commission on the university of Wales in 1916-1917, and of the 1918 departmental committee on adult education. For years, too, he was an ardent liberal. His interventions in politics concerned chiefly the free trade issue, and the budget of 1909 with its ensuing controversies. On the outbreak of the European War, he devoted his energies to two long campaigns on behalf of recruiting and of national savings. He served on many committees and public bodies, and finally, in 1918 visited the United States as a member of the British university mission to that country. This last work tried him greatly. A severe operation for cancer in 1913 had impaired his strength, and only his unshakable courage carried him through the days of public and private anxiety that followed. Of his six children, one son and one daughter had died in youth; his three remaining sons went on active service in the War, and the youngest died in France.

Soon after the end of the War, the cancer returned, and after three years of much suffering, though also of much productive work, Jones died in his country home at Tighnabruaich, in the Kyles of Bute, 4 February 1922. He was knighted in 1912; he received honorary doctorates from the universities of St. Andrews (1895) and Wales (1903), and was elected a fellow of the British Academy in 1904. In January 1922, a few weeks before his

death, he was made a Companion of Honour. There are portraits of him in the University College, Bangor, and in the university of Glasgow.

[Sir Henry Jones, *Old Memories*, 1923; H. J. W. Hetherington, *The Life and Letters of Sir Henry Jones*, 1924; J. H. Muirhead, *Sir Henry Jones, 1852-1922*, in *Proceedings of the British Academy*, vol. x, 1921-1923; personal knowledge.] H. J. W. HETHERINGTON.

JONES, HENRY ARTHUR (1851-1929), dramatist, was born 20 September 1851 at Grandborough, Buckinghamshire, the eldest son of Silvanus Jones, a farmer of Welsh descent, by his wife, Elizabeth, daughter of John Stephens, also a farmer. At the age of twelve Jones was withdrawn from John Grace's Commercial Academy at Winslow and sent to work for his uncle, a Ramsgate draper. Three and a half years later he passed into the service of another draper, at Gravesend; thence, in 1869, to a warehouse in London. For the next ten years he worked as a commercial traveller in the London, Bradford, and Exeter districts.

Jones read widely and intelligently in his leisure hours. During his first year in London he wrote several one-act plays (all rejected) and followed these with a novel, which was also unsuccessful. The first of his plays to be produced was *It's Only Round the Corner*, which was put on at the Theatre Royal, Exeter, 11 December 1878. Thereafter he gave up his employment and relied for a livelihood solely on the writing of plays. His first London production was the comediotta, *A Clerical Error*, which was played 16 October 1879 at the Court Theatre, just opened under the management of Wilson Barrett [q.v.]. The same actor-manager produced and took the principal part in the melodrama, *The Silver King* (Princess's Theatre, 16 November 1882) which ran for 289 nights, made Jones's name widely known, and banished all his pecuniary anxieties. Henry Herman [q.v.] and Wilson Barrett both had some share in shaping this play, but in later years Jones repudiated in acrimonious terms Barrett's claim to its authorship. In 1905 an arbitration vindicated Jones as sole author. Matthew Arnold saw the play, and described it as 'a sensational drama in which the diction and sentiments do not overstep the modesty of nature'.

Jones was now fairly launched on his career as a dramatist. *Saints and Sinners* (Vaudeville Theatre, September 1884) had

a successful run, although a section of the audience on the first night resented its use of biblical quotations. In 1887 (Sir) Herbert Beerbohm Tree played in *Hard Hit* at the Haymarket Theatre; *The Middleman*, produced at the Shaftesbury Theatre in 1889, was the beginning of a long association with E. S. Willard; and *Judah* (Shaftesbury Theatre, May 1890) was generally hailed as a distinct advance in thought and technique. An even greater success was *The Dancing Girl* (Haymarket Theatre, January 1891), in which Tree took the part of the Duke of Guisebury, and which ran for 310 nights. An allusion in this play to the teaching of Herbert Spencer led to a meeting with the philosopher which greatly gratified Jones, who had long been a close student of Spencer's works and acknowledged a deep intellectual debt to him.

The Bauble Shop (Criterion Theatre, January 1893) was Jones's first play under the management of (Sir) Charles Wyndham [q.v.]. In the same year he broke new ground with *The Tempter*, a tragedy in blank verse with incidental music by (Sir) Edward German, which was produced by Tree at the Haymarket Theatre in September, with Julia Neilson, Fred Terry, and Irene Vanbrugh in the cast. In Jones's own judgement, given shortly before his death, this was one of his five best plays, the other four being *The Case of Rebellious Susan* (1894), *Michael and his Lost Angel* (1896), *The Liars* (1897), and *The Divine Gift* (1913, never produced). The consensus of critical opinion considers *The Liars* to be his best work. *The Triumph of the Philistines* (St. James's Theatre, May 1895) and *Michael and his Lost Angel* (Lyceum Theatre, January 1896) both caused controversy—the first because of its criticism of Victorian prudery, and the second because it contained a church scene and showed a clergyman guilty of adultery. *Truth* found the very title 'as silly as it is objectionable', (Sir) Johnston Forbes-Robertson wanted the title altered, and Mrs. Patrick Campbell, after rehearsing for seven weeks, abandoned the part of Audrie because she disliked the church scene. But Jones, as was his invariable practice, refused to alter a line. *The Liars* (1897) and *Mrs. Dane's Defence* (1900) showed at their highest the dramatist's constructive power, stagecraft, and command of dialogue. *The Hypocrites* (produced by Charles Frohman at the Hudson Theatre, New York, in 1906) was strong in action and social

criticism, and *The Lie*, which had been played in New York in 1914, was produced at the New Theatre, London, in October 1923, with (Dame) Sybil Thorndike as leading lady, and had a *succès fou*.

From the time of the outbreak of the European War in 1914, Jones unfortunately frittered away much energy in ill-tempered and somewhat incoherent political controversy. In his early days he had been proud to meet William Morris; and under Morris's influence and that of (Sir) Emery Walker, a lifelong friend, he had shown some interest in socialistic theories. But material success, coupled with constant fear of confiscatory legislation, drove him to the opposite extreme. His diatribes against Mr. H. G. Wells, Mr. Bernard Shaw, and advanced thought in general (e.g. *Patriotism and Popular Education*, 1910, and *My Dear Wells*, 1921), added nothing to his reputation. Always a vigorous controversialist, Jones wrote many articles in periodicals on subjects connected with the drama, a number of which were collected in volume form as *The Renaissance of the English Drama* (1895) and *The Foundations of a National Drama* (1919). He played a prominent part in the agitation for the abolition of the censorship. In his latest years he suffered grievously in health and underwent several surgical operations. He survived undaunted, however, to the age of seventy-seven, and died at his home in Hampstead, of pneumonia, 7 January 1929.

Jones married in 1875 Jane Eliza (died 1924), daughter of Richard Secley, manufacturer of artificial flowers, by whom he had three sons and four daughters.

In the revival of the English drama Jones played an important part. Thomas William Robertson [q.v.] had shown some stirrings of a returning sense of responsibility, but it was Jones and Sir Arthur Pinero who really initiated the renaissance of dramatic art in England. Jones approached his work with a sense of high purpose and, although he once said that very rarely had he been able to write exactly as he would have wished, he never failed to envisage the drama as a branch of literature—in his view, the highest and most difficult. He had neither the highly polished wit of an Oscar Wilde, nor the intellectual force of Bernard Shaw, but as a craftsman he was perhaps superior to both. From the rise of the curtain his plays fulfil the primary purpose of arousing interest in the characters and the dramatic situation, and Jones knew how

to sustain that interest. Many of his subjects seem, after thirty or forty years, a little tame; but one glance at a photograph of the actresses in the costume of those days brings a realization of how revolutionary Jones's views appeared to many, and of how far the drama has travelled since. In Mr. Percy Allen's phrase, Jones was 'always a shrewd observer rather than a deep philosopher'. He strongly repudiated the idea that he had been influenced by Ibsen. In point of fact he did not cut so deeply; yet, within his limitations, he has claims to be a pioneer. He had a genuine sense of comedy, and excelled in creating parts in which a middle-aged character draws the threads together and brings erring and emotional youth back to reality. That such parts were ideal for the established actor-manager may go a long way towards explaining his brilliant material success. Jones made many friends in the literary and social world. He also made not a few enemies, for his sincerity and strength of feeling often led him to express himself in violent terms. His work was keenly appreciated both in America and in France. In 1907 Harvard University conferred an honorary degree upon him, and the French government offered him the ribbon of the legion of honour.

A portrait of Jones by H. G. Riviere is in the possession of Jones's daughter, Mrs. Irving Albery, of the Manor House, Farningham, Kent.

[Jenny Doris Jones, *The Life and Letters of Henry Arthur Jones*, 1930 (contains the only full list of his works); P. P. Howe, 'Henry Arthur Jones', in *Dramatic Portraits*, 1913; Percy Allen, 'Henry Arthur Jones', in the *Fortnightly Review*, new series, vol. cxxv, 1929; R. A. Cordell, *Henry Arthur Jones and The Modern Drama*, New York, 1932.]

H. B. GRIMSDITCH.

JONES, SIR JOHN MORRIS- (1864-1929), Welsh poet and grammarian. [See MORRIS-JONES.]

JORDAN, SIR JOHN NEWELL (1852-1925), diplomatist, was born at Balloo, co. Down, Ireland, 5 September 1852, the second son of John Jordan, of Balloo, by his wife, Mary Newell. He came of substantial Presbyterian farmer stock on both parents' sides. He owed much to his mother, to whom he was devoted, and who imbued him with her own steadfast sense of duty. He was educated at the Royal Academical Institution, and at Queen's

College, Belfast, where he obtained first-class honours (B.A. 1873, M.A. 1881). In 1874 he went to Queen's College, Cork, where he was senior classical scholar, and subsequently junior classical tutor. He was made a freeman of Belfast in 1910, an honour of which he was particularly proud.

In 1876 Jordan joined the China consular service as student interpreter in Peking, and passed his Chinese language examinations with credit. The next nine years were spent in Peking and various ports where he learned the routine of the consular work which, owing to the peculiar conditions prevailing in the Far East, entails judicial and political duties not usually included elsewhere. Thus he came into constant contact with Chinese officials of the old obstructive diplomacy, who entertained suspicions of all foreigners and, when possible, pursued the policy of masterly inactivity. It was a school of patience and tact, by which Jordan amply profited. He acquired a deep insight into Chinese character and ways of conducting affairs, tempered with considerable sympathy: qualities which made him in the long run an outstanding public servant. While in Canton (1882) he reaffirmed the principle, then lapsing into abeyance, that British citizens in the service of China, such as the commissioners of maritime customs, are nevertheless amenable to British jurisdiction.

The pay was small and promotion seemed far off; but in 1886 Jordan was appointed to the legation in Peking and showed his value. He became assistant Chinese secretary in 1889, and full Chinese secretary in 1891, his versatility and energy combining with his practical experience to add distinction to a post always requiring great abilities, but especially in those years when other foreign nations were beginning to dispute the British tradition of the 'Open Door'. In 1896 Jordan was appointed consul-general at Seoul, the capital of Korea; he received the jubilee medal in 1897, was promoted to be *chargé d'affaires* in 1898, and minister resident in 1901. He was created K.C.M.G. in 1904. Korea was in the throes of contention between her old overlord China, and Russia and Japan. As a result of China's defeat by Japan in 1894-1895, Korea declared her independence of China, but only to fall more fully into the grasp of Japan. In 1895 the Queen of Korea, the sole hope of her people, was murdered by Japanese invaders, Korea turned to Russia for sympathy, and there began the struggle between Japan and

Russia over the Korean promontory. During this period Jordan made lasting friendships with the Chinese commissioners at Seoul, notably Tang Shao-yi, who later became one of the elder statesmen of the Chinese Republic, and Yuan Shih-k'ai, who became president. These friendships were to be of service in later years in promoting understanding of high diplomatic problems. In 1906, after the defeat of Russia by Japan, the legation at Seoul was withdrawn in consequence of the establishment of a Japanese general and resident, and Jordan was appointed envoy extraordinary and minister plenipotentiary to the court of Peking, in succession to Sir Ernest Satow [q.v.].

After the tragic upheaval of the anti-foreign Boxer Riots in 1900, a new era dawned in China, and the Chinese people now turned with eagerness to learn from the foreigner. Jordan had married in 1885 Annie Howe, daughter of Dr. Robert Cromie, of Clough, co. Down, and he and his wife showed much hospitality to both Western and Chinese guests alike in the beautiful old Chinese palace which is the British legation. In 1908, with Sir Alexander Hosie [q.v.], and Tang Shao-yi, his friend of Korean days, Jordan forwarded the negotiations begun in 1906, which had for their aim the cessation of the export to China of Indian opium, *pari passu* with the abandonment by China of her large cultivation of poppy. Their efforts were so successful that by 1913 the export of Indian opium to China had ceased entirely, despite the loss to Indian finances, and although in the prolonged chaos following the Revolution unlimited poppy-growing began in China again. But that blot on British trade was removed.

In November 1911, the revolt against the dynasty plunged China into civil war. The Northern anti-republican army, under the half-hearted direction of Yuan Shih-k'ai was, nevertheless, hard pressing the revolutionaries until Jordan, distressed at such fratricidal war, unknown since the Taiping Rebellion of 1853, persuaded Yuan to cease fighting and open negotiations. Throughout the remainder of his service, Jordan equally set his face against war-making in China, strongly deprecating any loan or advance which would eventually mean the purchase of war-munitions and materials. During the European War of 1914-1918 he used all his influence towards bringing China on to the side of the Allies. The Germans in China, as a result, lost the extra-territorial rights which all

foreigners in China then possessed, and became subject to Chinese jurisdiction; but since then the whole question has been opened up.

Jordan was made a privy councillor in 1915, created K.C.B. in 1909, G.C.I.E. in 1911, and G.C.M.G. in 1920. He retired in 1920 and lived at Putney. In November 1921 he accompanied Mr. (afterwards the Earl of) Balfour to the United States for the Washington Conference, at which the Powers undertook to respect China's territorial sovereignty, and to allow her to impose her own customs dues. These dues had been originally settled by treaties now considered out of date.

Jordan died in London 14 September 1925, leaving three sons. His only daughter predeceased him.

Jordan had an admirable gift of style, and his dispatches are models of conciseness, interest, and lucidity. Of a kind and cheerful nature, he won the affection and esteem of Chinese officials who realized that he never supported a cause unless he was convinced of its justice to Chinese as well as to British.

There is a pencil-sketch of Jordan from a photograph in the library of Queen's College, Belfast.

[*The Times*, 15 September 1925; private information; personal knowledge.]

D. HOSIE.

JOYCE, SIR MATTHEW INGLE (1839-1930), judge, was born 17 July 1839 at Brendon-on-the-Hill, Leicestershire, the fourth son of John Hall Joyce, yeoman farmer, of Blackfordby, Leicestershire, by his wife, Mary, daughter of Matthew Ingle, of Ashby-de-la-Zouch. He was educated at Ashby-de-la-Zouch grammar school and at Gonville and Caius College, Cambridge. He graduated as eighth wrangler in the mathematical tripos of 1862, and in that year was elected a fellow of his college, a position which he held until 1875. He was called to the bar by Lincoln's Inn in 1865, and was junior equity counsel to the Treasury from 1886 to 1900; in the latter year he was appointed a judge of the High Court and was knighted. He remained on the bench until 1915. On his resignation he was sworn a member of the Privy Council. His college made him an honorary fellow on his appointment as a judge. He married in 1891 Miriam Bertha (died 1922), eighth daughter of Sir William Jackson, first baronet, a well-known contractor, and had one daughter. He died at Liverpool 10 March 1930.

The outstanding characteristic which marked the judicial as the private life of Joyce was sincerity. One who had exceptional knowledge of him said that 'he never said anything he did not mean, and rarely refrained from saying what he did mean'. A somewhat brusque manner concealed the kindest of hearts, and no one who deserved help or encouragement failed to obtain it from him. Joyce never attempted to garnish his judgments with a display of learning. Perhaps the most important was *Colls v. Home and Colonial Stores* (1904), concerned with the nature and extent of the easement of light. His decision in this case was reversed by the Court of Appeal, but restored by the House of Lords. In *Grierson v. National Provincial Bank* (1918) he made a notable contribution to the mass of learned decisions on priorities among different mortgagees of the same land. In his whole judicial career Joyce showed himself to be a sound lawyer with a wide knowledge of real property and equity jurisprudence. He valued above everything simplicity and common sense, distrusting any subtlety or technicality. Although not one of the more profound lawyers in the history of the bench, he was in the highest sense a just and upright judge. He knew well how to impart his knowledge, for during his practice at the bar his pupil room was very popular and produced some distinguished lawyers, notably Lord Parker of Waddington and the younger Lord Russell of Killowen.

A cartoon of Joyce by 'Spy' appeared in *Vanity Fair* 23 January 1902.

[*The Times*, 12 March 1930; private information.] H. G. HANBURY.

KELLY, JAMES FITZMAURICE (1857-1923), historian of Spanish literature. [See FITZMAURICE-KELLY.]

KELTIE, SIR JOHN SCOTT (1840-1927), geographer, was born at Dundee 29 March 1840, the elder son of David Keltie, builder and stone mason, by his wife, Christian, daughter of William Scott, of Crieff. Soon after his birth his parents moved to Perth, where Keltie was educated until he entered the university of St. Andrews at the age of nineteen. He left the university before taking his degree in order to study in Edinburgh for the United Presbyterian Church; but although he completed his course he did not enter the ministry. While still a student he

began journalistic work, and in 1861 joined the staff of Messrs. W. & R. Chambers, and worked on *Chambers's Encyclopædia* and other publications, including *A History of the Scottish Highlands, Highland Clans and Highland Regiments* (1874). In 1871 he came to London to join the editorial staff of Messrs. Macmillan, and became sub-editor of *Nature* in 1873. In 1884 he undertook for this firm the editorship of the *Statesman's Year Book*, which he retained to the end of his life, being associated from 1919 with Mr. M. Epstein. In 1875 he began to write for *The Times* on biographical, statistical, and geographical topics, principally relating to Africa, which at that time was being actively explored and rapidly divided among the European powers.

Keltie's long association with the Royal Geographical Society began in 1884, when the Society, anxious to further geographical teaching, appointed him inspector of geographical education. After a year spent in visiting the universities and schools of Europe he presented an exhaustive report on the subject (*Report on Geographical Education*, 1886), which may be regarded as inaugurating the scientific study of geography in the schools and universities of Great Britain. Meantime (1885) Keltie had become librarian of the Society, and in 1892 he succeeded Henry Walter Bates [q.v.] as assistant secretary, a title changed in 1896 to that of secretary. As years went on the work of the Society occupied an increasing amount of Keltie's time and thought, and the high prestige which it gained was due in large measure to his wide interests, genial sympathy, and sound judgement, exercised over the long period of his service. Among his activities was the reorganization of the Society's publications. The new monthly *Geographical Journal* appeared in 1893, and was under Keltie's editorship until 1915 and joint editorship until 1917. In 1895 he was one of the chief organizers of the sixth international geographical congress in London, and in 1897, at Toronto, he was president of the geographical section of the British Association, on the council of which he afterwards served from 1919 to 1924. His editorial work included the geographical section of the tenth edition of the *Encyclopædia Britannica*, the *World's Great Explorer* series, the *Story of Exploration* series; and his principal books were *Applied Geography* (1890), *The Partition of Africa* (1893), and *The History of Geography* (with O. J. R. Howarth, 1913). He re-

signed the secretaryship of the Royal Geographical Society in 1915, was elected to the council in 1917, and became a vice-president in 1921.

Keltie was knighted in 1918, and was also made a commander of the Swedish order of the North Star, the Norwegian order of St. Olaf, and the Finnish order of the White Rose. Other honours he held were the honorary LL.D. of St. Andrews University (1897), the Cullum gold medal of the American Geographical Society (1914), the gold medal of the Royal Scottish Geographical Society (1915), the medal of the Paris Geographical Society (1915), and the Victoria medal of the Royal Geographical Society (1917). He was an honorary member of the chief geographical societies of the world.

Keltie married in 1865 Margaret, daughter of Captain John Scott, of Kirkwall (died 1922), and had one daughter. He died in London 12 January 1927.

[J. S. Keltie, 'Thirty Years' Work of the Royal Geographical Society', in the *Geographical Journal*, May 1917; *The Times*, 13 January 1927; *Geographical Journal*, March 1927; H. R. Mill, *Record of the Royal Geographical Society*, 1930; private information.]

R. N. RUDMOSE BROWN.

KENNEDY, SIR ALEXANDER BLACKIE WILLIAM (1847-1928), engineer, born in Stepney 17 March 1847, was the eldest son of the Rev. John Kennedy, congregational minister, by his wife, Helen Stodart, daughter of Alexander Blackie, bank manager, of Aberdeen, and sister of John Stuart Blackie [q.v.]. He was educated at the City of London School and the School of Mines, which was then in Jermyn Street. At the age of sixteen he was apprenticed for five and a half years to the firm of J. and W. Dudgeon at Millwall, and gained his first experience in marine engine construction. In 1868 he was made leading draughtsman in the engine works established by Sir Charles Mark Palmer [q.v.], at Jarrow-on-Tyne, and here he worked out the designs for the first compound marine engines built on Tyneside. In 1870 he became chief draughtsman to the firm of T. M. Tennant & Co., of Leith, working under Wilson Hartnell. He remained there until in 1871 he went into partnership with H. G. Bennett, a consulting marine engineer of Edinburgh and Glasgow. In 1873, at the request of William Henry Maw, editor of *Engineering*, he went to Vienna and in conjunction with Maw and James Dredge

[q.v.] contributed to *Engineering* (vols. xv, xvi) reports of the engineering exhibits in the Vienna Universal Exhibition. He continued to contribute regularly to *Engineering* until 1887.

In 1874 Kennedy was appointed professor of engineering at University College, London, at a salary of less than two hundred a year, and there founded a school of engineering teaching, the principles of which have been widely followed in England and the United States of America. His teaching was based on Franz Reuleaux's *Theoretische Kinematik*, which he translated and edited in 1876 with the title *Kinematics of Machinery: Outlines of a Theory of Machines*. He also established in University College in 1878 an engineering laboratory, the first of its kind in England. It was described by him in a paper which he read before the Institution of Civil Engineers in December 1886. In this laboratory between 1881 and 1892 he carried out experiments on the strength and elasticity of materials, on the strength of riveted joints, and on marine engines. While professor he designed the steel arch pier at Trouville and the steel and concrete internal structure of the Hotel Cecil and of the Alhambra Theatre, the latter being probably the first building in which concrete slabs were used on a large scale to carry heavy weights. Between 1887 and 1889, in collaboration with Bryan Donkin (1835-1902, q.v.), he made exhaustive tests of different kinds of boilers, the results of which were published in *Engineering*, and afterwards edited by Donkin under the title *Experiments on Steam Boilers* (1897).

In 1889 Kennedy resigned his professorship and began practice as a consulting engineer at Westminster, in partnership with Bernard Maxwell Jenkin, son of Henry Charles Fleeming Jenkin [q.v.], and on Jenkin's retirement in 1908, with his own son, John Macfarlane Kennedy, and Sydney Bryan Donkin, son of Bryan Donkin. In 1900 Kennedy was appointed by Lord Goschen a member of the Belleville boiler committee.

From 1889 or 1890, however, Kennedy directed his attention particularly to electrical engineering, which was becoming important, and in which his interest had been aroused in 1887 by trials of motors for electric lighting carried out by him with John Hopkinson [q.v.] and Beauchamp Tower for the Society of Arts (*Journal of the Society of Arts*, February 1889). For this work he showed remark-

able ability for one whose previous training had been in mechanical engineering; and without the aid of his splendid talents the establishment of low power electric stations in opposition to Ferranti's great project for supplying London might have been less successful [see FERRANTI, Sebastian Ziani de]. In a few years he built up one of the largest practices in the country. He was engineer to the Westminster Electric Supply Corporation from its foundation in 1889, and planned the whole system and works. Similarly he planned the system and was chief engineer of the Central Electric Supply Company from the start in 1899, and was also engineer to the St. James' and Pall Mall Electric Light Company, registered in 1888.

Kennedy was also closely connected with the development of electric transport. On the death of James Henry Greathead in 1890, he became joint engineer with W. R. Galbraith for the Waterloo and City Railway and prepared the whole of the electrical work, substituting for locomotives, motors in the front and rear ends of the train, a plan which afterwards came into general use where practicable. In 1899 the London County Council consulted him as to the electrical working of its tramways, and adopted his recommendation of a conduit system for the central district with overhead wiring for the outlying suburbs. As consulting engineer to the Great Western Railway, he prepared the plans for the work of electrification west of Paddington on the Great Western, and Hammersmith and City railways. His firm were consulting electrical engineers to the London and North Western, and London and South Western railways for their schemes of suburban electrification round London, and later on he carried out similar work for the South Eastern and Chatham railway. He was consulting engineer to the Calcutta Electric Supply Corporation until 1928, and to the Corporation of Edinburgh. He was also concerned with the construction of electrical stations in Manchester and many other English and Scottish towns, and also in Japan.

Kennedy did work in other fields. From June 1909 he was an associated civil member of the Ordnance Committee, and in 1913 served on Lord Parker's committee on wireless telegraphy. During the European War he served on the panel of the Munitions Invention department, was chairman of the committee on gun-sights

and range-finders, and was vice-chairman of the committees on ordnance and ammunition and on anti-aircraft equipment. In 1920 he was chairman of the Ministry of Transport's committee on electrical railways. He was also closely associated with the formation of the London Power Company.

After the War Kennedy was desirous of preserving a record of the scenes of devastation. He therefore made a survey of the Western front, and in 1921 he published his observations and photographs under the title *From Ypres to Verdun*. In 1922, at the age of seventy-five, he undertook the exploration of Petra with a view to giving a full description of the remains there. He made a short preliminary visit in 1922 and two long visits in the years following. Husain, king of Nedj and Hejaz, received him kindly, afforded him help, and gave him the title of pasha in 1924. In 1925 he published *Petra; Its History and Monuments*, the most complete monograph on the subject, the value of which is considerably enhanced by the photographs, taken by himself. He was a musical amateur of taste and enthusiasm, and at his rooms in The Albany, Piccadilly, gave private concerts at which chamber music was performed by leading professional musicians. He was president of the London Camera Club, and a member of the Alpine Club, and in 1902 edited and published Adolphus Warburton Moore's diary under the title *The Alps in 1864*. In addition to the works already mentioned, he wrote a text-book, *The Mechanics of Machinery* (1886, 4th edition 1902).

Kennedy became a member of the Institution of Civil Engineers in 1879, and president in 1906, a member of the Institution of Mechanical Engineers in 1879, and president in 1894, and a member of the Institution of Electrical Engineers (originally the Society of Telegraph Engineers) in 1890. He was elected F.R.S. in 1887, and was knighted in 1905. He received honorary degrees from the universities of Glasgow (1894), Birmingham (1909), and Liverpool (1913). He retired from business early in 1928 and died in London 1 November of that year at The Albany, Piccadilly. He married in 1874 Elizabeth Verralls (died 1911), eldest daughter of William Smith (1816-1896, q.v.), actuary, of Edinburgh, and the translator of Fichte. He had two sons and one daughter.

[*The Times*, 2 November 1928; *The Engineer*, 9 November 1928; *Engineering*, 9

November 1928; *Proceedings of the Institution of Civil Engineers*, 1928-1929, vol. cxxxi, pp. 269-275; *Proceedings of the Institution of Electrical Engineers*, April 1922 and December 1927.] E. I. CAULLEY.

KENNY, COURTNEY STANHOPE (1847-1930), legal scholar, was born at Halifax, Yorkshire, 18 March 1847, the elder son of William Fenton Kenny, a solicitor of that town, by his wife, Agnes Ramsden Ralph, of Halifax. On his father's side Kenny was descended from a family of French Huguenots named Du Quesne, who had fled to Connaught in the seventeenth century. He was educated in Yorkshire at the Heath and the Hipperholme grammar schools, and in 1863 was articled to a Halifax firm of conveyancing solicitors. After his admission to practice in 1869, he worked for two years as a partner in the firm, but in 1871 he decided to leave practice and acquire a university education. He entered Downing College, Cambridge, in that year and was elected to a foundation scholarship in 1872. His career as a student was brilliant. In 1874 he was senior in the law and history tripos, won the Winchester reading prize, and was elected president of the Union. In 1875 he won the Chancellor's medal for legal studies.

Kenny was elected a fellow of Downing College in 1875, being appointed to a lectureship in law and moral science. In three successive years, 1877, 1878, 1879, he won the Yorke prize with essays on *The History of the Law of Primogeniture in England and its Effect upon Landed Property*, *The History of the Law of England as to the Effects of Marriage on Property and on the Wife's Legal Capacity*, and *The True Principles of Legislation with regard to Property Given for Charitable or other Public Uses*. In all of these works Kenny wrote both as a legal historian and as a reformer, his book on charities exercising a direct influence in bringing about the introduction in 1891 of the Mortmain and Charitable Uses Bill, which Lord Herschell piloted through parliament.

In 1881 Kenny was called to the bar by Lincoln's Inn and joined the South-Eastern circuit. In 1885 he was elected member of parliament for the Barnsley division of Yorkshire, as a follower of Mr. Gladstone, and at the general election of June 1886 he was again returned. While in parliament he introduced bills for the abolition of primogeniture and for the amendment of the law relating to blasphemy, demanding

the repeal of the laws restricting the expression of religious opinion.

In 1888, on the election of Frederic William Maitland [q.v.] to the Downing professorship of the laws of England, Kenny succeeded him as university reader in English law, and retired from parliament in order to devote himself exclusively to his academic duties. He took part, however, in local affairs, serving for several years as vice-chairman of the Cambridgeshire county council and for a long period as chairman of the Cambridgeshire quarter sessions. The practical experience thus gained proved of great value to him as a lecturer and writer on law. In 1907, on Maitland's death, Kenny was elected to succeed him as Downing professor, and he held the chair until his resignation in 1918.

Kenny was unquestionably the most successful of all the Cambridge law teachers of his time. He did more than any one else to raise the standard of lecturing, for, as Professor Winfield has said, 'His lectures flame like a beacon in the memories of those who have attended them, and have been the altar at which younger instructors have sought to kindle their own more humble torches.' Kenny's contributions to legal literature cover a wide range, and are distinguished by sound scholarship, lucid expression, and charm of style. He was one of the first to edit collections of judicial decisions, his *Cases on Criminal Law* (1901, 7th edition 1928) and his *Cases on the Law of Torts* (1904, 5th edition 1928) being recognized as models of their kind. Of the former Maitland once said that he could not imagine a book better fitted to give the freshman his first ideas about law. Kenny's three articles, 'What an Old Reporter Told me', in the *Law Quarterly Review* (vol. xliii, 1927) illustrate his lively interest in the human side of the law, a characteristic which distinguishes all his writings.

Kenny's most important work is his *Outlines of Criminal Law* (1902, 14th edition 1932; American edition by J. H. Webb, 1907; French edition by A. Pouliat, 1921). It has become a legal classic, being an indispensable text-book used not only by students but also by the bench and bar. It contains a clear and penetrating exposition of fundamental principles, illustrated by novel and vivid examples, many of them borrowed from Continental legal literature, for Kenny had made a study of French, German, and Italian criminal law. Of the *Outlines* Professor A. V. Dicey wrote that it 'proves conclusively that the

art of treating legal topics with the literary skill which makes a legal text-book a work, full not only of instruction but of interest, may be displayed to-day quite as markedly as in the time of Blackstone'. In 1910 Kenny published his essay on *The Law of the Air*, which was one of the pioneer contributions to this subject; and in 1927 he brought out an edition, with introduction and notes, of *Parliamentary Logic*, the title under which the works of William Gerard Hamilton [q.v.], 'Single-speech Hamilton', were published in 1808 by Edmund Malone.

Kenny was elected a fellow of the British Academy in 1909, and later served as a member of its council. He married in 1876 Emily Gertrude, daughter of William Wood Wiseman, surgeon, of Osset, Yorkshire, and had two daughters. He died at Cambridge 18 March 1930. There is a portrait of him by Clegg Wilkinson in the hall of Downing College, and a pair of wrought iron gates, known as the Kenny memorial gates, have been presented to the college by his daughters.

[*The Times*, 19 March 1930; H. D. Hazelline, *Courtney Stanhope Kenny, 1847-1930*, in *Proceedings of the British Academy*, vol. xviii, 1932; P. H. Winfield, Biographical Note, with portrait, in *Cambridge Legal Essays*, 1920; *Cambridge Review*, 25 April 1930; private information; personal knowledge.]

A. L. GOODHART.

KER, WILLIAM PATON (1855-1928), scholar and author, was born at Glasgow 30 August 1855, the eldest son of William Ker, merchant, of that city, by his wife, Caroline Agnes Paton. He passed from Glasgow Academy to Glasgow University, and proceeded thence in 1874 with a Snell exhibition to Balliol College, Oxford, of which Benjamin Jowett was then master. He obtained a first class in classical moderations (1876) and a second class in *literae humaniores* (1878). He was awarded the Taylorian scholarship in the latter year, and was elected to a fellowship at All Souls College in November 1879. In 1878 he was appointed assistant to William Young Sellar [q.v.], professor of humanity in the university of Edinburgh. This assistantship was one of the most valued experiences of his life.

In 1883, at the age of twenty-eight, Ker was appointed professor of English literature and history in the new university college of South Wales, Cardiff. It was hard, pioneering work, and he looked back on it with keen pleasure. Six years later, in

1880, he succeeded Henry Morley [q.v.] in the Quain chair of English language and literature in University College, London. Until his resignation of that chair in 1922 he spent most of the long London terms at his house, 95 Gower Street. He gave every week a great number of lectures and classes—in the early years of his professorship as many as a dozen. When the university of London was reorganized in 1900, Ker was appointed chairman of the modern languages board, and later of the English board, and he took the leading part in moulding English studies throughout the university. It was not always an easy task. He was inflexible in his hatred of any officialdom which seemed likely to hamper the school, and, on the other hand, of any slackness on the part of his colleagues on the board. But the building up of an honours school of English was only one of Ker's labours. He threw himself into the general work of the university, as a member of the senate, the academic council, and the faculty of arts, and of the professorial board of his college. He attended meetings assiduously, spoke seldom, and then always very briefly, but with extraordinary effect. He was conservative in politics and in every habit of his daily life, but his conservatism was combined with a readiness for any development upon sound lines. His eagerness for new adventure was shown by the energy with which, even during the distractions of the European War, he undertook the work of organizing Scandinavian studies in London University. He had been teaching Icelandic to his students for years, but that was not enough: largely through his initiative and energy a department of Scandinavian studies was founded in 1917, and he became its first director.

Such was the 'ubiquitariness' of Ker's mind that he could attend to all the literatures of Western Europe, and to the affairs of more than one university, with a thoroughness which made it difficult to believe that each of these interests was not first in his mind. He retained his fellowship at All Souls for forty-four years, until his death, for he never married; indeed, the college, quite as much as his house in Gower Street, was his home. His position at All Souls was unique. He was at once a wit, a sage, and an institution. He held at different times various offices in the college; he was assiduous in his attendance at its meetings, sparing of speech but rich in wise counsel; above all, he was the very centre of the college's social life.

As a talker he was unequalled; his very silence, frequent enough, breathed sympathy. His kindness to the young Fellows was unbounded: the rich stores of his learning, never displayed, were always at their disposal; and many of his happiest hours were spent in taking them for long walks in the country or in sitting with them in the common room in the evening. Almost every week-end in term time was spent in Oxford, and he kept throughout in the closest touch with Oxford affairs. In 1920 he was elected to the chair of poetry at Oxford—a distinction which might have been his earlier had he wished, and one which he retained when he resigned his London chair. His directorship of Scandinavian studies he also retained to the end.

Ker was slow to publish. He was forty-two when *Epic and Romance* appeared in 1897; until then he had printed hardly anything, except an essay on 'The Philosophy of Art', which appeared in *Essays in Philosophical Criticism* in 1883. It was not at once realized how great was the light which *Epic and Romance* threw on problems which had been puzzling scholars for many years. In 1900 Ker selected and edited *The Essays of John Dryden* (2 vols.), and from 1901 to 1903 he edited Lord Berners' translation of Froissart's *Chronicles* (6 vols.) with a characteristic introduction. In *The Dark Ages* (1904) and *English Literature: Medieval* (1912) he compressed into small volumes much of the result of his vast reading. His lectures as professor of poetry were issued in 1923 (*The Art of Poetry: Seven Lectures, 1920-1922*); most of his shorter writings have been reprinted in *Essays on Medieval Literature* (1905) and in the two volumes of *Collected Essays of W. P. Ker* (1925) edited by Charles Whibley [q.v.] after Ker's death. *Form and Style in Poetry* (edited by R. W. Chambers, 1928) includes lectures delivered in Cambridge and London on the history of poetic forms and the relation of form and substance, subjects which he had made peculiarly his own.

Ker's wide reading in many languages, his critical acumen, and strength of imagination enabled him to see farther into things than most people, and so to throw fresh light on problems of literary relationships and to bring out the essential in the books and authors with which he dealt. His best-known work, perhaps, is concerned with questions of literary form and medieval literature, but his lectures on writers of later centuries, French, Italian,

Spanish, Scandinavian, as well as English, are no less valuable.

Immense as was the range of Ker's knowledge, he always kept the spirit of an adventurer, wandering far afield when the spirit really prompted, carrying his students with him by his power of mind and temper. Towards the end of his life he gave *Nos manet Oceanus* as his favourite motto; it was in this spirit that in his farewell speech at University College he gave his students the advice of the abbey of Thelema, 'Do what you like'. Few men liked more things, or got more out of life in all its aspects than Ker. The love of books and the love of nature were the two passions of his life; he loved children also, and animals, climbing, walking, rowing, dancing, good wine, and good fellowship. He had a keen wit and a strong sense of humour, and a firm belief in the virtue of cheerfulness. Above all, he had the instinct for friendship in a most uncommon degree; students and friends alike found him full of generous sympathy and understanding.

Ker's vacations were mostly spent walking or climbing, boating or swimming, in Scotland, Switzerland, and elsewhere. During the European War he was doing confidential work for the Admiralty: after the War he returned to the Alps, doing, at the age of sixty-five, strenuous climbs in quick succession, in a way which might have tried a young and very strong man. His first and last year of complete freedom, after the resignation of his London chair in 1922, was passed in this way, in the spirit of an explorer, until, on 17 July 1923, he fell dead from heart failure on the Pizzo Bianco, which he had just described as 'the most beautiful spot in the world'. He was buried in the old churchyard at Maugnagna, Italy.

A portrait of Ker by Wilson Steer is at University College, London, which also possesses a bronze bust by his lifelong friend John Tweed; another bust by Tweed is at All Souls College, Oxford, and a replica is at the university of Glasgow.

R. W. CHAMBERS.

KERR, LORD WALTER TALBOT (1839-1927), admiral of the fleet, was born at Newbattle Abbey, Midlothian, 28 September 1839, the fourth son of John William Robert Kerr, seventh Marquess of Lothian, by his wife, Lady Cecil Chetwynd Talbot, daughter of Charles Chetwynd, second Earl Talbot [q.v.]. Their second son was Schomberg Henry Kerr, ninth Marquess of Lothian [q.v.]. He was educated at Radley School from 1851 till 1853, when he joined H.M.S. *Prince Regent* as a naval cadet. During the Baltic operations of the Crimean War, 1854-1855, he served in the *Nephtune* and *Cornwallis* and earned the Baltic medal, being promoted midshipman in August 1855. The next year Kerr was appointed to the *Shannon*, China station. On the outbreak of the Indian Mutiny in 1857 his ship was ordered to Calcutta, and his captain, (Sir) William Peel [q.v.], third son of Sir Robert Peel, the statesman, landed with most of his ship's company as a naval brigade. Kerr served with it throughout the Mutiny, was wounded in an action near Cawnpore, and was given an independent command at the siege and capture of Lucknow. For this service he was specially rated mate for the rest of the *Shannon's* commission, and in the following year served for a few months in the same rank in the *Victoria and Albert*, and was promoted lieutenant in September 1859. In 1860 he was appointed to the *Emerald* for three years' service in the Channel, and in 1864 he went to the *Princess Royal*, flagship on the East Indies and Cape station, for another three years. Kerr was promoted commander in 1868 and served in that rank in the *Hercules*, Channel squadron, until 1871, and afterwards in the *Lord Warden*, Mediterranean flagship, until promotion to captain in November 1872. While in the *Hercules* he was given the silver medal of the Royal Humane Society for jumping overboard from a height of thirty feet into the Tagus in order to rescue a man who had fallen from the rigging.

During his first eleven years on the captains' list, four of which were spent on half-pay, Kerr's principal commands were as flag-captain to Sir Beauchamp Seymour (afterwards Lord Alcester) in the Channel squadron 1874-1877, and in the Mediterranean 1880-1881. In September 1880 he was sent by Seymour, who was in command of the combined fleet of the five naval powers assembled to enforce, under the terms of the Treaty of Berlin, the surrender of Dulcigno to Montenegro by

Turkey, on a special mission to Riza Pasha, the Turkish governor of Albania. He then had a shore appointment as captain of the *Medway* steam reserve until 1885, when Lord George Hamilton [q.v.], on becoming first lord of the Admiralty, appointed him as his naval private secretary.

Kerr retained this appointment at the Admiralty until nearly a year after his promotion to rear-admiral in January 1889. He then hoisted his flag in the *Trafalgar*, as second in command in the Mediterranean until 1892, when he returned to the Admiralty as junior naval lord, the fifth Earl Spencer, on taking office, including him in his Board for the duties of fourth naval lord, although he was actually senior to (Sir) John Fisher [q.v.], who was third naval lord and controller of the navy. In November 1893 he became second naval lord until May 1895, when, having been promoted vice-admiral in the preceding February, he was appointed vice-admiral commanding the Channel squadron, with his flag in the *Majestic*, for two years. In June 1895 he took part with his squadron in the celebration of the opening of the Kiel canal. In May 1899 Mr. Goschen brought him back to his former post on the Board of Admiralty, preparatory to succeeding Sir Frederick Richards [q.v.] as senior naval lord in the following August. He retained the latter office, being promoted admiral in March 1900, and by a special order in council admiral of the fleet in June 1904, until Trafalgar day (21 October) of that year, when Lord Selborne brought Sir John Fisher back from Portsmouth to succeed him. He remained on half-pay until he retired on account of age in September 1909.

Kerr's early promotions made him a senior captain when he came to the Admiralty as private secretary, but although some naval members of the Board were his juniors, he did not presume upon his seniority to take a too prominent part in the administration, while his high rank enabled him to be of good service to the first lord in the course of certain troubles with members of the Board, notably in connexion with the difference between Lord Charles Beresford [q.v.], junior or fourth naval lord, and Sir Arthur Hood, senior or first naval lord. By temperament Kerr was unassuming and not opinionative and therefore got on well with all his colleagues, naval and civilian, while his moderation and judgement ensured respect for his opinions. He was a thorough seaman and

had a great love of the service, and although conservative at heart, he recognized the necessity of advancing with the times. He was not a man to initiate change, but when he recognized its necessity, he at once adopted it and gave it his firm support. His service at the Admiralty as private secretary coincided with the beginning of the shipbuilding activity which continued with only one brief interruption up to the outbreak of war in 1914, and his sound common sense and knowledge of the service were of great help to Lord George Hamilton in carrying out the programme of the Naval Defence Act of 1889. Again, as fourth naval lord and second naval lord from 1892 to 1895, his moderation and firmness were of much help to Lord Spencer, when confronted with Cabinet difficulties in the carrying out of the second shipbuilding programme. Finally, in his last period of service at the Admiralty as senior naval lord from 1899 to 1904, under Lords Goschen and Selborne, he was able to give wise advice in the carrying out of the far-reaching changes in the training and organization of the personnel of the navy, for which Lord Fisher was primarily responsible. He ably held the balance between the exuberance of the reformers and the hostility of their opponents. During Fisher's absence as commander-in-chief at Portsmouth (1903-1904) the carrying out of the new scheme rested largely with Kerr, and it was due to his firmness that things proceeded without a hitch during the interval until Fisher returned as first sea lord himself. Kerr had no share in the changes made in the organization of the fleet in 1905, but it would not have been so easy to make those reforms if he had been less convinced of the necessity of the changes to come. His was not a creative mind, but his character was such that he enjoyed in the highest degree the esteem of his fellow officers and of all who knew him. In Lord George Hamilton's own words, he might well be termed the *Preux Chevalier* of the royal navy. He was created K.C.B. in 1896 and G.C.B. in 1902.

Soon after Kerr entered the navy, his widowed mother became, with her younger children, a Roman Catholic, and Kerr was thenceforth a devoted adherent of that faith. He married in 1873 Lady Amabel Cowper (died 1906), the youngest daughter of George Augustus Frederick, sixth Earl Cowper, and sister of Francis Thomas De Grey, seventh Earl Cowper [q.v.]. They had four sons and two daughters. On the seventh earl's death in 1905, Lady Amabel

succeeded to the properties of Brocket Hall, Hertfordshire, and Melbourne Hall, Derbyshire, and became co-heiress, with Lady Desborough and Lord Lucas, of the barony of Butler. After his retirement, Kerr resided at Melbourne Hall, and died there 12 May 1927. His grandson, Peter Francis Walter (born 1922), is the heir presumptive to the Marquess of Lothian.

A cartoon of Kerr by 'Spy' appeared in *Vanity Fair* 8 November 1900.

[*The Times*, 13 May 1927; Admiralty records; private information; personal knowledge.]
V. W. BADDELEY.

KINGSFORD, CHARLES LETHBRIDGE (1802-1926), historian and topographer, was born at Ludlow 25 December 1802. He was the third son of the Rev. Sampson Kingsford, headmaster of the grammar school there, by his wife, Helen, daughter of William Lethbridge, of Kilworthy, Tavistock. He received his education at Rossall and at St. John's College, Oxford (1881-1886), where he gained a first class in *literae humaniores*, a second class in modern history, and the Arnold essay prize (1888). After a year's experience of sub-editorial work on the *Dictionary of National Biography*, he published a scholarly edition of the *Song of Leves* (1890) and in the same year he became a junior examiner at the Board of Education. Kingsford rose to the position of assistant secretary (1905); but the Education Act of 1902 had led to changes in the office which he found uncongenial. In 1912 he voluntarily resigned and thenceforth devoted his whole time to historical research. No radical change of habits was involved, for the record of his publications between 1890 and 1912 shows how fully the leisure hours of his official life must have been occupied in such studies. He contributed nearly four hundred biographies to this *Dictionary* and more than thirty to the *Encyclopædia Britannica*. At first, his main interests lay in the twelfth, thirteenth, and fourteenth centuries, and in 1894 he published, with T. A. Archer, a volume on *The Crusades: the Story of the Latin Kingdom of Jerusalem*; but his attention was diverted to the last century of the Middle Ages by the task of writing for this *Dictionary* the life of Henry V. The article (1891) was expanded into a book in 1901 (2nd ed. 1923), which was followed by a study of the early biographies of Henry (*English Historical Review*, January 1910) and an edition of the *First English Life of Henry V* (1911).

Kingsford's discovery of the importance of city chronicles for Henry's reign led him into a new and fruitful field of study, that of London history and topography. His edition of three unprinted *Chronicles of London* in 1905 was pioneer work which he and others afterwards carried much further. An important outcome of these investigations was a new edition of John Stow's *Survey of London* (1908), freed from the accretions due to earlier editors and furnished with admirable introduction, notes, and indices. It has placed the study of London history and topography upon a new footing. The first fruit of Kingsford's increased leisure after his retirement from the Board of Education was the expansion of a course of lectures delivered at Oxford in 1910 into a volume on *English Historical Literature in the Fifteenth Century* (1913), an illuminating survey which has no parallel for any other century of English history. The outbreak of war, during which he served first as a special constable and afterwards in the Ministry of Pensions, interrupted most of his historical activities, but he was able to some extent to continue his work on medieval London, and, in another field, he wrote *The Story of the Middlesex Regiment* (1910).

With the return of peace, Kingsford fell to work again. Two volumes of the medieval letters and papers of the Stonor family appeared in the Camden Series of the Royal Historical Society in 1919; *The Story of the Royal Warwickshire Regiment* followed in 1921; in 1923-1924 he delivered the Ford lectures at Oxford, and in 1925, besides printing these as *Prejudice and Promise in Fifteenth-Century England*, an able plea for a fairer estimate of that century of our history, he brought out his most striking contribution to London topography, *The Early History of Piccadilly, Leicester Square, Soho, and their Neighbourhood*. His services to history were recognized in 1924 by his election as a fellow of the British Academy. Meanwhile, he was busy preparing reports on the manuscripts of Lord De L'Isle and Dudley for the Historical Manuscripts Commission, and on those at Madresfield Court for Earl Beauchamp. His contributions to historical periodicals and to the transactions of the many learned societies of which he was a member, and often an officer, make a long list; and one paper at least was in proof at the time of the sudden seizure which ended in his death at his house in Kensington 27 November 1926.

Kingsford married in 1892 Alys, daugh-

ter of Charles Thomas Hudson [q.v.], naturalist. They had no children. He was above the middle height, of sturdy build, and in later years looked 'like a country squire, not a Londoner'. He was rather reserved, but a good friend and colleague, very conscientious in all he undertook, and an exceptionally methodical and accurate worker. Something of this he may have owed to his official training. He had a vein of humour which does not often appear in his books and an occasional causticity of speech to which he seems to have given much freer rein in official circles than in the more congenial surroundings of his later life.

[*The Times*, 20 November 1926; A. G. Little, *Charles Lethbridge Kingsford, 1802-1926*, in *Proceedings of the British Academy*, vol. xii, 1926; E. Jeffries Davis, 'The Work of C. L. Kingsford in London History and Topography' in *The London Topographical Record*, vol. xiv, 1928.] J. TAIT.

KIRK, SIR JOHN (1832-1922), naturalist and administrator, was born at Barry, Forfarshire, 19 December 1832, the second son of the Rev. John Kirk, at that time minister of the parish, by his wife, Christian Carnegie, who was descended from a cadet branch of the Southesk family. From Arbroath high school he passed in 1847 to the university of Edinburgh, where he took his M.D. degree in 1854. After a year as a physician in the Edinburgh Royal Infirmary, Kirk volunteered for the Crimean War and served in the Erenkevi hospital on the Dardanelles (1855-1856), giving his spare time to the study of the botany of Asia Minor. On his return to England in 1857 he gave up the idea of teaching natural history on being appointed to accompany David Livingstone [q.v.], as physician and naturalist, on his second Zambezi expedition. For five years (1858-1863) Kirk was Livingstone's chief assistant and proved an unqualified success. The expedition first explored the Shire valley and highlands, and made the earliest investigation of Lake Nyasa and its surroundings; the Zambezi was then ascended as far as Sasheske, and a thorough examination made of the Victoria Falls. On the return journey Kirk was nearly drowned (November 1860) in the Kebra-basa rapids, and early in 1863 he was attacked by dysentery and ordered home. His botanical collections were considerable and laid the foundations of the *Flora of Tropical Africa* which was published under government auspices 1868-1917.

His experiences turned Kirk's interests definitely towards Africa, and he refused an important post at the Royal Gardens, Kew, in order to accept one as medical officer to the Zanzibar agency in 1866. Later in that year he was made vice-consul, and in 1868 assistant political agent, in 1873 consul-general, and in 1880 political agent.

When Kirk came to Zanzibar the Sayyid or Sultan, fortified by the guarantee of Great Britain and France (1862) of his rights in tropical Africa, saw no reason to interfere with the lucrative slave-trade. Kirk, however, soon gained a position of authority and persuaded the Sayyid that his interests lay in abolishing the trade. Accordingly in 1873 the Sayyid made slavery illegal in his dominions. The prosperity of the coast towns was adversely affected, but Kirk found a partial remedy in the establishment of the East African rubber trade (1878), the outcome of his discovery of the rubber-yielding vine (*Landolphia*). British influence was in the ascendant and Kirk had become virtual ruler of Zanzibar when, in 1885, Friedrich Gerhard Rohlfs, the explorer, arrived as first German consul. Previously Kirk had been consul for Hamburg as well as for Portugal and Italy. Two years later (1887) the German East Africa Company was founded and acquired from native chiefs much of the territory over which the Sayyid claimed nominal authority. Kirk was instructed by the British government to mollify the Sayyid (who had dispatched forces to the disputed territories) and to discourage opposition to German claims. At the same time he checkmated German designs on Zanzibar and, as his crowning work in Africa, was instrumental in persuading the Sayyid to make great concessions from the rest of his mainland territories to the East African Association (1887), which in the next year became the Imperial British East Africa Company.

In 1887 Kirk retired from the consular service but continued to serve the state in several capacities in African affairs. He was British plenipotentiary to the African slave-trade conference at Brussels (1889-1890). In 1895 he was sent to Nigeria to inquire into a dispute, which had resulted in considerable fighting and loss of life, between the Brass natives and the Royal Niger Company; and the subsequent *Report by Sir John Kirk on the Disturbances at Brass* (1896) supplied important information about the country and people. From 1895 he was chairman of the govern-

ment committee for the construction of the Uganda railway, and in 1896 he was appointed to the Royal Society's tsetse fly committee. Kirk's many valuable contributions to the botany and zoology of Zanzibar and East Africa were communicated in various papers to the Linnean, Zoological, and other societies. Several were of an important economic nature, and his experimental garden at Mgweni may be regarded as the precursor of several botanic gardens which have materially helped the economic development of East Africa.

Kirk was awarded the patron's medal of the Royal Geographical Society in 1882, was a vice-president of the society from 1891 to 1894, and foreign secretary from 1894 to 1911. In 1887 he was elected a fellow of the Royal Society and in 1894-1895 he was a vice-president. He was also a vice-president of the Linnean Society 1882-1883. He was awarded the C.M.G. in 1870, and was created K.C.M.G. in 1881, G.C.M.G. in 1886, and K.C.B. in 1890. He received decorations from Portugal and Italy, and was an honorary LL.D. of Edinburgh (1890), Sc.D. of Cambridge (1897), and D.C.L. of Oxford (1898). His name is perpetuated in Nyasaland in the Kirk Range, west of the Shiré river.

Kirk married in 1867 Helen (died 1914), daughter of Charles Cooke, of Ledbury, Herefordshire, and had one son and three daughters. He died 15 January 1922 at Sevenoaks.

A portrait of Kirk by his nephew, A. H. Kirk, hangs in the National Portrait Gallery.

[*The Times*, 16 January 1922; D. Livingstone, *Narrative of an Expedition to the Zambesi and its Tributaries*, 1865; W. G. Blaikie, *Personal Life of David Livingstone*, 1880, 6th edition 1925; R. Coupland, *Kirk on the Zambesi*, 1928; *Geographical Journal*, March 1922; *Proceedings of the Royal Society*, vol. xciv, B, 1923.] R. N. RUDMOSE BROWN.

KIRK, SIR JOHN (1847-1922), philanthropist, the second son of Alfred Kirk, tinsmith and brazier, of Kegworth, Leicestershire, by his wife, Mary, daughter of Harry Wilkins, was born at Kegworth 10 June 1847. He was educated at Castle Donington grammar school, Leicestershire. Part of his boyhood was spent in France, but at the age of sixteen, after his father's death, he went to London and was appointed clerk to the Pure Literature Society.

In 1867 Kirk entered the service of the

Ragged School Union, then housed in 'two rooms and a cupboard' in Exeter Hall, Strand. He acted as evening schools visitor from 1873 to 1879, during which period he was secretary of the Open Air Mission, but in 1879 he was appointed secretary of the Ragged School Union. He thus became closely associated with Antony Ashley Cooper, seventh Earl of Shaftesbury [q.v.], president of the Union from 1844 until his death in 1885. It was largely owing to Kirk's power of adaptation, his gift of seizing opportunities, and his determination, that the Union survived the critical years following the passage of the Education Act of 1870. Thereafter ragged schools were transformed into mission Sunday schools with multiplying activities: country holiday homes, the cripple mission, and clothing guilds were developed.

Kirk was knighted in 1907 and a public testimonial was presented to him at the Mansion House; his title was altered from secretary to director. His jubilee of service was celebrated in 1917, also at the Mansion House, when he took the opportunity of presenting a cheque for £1,000, which he had raised privately, for the establishment of a Shaftesbury Foundation Fund. The same year he delivered the first Shaftesbury lecture, a notable review and forecast of child welfare.

During Kirk's period of service the annual income of the Union increased from £6,000 to £60,000. In 1914 its title, as an incorporated body, was changed to the Shaftesbury Society and Ragged School Union. Kirk resigned the position of director in 1919, but accepted the post of honorary treasurer, which he held until his death, which took place at his home at Westcott, Surrey, 8 April 1922. The freehold quarters of the Society in John Street, Bloomsbury, bear Kirk's name, but the best tribute to his philanthropic career is the great expansion of the work of the Society which he guided for fifty years.

In 1892 Kirk helped (Sir) Cyril Arthur Pearson [q.v.] to start the Pearson 'fresh air fund', and in 1900 he founded the National Federation of Christian Workers among Poor Children.

Kirk travelled widely. He visited the United States and Canada four times, also South Africa, and in 1911 went on a world tour which included America, Australia, and New Zealand. He was a modest man, open-minded, observant, and possessed of a great capacity for the service of others. In religion he was a devout evangelical.

Kirk married in 1872 Elizabeth (died 1934), daughter of George Ayris, of Witney, Oxfordshire, and had four sons and three daughters.

There is a portrait of Kirk by Fred Stratton at John Kirk House.

A. BLACK.

KNOLLYS, FRANCIS, first Viscount **KNOLLYS**, of Caversham (1837-1924), private secretary to King Edward VII, was born in London 16 July 1837, the second son of General Sir William Thomas Knollys [q.v.], by his wife, Elizabeth, daughter of Sir John St. Aubyn, fifth baronet [q.v.]. He was educated in Guernsey, and proceeded in 1851 to the Royal Military College at Sandhurst. Although he received a commission as ensign in the 28th regiment of Foot in 1854, Knollys decided to abandon a military career and to enter the civil service. He became junior examiner in the department of the Commissioners of Audit in 1855. When his father was appointed treasurer and comptroller of the household to Albert Edward, Prince of Wales, in 1862, Knollys helped him with his work, and in 1870 was appointed private secretary to the prince.

The Prince of Wales's interests were very varied, and although he relied on experts to advise him in many matters, it was to his private secretary that he usually turned for information and counsel. He soon found that he could rely on Knollys's sound judgement and carefully considered advice. In cases like the Mordaunt divorce suit (1870), when the Prince of Wales was brought in quite unnecessarily, and the baccarat scandal (1891), which was grossly mishandled at the start, the advantage of having some one with whom he could talk freely, some one who would tell him the whole truth, however unpalatable, was incalculable. Knollys's tact and discretion could always be relied upon, and his knowledge of men, and of the motives which actuated them when they put forward requests, enabled the Prince of Wales to deal successfully with many difficult problems. In 1868 Queen Victoria, in order to show her appreciation of Knollys's services, appointed him gentleman usher in her household. In 1875 he accompanied the Prince of Wales on his Indian tour as private secretary, and was the pivot of a large staff which had been chosen to go with the prince.

When the Prince of Wales ascended the throne as King Edward VII in 1901, Knollys naturally continued to be his private secretary, and was raised to the peerage as Baron Knollys, of Caversham, in 1902. In accordance with tradition, the Prince of Wales had become more and more liberal as Queen Victoria became more and more conservative, but this suited Knollys, as his instincts were wholly liberal. During the reign of King Edward, however, the fact that Knollys was so strong an adherent of the liberal party was the subject of much criticism among conservatives, who considered that the private secretary to the sovereign should be as unbiassed as a civil servant. None the less, his absolute impartiality was recognized by Mr. Balfour, who was prime minister at the beginning of the reign, and by the other ministers of the conservative government.

Knollys was a past master at letter writing, and had the gift of expressing himself concisely without omitting anything of importance. He usually wrote his letters standing up at a high desk and considered a stenographer unnecessary and tiresome, but after King Edward's accession the number of letters and telegrams increased so much that Knollys was forced to dictate most of his answers, although he continued to write all political letters with his own hand up to the end. He was an omnivorous reader, and his grasp of political questions combined with a quaint sense of humour made him a delightful companion. He had a certain contempt for orders and decorations, both British and foreign—a trait in his character which was quite unintelligible to King Edward. He was created K.C.M.G. in 1886, K.C.B. in 1897, G.C.V.O. in 1901, I.S.O. in 1903, G.C.B. in 1908, and received many foreign orders. He was made a privy councillor in 1910, and was advanced to a viscount in 1911.

On the death of King Edward in 1910 Knollys was pressed by King George V to remain as joint private secretary with Lord Stamfordham. This he did for three years, but in 1913 he asked to be allowed to retire. In 1910 he became lord-in-waiting to Queen Alexandra, a purely honorary post which he accepted in order that he might be of some assistance to the queen in her retirement. He died at Rickmansworth 15 August 1924.

Knollys married in 1887 the Hon. Ardyn Mary, daughter of Sir Henry Thomas Tyrwhitt, third baronet, and had

one son, Edward George William Tyrwhitt (born 1895), who succeeded his father as second viscount, and one daughter.

F. E. G. PONSONBY.

KNOTT, RALPH (1878-1920), architect, was born at Whitheads Grove, Chelsea, 3 May 1878. He was the eighth child and youngest son of Samuel Knott, tailor, of Pont Street, London, by his wife, Elizabeth Ann White, formerly of Portland, Dorset. He was educated at the City of London School and later articled to Messrs. Wood & Ainslie, architects, of London. During this period he also studied at the Architectural Association, and was taught etching by Frank Brangwyn, R.A. After the completion of his articles he entered the office of Sir Aston Webb [q.v.] as a draughtsman. Here he gained experience of large architectural work and of architectural competitions, which stood him in good stead later on. Among the latter was the competition for the design of the layout of the Queen Victoria Memorial, for which Knott made many beautiful drawings under Sir Aston Webb's guidance. He was an architectural draughtsman of no mean order and an able water-colourist; he was left-handed and could draw equally well with either hand. In 1908 he entered into partnership with E. Stone Collins; they had offices in Adelphi Terrace.

When in 1908 the London County Council announced a public competition in two stages for the design of the new County Hall on the south side of the river at Westminster, Ralph Knott entered for it and was placed amongst the successful competitors in the first stage. For the second stage some of the most successful architects of the day sent in designs, but Knott, at the age of twenty-nine, won the competition. The building was modified somewhat from his competitive design, which in one respect at least was twenty years ahead of its time; in Knott's design the offices in the cross blocks were planned on both sides of the corridors—an almost universal practice to-day in office building both in England and in America. In the first portion of the County Hall to be built, this arrangement was abandoned, but it was adopted in a modified form in the last section of the building. The outbreak of the European War interrupted the progress of the building, and Knott spent three years of this period in the designing shops of the Royal Air Force. In 1919 on his return to civil life the work on the

County Hall went rapidly forward, and about two-thirds of the building—the centre and one wing—were completed and opened by King George V in 1922. Posterity must be the final judge of this great building; but by contemporaries it is considered to be one of the most successful public buildings of its time, a signal addition to the architecture of London, and not unworthy of the Houses of Parliament on the other side of the river.

From this time to his death, Knott did no work of great importance architecturally, but the vigour of his style can be seen in No. 21 Upper Grosvenor Street; its simplicity and directness of purpose in a delightful little house in Mallord Street, Chelsea, and in commercial work for Messrs. W. T. Henley's Telegraph Works Company at Gravesend. He made the sketch plans for the remaining portions of the County Hall in 1928 and 1929, which were completed by his partner, Mr. E. S. Collins, after his death.

In 1923 Knott was instructed by the British government to design the speaker's residence and the two blocks of departmental offices, forming part of the Parliament Buildings for Northern Ireland at Belfast. (Sir) Arnold Thornely was appointed architect of the Parliament House proper, and Knott's office blocks were to be in the form of two buildings flanking the central Parliament House. Later it was decided that Thornely should re-design the Parliament House in order to include the departmental offices and the Upper and Lower Chambers under one roof. Knott was compensated, and to his great disappointment his agreement terminated.

Knott was elected fellow of the Royal Institute of British Architects in 1921. In 1919 he married Ada, widow of Sidney James Longden, and daughter of Richard Brown. He left no issue. He died 25 January 1929 at West Lodge, East Sheen.

M. E. WEBB.

KNOX, SIR GEORGE EDWARD (1845-1922), Indian civil servant and judge, was born at Madras 14 November 1845, the eldest son and child of the Rev. George Knox (an Irishman who was at that time chaplain in the East India Company's service and afterwards vicar of Exton, Rutland) by his wife, Frances Mary Anne, daughter of Thomas Forbes Reynolds, M.D., of Wallington, Surrey. His younger brother, Edmund Arbuthnot Knox, was bishop of Manchester from 1908

to 1921. He was educated at Merchant Taylors' School, where he laid the foundation of his linguistic attainments by acquiring the rudiments of Hebrew in addition to the usual classical training; and while still at school he became also an evening student at University College, London, where he gained a first prize in Sanskrit. In 1864 he passed the open examination for the Indian civil service; and, continuing a member of University College for his probationary year, again secured a first prize in Sanskrit. He proceeded to India in the autumn of 1865 and was almost the last member of the Indian civil service to be posted for further study to Fort William College, Calcutta—a course which, in his case, proved to be abundantly justified. In eighteen months, in addition to the usual examination in Hindi, he passed the high proficiency tests both in Urdu and Sanskrit. Urdu he spoke and read throughout his career with fluency and ease. He also acquired a knowledge of Persian, and learned Arabic sufficiently well to be able to consult the classical authorities of Mohammedan law in the original texts. The latter accomplishment is exceptional for English and even for Indian judges, and combined with proficiency in Sanskrit law texts almost unique.

On completing his training in 1867 Knox was posted to Meerut, and for nearly ten years carried out the ordinary duties of an executive officer. In 1877 he joined the judicial department as judge of the small causes court at Allahabad, a post which provides valuable insight into the details of the daily life of humble folk. After two years he began to hold posts as district and sessions judge, involving responsibilities which correspond roughly with those of a high court judge in England. In 1885 he was chosen legal remembrancer to the local government of the North-Western Provinces and Oudh, a post which combined the functions of principal law officer and draftsman, and carried with it a seat in the local legislature. In 1890 Knox was appointed a judge of the high court of judicature at Allahabad; and, as at the time of his appointment there was no retiring limit for judges appointed to the high courts from the Indian civil service, he continued on the bench for the next thirty years, acting as chief justice on no less than thirteen different occasions. He received a knighthood in 1908. Failing health compelled him to take long leave in January 1921; and while still on leave he died,

20 July 1922, at Naini Tal, the official hill station of the United Provinces.

Long before his death, Knox had become an almost legendary figure. In fifty-six years' service he had only taken one day's furlough, and that through an accident for which he was not responsible; he served for longer than any other civil servant since the time of John Company and was senior by over a quarter of a century to the next member of the service on the active list in the United Provinces. His patriarchal appearance and long white beard were in keeping with the fact that he had a son and a grandson on the active list of the service in his own province. But he was much more than a picturesque figure: his legal, no less than his linguistic, equipment for judicial office was outstanding; and his great experience was always ready to the need of the moment. Even more noteworthy was his industry: as a junior officer he had edited a number of legal works, and during the greater part of his time in the high court he not only dealt with a volume of judicial work equal to if not larger than that of any of his colleagues, but also had the supervision and control of the subordinate judiciary and establishments in some forty districts. His complete independence of official translators contributed greatly to the dispatch of business. He also took an active interest in the affairs of Allahabad University, serving the office of vice-chancellor on more than one occasion. His services were recognized by the honorary degree of LL.D.

Knox was a devout churchman of the evangelical school. He gave generously both time and money to missionary, educational, and other activities of the Church; and, if his rigid sabbatarianism occasionally involved him in controversy, it in no way diminished the respect in which he was universally held. To the bar in general and specially to its Indian members he was endeared by his unflinching courtesy and patience on the bench.

Knox married in 1868 Katharine Anne Louise, younger daughter of Major William Loch, 1st Bombay Lancers. She survived him with five sons and two daughters. Four of his sons attained distinction in the Indian services.

S. V. FITZGERALD.

LAMBOURNE, first BARON (1847-1928), politician. [See LOCKWOOD, AMELIUS MARK RICHARD.]

LANE, JOHN (1854-1925), publisher, born 14 March 1854 at West Putford, Devon, was the only son of Lewis Lane, yeoman, by his wife, Mary Grace, daughter of John Jenn, miller and corn merchant, of Cory Mill, in the same parish. He went first to the national school at Hartland, whither his family had removed when he was three years old, and was afterwards sent to a school at Chulmleigh, near South Molton. In 1869 he was appointed to a junior clerkship in the Railway Clearing House. He is described by one of those who knew him in his earliest London days as shy, rustic in appearance, and speaking with a strong Devonshire accent. These characteristics he exchanged in time for a debonair exterior and a very urbane manner.

During the eighteen years that Lane was forced to spend in the Railway Clearing House, the idea of becoming a publisher was slowly taking shape in his mind. It was not, however, until 1887 that, having chanced upon suitable premises in Vigo Street, Piccadilly, he began business in association with Elkin Mathews, an antiquarian bookseller from Exeter. Lane was a born antiquary, and his passion for collecting books, prints, china, glass, samplers, fans, pewter, pictures—in short any and every historical relic that came to his hand—won him a number of friends among persons of similar tastes. When, therefore, he set up in business, first as a vendor of rare editions, and, soon afterwards, as a publisher, he had a clientèle ready to his hand.

Appropriately enough, the name of Sir Thomas Bodley, one of the most illustrious of Devonians, was chosen as the tutelary genius of the business. In 1889 appeared the first book under the imprint of the 'Bodley Head'; this was *Volumes in Folio* by Richard Le Gallienne. From this modest beginning, in a tiny office, with an absurdly small capital, most of it borrowed, sprang a publishing house which soon became well known. Almost at once, indeed, the new firm gained a high reputation, not only for the quality of its publications, but also for the taste and elegance with which they were produced. In no long time the Bodley Head became a favourite haunt of the Muses, 'a nest of singing birds'. Among the poets whose work appeared under its imprint were

William Watson, John Davidson, Francis Thompson, Ernest Dowson, and Richard Le Gallienne. If the artist in John Lane had cause for pride in being the means of giving good poetry to the world, the man-of-business in him had no less reason to be contented, because the poetry paid.

No publishing house ever took on a more personal and intimate character than the Bodley Head. It was, in fact, much more like a club than a place of business; and to a degree that no other firm could rival, it became the centre of that extraordinary ferment in art and letters which is associated with the 'nineties. Writers and artists offering the strongest contrasts in character and aim were found equally patient of Lane's yoke. This result Lane achieved largely by means of *The Yellow Book*, an illustrated quarterly into which all his flock—poets, essayists, dramatists, story-tellers, artists—poured their multifarious, and often startling, contributions. The literary contents of the new periodical were under the control of Henry Harland [q.v.]; while for its artistic side Aubrey Beardsley [q.v.] was responsible. Among the most noted writers who contributed to *The Yellow Book* were Max Beerholm, John Davidson, 'Baron Corvo', Ernest Dowson, (Sir) Edmund Gosse [q.v.], Kenneth Grahame, Henry James, Richard Le Gallienne, Anatole France, George Moore, George Saintsbury, Maurice Baring, (Sir) William Watson, Netta Syrett, Ella D'Arcy, and Arthur Waugh. Its artists included (Lord) Leighton, Joseph Pennell, (Sir) William Rothenstein, R. Anning Bell, D. Y. Cameron, Walter Sickert, C. W. Furse, P. Wilson Steer, and, of course, Aubrey Beardsley. When, after the fourth number, Beardsley gave up the post of art-editor, Lane himself took it over. *The Yellow Book* lasted a little over three years, the first number appearing in April 1894 and the last in April 1897.

The seven years' partnership with Elkin Mathews came to an end in 1894 and, taking with him the sign of the Bodley Head and most of the young poets and artists who had gathered around it, Lane moved across Vigo Street to The Albany where, with undiminished ardour and success, he continued his search for new, distinguished, and sometimes daring, writers and artists. One of his achievements was the collected edition of the works of Anatole France in English. Another name indissolubly associated with the firm is that of William John Locke [q.v.], some thirty of whose novels appeared under its imprint.

As early as 1896 Lane opened a branch of his business in the United States, the John Lane Company of New York, which endured with varying success until the spring of 1922 when, chiefly owing to the difficulties arising from the tariff on imported books, he brought it to an end. Before that, in the spring of 1921, Lane had converted his London business into a private limited liability company.

If anything exceeded Lane's antiquarian and artistic ardour, it was his passionate love of his native county, Devon, and particularly of Hartland, the home of his childhood. When, therefore, he succumbed to an attack of pneumonia at his London house 2 February 1925, it was fitting that Hartland should receive his remains, and there, on the seaward side of the church of St. Nectan, his ashes repose.

Lane married in 1898 Annie, daughter of Julius Eichberg, director of the conservatory of Music at Boston, U.S.A., and widow of Tyler Batcheller King, LL.D., of Boston. They had no children. Mrs. John Lane who, as a girl of sixteen, wrote the words of the American national hymn 'To Thee, O Country', for music composed by her father, was the author of *The Champagne Standard, According to Maria*, and several other books published by the Bodley Head, to which she also acted as an unofficial literary adviser.

[Holbrook Jackson, *The Eighteen Nineties*, 1913; Osbert Burdett, *The Beardsley Period*, 1925; personal knowledge.]

J. LEWIS MAY.

LANGLEY, JOHN NEWPORT (1852-1925), physiologist, was born at Newbury 2 November 1852, the second son of John Langley, a private schoolmaster there, by his wife, Mary, eldest daughter of Richard Groom. He was educated first at home, and later at Exeter grammar school, where his uncle by marriage, the Rev. Henry Newport, was headmaster. In October 1871 he proceeded with a sizarship to St. John's College, Cambridge, where he was subsequently awarded a scholarship. He was reading mathematics and history with a view to entering the Indian civil service when, late in his second year at Cambridge, he began, under the tuition of (Sir) Michael Foster [q.v.], praelector of physiology at Trinity College, a course in biology. Attracted by that subject and by its teacher, Langley relinquished mathematics and history, and began to read for the natural sciences tripos, in which he gained a first

class in 1874. In the following year Foster appointed him a demonstrator in succession to H. Newell Martin. In 1877 he was elected to an open fellowship at Trinity College. He resided at Trinity until his marriage in 1902.

At Foster's suggestion, Langley began experimental research even before taking his degree. Foster had handed him a new drug, pilocarpine, to examine; its action as tested on the frog's heart formed Langley's earliest subject of research. The work was published in the newly started 'Papers from the Cambridge Physiological Laboratory' along with contributions by a group of young researchers, most of whom became well known, and with most of whom Langley formed enduring friendships. They included F. M. Balfour, Milnes Marshall, S. H. Vines, W. H. Gaskell, and James Ward.

The course of his work on pilocarpine led Langley to the study of secretion. He passed from the frog's heart to the mammalian salivary glands. It was characteristic of him to seek a field where with skilled technique he could hope to deal quantitatively with fundamental factors. He found that the new drug exerted a specific influence on the secretory process. He took this reaction as the point of departure for a study of secretion in general; he followed it with a precision which had never before been approached. He soon showed that the accepted view, based on statements made by Rudolf Heidenhain, of Breslau, that gland-cells become more granular as secretion proceeds, is actually the reverse of what obtains. He demonstrated that the secretory granules accumulate when the gland is not secreting, and when secretion ensues the granules are discharged from the cell. Along with strictly quantitative secretory experiments he conducted careful microscopical examination of the gland-cells which were actually under experiment. He further checked his microscopical observations of the 'fixed' and 'stained' gland-cells by observations on the living cells themselves, sampled from the glands at various stages of experiment. Langley investigated also the nervous influence exerted on the gland-cells; he distinguished between the 'loaded' and the 'exhausted' states of the gland. He showed that the belief in the existence of specific 'trophic' nerve-fibres for the salivary glands rested on evidence which could be explained by vascular effects concurrently produced in the local blood-circulation. Besides the fundamental in-

formation his papers furnished, the form and style in which the papers themselves were cast were generally recognized as setting an exceptionally high standard of effectiveness, clearness, and precision of statement, with absolute freedom from all merely speculative argument.

Langley's systematic exploration of the secretory process occupied the first fifteen years of his career in research. In 1884 he was appointed a lecturer at Trinity College, and the same year university lecturer in histology. He was thus confirmed, both in college and university, as assistant to Foster who, in 1883, had been appointed professor of physiology. In 1900 Langley became deputy to Foster, and in 1903 succeeded him in the professorship. He wrote the notice of Foster for this *Dictionary*. As far back as 1878 Foster had founded the *Journal of Physiology*, in order to supply a medium for publication of English and American research in what was already a rapidly growing study. This *Journal* had established its reputation, but it did not pay its way. It was saddled with a very extensive free-list to professors and laboratories on the continent of Europe. By 1894, it had become greatly embarrassed by running expenses and by debt; it seemed doomed to extinction. Langley then came forward, and arranged to pay off the very considerable debt and to receive the unsold stock. Thenceforward until his death he both owned and edited the *Journal*, though Foster's name was retained upon the cover during Foster's lifetime. This taking over of the *Journal* by Langley proved a decisive event not only for the *Journal* itself but indeed for British physiology. Langley saw to it that every paper issued in his *Journal* made not only a solid contribution to knowledge, but maintained the standard of form and style desired, saying what it had to say with succinctness, perfect lucidity, and a minimum of speculative discussion. He would, where he judged fit, almost entirely recast a paper, even of a distinguished contributor. He shrank from no labour or difficulty in that respect. His strictness annoyed many of his collaborators; some it alienated altogether. Many, however, came ultimately to recognize his assistance with gratitude. He declined unalterably any published acknowledgement of the unselfish labour which he thus put upon himself. In the course of time not only the English-speaking world but the international scientific world came to recognize

that in doing what he did he was accomplishing a reform and setting a pattern in the presentation of scientific work which soon proved a boon to every reader wherever such literature was used. To-day it is generally felt that the diffuse publications of Central Europe must eventually follow the example which he set, and attain greater intelligibility and lessened monetary charge to their subscribers.

As an investigator, the climax of Langley's achievement was perhaps his research (1890-1906) into the sympathetic nervous system. William Henry Gaskell [q.v.], likewise working in Foster's laboratory, had in the preceding decade shown that that system is wholly of spinal origin, and with unexpectedly restricted spinal segmental connexions. Langley carried this analytic inquiry further. Proceeding from the discovery, made by himself and his pupil, W. Lee Dickinson, in 1889, that nicotine 'paralyses' the nerve-cells in sympathetic ganglia, he used that procedure as a method, and subjected the whole of the sympathetic ganglionic system to exhaustive analysis, determining for each ganglion whence its paths come and whither they lead. Previously the belief had been that sympathetic nerve-paths vary greatly, and differ greatly between themselves; thus that some have one and some many nerve-cells intercalated along their course. Langley made clear that in the sympathetic from its spinal to its distal goal, wherever this latter be, whether in muscle, gland, or other peripheral tissue, one nerve-cell and one only is interposed in each and every path. Each ganglion forms the one and only relay station for the fibres interrupted there. Langley showed further that the sympathetic ganglia belong entirely to efferent paths. It became clear, therefore, that the pain so common and formidable an accompaniment of visceral disease, is not due to the ganglia, predominantly visceral though they are. It had been thought that the true reflex actions could be obtained from sympathetic ganglia, but Langley showed that spread of conduction along merely branched nerve-fibres (axon-reflexes) would explain the seemingly reflex phenomena. Indeed, the functional anatomy of a portion of the nervous system, knowledge of which had previously been a sheer confusion of obscurities and mistakes, he left perhaps the most clearly elucidated in the body, so simple indeed that the smallest text-book, after he had made his

investigation, provided the student with a key diagram of its arrangement. This work will always remain a landmark in the history of physiology. Of it Langley furnished an excellent summary in 1901 for (Sir) E. A. Sharpey-Schafer's *Advanced Text-book of Physiology*, vol. ii.

In 1907 Langley turned to another field, there again using the selective action of drugs as a means of analysis. He noticed that adrenaline stimulates the cells of the sympathetic after degeneration of the spinal fibre which conveys to them their normal stimulation. He found that the same holds good for nicotine. Nicotine causes also a local contraction of muscle which has its seat at the point of nerve-entry into the muscle-fibre; this local contraction is prevented by curari. Langley inferred from observations of this kind that the mechanism of excitation of one cell by another consists in a locally developed 'receptive' substance which sensitizes the cell for the stimulus which it receives from the cell to which it reacts. The cells of different tissues he supposed to have different and specific 'receptive' substances.

This work was interrupted by the outbreak of the European War in 1914. Earlier in that year, owing to the generosity of the Drapers' Company, a fine new physiological laboratory had been completed from designs by Sir Thomas Graham Jackson [q.v.] in consultation with Langley. The War at once depleted it of staff and students. Langley therefore directed the energies of its remaining workers into channels of direct value for medical application in time of war. He was himself sixty-two years of age, but he performed service of national importance by collaborating with foreign visitors to his laboratory, mainly Japanese, in investigations especially connected with the trophic changes ensuing in muscle and nerve from traumatic injury and during recovery from such injury.

When the War was over Langley quickly returned to his former routine of research and teaching. His reputation had for many years past attracted to Cambridge young men who wished to work at physiology, and his school now grew larger than ever. The results of his later research were collected in his *Autonomic Nervous System*, Part I (1921); no further Part appeared. As for himself, the progress of years seemed to affect but little his well-knit frame and brisk, athletic step. His personal touch with his students and

junior staff did, however, perhaps grow less constant. At the beginning of November 1925 he was apparently in his usual health, when he was suddenly attacked by pneumonia, which in a few days proved fatal. He died at his home at Cambridge 5 November.

Langley married in 1902 Vera Kathleen (died 1932), daughter of Frederick G. Forsythe-Grant, of Ecclesgreig, Kincardineshire, and had one daughter. From his marriage onward he lived at Hedgerley Lodge, a house just outside Cambridge in the direction of Madingley. All his life he had a keen interest in outdoor games. With years he passed from rowing to lawn-tennis, from lawn-tennis to gardening. He had been a first-rate skater. Physically, he was of middle stature, and his steel-blue eyes, habitually rather widely opened, lent an arresting trait to his regular-featured face otherwise chiefly remarkable for its firmness. He showed considerable power as a hypnotist, when, for a time, the subject of mesmerism had engaged his attention.

Langley was elected a fellow of the Royal Society in 1883, was vice-president in 1904-1905, delivered the Croonian lecture in 1906, and received the royal medal of the Society in 1892. He was president of the Neurological Society of Great Britain in 1893, and of the physiological section of the British Association in 1899. He was awarded the Baly medal of the Royal College of Physicians in 1903, and the Andreas Retzius medal of the Swedish Society of Physicians in 1912. Among the other honours which he received were honorary degrees from several British and foreign universities.

During Langley's tenure of the chair of physiology at Cambridge his school was remarkably productive of physiologists of distinction, several of whose names already find place in this Dictionary. His own direct influence as a teacher was, however, largely confined to those whom he met in the research rooms; in the lecture room he was less effective. His accuracy in experimental observation, his scrupulous fidelity of statement, and the untiring pains which he took to obtain objective data were a byword not only in his own laboratory, but wherever physiology was studied. He was a member of the international committee of the International Congresses of Physiology from 1904 until the outbreak of the War. His name is ensured a lasting place in the annals of experimental biology; the *Journal to*

whose development, character, and practical success he gave so much time and care, bears the lasting impress of his public-spirited devotion and of his fearless service in the cause of an ideal.

[*The Times*, 6 November 1925; *Proceedings of the Royal Society*, vol. ci, B, 1926 (portrait); personal knowledge.]

C. S. SHERRINGTON.

LANKESTER, SIR EDWIN RAY (1847-1929), zoologist, was born at 22 Old Burlington Street, London, 15 May 1847, the eldest son of Dr. Edwin Lankester [q.v.] by his wife, Phebe, eldest daughter of Samuel Pope, of Highbury (formerly a mill-owner in Manchester), and sister of Samuel Pope [q.v.], barrister. His father, a physician and coroner for Central Middlesex, was a scientist of distinction, particularly interested in microscopy, and one of the founders and editors of the *Quarterly Journal of Microscopical Science*; his mother was an accomplished writer on wild flowers. Lankester's boyhood was spent at home, where he met Darwin, Huxley, and other eminent men of the day. Educated at St. Paul's School, he obtained a scholarship at Downing College, Cambridge, at the age of seventeen; but migrated in his second year to Oxford, where Professor George Rolleston [q.v.] was giving courses of lectures and practical work in zoology in the newly built University Museum. Having entered Christ Church as a junior student (1866) Lankester gained a first class in the honour school of natural science (1868), the Burdett Coutts scholarship in geology (1869), and the Radcliffe travelling fellowship (1870). He then visited Vienna and Leipzig, and studied marine zoology in Naples (1871-1872). There he met Anton Dohrn, the founder of the Stazione Zoologica, in which famous laboratory he and Francis Maitland Balfour [q.v.] were among the first students to work. Returning to Oxford in 1872 Lankester became a fellow and tutor at Exeter College. In 1874 he was appointed to the Jodrell chair of zoology at University College, London, and in 1875 he was elected F.R.S. In 1882 he accepted the regius professorship of natural history at Edinburgh University; but, finding the conditions of the appointment to be other than he supposed, he resigned in a fortnight and returned to University College. There he remained until 1891, when he succeeded his friend Henry Nottidge Moseley [q.v.] in the Linaere chair of comparative anatomy at Oxford, to which

a fellowship at Merton College was attached.

At Oxford Lankester took great interest in the reorganization of the zoological exhibits in the University Museum, and he made good use of his experience when, in 1898, he was appointed director of the natural history departments and keeper of zoology in the British Museum, South Kensington. In the same year he was appointed Fullerian professor of physiology and comparative anatomy in the Royal Institution—a post which he held until 1900. On his retirement from his posts at the British Museum at the age of sixty he was created K.C.B. (1907). He was awarded the royal medal of the Royal Society in 1885, the Copley medal in 1913, and the Darwin-Wallace medal of the Linnean Society in 1908, and he received numerous honours from other societies at home and abroad. He was vice-president of the Royal Society in 1882 and 1896, and in 1906 presided over the meeting of the British Association at York. He was elected an honorary fellow of Exeter College in 1889 and an honorary student of Christ Church in 1912.

Endowed with a powerful intellect and a commanding presence, Lankester soon became recognized as the leading British authority in zoology. He had a great love for the wonders and beauties of nature, a knowledge ranging over the whole field of biology, an insatiable scientific curiosity which lasted to the very end of his life. A keen observer, a skilful manipulator, he was also a great teacher and master of exposition, who could rouse the interest and stir the imagination of his hearers. Pupils and colleagues owed much to his help and advice in research. He was a quick worker and prolific writer. Some two hundred scientific papers stand to his credit—most of them short, written without waste of words, and often admirably illustrated by his own hand. He was no specialist; his researches extended over almost every group of the animal kingdom; but it was as a morphologist that he gained most distinction. His first publication was a letter on *Pteraspis* (*The Geologist*, 1862), one of the remarkable group of early fossil fishes on which he later wrote a classical monograph (*Proceedings of the Palaeontological Society*, 1868-1870). He was no more than a schoolboy when he began writing on the earthworm (1863), and later he made important contributions to the knowledge of other Oligochaeta, the Mollusca and the

Arthropoda. These and other studies helped much towards the understanding of the general morphology and phylogenetic relationships of the Invertebrata. More particularly did they explain the nature of the body cavities in animals, and the distinction between the coelom in worms and vertebrates and the enlarged blood-space, or haemocoel, in Mollusca and Arthropoda; also the unique structure of the heart, and the segmental nature of the head and brain in arthropods.

Lankester's famous memoir on 'Limulus an Arachnid' (*Quarterly Journal of Microscopical Science*, new series, vol. xxi, 1881) not only proved that remarkable animal, the king crab, to be closely allied to the scorpion, but permanently removed it from the class Crustacea in which it had previously been placed. His pioneer researches on the embryology of the Mollusca led to the publication of two important essays, *The Primitive Cell-layers of the Embryo* (1873) and *Notes on the Embryology and Classification of the Animal Kingdom* (1877), which have had a lasting influence on the science of embryology. It was in these essays that he introduced many new terms, such as 'invagination', 'nephridium', 'blastopore', 'stomodaeum', 'proctodaeum', which have since been universally adopted.

The Protozoa had a great fascination for one so devoted to the microscope. Lankester was among the first, in 1871, to describe protozoan parasites in the blood of vertebrates. These early researches, and C. L. Laveran's later discovery of the malarial parasite in man, led to a great advance in the knowledge of the cause and prevention of disease. Both at home and abroad Lankester did much to encourage the study of this important branch of parasitology. He also worked on various interesting bacteria, and put forth a theory of 'pleomorphism', maintaining that various cocci, bacilli, and vibrios, may be but form-phases of the same protean species found under different conditions. Another line of microscopical research dealt with the corpuscles or cells which float in the blood and other fluids of animals, and with the respiratory and other pigments of invertebrates.

Of Lankester's later works on vertebrates may be mentioned papers on Lepidosiren, Okapia, the heart of various fishes, and more particularly on Amphioxus; while of a more general character were his essays *On Comparative Longevity in Man and the Lower Animals* (1870), *On the use*

of the term Homology (1870), *Degeneration; a chapter in Darwinism* (published 1880, reprinted in *The Advancement of Science*, 1890), and a letter on Lamarckism (*Nature*, 1894); all these were contributions of value, remarkable for common sense and sound judgement. Scientific imagination and penetrating insight distinguished all his work: for speculation remote from facts he had no liking.

So early as 1865 Lankester wrote on the brain of the monkey, *semnopithecus*, and later (1899) on *The Significance of the increased size of the Cerebrum in Recent as compared with Extinct Animals* (Jubilee volume of the Société de Biologie, Paris), pointing out the importance of inherited educability as opposed to acquired responses in the evolution of man, a theme which he developed further in the Romanes lecture which he delivered in Oxford in 1905. In his later years he became keenly interested in pre-history and the flint implements of the Pliocene age. It was greatly due to his influence that the rough 'rostrum-carinate' implements were accepted as artifacts by many archaeologists. To the ninth edition of the *Encyclopædia Britannica* he contributed masterly articles on Protozoa, Hydrozoa, Mollusca, Polyzoa, and Vertebrata; in the tenth edition he wrote on Arachnida and Arthropoda, and in the eleventh the article on zoology. He was the author of interesting introductions to parts I and II of *A Treatise on Zoology* (1900-1909), of which he was general editor, while among his more popular writings may be mentioned *Extinct Animals* (1905), *The Kingdom of Man* (1907), *Science from an Easy Chair* (1910), and *Great and Small Things* (1923).

From 1869 to 1878 Lankester was joint-editor with his father of the *Quarterly Journal of Microscopical Science*. Under his sole editorship from 1878 to 1920 it became the leading British journal of zoology and acquired a world-wide reputation.

Among the great services rendered by Lankester to zoological science must be mentioned the founding of the Marine Biological Association in 1884. It was greatly owing to him that the necessary funds were raised for erecting its laboratory at Plymouth, and that the undertaking became an institution of national importance to which the government contributed its support. For long, as its president, Lankester took an active interest in the welfare of the Association, and helped to raise its laboratory to the position which

it now holds as a centre of zoological research.

Lankester received the honorary degree of D.Sc. from the universities of Oxford and Leeds, and the honorary LL.D. degree from the university of St. Andrews. He died in London 15 August 1929. There is a portrait of him by Sir William Orpen at Messrs. Knoedler's, 15 Old Bond Street, London. A cartoon of him by 'Spy' appeared in *Vanity Fair* 12 January 1905. He was unmarried.

Lankester was a man of strong feelings which he did not hesitate to express. Any form of sham, fraud, or injustice roused his anger. As an instance may be given his ruthless exposure of the fashionable medium Slade in 1876. Though generally in the right, his impetuous temperament sometimes led him into regrettable quarrels and difficulties. He had many interests, artistic and literary as well as scientific, and could talk well on almost any subject. His tall and massive frame, his mobile expressive face, his deep booming voice made up a vivid and impressive personality. Eager, direct, humorous and sympathetic in conversation, sociable in habit, steadfast in friendship, he possessed a personal charm which endeared him to a wide circle of friends at home and abroad.

[*The Times*, 16 August 1929; *Proceedings of the Royal Society*, vol. cvi, B, 1930 (portrait); *Nature*, 24 August 1929; *Journal of the Marine Biological Association*, vol. xvi, 1930; *Journal of the Royal Microscopical Society*, vol. xxxix, 1929; *Quarterly Journal of Microscopical Science*, vol. lxxiv, 1931.] E. S. GOODRICH.

LANSDOWNE, fifth MARQUESS OF (1845-1927). [See PETTY-FITZMAURICE, HENRY CHARLES KEITH.]

LAW, ANDREW BONAR (1858-1928), statesman, born 16 September 1858 at Kingston, near Richibucto, New Brunswick, Canada, was the first man of colonial birth to become prime minister of Great Britain. His father, the Rev. James Law, a Presbyterian minister, was an Ulsterman who came of farming stock from the neighbourhood of Portrush. His mother, a native of Halifax, Nova Scotia, was Elizabeth, daughter of William Kidston, a Glasgow iron-merchant. They had four sons, of whom Bonar was the youngest, and one daughter. The manse was a lonely wooden farm-house, four or five miles above the mouth of the Richibucto river. The Sunday congregation consisted of

settlers drawn largely from Dumfries and Galloway. The pastor was a man of intellectual gifts and an eloquent preacher. But he was the victim of a brooding melancholy which increased as the years advanced, and the memory of this affliction sometimes depressed his youngest son and made him fear a similar fate. Bonar Law's mother died when he was two years old, and in his twelfth year he was brought by an aunt from Canada to Scotland. He now found himself in affluent surroundings, but the lessons of his simple home, where the tasks of the kitchen and the farm were shared by all, were not lost upon him. After a short period at Gilbertfield School, Hamilton, he was sent to Glasgow high school, where James Bryce and Henry Campbell-Bannerman had been educated a few years earlier. He had a quick and energetic mind, but neither there nor at lectures which he attended later at the university, did he show unusual promise. He was an omnivorous reader, and delighted in recalling the fact that before he was twenty-one he had read Gibbon's *Decline and Fall of the Roman Empire* three times. But undoubtedly the author who gripped him at this period was Thomas Carlyle, from whose pages he later drew the literary quotations with which he occasionally graced his political speeches: his favourite quotations were figures from blue books.

Bonar Law's relatives, William, Richard, and Charles Kidston, were partners in a Glasgow firm of merchant bankers. Their business had been mainly concerned with financing trade in iron and steel, but at this time they were in the autumn of their commercial careers, nursing their investments rather than actively trading with them. From these conservative cousins he imbibed his earliest political impressions, including dislike of Mr. Gladstone and admiration of Mr. Disraeli. At the age of sixteen he entered the family business and had leisure and means to visit France, Germany, and Italy, to learn to read French and German, and to speak French. His speech in French, as in English, betrayed his ancestry and upbringing. In 1885, at the age of twenty-eight, he joined the Glasgow firm of William Jacks & Co., iron-merchants, as a junior partner. The business of the Kidstons was merged in the Clydesdale Bank, of which, later, Bonar Law became a director. Other directorships and the chairmanship of the Glasgow Iron Trade Association followed. He lived with the Kidstons at Helensburgh and there met

Annie Pitcairn, daughter of Harrington Robley, of Glasgow, whom he married in 1891, and by whom he had four sons and two daughters. He continued after his marriage to travel daily between Helensburgh and Glasgow.

When about twenty years of age Bonar Law had joined the Glasgow Parliamentary Debating Association, the procedure of which was closely modelled on that of the House of Commons. As member for 'North Staffordshire' of this local 'parliament' for many years, he rehearsed his later triumphs as a debater and made himself thoroughly familiar with parliamentary procedure. It is probable that during these debates was born the ambition to exchange the local for the national forum, and the way was made possible not only by such means as he acquired in business, but also by the receipt of two legacies of £30,000 each, from Miss Catherine Kidston and Mrs. Janet Kidston, the childless widow of Charles Kidston. The abilities which he displayed at the Debating Association impressed officials of the Conservative and Liberal Unionist Associations, and in 1898 he was adopted as their candidate for the Blackfriars and Hutchesontown division of Glasgow. It was and had long been a radical seat, but in the general election of 1900 the liberal candidate deserted his party on the question of Home Rule. The Irish voters preferred to support the unionist, and with their help Bonar Law was returned by a majority of 1,000 and entered parliament at the age of forty-two.

In February 1901, in a debate on the Address, Bonar Law delivered his maiden speech—a defence of Joseph Chamberlain and Cecil Rhodes, who had been attacked on the previous day by Mr. Lloyd George. It was ignored by the press, which was more interested in the maiden speech made during the same sitting by Mr. Winston Churchill. The speech which singled out Bonar Law for special notice by the government was made on 22 April 1902 in favour of the corn duty proposed by the chancellor of the Exchequer (Sir Michael Hicks Beach). This speech was widely praised, and led to Bonar Law's appointment as parliamentary secretary to the Board of Trade, after a parliamentary apprenticeship of barely eighteen months. He soon distinguished himself in a twenty-minutes' speech on the Sugar Bounty Convention, the colonial secretary (Mr. Chamberlain) describing it as 'one of the most admirable short speeches he had

ever listened to in the House of Commons'. These early speeches were closely reasoned and delivered without notes, but they were marred by a too rapid delivery. Their strength lay in the speaker's familiarity with the intricacies of imperial and foreign trade, and it was these matters which were to become in the immediate future the warp and woof of party warfare. In May 1903 Chamberlain launched his scheme of colonial preference and tariff reform. Nothing could have better suited the retired Glasgow iron-merchant, and he advanced steadily to the front rank of the exponents of the new policy. On 16 September 1903 Chamberlain resigned from Mr. Balfour's administration in order to be free to carry on his campaign in the country. This and the simultaneous resignation of free-trade ministers weakened the government, and in the general election of January 1906 it suffered overwhelming defeat. The conservative party was reduced to 157 members, who were divided into Balfourites, Chamberlainites, and unionist 'free-fooders'. At Blackfriars (Glasgow) Bonar Law was defeated by Mr. G. N. Barnes, a labour candidate, but on 15 May 1906 he was returned for Dulwich at a by-election. In the summer of 1906 Chamberlain's health broke down. Balfour's attitude to tariff reform, however clear to himself, was incomprehensible to the multitude. Bonar Law, on the other hand, was sure of himself and his utterances bore no trace of philosophic doubt. He was a merchant. He and Mr. Austen Chamberlain were now recognized as the most effective advocates of fiscal change in the unionist party. Bonar Law delivered innumerable speeches on the one subject, buttressed by an array of statistics which impressed those less skilful in their use.

The mantle of Joseph Chamberlain, now aged seventy, passed quietly to Bonar Law. Their careers were similar. Both were metal merchants, who entered parliament in middle age after succeeding in business; both found office at the Board of Trade; both were fighting men and effective speakers in and outside the House of Commons; both were ardent advocates of imperial preference. In origin and outlook they were both middle class. Neither belonged to the Church of England.

On 29 April 1909 Mr. Lloyd George, as chancellor of the Exchequer, made his first budget statement. Bonar Law denounced it as socialism 'pure and unadulterated'. Nor was he enamoured of the chancellor's schemes for health and unemployment in-

insurance. 'It was the success of tariff reform,' he argued, 'which had made the German insurance system possible.' Also he would have made the scheme for old age pensions contributory. The struggle over the budget had been preceded by a demand on the part of the conservatives for the construction of battleships of the *Dreadnought* class in reply to the German naval programme. Throughout this and the following year party feeling ran high. Joseph Chamberlain, from his retirement, declared that the fate of the budget involved the fate of tariff reform, and called upon the House of Lords to reject the measure. The Lords did so, and on 1 December Mr. Asquith moved that the action of the House of Lords was a usurpation of the rights of the Commons.

At the general election which followed, in January 1910, Bonar Law was again returned for Dulwich, but at that of December 1910, at the bidding of his party, he gave up a safe seat and essayed to win North-West Manchester. This fight aroused intense interest, as the seat had been wrested from Mr. Winston Churchill in 1908 by Mr. William Joynson-Hicks (afterwards Viscount Brentford), and had been lost again to the liberals in January 1910. Bonar Law failed to capture it, but he reduced the liberal majority from 783 to 445. In March 1911, however, he was returned for the Bootle division of Lancashire at a by-election. Throughout these contests his main themes were: 'naval supremacy and not merely naval superiority over Germany'; 'the defence of the loyal minority in Ireland against the imposition of a tyranny'; and tariff reform as 'the greatest of all social reforms'. 'We propose two things: to raise part of our revenue by the imposition of a duty on foreign manufactured goods that compete with those made in this country, and we propose also so to readjust our taxation as to obtain the largest possible amount of preference for the work of our own people in the overseas markets of the Empire' (Manchester, December 1910).

Disaffection in the conservative party over the questions of tariff reform and the Parliament Bill had undermined Mr. Balfour's prestige as leader. Bonar Law supported Lord Lansdowne and Mr. Balfour in their decision to accept the Parliament Bill rather than proceed to extreme courses with Lord Halsbury and the 'diehards'. On 8 November 1911 Balfour resigned, and on 13 November Bonar Law was elected leader in the Commons. The party

was pretty evenly divided between supporters of Mr. Walter (afterwards Viscount) Long [q.v.] and (Sir) Austen Chamberlain. These two respectively proposed and seconded, as a compromise, the election of a man much their junior in parliamentary experience and public recognition, who had never held Cabinet office. 'The fools have stumbled on their best man by accident' was Mr. Lloyd George's comment at the time.

When his wife died in 1909 Bonar Law was desolate; old associations were ended and never renewed. Into the void came Mr. William Maxwell Aitken, a young Canadian man of business, full of energy and confidence. A strong and lasting friendship sprang up between the two men. In Lord Beaverbrook, as Aitken became in 1916, Bonar Law found the kind of assistance which is given to a minister by a first-rate parliamentary secretary in whose judgement the minister has confidence and who can be used as a sounding-board for ventilation of ideas and criticism of persons, and for the expansion of the minister's influence.

On 23 November 1911 the new leader of the opposition addressed a conference of the National Union of Conservatives at Leeds, where he denounced Home Rule, the disestablishment of the Welsh Church, and free trade with a stinging directness which contrasted sharply with Balfourian subtleties. 'The waters of Marah were not more bitter than his speeches' wrote a contemporary. This bitterness found its most tart expression in his handling of the Irish question which, with tariff reform, almost monopolized the attention of politicians in the years preceding the European War. With Sir Edward Carson he shared the leadership of the section which repeatedly postponed and paralysed a succession of Home Rule Bills, carrying their opposition to the brink of civil war. At vast demonstrations in 1912 at Belfast (Easter) and at Blenheim (27 July) and in the House of Commons itself Bonar Law imported into his speeches a deliberate note of defiance of authority. To the organizers of the Orange celebrations (12 July 1913) he sent a message declaring that 'whatever steps they might feel compelled to take, whether they were constitutional, or whether in the long run they were unconstitutional, they had the whole of the Unionist Party under his leadership behind them'. At Wallsend (29 October) he indicated the various courses which were open to the government. Either it

must go on as it was doing and provoke unionists to resist—that was madness; or it could consult the electorate, whose decisions would be accepted by the unionist party as a whole; or thirdly, it could try to arrange a settlement which would at least avert civil war. When parliament met in February 1914, the prime minister, Mr. Asquith, struck a conciliatory note and promised to introduce a proposal which would 'consult . . . the susceptibilities of all concerned'. This proved to be county option with a time limit of six years. In an Amending Bill to the Home Rule Bill which the Commons had passed (25 May) the Lords substituted the permanent exclusion of the whole province of Ulster for the proposed county option with a time limit (8 July). But instead of introducing the Amending Bill in the altered form in which it had left the Upper House, Asquith announced the meeting of a conference at Buckingham Palace to discuss the Irish situation. Lord Lansdowne and Bonar Law represented the unionist party. The conference failed to reach agreement on the portion of Ulster which should be excluded from the jurisdiction of the Dublin parliament. On 30 July the prime minister, prompted by Bonar Law and Carson, said that the Amending Bill would be indefinitely postponed in order that the country might present a united front to the threatened outbreak of war in Europe.

The rest of the Irish story may be outlined here before Bonar Law's services during the War are described. On 18 September the Home Rule Bill received the royal assent, and a Suspensory Bill simultaneously provided that it should remain in abeyance until after the end of the War. Bonar Law denounced this as a breach of faith, left the House with his followers in protest, and crossed to Belfast in order to renew and even to extend the pledges of the unionist party to Ulster (28 September). Abortive negotiations for a settlement proceeded intermittently throughout 1915 and 1916, and in 1917 (16 May), when Bonar Law was chancellor of the Exchequer, Mr. Lloyd George offered Ireland the alternative of a bill for the immediate application of the Home Rule Act to Ireland, excluding the six counties of North-East Ulster, or the summoning of a convention of Irishmen of all shades of opinion for the purpose of drafting a constitution. The latter was accepted, but its report (8 April 1918) showed that the 'substantial agreement' laid down by the prime minister as the condition precedent

to legislation had not been reached. Ten days later the Military Service (No. 2) Act, 1918, extended conscription to Ireland, and in announcing that the government intended to enforce it, Bonar Law announced also the introduction of a further Home Rule Bill. This was never produced owing to the discovery in May of a widespread mutinous intrigue in Ireland and the arrest of Arthur Griffith [q.v.] and Mr. Eamon de Valera. Conscription remained a dead letter. On the eve of the general election of December 1918, Mr. Lloyd George and Bonar Law issued a joint letter which declared: 'Two paths are closed: the one leading to a complete severance of Ireland from the British Empire, and the other to the forcible submission of the six counties of Ulster to a Home Rule Parliament against their will.' The policy of alternating repression with conciliation continued. At the end of 1919 the government introduced the last Home Rule Bill, providing a parliament for Northern Ireland (the six counties), a parliament for the rest of Ireland, and a federal council for all Ireland. Bonar Law supported the Bill in a speech in which he condemned Dominion Home Rule as tantamount to giving the right to set up an Irish republic. On 17 March 1921, his health undermined, Bonar Law resigned the leadership of the House of Commons and of the unionist party after filling the one post for over four years and the other for nearly ten. He was thus not a member of the Coalition ministry which concluded the Irish Treaty (6 December 1921). But he was frequently consulted by the government and by Sir James Craig (afterwards Lord Craigavon), who spoke for Ulster, and he emerged unexpectedly from his temporary retirement in order to recommend the treaty to the House of Commons. Had he opposed the negotiations there would have been no treaty.

On the outbreak of the European War Bonar Law tendered the liberal prime minister (Mr. Asquith) the support of the unionist party in resisting German aggression (2 August 1914). During the opening months of the War this support was loyally given, but with growing impatience on the part of the opposition. Traces of the conflict over Ireland still remained and made co-operation difficult. Finally, on the resignation of Lord Fisher from the Admiralty, Bonar Law informed the prime minister (17 May 1915) that a change in the composition of the government had become inevitable. Two days later the

formation of the first Coalition ministry was announced, and the leader of the unionist party found himself relegated to the insignificant position of secretary for the Colonies, an appointment which not only reflected Bonar Law's self-abnegation but also Asquith's preference for Balliol men to business men as close colleagues. In the autumn of 1915 Bonar Law led the group in the Cabinet which pressed for the evacuation of the Dardanelles, carrying his own opposition to the verge of resignation, at which point Asquith surrendered. In January 1916 he took charge of the Compulsory Military Service Bill. He resisted its application to Ireland as, on balance, unprofitable, and skillfully surmounted amendments dealing with conscientious objection. The third reading was carried by 383 votes to 36. In June 1916 he attended an economic conference in Paris and agreed to the policy of joint economic action by the Allies during the War and permanent defensive collaboration thereafter. It was not until April 1917 that he had the satisfaction of announcing that the Imperial War Cabinet had accepted the principle of imperial preference for the British Empire.

As early as March 1916 Bonar Law had expressed the view to John Redmond that while Asquith was then the best possible prime minister, he would probably eventually be replaced by Mr. Lloyd George. This actually happened in December 1916. The devious operations by which Bonar Law's mistrust of Mr. Lloyd George was changed into active co-operation have been described by Lord Beaverbrook, who largely engineered them, by the biographers of Mr. Asquith, and by Mr. Lloyd George in his *War Memoirs*. They cannot be disentangled here. On 3 December, after a meeting of conservative ministers, Bonar Law saw the prime minister at Downing Street and demanded the resignation of Asquith's government. Mr. Lloyd George resigned on 5 December and Asquith a few hours later on the same day. On the same evening King George V invited Bonar Law to form an administration. He first sought the co-operation of Mr. Lloyd George and then that of Asquith, and when this was not forthcoming he advised the king to call on Mr. Lloyd George. On 7 December Mr. Lloyd George became prime minister. In the new government Bonar Law became chancellor of the Exchequer and leader of the House of Commons. He was also a member of the War Cabinet, but he was not expected to take

the same active part in it as the other four members. At the Treasury and in the House Bonar Law quickly revealed abilities which had been fatally underestimated by Asquith. He reversed the prevailing policy of high money rates and short-term indebtedness and issued a series of War Loans, on a lower interest basis for long terms, which rank among the greatest achievements in the history of British finance. In October 1917 he launched a campaign for national war bonds to an unlimited amount on terms which ingeniously combined the advantages of short- and long-dated securities. This was remarkably successful and provided the state with a continuous flow of money until the end of the War.

The fifth war budget was introduced by Bonar Law on 2 May 1917. He recounted with pride the great success of the war loan which he had floated in a memorable appeal at the Guildhall on 11 January. By 31 March the total yield, including conversions, amounted to £2,067 millions. In fixing the low terms of this loan he had defied the advice of the City and of his own officials, and the public response amply supported his judgement. He now added no new taxes, but increased the excess profits duty from 60 to 80 per cent. and the tobacco duties and entertainments tax were also increased. Critics denounced the budget for 'its miserably small addition to taxation' and the needless burden which would cripple industry in the post-War years. The chancellor argued that no belligerent country had provided, as Great Britain had done, 26 per cent. out of revenue to meet expenditure during the War. Replying to those who desired conscription of wealth as of men, he said: 'If we can get the money we need by voluntary methods, by unsettling as little as possible the existing machinery, then I am certain you will get more of it and for a longer time than by an attempt at conscription.'

On 22 April 1918 Bonar Law submitted the sixth war budget, 'a financial statement on a scale far exceeding any that had ever been known at any time or in any country'. The revenue for 1918-1919 he estimated at £842 millions, expenditure at £2,972 millions. New taxes were expected to produce £114 millions in a full year. Income tax was placed at 6s. in the £ at £2,500 a year, and super-tax at 4s. 6d. in the £ on excess over £10,000 a year. Farmers' tax was doubled. A proposal to tax luxuries, a French fiscal device, was later withdrawn

as impracticable. The balance to be borrowed, roughly £2,000 millions, was more than three times the pre-War national debt. The chancellor declared himself to be guided by the rule of his predecessor, Mr. Reginald McKenna, that 'on the assumption that the War came to an end at the close of the year for which the financial statement was made, there would be a sufficient revenue without new borrowing or new taxation to make sure that not only the expenditure left after the War, but the debt charge could be met'. This unparalleled budget coincided with some of the most desperate struggles of the War, and it passed very easily and with so little change that the chancellor's revenue proposals were modified only in respect of two million pounds.

Throughout these years of vast and anxious responsibility the chancellor, while confident of the ultimate victory of the Allies, deprecated optimism and pessimism alike, and couched his appeals for sacrifice in speeches of marked sobriety. These were in sharp contrast to the flamboyant manifesto issued by Mr. Lloyd George and himself on the eve of the general election of December 1918, which followed the Armistice (11 November). Bonar Law justified the continuance of the Coalition as the one condition of ensuring peace abroad, and preventing revolution at home. The 'orgy of chauvinism' which characterized the election was not his doing, and he discouraged extravagant hopes of the financial terms to be imposed upon Germany. But he was a consenting party to the device of issuing 'coupons' to approved unionist and coalition liberal candidates, whereby the sacrifice of seats to labour candidates and independent liberals was avoided. The result was a coalition majority of nearly 250, and a large accession of unionist members. Bonar Law himself was returned for Central Glasgow, the division in which his business life had been spent. He took the office of lord privy seal and leader of the House of Commons, and during the prolonged absences of Mr. Lloyd George while attending conferences abroad he acted as prime minister. Only when his presence was absolutely necessary did he attend the Peace Conference at Paris, travelling by air whenever possible. He was one of the signatories to the Treaty of Versailles. At home, during the years 1919 and 1920, he was absorbed in the problems of demobilization and resettlement, the removal of war-time restrictions, and the

transfer of industries from a war-time to a peace basis. And there was always the Irish question. When delivering his address as lord rector of Glasgow University on 11 March 1921, he betrayed signs of momentary collapse, and on 17 March, broken down by years of incessant labour and by personal sorrows, he resigned office and sought rest in the south of France. His health improved and he returned home in the autumn, emerging from his retirement to recommend the Irish Treaty.

Meanwhile a growing section of conservatives was chafing under the dominance of Mr. Lloyd George and the Coalition. Matters came to a head over 'the Chanak crisis'—the fear that the prime minister and certain of his colleagues were bent on resuming war against Mustapha Kemal, who was threatening the neutral zones by which Constantinople, the Bosphorus, and the Dardanelles were then protected. This policy aroused widespread opposition in the country among all parties, but conflict was avoided by the tactful attitude of Sir Charles Harington, the Allied commander-in-chief at Constantinople. At the Carlton Club on 19 October 1922 a speech by Mr. Stanley Baldwin, and the declaration of Bonar Law that the unity of his party could only be saved by withdrawing from the Coalition, combined to bring about the fall of the government. Mr. Lloyd George resigned, and on 23 October Bonar Law became prime minister with a purely conservative Cabinet. On the same day he was unanimously elected to the leadership of the party in place of Mr. Austen Chamberlain. The new prime minister at once struck the note of his policy: tranquillity and stability, 'leaving the recovery to come, not so much by action from above, as by the free play and energy of our own people. . . . There are times when it is good to sit still and go slowly.' This programme of negation secured him an independent majority of 75 at the general election in November. Nevertheless, unemployment, housing, and foreign affairs gave the prime minister little of the 'freedom from disturbance at home and abroad' for which he yearned.

During 1922 British and French 'reparations' policies, which had hitherto been in general accord, showed signs of increasing divergence. At the conference held at Cannes in January, and indeed throughout that year, British influence was being used to mitigate and postpone payment of reparations by Germany in face of the vigorous and literal demands

of M. Poincaré, and to question the right of independent action by France in the event of default. The German mark fell in the course of the year from about 800 to 34,000 to the £. Inter-allied debts, reparations, the co-operation of the United States of America in the affairs of Europe, and the mounting figures of unemployment had been treated by the Coalition Cabinet as interlocked problems, and the solution of none of them was in sight when Bonar Law took office. He presided over a conference of Allied prime ministers in London, 9-11 December, which was adjourned to Paris until January 1923. Between the two sessions Bonar Law announced that on certain conditions Great Britain 'would be willing to run the risk in the end of paying more to the United States than she would receive from the Allies and Germany', and the Reparations Commission, the British member dissenting, declared that Germany's failure to deliver timber to France during 1922 constituted a default and that this paved the way for the imposition of sanctions. In Paris (2 January 1923) Poincaré and Bonar Law tabled proposals too complicated for summary here; in essence their differences were accentuated. Great Britain wished to fix figures within the reasonable capacity of Germany to pay, on condition that she should stabilize the mark and balance her budget under supervision. France would agree to no policy which did not involve strict control of Germany's finances, together with the taking of extensive 'productive pledges' of material assets guaranteeing future payments. At the close of the first session of the conference Bonar Law was convinced that compromise was impossible, and but for the demands of courtesy and the pressure of advisers he would have returned to London at once. On 4 January he declared that 'the ditch was one which no bridge could span', and the conference broke down. Within a week the French and Belgian governments announced their intention of occupying the Ruhr, the policy against which Bonar Law had protested in vain. It is difficult to imagine him conducting international conferences extending over many weeks, like Lord Curzon at Lausanne, or Mr. Lloyd George on several occasions. He was quick to understand a situation, deliberate and dexterous in handling it, lucid and accurate in his statement of it, but his patience and resource were very limited. He never practised self-deception, and of two views

he chose the one less favourable to himself. He did not preen himself, delivering elaborate pronouncements after the manner of Lord Curzon, nor revel in a battle of bargaining wits like Mr. Lloyd George. He was free of the vanity which clothes failure in a formula, and, like Mr. Asquith, he 'disdained the minor arts of popularity'.

One of the major questions which called for immediate action by the new conservative administration was that of the funding of the American debt. The parts played respectively by the prime minister and the chancellor of the Exchequer (Mr. Baldwin) in the settlement ultimately concluded have been the subject of much debate, and until contemporary state documents are available in Great Britain and in the United States no final judgement is possible. Reluctance to surrender office and disperse colleagues newly assembled in a purely conservative Cabinet after seventeen years in opposition or coalition, must have weighed heavily with the prime minister. Mr. Richard Law, member of parliament for South-West Hull, in a speech delivered in the House of Commons on 18 June 1933, stated it as his view that, but for the fact that his father was at the time a very sick man, he would not have accepted the settlement, and would sooner have broken up his own government, fresh as it then was.

As early as November 1918, Bonar Law, then chancellor of the Exchequer, had considered the possibility of the entire cancellation of inter-Allied debts, and throughout the years of negotiation which followed, this idea persisted in the minds of some British ministers, despite recurrent and emphatic discouragement from Washington. Another body of opinion, considering the economic restoration of Europe to be the matter of chief urgency, favoured the funding of the debt without delay and on such terms as were then obtainable. There were also those who, while willing to forgo Great Britain's reparation claims as part of a general settlement, were unwilling that the United States should play off debtors against each other, and insisted on a most-favoured-nation clause as a condition of agreement. After protracted debate and delay the Cabinet succeeded in harmonizing its views in the Balfour Note (1 August 1922). It had already agreed to dispatch a delegation to Washington. Certain other antecedent facts must be borne in mind in judging the position as it stood when Bonar Law became premier. On 31 January 1922 the American senate had

passed an Act establishing a World War Debt Funding Commission, closely defining its powers, fixing the minimum rate of interest at $4\frac{1}{2}$ per cent. and the period of debt repayment at twenty-five years. On 20 February 1922 the financial secretary to the British Treasury had announced that £25,000,000 would be provided in the budget estimates for 1922-1923 to cover one half-year's interest, and on 21 March the chancellor of the Exchequer (Sir Robert Horne) told the House of Commons that he did not propose 'to make any conditions to the United States for the payment of our due obligations'. The absence of hostile criticism of this announcement suggests that the prevailing opinion was that, whatever other nations might do, Great Britain meant to pay. Speaking in New York (4 October 1922) Mr. Reginald McKenna, a leading banker and former chancellor of the Exchequer, declared that Great Britain had both means and determination to pay the debt in full. The effect of the Balfour Note on American opinion was bad, and would have been worse but for the good will engendered by the signature of the agreement constituting the Irish Free State (6 December 1921) and of the Washington Naval Treaty (18 December 1921 and 6 February 1922).

The British delegates, the chancellor of the Exchequer (Mr. Baldwin) and the governor of the Bank of England (Mr. Montagu Norman), arrived in Washington on 4 January 1923. They had been given no written instructions, but they knew that the annuity envisaged by the prime minister was in the neighbourhood of £25,000,000 and a rate of interest of $2\frac{1}{2}$ per cent. Even lower figures than these had been hinted at by the American ambassador to Great Britain (Mr. George Harvey) as likely to satisfy Congress, and this had coloured Bonar Law's views. This optimism had no basis in fact. Negotiations between the British and American commissions proceeded and were reported to the prime minister, who grew increasingly despondent. On 14 January the American commission offered a settlement on the basis of 3 per cent. interest for the first ten years and $3\frac{1}{2}$ per cent. thereafter; a sinking fund at $\frac{1}{2}$ per cent. throughout, and back interest to be calculated at $4\frac{1}{2}$ per cent. This offer was equivalent to annual payments of \$161,000,000 for ten years, and of \$184,000,000 for fifty-two years, and was in reply to Mr. Baldwin's provisional suggestion of

3 per cent. throughout. Its acceptance was strongly pressed upon the Cabinet by the delegation and by the British ambassador to the United States (Sir Auckland Geddes) as the best obtainable, and on 21 January Sir Robert Horne, then in New York and in consultation with interests friendly to England, cabled the same advice. Bonar Law denounced the terms as exceedingly harsh and unfair; they would inflict a crippling burden of taxation on the British people for two generations and would severely strain their relations with the people of the United States. The French were in occupation of the Ruhr, and he saw little hope of payments being made to England from Europe. Mr. McKenna and Lord Beaverbrook, two of his closest friends, and also Mr. J. M. Keynes, the economist, confirmed the prime minister in his opposition. A meeting to adjourn the Washington negotiations and to permit consultations in London was fixed for 18 January, but on 16 January the respective offers of the two commissions appeared in the American press and the result was to stabilize the American offer. Some observations made by Mr. Baldwin to pressmen on his arrival at Southampton on 27 January stiffened opinion in the United States against any further concession. The British Cabinet met on 30 January, and Bonar Law made it clear that he would resign rather than be a party to the proposed terms. He refused to believe that a day would not come when the rank and file of Americans would share what he knew to be the mind of their more enlightened compatriots. The discussion was inconclusive and was adjourned to the following afternoon. In the interval certain ministers indicated that they were not prepared even to appear to repudiate acknowledged obligations. This became the dominant view of the large majority of ministers. On the morning of 31 January Mr. McKenna, convinced that the City favoured acceptance, advised Bonar Law to yield. In the afternoon the Cabinet decided to accept the American terms and the crisis ended. Whether Bonar Law yielded because he was at the time a very sick man, or whether, but for his sickness, he would have shared the views of his colleagues, no one can say.

When Bonar Law had left office in March 1921 he had told the prime minister that he was 'quite worn out'. Before returning to office on 23 October 1922 he had 'hesitated up to the last moment'. He was prime minister for 209 days only,

resigning on Whitsunday, 20 May 1923. When, on 30 October following, he died, there could be no doubt that, in the words of his successor, Mr. Baldwin, Bonar Law had given his life for his country, just as much as if he had fallen in the European War. He died at 24 Onslow Gardens, London, and was buried in Westminster Abbey on 5 November. Two of his sons were killed in the War, Charles in Palestine, and James in France. He was survived by two sons and two daughters.

No one will claim for Bonar Law a place among the greatest of England's prime ministers. Posterity indeed may give him a lower rank than is his due, not only because of his own indifference to fame but also because his solid qualities made no popular appeal. When he reached the top he was a tired man. He had filled the highest offices in the state with great ability and sagacity in years of unparalleled strain and anxiety. His mind worked rapidly; he grasped clearly the most technical memoranda submitted to him; his criticism was swift, acute, and extremely practical; his memory was abnormally retentive and accurate. His industry was concentrated and his curiosity severely restricted. He had none of Lord Curzon's insatiable appetite for information. Literature and art had no interest for him; to music he was deaf and to scenery blind. His sceptical outlook was tinged with melancholy. He lived simply, smoked excessively, and shunned society. He rarely left London and made no use of Chequers Court in Buckinghamshire, the official country residence of the prime minister. All this is true, but it gives a completely misleading picture of the man. Bonar Law united a character 'honest to the verge of simplicity' with a disposition 'sweet and kind' and a manner so gentle and charming as to prove irresistible to his associates. Diffident about his own powers, he could, when roused, show a stubborn firmness and decision. But his normal attitude was one of repose and quiet friendliness, which kindled a loving loyalty in all who became intimate with him. In human affection and hard work, he told the Glasgow students, he had found the best that life could offer. He played chess and bridge, lawn-tennis and golf, and was proficient in all, but parliament absorbed his energies. He was supreme as leader of the House of Commons, and his ascendancy has been compared with that of Walpole in the eighteenth century and of Peel in the nineteenth. He conducted

its business with easy mastery from day to day, judging bills primarily by the smoothness of their passage, and untroubled by dreams of millennial achievement. For him, as for his hero, Joseph Chamberlain, a fortnight's future sufficed in politics. By Ulster alone was he stirred to the depths as by some primitive passion. Tariff reform was a paying business proposition. For the rest, he was open to argument, and it was parliamentary expediency which was apt to turn the scale. In the election of November 1922, where his was the determining voice, he envisaged 'as little legislation as possible'. This was doubtless in part reaction from the methods of December 1918, but it was also in harmony with the speaker's native caution and distrust of glittering promises.

Bonar Law's speeches are no longer read, but if judged by their fitness for their immediate purpose they must be given high rank. Speaking with engaging candour, his lucidity, moderation, and plain sense were perfectly adapted to convince and unite those who listened to him and to dissolve opposition. During the years of the War his fairness in debate, his modesty in demeanour, his freedom from envy and all uncharitableness, no less than the purity of his patriotism, made him beloved of all parties in the House of Commons. A passage from Macaulay's description of William Pitt the younger as a speaker can be applied to Bonar Law:

'He could with ease present to his audience, not perhaps an exact or profound, but a clear, popular, and plausible view of the most extensive and complicated subject. Nothing was out of place; nothing was forgotten; minute details, dates, sums of money were all faithfully preserved in his memory. Even intricate questions of finance, when explained by him, seemed clear to the plainest man among his hearers. . . . He was the only man who could open a Budget without notes.'

In December 1916 it was Bonar Law's action which made possible the second Coalition government and which brought Mr. Lloyd George to the premiership. The partnership of the two men—'the most perfect partnership in political history'—with their humble origin and austere upbringing, with their complementary gifts and divergent temperaments, profoundly affected the fortunes of the War. For over four years the one never took an important step without conferring with the other, and to compute the contribution of Bonar

Law to the partnership it would be necessary to know not only the policies and projects of his sanguine colleague which he approved, but also those which he resisted, modified, or defeated. That colleague has placed on record his sense of the value of Bonar Law's searching criticism and his real courage when together they were responsible for the momentous decisions of the European War.

There is a portrait of Bonar Law by Sir James Guthrie in the National Portrait Gallery; a second by René de l'Hôpital at the Carlton Club; a third, outlined by Sir James Guthrie and painted by J. B. Anderson, at the Constitutional Club; a fourth by J. B. Anderson at the Conservative Club, Glasgow; a cartoon by 'Spy' appeared in *Vanity Fair* 2 March 1905, and an anonymous one 10 April 1912.

T. JONES.

LAWRENCE, DAVID HERBERT (1885-1930), poet, novelist, and essayist, born 11 September 1885 at Eastwood, near Nottingham, was the fourth child and third son of John Arthur Lawrence, a coal-miner, by his wife, Lydia Beardsall. As a child Lawrence had pneumonia, and became susceptible to consumption. Later in life he contracted the disease, and eventually died of it. Life as a collier was therefore out of the question. At the age of thirteen, however, he won a scholarship at Nottingham high school, and, after a short period as a clerk, went to the British school at Eastwood as a pupil teacher. At the age of eighteen he entered Nottingham University College, matriculated, and two years later took his teacher's certificate, and was appointed to the Davidson Road School, Croydon. This education was made possible by the self-sacrifice of his mother, to whom he was passionately devoted; and it is possible that her example influenced his literary pursuits, since she had been a school teacher, had a taste for reading, and had written poetry. Mr. Ford Madox Hueffer, at that time editor of *The English Review*, encouraged Lawrence to write, published contributions by him, and introduced him to his first publisher. Lawrence was also assisted by the friend-

ship and advice of Mr. Edward Garnett. After the publication of his novel, *The White Peacock*, in 1911, Lawrence resigned his post (receiving very honourable certificates from his superiors), and determined to live by his writing.

The circumstances of his early life made a deep impression on Lawrence's sensitive nature. The conditions of life in a mining community filled him with bitter hatred of industrialism and machinery, because he believed that men were degraded by them. Fortunately, he was able to escape to the open country on long walks, and the poet in him awoke as he responded to the rhythm of natural life with a passionate sensibility which is apparent throughout his writings. He felt the universe as a living thing, a mystic inspiration ('Not me, not me, but the wind which blows through me'), and his life might be explained as the passionate and fruitless quest for a society where men 'lived breast to breast with the cosmos'. His human sympathies were no less vivid, stimulated by contact with miners and farm people and by his profound filial love for his mother. From them Lawrence learned to value quality of feelings more than intellectual distinction, sensibility more than agreeable manners, vitality more than success.

After *The White Peacock*, Lawrence wrote *The Trespasser* (1912) and one of the most widely read of all his books, *Sons and Lovers* (1913), which appeared soon after his first book of poems, *Love Poems and Others* (1913). Meanwhile he had gone abroad for the first time, to Germany in May 1912. There he lived in a small cottage in the Isar valley; then he moved into Austria, and went on foot over the Brenner Pass to Lake Garda, where he stayed (at Gargnano) until April 1913. After a brief return to Germany and thence to England, he lived at Leri, in Italy, from September 1913 until June 1914. In July 1914 he was married in England to Frieda von Richthofen, after her divorce from her first husband, Professor Ernest Weelkey. She was the daughter of Baron von Richthofen, military governor of Metz. It is entirely erroneous to suppose that Lawrence either practised or countenanced 'free love'. He placed the sanctity of marriage in the reality of the human relationship and not in its social or legal aspect. For the poetry of this period, see his *Amores* (published 1916) and *Look, We Have Come Through* (published 1917).

Like most people who achieve anything,

Lawrence had gambled on the future, by abandoning teaching and by assuming the responsibilities of marriage. It was not so imprudent as might be thought. In 1914 he had already won a certain reputation as an author, and was welcomed in London by distinguished members of his own profession as well as by people in society. And he was in no danger of being spoiled by success. He was a man of frugal, even austere habits, to which he owed the preservation of his always delicate health. To spare his lungs, he never smoked; he drank little, and lived on the plainest food, which he frequently prepared himself; all his tastes were simple. He was indifferent to material success and to all the usual rewards; but he did ardently desire a sympathetic response to his writings and was convinced that what he had to say was of value to mankind. Here he was defeated by the disarray and hectic psychology of the years of the European War.

During the early part of the War, Lawrence lived in or near London, and in December 1914 he published a volume of short stories, *The Prussian Officer*. The topical title was not his. Active service was impossible for a man so fragile, even if his views had allowed him to serve willingly; but though he could not be a conscientious objector, and was twice rejected for service, he held that the War was wholly evil. Something of this attitude is expressed in the latter part of *The Rainbow*, a novel which he published in 1915, though the war there denounced is the Boer War. This book, perhaps the most profound and poetical of Lawrence's novels, was the subject of a prosecution, and was condemned as indecent. The blow to Lawrence was far more staggering than is generally realized. It involved him in pecuniary difficulties which he did not escape for years; it marked him with a disgrace which he felt keenly, and believed to be undeserved; it was a severe rebuff to his idealistic beliefs. All this was mingled with acute suffering over the continuance of the War and its destructiveness.

Lawrence's chief desire now was to leave England, and he applied for passports for himself and his wife to America. Lack of money for the passage frustrated his project, and he retired to a small cottage at Zennor, Cornwall, where he worked on *Women in Love* (privately printed in New York, 1920; published in London, 1921). For reasons unknown to him, he and his wife (who was cousin to the well-known

German airman, von Richthofen) were ordered to leave Zennor in October 1917, and not to enter any prohibited area. He went first to London; then lived in small cottages, at Hernitage near Newbury, and at Middleton-by-Wirksworth in Derbyshire. His sufferings during this period are related in two long chapters, headed 'The Nightmare', in his Australian novel, *Kangaroo* (1923).

Towards the end of 1919 Lawrence scraped together a few pounds and left England, to which he never returned except on very brief visits. While resentment at the treatment he had received may have had something to do with this, the chief motive of his exile was despair at the hostile attitude displayed in England towards himself and his writings. For the remainder of his life he was a wanderer, and only the main outline of his pilgrimage can or need be traced here. He went first to Florence (see the Florentine chapters in *Aaron's Rod*, 1922), then to Picinisco in the Abruzzi (see the latter part of *The Lost Girl*, 1920). He fled from the intense cold of the Abruzzi to Capri, liked and disliked it, and then settled for a time at Fontana Vecchia, near Taormina, where he remained until February 1922, except for short excursions. In *Sea and Sardinia* (1921) he produced the second of his remarkable travel books—the first was *Twilight in Italy* (1916), describing a walking tour through Switzerland to Italy—and accomplished the feat of making an interesting book out of the impressions and experiences of a few days.

The chronology of Lawrence's writings cannot at present be precisely determined; what is certain is that the order of composition does not correspond with the dates of publication. Among the books published at this time may be mentioned *Psychoanalysis and the Unconscious* (New York, 1921), *Fantasia of the Unconscious* (1922), and the short stories entitled *England, My England* (New York, 1922). Traces of his life in Sicily will be found in his beautifully written introduction to *Memoirs of the Foreign Legion* by 'M. M.' (London, 1924) and in the poems, *Birds, Beasts and Flowers* (1923). *Studies in Classical American Literature* was issued in America in the same year (1923).

Early in 1922 Lawrence left Sicily for America, by way of Ceylon and of Australia, where he stayed for a time. He reached San Francisco in September 1922, travelled in the United States and in Mexico, and settled on a small mountain ranch near

Taos, New Mexico. Between December 1923 and March 1924 he paid a flying visit to England and the Continent, returning to Taos, from which he moved in October 1924 to Oaxaca, Mexico. Experiences there are recorded in his novel *The Plumed Serpent* (1926) and in *Mornings in Mexico* (1927). In 1925 he was seriously ill with malaria, and nearly died; this may have been the basis of his imaginative story, 'The Man Who Died', published in 1929 under the title *The Escaped Cock*. His illness compelled him to leave Mexico in October 1925. He lived at Spotorno, Italy, until March 1926, and then settled at the Villa Mirinda, Scandicci, near Florence. There he wrote *Lady Chatterley's Lover* (Florence, 1928) and remained until May 1928. No less than three manuscript versions of this novel are extant, showing the pains which he took over its composition; yet in many ways it is one of the least satisfactory of his books.

Lawrence's last years were agitated by the police prosecution of *Lady Chatterley's Lover*, the confiscation of the original manuscript of his poems, *Pansies* (1929), police action over an exhibition of his pictures held in London in 1928, and the suppression of the book containing facsimile reproductions of these paintings. It is an ironical fact that far more attention was drawn to Lawrence by these unfortunate scandals than by the excellence of his other and very varied productions; while his private edition of *Lady Chatterley's Lover* brought him more substantial earnings than any of his previous books. While living near Florence Lawrence had more than once been seriously ill and near death, yet he had found energy to visit Etruscan towns, and produced the unfinished *Sketches of Etruscan Places*, published posthumously. After leaving Florence, he lived at Bandol, near Toulon, and visited Spain. Early in 1930 his condition became so serious that he was moved to a clinic at Venice, where he died on 2 March 1930. His grave there is marked by a mosaic of the risen phoenix, which he had long before chosen as his emblem. His literary activity continued to the very end, and an unfinished poem was written only a few days before he died. Among the posthumous books the most important are: *the Letters* (1932); *Apocalypse* (Florence, 1931), a statement of his attitude to life; and *Last Poems* (Florence, 1932), which contains, among pieces of slighter interest, the poignant record of his feelings and thoughts as he faced the reality and cer-

tainty of death. His spiritual loneliness was complete.

Since his death Lawrence's reputation has grown with astonishing swiftness, and, though opinion is far from unanimous, he is now widely recognized in many countries as one of the most original and gifted English writers of his age. The misunderstanding which original genius often meets with from contemporaries is gradually being cleared away, and his reputation cannot but gain by closer and more serious study of his books.

R. ALDINGTON.

LEADER, BENJAMIN WILLIAMS (1831-1923), painter, was born at Worcester 12 March 1831, the second son in the family of eleven children of Edward Leader Williams, chief engineer to the Severn Navigation Commission. The eldest son was Sir Edward Leader Williams [q.v.], the engineer of the Manchester ship canal and of Shoreham harbour and Dover docks. Having been educated at Worcester grammar school, Benjamin Leader Williams worked for a time in his father's office, studying also at the Government School of Design at Worcester; in 1854 he entered the Royal Academy Schools. At this period of his career he felt greatly attracted towards the pre-Raphaelites, and began by painting figure subjects which are definite essays in the pre-Raphaelite manner. The first picture exhibited by him at the Royal Academy, in the year of his admission (1854), was 'Cottage Children blowing Bubbles', and this was followed in 1855 by 'The Bird Trap' (bought by Mr. Arden, who from the same exhibition acquired (Sir) J. E. Millais's 'Order of Release'), and in 1856 by 'The Young Mother'. The following year, in order to avoid confusion with the many painters of the name of Williams, he transposed his surname and second christian name, adopting the latter as his surname.

In 1862 Leader settled at Whittington, near Worcester, henceforth devoting himself mainly to landscape painting, choosing his subjects from Worcestershire and Wales. After a long period of steady work and fair, but not conspicuous success, Leader for the first time came prominently

into the public eye with his large Worcestershire landscape 'February Filly-Dyke', contributed to the Academy exhibition 1881. Scarcely inferior was the success of his landscape entitled 'In the Evening there shall be Light', exhibited at the Academy in 1882, and in 1889 at the Paris Salon, where it gained the gold medal. In 1888 Leader, by now well established as one of the most successful landscape-painters of the day, was elected an A.R.A., becoming R.A. in 1898; his diploma work was 'The Sandpit, Burroughs Cross'. In the meantime he had moved to Surrey, settling in 1890 at Burrow's Cross, Shere, near Guildford, a house built by Richard Norman Shaw for the painter Frank Holl.

Until the very end of his long life Leader went on painting, contributing, indeed, three pictures to the Academy exhibition of 1922, the year preceding that of his death at the age of ninety-two. His style as a landscape painter tends to be over-emphatic in design and commonplace in colour. He betrays, indeed, little of that connexion with Constable which one might feel inclined to deduce from the fact that Constable was a friend of the Williams family and deposited some of his pictures at their house. However, the popular appeal of Leader's art was enormous for a time, and was exercised not only through the originals but also through a large number of engraved reproductions. In June 1914 Leader was presented with the freedom of the city of Worcester; he had been made a chevalier of the legion of honour by the French government in 1889.

Leader died at his Surrey home 22 March 1923. He married in 1876 Mary, daughter of William Eastlake, of Plymouth, and niece of Sir Charles Lock Eastlake, president of the Royal Academy [q.v.], herself a painter of flowers. They had two sons, the elder of whom was the painter, Eastlake Leader, who was killed in action in 1916; they also had three daughters.

Leader, R.A.* (the Christmas number of the *Art Journal*, 1901); Algernon Graves, *The Royal Academy of Arts, a complete dictionary of contributors and their work*, vol. v, 1906; subsequent Royal Academy Exhibition Catalogues.] T. BORENIUS.

LEAF, WALTER (1852-1927), classical scholar and banker, was born at Upper Norwood 28 November 1852, the elder son of Charles John Leaf, who was a partner

in the firm of Leaf, Sons, and Co., dealers in silks and ribbons, of Old Change, London. His mother was Isabella Ellen, daughter of John Tyas, a fine classical scholar, who was for twenty years on the staff of *The Times* and had been an important witness of the 'Peterloo massacre' in 1819. Leaf was tutored at home by Dr. Charles Mayo and won an entrance scholarship at Winchester, but was not sent there as his parents wished him to continue living at home. For that purpose they sold their house in Norwood and moved to Harrow, where in 1866 he entered the school as a 'home boarder'. He was very short-sighted, and since, according to the custom of the time, no one thought of providing him with spectacles, he was at a great disadvantage in sports and games. He quickly became a favourite with his teachers, and in 1867 was taken by two of them, E. M. Young and Edward Ernest Bowen [q.v.], on a trip to Rome and Naples. In 1868 his tutor, Frederic William (afterwards Dean) Farrar [q.v.], took over a house, The Park, which had got into a bad state of discipline, and asked Leaf to come to it as head boy. The ordeal for a small, short-sighted, and scholarly boy was terrifying, but Leaf faced it, insisted on order, caned a miscreant twice his size, and conquered. In March 1869 he won a classical scholarship at Trinity College, Cambridge, but as he was not much over sixteen did not reside until October 1870. The year between was spent in deliberate coaching for the tripos, five years distant, for which he and F. H. Rawlins, of King's College, were early marked as the favourites. At Cambridge he was a member of the select society known as the 'Apostles', which included F. W. Maitland, S. H. Butcher, and A. W. Verrill; he became an adept at figure-skating and mountaineering; won the Craven scholarship in 1873; and in 1874 was bracketed senior classic with Rawlins, with whom he also tied for the chancellor's classical medals. In the following year he was elected a fellow of Trinity. In the meantime, however, the family business was in need of help; in 1874 Leaf's father had a severe illness, and his grandfather and his uncle Frederick died; his uncle William had died three years before. Leaf felt it his duty to abandon Cambridge and his intended career at the bar, and enter the 'rag business', in which two years later (1877) he was made a partner.

In spite of his first distaste for Old Change, Leaf's clear head and firm charac-

ter were in due course to make him a power in the City. During the time that he remained with his firm it was converted into a limited liability company, of which he was chairman from 1888 to 1892. When, in the latter year, the company was amalgamated with a kindred business, Leaf retired in order to devote more attention to banking. In 1891 he had been elected a director of the London and Westminster Bank; in 1918 he became chairman of the bank and in 1919 of the Institute of Bankers. He wrote for the 'Home University Library' an admirable little handbook on *Banking* (1926), and his speeches on financial subjects were greatly admired by a severe critic, Mr. Asquith. After the European War he supported the League of Nations movement, and in 1926, as president (elected in 1924) of the International Chamber of Commerce, he made an important and successful visit to Germany with a view to economic reconciliation. It was immediately after this effort that his health failed, and, after a voyage to South Africa, he died at Torquay 8 March 1927. He married in 1894 Charlotte Mary, daughter of John Addington Symonds [q.v.], and had one son and one daughter.

Leaf was a man of extraordinary intellectual range. His list of languages included—besides perfect French and German—Italian, Russian, and Persian. He was a fine musician, an authority on political economy, and an important, though sceptical, member of the Society for Psychical Research. On other subjects, such as mathematics, astronomy, and botany, he was generally 'the best informed person in the room'. He was also one of the founders in 1876 of the University Extension movement, a leading member of the London County Council—he represented East Marylebone from 1901 to 1904—and was active in various forms of social work. It is recorded that he had a quite peculiar power of restoring confidence in the 'down and out'. People could not help trusting him and drawing, as it were, on his own stores of integrity and courage.

But Leaf's reputation rests chiefly on his work as a Greek, and particularly as a Homeric, scholar. His first book, produced in 1882 in co-operation with Andrew Lang [q.v.] and Ernest James Myers [q.v.], was a translation of the *Iliad* into archaic and poetical prose, a delicate task successfully carried through. On the death in 1878 of J. H. Pratt, of Trinity College, Cambridge, he was invited by Messrs. Macmillan to undertake the large edition of the *Iliad*

which Pratt had promised, and from 1886 to 1888 he produced his first edition in two volumes with a commentary. The second edition (1900-1902) was enlarged and improved, particularly by the collation of five important manuscripts. This remains by far the best edition of the *Iliad* in English, and perhaps the best in any language. Its lasting goodness is the more remarkable because Leaf had adopted, and followed with scrupulous consistency, a hypothesis which is now generally abandoned—that of a 'genuine' story of Achilles by 'Homer', expanded by later 'interpolations' into our present *Iliad*. Leaf had such mastery of his subject, and such a clear and exact way of treating his problems, that this error of theory hardly affects the value of the book.

In 1912 Leaf published *Troy, a Study in Homeric Geography*, based on his own explorations and those of Wilhelm Dörpfeld, and arguing that the catalogue of Trojan allies contained in the *Iliad* proves the existence of ancient trade routes converging on Troy as a centre. He thus agreed with V. Bérard that Troy shut off the trade of the Hellespont, and hence the war against her was commercial in origin. In *Homer and History* (1915) he argued that the Greek catalogue was a late addition, describing a division of territory inconsistent with the rest of the *Iliad*, which, for the purposes of argument, he treated as a consistent unity. He accepted the conclusions of H. M. Chadwick's *Heroic Age* (1912) and Dörpfeld's more doubtful identification of Ithaca with Leucas. Finally in *Strabo on the Troad* (1923) he edited with translation and commentary Strabo's discussion of that territory. The book is a masterly chapter, as it were, of that edition of the whole of Strabo which he had long contemplated as a joint enterprise to be undertaken by the Hellenic Society.

Leaf said of himself that he tried to combine 'scholarship with reality'. That explains the great qualities of his work. He never lost his sense of reality and proportion; all that he wrote was interesting, alive, and businesslike. He was admirably fair in controversy and clear in sustained argument. His fine scholarship was combined with a vigilant common sense. On the other hand, it may be thought that this desire for 'reality' made him try to find historical and geographical 'realities' where they did not exist, and not allow sufficiently for the elements of myth, fiction, and mere conventional ornament in

Homeric poetry. Not that he lacked poetical sense; his translations of the *Greek Anthology* are of high quality, and there is real beauty in his Greek elegiacs; for example, those prefixed to *Homer and History*.

A drawing of Leaf by William Rothenstein (1910) is reproduced in *Portrait Drawings of William Rothenstein, 1889-1925* (1926).

[Leaf's published works; Charlotte M. Leaf, *Walter Leaf*, containing a fragment of autobiography, 1932; personal knowledge.]

G. MURRAY.

LEE, SIR SIDNEY (1859-1920), Shakespearean scholar and editor of the *Dictionary of National Biography*, born in Keppel Street, Russell Square, London, 5 December 1859, was the elder son of Lazarus Lee, a London merchant, by his wife, Jessie Davis. He was originally named Solomon Lazarus, but early in 1890 he adopted the name Sidney instead of Solomon, and shortly afterwards dropped the name Lazarus. He was educated at the City of London School, then situated in Milk Street, Cheapside, under Dr. Edwin A. Abbott [q.v.]. Abbott's predecessor, Dr. G. F. W. Mortimer [q.v.], had encouraged the study of English, and Abbott, by his teaching and influence, stimulated interest in Elizabethan literature. The Elizabethan scholar, Arthur Henry Bullen [q.v.], and Henry Charles Beeching [q.v.], the poet and writer, were Lee's contemporaries at school and friends in later life. Lee matriculated from Balliol College, Oxford, as a commoner, in October 1878. In November 1879 he was *proxime accessit* for the Brackenbury history scholarship and was awarded a minor exhibition. He obtained a third class in classical moderations in 1880 and a second class in modern history in 1882, graduating B.A. in the same year. Among his contemporaries at Balliol, though two years senior, was his lifelong friend (Sir) Charles Harding Firth, who afterwards gave valuable advice and assistance to the *Dictionary of National Biography*.

Lee's Shakespearean studies began early. While an undergraduate he wrote two articles in the *Gentleman's Magazine* which attracted notice from Shakespearean scholars, especially from J. O. Halliwell-Phillips and F. J. Furnivall. The first of these articles, *The Original of Shylock*, which appeared in February 1880, suggested that the reputation of Roderigo Lopez [q.v.] and the popular excitement caused by

his trial and execution in 1594, incited Shakespeare to a subtler study of Jewish character than had been essayed before (cf. *English Historical Review*, vol. ix, 1894, pp. 470-472). The second article, which appeared in October 1880, called attention to the topical character of *Love's Labour's Lost*, the relation of its nomenclature to Henry of Navarre and his circle, and its references to contemporary France. Lee afterwards expanded these two articles. The first formed the basis of a paper, dealing with Jewish life in Elizabethan England, which he read to the New Shakespeare Society on 10 February 1888 (*Transactions*, 1887-1892, p. 143). The topical aspect of Elizabethan drama was made the subject of two papers read by him to the same society on 8 February 1884 and 22 October 1886 (*ibid.*, 1880-1886, p. 80; 1887-1892, p. 1).

About May 1882 Lee was offered a professorship of English which was about to be founded in the university of Groningen; but before the matter was finally arranged he became sub-editor to (Sir) Leslie Stephen [q.v.] when George Smith founded the *Dictionary of National Biography* [see the memoir of Smith now prefixed to the first volume]. Dr. F. J. Furnivall, who had already commissioned Lee to edit for the Early English Text Society the translation by Lord Berners of *The Boke of Duke Huon of Burdeaux*, which appeared in four volumes between 1882 and 1887, recommended him to Stephen, and he became assistant editor in March 1883 at a salary of £800 a year [see the memoir of Lee prefixed to the volume for 1912-1921]. From the beginning Lee gained Stephen's confidence by his industry and discretion, and this confidence ripened into intimacy and lifelong friendship. In 1903 Stephen wrote: 'My greatest piece of good fortune was that from the first I had the co-operation of Mr. Sidney Lee as my sub-editor. Always calm and confident when I was tearing my hair over the delay of some article urgently required for the timely production of our next volume, always ready to undertake any amount of thankless drudgery, and most thoroughly conscientious in his work, he was an invaluable helpmate' [*Some Early Impressions*, ed. 1924, p. 160]. In fact, Stephen and Lee were admirably fitted to co-operate in the work in hand. Stephen's position among men of letters enabled him to choose and control the contributors, while Lee's exact and scholarly methods were well fitted for organizing the editorial

work and raising the general standard of the articles by adding necessary detail and excluding what was redundant. The latter function was later summarized by Canon Alfred Ainger [q.v.] at the dinner given by George Smith to the contributors at the Hotel Métropole on 8 July 1897 in the phrase, 'No flowers by request'.

In the autumn of 1889 Stephen had a serious break-down, and Lee became joint editor at the beginning of 1890. A recurrence of Stephen's illness led him to resign his editorship in April 1891, whereupon Lee became sole editor. He held this post until the Dictionary and its First Supplement were completed in 1901, and he resumed it from October 1910 to December 1912, while editing the Second Supplement. But he retained throughout the years 1901 to 1916 the general oversight of the Dictionary, receiving and incorporating corrections, and adding fresh information. Lee set out his views on biography and biographical work, as they evolved, in his lecture on 'National Biography' delivered at the Royal Institution on 31 January 1896, in his Leslie Stephen lecture given at Cambridge on *Principles of Biography* (1911), and in his address delivered to the English Association in 1918 on *The Perspective of Biography* (English Association pamphlet no. 41). As editor, however, his greatest asset was his personality. Leslie Stephen said that the editor ought to be a 'considerate autocrat' (*Athenæum*, 23 December 1883), but Lee was not more autocratic than was necessary for the smooth running of the machine up to time. He preserved the balance and uniformity of the Dictionary, and realized that its value depended on the general standard of the articles and not chiefly on the merits of the more important lives. He kept in close personal touch with most of the regular contributors, frequently entertaining them at his house in Lexham Gardens and at his clubs. His popularity with them was evinced in a presentation of silver plate which they made to him in 1900. His relations with his staff were far from autocratic, although he believed in a good day's work, and his own powers of prolonged work at a pinch were remarkable. A four-hour afternoon without tea was the main trial to his Oxford assistants. *Hospitable, kindly, and considerate, Lee* made the period of service a happy memory to the present writer. The Dictionary was completed in sixty-three volumes in October 1900, and the First Supplement, including the lives of persons accidentally

omitted and of those who, while the work was coming out, had died too late for admission, was issued in three volumes in 1901.

Out of two of his articles in the Dictionary Lee developed his *Life of William Shakespeare* and his *Queen Victoria, a biography*. The article on Shakespeare appeared in July 1897 and the book in November 1898. It was received enthusiastically, and went through four editions in two months. Although the book was based on the article, the changes and additions were sufficient to make it an independent production. After it had passed through six editions Lee published in October 1915 a rewritten and enlarged edition in anticipation of Shakespeare's tercentenary; in this he gave a much fuller account of the development of the Elizabethan drama and its presentation on the London stage, and incorporated many of the results of his own subsequent work and of his discoveries in the archives at Stratford-on-Avon and the wills at Somerset House of Shakespeare's Stratford friends. The *Life* reached a thirteenth edition in his lifetime (1925), and was translated into German in 1890 under the direction of Professor Richard Paul Wülcker, of Leipzig. The copyright was left by Lee to the Faculty of English Language and Literature at Oxford, and a fourteenth edition was published in 1931 under the supervision of that body.

In his preface to the *Life* Lee modestly claimed to have provided students of Shakespeare with 'a full record of the duly attested facts and dates of their master's career' and with 'verifiable references to all the original sources of information'. But with more than eighteen years of Elizabethan study behind him he did much more than this. By treating the life and writings of Shakespeare in close connexion with each other and with the literature and history of the time, he produced a work of exegesis of the first order; and although he asserted that he 'avoided merely aesthetic criticism', he furnished a reliable basis for sound aesthetic appreciation by his study of the origin and formation of Shakespeare's text and of the influence of foreign literature on Shakespeare's subject-matter. These two themes, especially the second, he proceeded to develop subsequently. He followed up the former in 1902 in his introduction to the Clarendon Press facsimile of the first folio of Shakespeare's Plays, where he described the methods by which

publishers at that time procured their 'copy', and discussed the sources and value of the text of the folio. In 1905 he brought out for the Clarendon Press facsimiles of the earliest editions of *Venus and Adonis*, *Lucrece*, the *Passionate Pilgrim*, the Sonnets, and *Pericles*, with introductions dealing in the case of the Sonnets mainly with the text, but in that of the others with the literary origin and subject-matter also. In 1908 he reprinted at Stratford-on-Avon the quarto editions of *The Merchant of Venice*, *A Midsummer Night's Dream*, *King Lear*, and *The Merry Wives of Windsor*. In 1909 he edited a facsimile of *The Chronicle History of King Leir*, which, if compared with Shakespeare's play, affords an interesting illustration of the poet's treatment of raw material.

The question of Shakespeare's subject-matter led Lee to deal with the wider issue of the extent of foreign influence on Elizabethan literature, and to insist on the need for the comparative study of national literatures. In his *Life of Shakespeare*, while examining the influence of France on Shakespeare's poems, sonnets, and early plays, he had contended that the subject-matter and even the thought, particularly of the sonnets, was mainly conventional and that the poet, while improving what he touched, had borrowed abroad from Ovid, Petrarch, Ronsard, and Desportes, as well as from Sidney, Thomas Watson, and others at home. In his introduction to the two volumes of Elizabethan sonnets in Thomas Seecombe's revised edition of Edward Arber's *English Garner* in 1904, and in his article on 'The Elizabethan Sonnet' in the *Cambridge History of English Literature*, vol. iii (1909) he demonstrated more generally the close dependence of Elizabethan sonnets on foreign models. In the facsimiles of 1905, already mentioned, he dealt similarly with the Poems and with *Pericles*. In April 1909, in an article in the *Quarterly Review* on *Ovid and Shakespeare's Sonnets*, he worked out in detail the debt of the Sonnets to the *Metamorphoses*, and in his lecture delivered in June to the English Association on 'The Impersonal Aspect of Shakespeare's Art' (English Association leaflet no. 13), he denied that Shakespeare's personal life was reflected in his plays. In 1910 Lee enlarged and published some lectures which he had given at Oxford in 1909 under the auspices of the Common University Fund, under the title of *The French Renaissance in England*. In these

he dealt with the debt of Tudor culture to French grammarians, prose-writers, and dramatists, while in a lecture delivered to the British Academy in 1915 on *Shakespeare and the Italian Renaissance* he indicated the channels through which the 'new faith in beauty and reason' filtered from Italy through France to England, where it found disciples in Sidney, Spenser, and Shakespeare. Finally, he published a paper in the *Anglo-Italian Review* for September 1918 on *Tasso and Shakespeare's England*. With these studies on international literary relations, which demanded an extraordinarily accurate knowledge of the great body of literature from which they were drawn, may be mentioned *The Call of the West*, four articles published in *Scribner's Magazine* during 1907, setting forth the knowledge of America in Shakespeare's time and its influence on current thought in Spain, France, and England. On 19 October 1918, in his inaugural address to the Modern Language Research Association (now the Modern Humanities Research Association), he emphasized the pacific influence of the international element in literature.

The other book developed from the Dictionary, *Queen Victoria*, was to some extent unpremeditated. When the First Supplement of the Dictionary was planned it was intended to carry it down to the end of the nineteenth century, but when the queen died twenty-two days later, it was resolved to include the whole period of her reign. With some misgiving with regard to its difficulties Lee undertook the article on the queen at the earnest request of George Smith. The article appeared in October 1901, and in response to a widespread wish the book followed in November 1902. It was the first serious attempt to present the queen's public and private life as a whole. The book was expanded to contain more biographical detail than had been given in the article and more explanatory comment on events. Lee aimed at making the queen's personality the principal study, and with space at his disposal he was able to use more fully references to public affairs in her diary and letters, so far as these were available, and 'to let the Queen speak for herself'. Victoria's influence on events after the death of the Prince Consort in 1861 was very imperfectly known, and became increasingly difficult to elucidate as her reign drew nearer to its close. Although Lee's reputation as an editor for discretion and care assisted him to get information

otherwise unattainable, the latter part of the biography is distinctly slighter than the rest. But as a pioneer piece of work it was remarkably successful. A fourth edition appeared in 1907.

Lee suffered financially when his full employment as editor ceased in 1901. He did some further work for the Dictionary before the commencement of the Second Supplement, superintending a summary which appeared in March 1903 as the INDEX AND EPILOGUE, a volume of ERRATA in 1904, and a reissue of the Dictionary and First Supplement in 1909. But as these were not very remunerative, he also engaged in lecturing and writing. As a lecturer Lee was sometimes diffuse, but he improved very much in later years. He was Clark lecturer in English literature at Trinity College, Cambridge, in 1901-1902, he made a successful tour through the universities and colleges of the United States of America in 1903, and in October 1904 he published his lectures delivered at the Lowell Institute, Boston, on *Great Englishmen of the Sixteenth Century* (new ed. 1925). He edited for the university press of Cambridge, U.S.A., between 1907 and 1910 the *Renaissance Shakespeare*, using William Aldis Wright's text, and contributing a general introduction and notes, as well as separate introductions to several plays. This work was reissued in England in 1910 as the *Caxton Shakespeare*. In 1909 he undertook to edit for the Clarendon Press *Shakespeare's England*, a collection of articles describing the habits and life of the time. Although Lee contributed only one article, he planned the work and enlisted most of the writers, but in 1914 he gave up the editorship of the volume, which was brought out by (Dr.) C. T. Onions in 1916.

From October 1910 to December 1912 Lee was engaged in editing the Second Supplement of the Dictionary. George Smith had intended to continue the work by means of a supplement at the end of each decade, and Mrs. Smith, to whom he bequeathed the Dictionary, proceeded to carry out his plan. This principle of quick biography has met with criticism, but it was advocated by Leslie Stephen on account of the rapid disappearance of material, and defended by Lee in December 1912 in the *Nineteenth Century and After* in an article entitled 'A Journey's End', in which he instanced Boswell's *Johnson* and Lockhart's *Scott* in support of his view.

Neither the First nor the Second Supple-

ment preserved exactly the standard of selection maintained in the main work. The First Supplement tended to restrict admission, particularly in certain classes; the Second Supplement, on the other hand, was far more inclusive than the main Dictionary. The work of editing was undoubtedly more arduous, as Lee had to train a new staff and to supply the place of contributors no longer available after ten years. Nevertheless, the rate of production was maintained and the work appeared less than a year after the close of the period which it covered. Lee wrote few articles, but among them were those on King Edward VII, Leslie Stephen, Goldwin Smith, F. J. Furnivall, and John Churton Collins. After its issue Lee, as before, carried on a general editorial supervision until the death of Reginald John Smith [q.v.] in December 1916. The Dictionary was soon afterwards presented to Oxford University, which transferred it to the Clarendon Press, and Lee's connexion with it came to an end. Lee felt that the Dictionary should be carried on in accordance with George Smith's plan and on traditional lines, and insisted on this with considerable and natural earnestness. Though it was impossible, while the War continued, for the Clarendon Press to make definitive pledges, a volume covering the years 1912-1921, with Henry William Carless Davis [q.v.] and J. R. H. Weaver as editors, was begun soon after the conclusion of peace.

Lee became a university professor comparatively late in life. From early days he had been an unofficial teacher and had devoted much of his spare time to popularizing English studies. He took part in the University Extension summer meetings at Oxford and Cambridge, and in London he lectured on Saturday evenings at the Working Men's College in Mile End Road. But the institution with which he was most closely connected was Toynbee Hall, for which in early days he arranged concerts and lectures, and where from 1890 he was president of the Elizabethan Literary Society. This society was founded in London on 8 March 1884 by the Rev. W. Bartlett, was given head-quarters at Toynbee Hall in 1886 by Samuel Augustus Barnett [q.v.], and in 1913 removed to King's College, Strand. Lee was included in the first list of vice-presidents and he and Frederick Rogers, who began life as an errand boy, were largely responsible for developing it as a centre of Elizabethan study. Especially Lee brought it into

touch with contemporary research and secured the active support of leading Elizabethans of the day. In January 1925, at the annual supper, he induced the Society to set itself to complete the Marlowe memorial at Canterbury, designed by Edward Onslow Ford [q.v.] and completed by Charles Hartwell. It had been projected by two members of the Society, Rogers and J. E. Baker, was erected in the Canterbury butter-market in 1891, and removed still incomplete in 1924 to the Dane John park, where it now stands, and finally completed and unveiled on 1 November 1928. Lee was also one of the founders of the English Association in 1900 and was its president in 1917; he compiled for it in 1910 a catalogue for *A Shakespeare Reference Library* (English Association leaflet no. 15; 2nd ed., with Sir E. K. Chambers, 1925, English Association pamphlet no. 61). In 1913 Lee was appointed to the new chair of English language and literature at the East London College in the university of London. His lectures attracted serious students. 'He took great personal interest in his pupils and was never weary of advising and helping them, especially if they were ex-service men' [Firth, *Sir Sidney Lee*, p. 10]. The death on 10 July 1920 of his sister, Elizabeth Lee, who shared his interests and to whom he was much attached, was a great sorrow to him. In 1921 he had a serious operation, and in 1924 impaired health and pressure of other work led him to give up his professorship.

Lee's last work of importance was his *Life of King Edward VII*, undertaken at the request of King George V. Unlike the *Queen Victoria* it was not made difficult by scarcity of material. The documents in the royal archives at Windsor Castle and Buckingham Palace were placed at his disposal, as well as several private collections of King Edward's letters. Controversies concerning the diplomatic origin of the European War had led to the publication of much British and foreign official material relating to the period, and the marked decrease in Great Britain and in other countries of the reticence of public men with regard to recent public affairs was also not without its advantages. King George, who made the work feasible, left the plan and the execution entirely to Lee's discretion. As with Victoria, Lee made Edward VII's personality and influence the central study, and therefore gave considerable space to international affairs. The first volume appeared in

March 1925, but its production overtaxed Lee's failing strength and the second volume, which dealt with the reign, was far from completely written at the time of his death. It was finished by his secretary, Mr. F. S. Markham, with some assistance noticed in the preface, and appeared in 1927. In the autumn of 1925 Lee's health steadily gave way, and he died, unmarried, 3 March 1926 at his residence, 108A Lexham Gardens, Kensington. After cremation his remains were interred, as he had requested, in the cemetery at Stratford-on-Avon.

All through life Lee had many warm friends. It was said of him in *The Times* that 'those who knew him best know best how genial and generous he was, and how unselfishly he gave himself, both publicly and privately in service to others'. Beside this may be recorded George Saintsbury's testimony, given two days later in the same paper: 'He is about the only man, I think, of the whole lot of us (including myself) from whom I have never heard an unkind speech about a fellow craftsman.' Lee's portrait, drawn in the last months of his life, by William Rothenstein, is at East London College; but some of the photographs of him, especially that reproduced in Professor Boas's collection of Lee's *Essays* (opposite p. 84), recall him better to those who knew him earlier.

Lee held many offices. He was chairman of the executive of Shakespeare's Birthplace Trust from 1903 until his death, and worked hard on its behalf. He was registrar of the Royal Literary Fund from 1907. In 1910 he was appointed a member of the royal commission on the public records and elected a fellow of the British Academy. He was appointed a trustee of the National Portrait Gallery in 1924. He was a foreign member of the American Academy of Arts and Sciences and a corresponding member of the Massachusetts Historical Society. He was knighted in 1911, was elected to the Athenaeum Club in 1901 under Rule II, and received honorary degrees from the universities of Manchester (1900), Oxford (1907), and Glasgow (1907).

Besides the books and articles already mentioned, Lee wrote a *History of Stratford-on-Avon from the Earliest Times to the Death of Shakespeare* (1885, new ed. 1907); edited the *Autobiography of Edward, first Baron Herbert of Cherbury* [q.v.] with a continuation of his life (1886, new ed. 1906); compiled a *Census of Extant Copies of the First Folio of Shakespeare's Plays* as

a companion to the *Facsimile* (1902), and gave an account of fourteen more copies in *The Library*, April 1906 (reprinted as *Notes and Additions to the Census*, 1906); contributed in 1904 to vol. iii of the *Cambridge Modern History*, chapters x and xi, on 'The Last Years of Elizabeth', of which period he contemplated writing a detailed history, and 'The Elizabethan Age of English Literature'; and published in 1906 eleven articles on *Shakespeare and the Modern Stage and other Essays*. In 1929 Professor F. S. Boas published a selection of Lee's lectures and essays under the title of *Elizabethan and Other Essays*. Lee left a number of his books to the Birthplace Museum at Stratford-on-Avon, and his annotated working copy of the reissue of the Dictionary of National Biography to the London Library for the use of the librarian and staff. The bulk of his English library belongs by bequest and purchase to East London College, to which he also left £5,000 with which to endow two bursaries.

I. CARLYLE.

LEISHMAN, Sir WILLIAM BOOG (1865-1926), bacteriologist, born in Glasgow 6 November 1865, was the fourth child and youngest of three sons in the family of six children of William Leishman (1833-1894), regius professor of midwifery in the university of Glasgow, by his wife, Augusta Selina, eldest daughter of George Drevar, of Roschill, Blackrock, co. Dublin. Educated at Westminster School and at the university of Glasgow, where he graduated M.B., C.M. in 1886, he entered the Army Medical Service in 1887, passing fifth into the Army Medical School at Netley. After home service for three

years, he proceeded to India and served until 1897 with a year's sick leave (1892-1893); he went through the Waziristan campaign of 1894-1895. Promoted major in the Royal Army Medical Corps in 1899, he was posted to Netley in order to take charge of the medical wards, spending his spare time in the pathological department then under the direction of (Sir) Almroth Wright, and in the following year succeeded Major (Sir) David Semple as assistant professor of pathology.

Although he had been exceptional in taking a microscope with him to India in 1890 and had worked at bacteriology when staff surgeon to Sir George Wolsley at Lahore, this appointment at the Army Medical School was Leishman's first real opportunity for original work, and came a little late in his career. At Netley he was able to watch the early development of Almroth Wright's anti-typhoid vaccination, in which he later took so important a part. During this period Leishman elaborated the stain for blood—a modification of Romanowsky's—which is known by his name and was employed by him in the detection of the parasite of kala-azar, also called Dum-Dum fever. This parasite, now known as the Leishman-Donovan body (*Leishmania donovani*), Leishman detected in 1900, but he did not publish his observations until 1903, the year in which Lieut.-Col. Charles Donovan, of the Indian Medical Service, confirmed the discovery. The name Leishmania was introduced in 1903 by Sir Ronald Ross; the term Leishmaniasis also covers Oriental sore, a disease due to the closely allied protozoan parasite *Leishmania tropica*.

When the Army Medical School was transferred from Netley to Millbank, London, in 1903, Leishman became professor of pathology, and held this post until 1913. During these ten years he continued his work on kala-azar and perfected the protective vaccine against typhoid fever, a large reserve store of which was kept at the Royal Army Medical College, so that within two weeks of the outbreak of war in August 1914 170,000 doses were issued to the troops. It has been estimated that without its use in the European War there would have been about 551,000 cases of this disease, with more than 77,000 deaths; actually there were 21,139 cases and 1,191 deaths only. Leishman also spent much time on a difficult piece of research, for which his masterly technique fully qualified him, namely, the life cycle of the *Spironema duttoni* of relapsing fever, con-

veyed by the tick *Ornithodoros moubata*; in 1920 he gave the Horace Dobell research lecture before the Royal College of Physicians of London, taking as his subject 'An experimental investigation of the Parasite of Tick Fever'.

When Leishman's professorship terminated at the end of January 1914, he became War Office expert on tropical diseases on the army medical advisory board, but he was able to continue for a time his own research work in the laboratories at the Royal Army Medical College. In October 1914 he joined the British Expeditionary Force in France as adviser in pathology, and was chairman of the committees on 'trench fever' and 'trench nephritis', new aspects of disease consequent on stationary warfare. In April 1918 he was brought back to duty at the War Office; in the following October he was gazetted major-general; and in June 1919 he became the first director of pathology at the War Office, a post which he retained until, in July 1923, he was appointed medical director-general, Army Medical Services, with the rank of lieutenant-general—promotion which showed that an officer who has devoted his life to the scientific aspects of medicine can obtain the highest position in his branch of the service. Leishman had shown his administrative ability at Netley and also in connexion with the organization of anti-typhoid inoculation; he had proved a very successful teacher and promoter of research, who had won the confidence of the members of his corps. A fellow officer wrote that 'he made potential rivals into friends and friends into brothers'.

Leishman was knighted in 1909, created C.B. in 1915, K.C.B. (military) in 1924, and K.C.M.G. in 1918. He was made honorary physician to King George V in 1912, commander (1915) and grand officer (1925) of the legion of honour, and he received the distinguished service medal of the United States of America. He was elected a fellow of the Royal Society in 1910 and later served on the council and on many committees. In 1914 he was elected a fellow of the Royal College of Physicians of London under the special by-law xl (6), and in 1925 a member of the Athenaeum Club under Rule II. He was an original member of the Medical Research Committee (later Council) from 1913 to 1923 and was re-elected in 1926. He was president of the Society of Tropical Medicine and Hygiene (1911-1912), of the section of comparative medicine of the Royal

Society of Medicine (1920), and chairman of the foot-and-mouth disease research committee, Ministry of Agriculture (1924). The universities of Glasgow and McGill conferred on him the honorary degree of LL.D. He delivered the Harben lecture (1910) on anti-typhoid inoculation, and the Linaere lecture at St. John's College, Cambridge, on health in the tropics (1925).

Leishman had many interests outside his profession and was an accomplished landscape artist and musician. He married in 1902 Maud Elizabeth, eldest daughter of Lieut.-Col. Edward Gunter, East Lancashire Regiment, and had one son and three daughters. He died after a short illness 2 June 1926 at Queen Alexandra's Military Hospital, Millbank. Memorial tablets were placed in the chapel of the Hospital and in the pathological laboratory of the Royal Army Medical College, Millbank.

H. D. ROLLESTON.

LE SAGE, SIR JOHN MERRY (1837-1926), journalist and managing editor of the *Daily Telegraph*, was born at Clifton 23 April 1837, the only son of John Sage, of that town, by his wife, Elizabeth Godfrey. He adopted the name of Le Sage in middle life. Educated at Bristol, Le Sage became a reporter on the *Torquay Directory* and the *Western Morning News* at Plymouth before obtaining an appointment in London on the *Daily Telegraph*. His connexion with that paper, begun in 1863, remained unbroken until his retirement sixty years later.

Le Sage's principal journalistic feat as a special correspondent consisted of getting through to London, hours ahead of his rivals, an account of the entry of the German army into Paris in January 1871. He remained in Paris throughout the Commune. He attended the coronations at St. Petersburg of Alexander III (1881) and Nicholas II (1894), was in Egypt in 1882 at the time of Sir Garnet Wolseley's expedition against Arabi Pasha, and was received in audience by Pope Leo XIII and by Sultan Abdul Hamid. Le Sage did not, however, achieve marked distinction as a writer on a paper which had on its literary staff such well-known journalists as (Sir) Edwin Arnold, George Augustus Sala, W. Beatty Kingston, W. J. Prowse, George Hooper, Frederick Greenwood,

Edward Blanchard, and, at a later date, H. D. Traill, E. J. Dillon, and W. L. Courtney.

Le Sage's talents were best displayed in an executive capacity. He enjoyed the confidence in turn of Joseph Moses Levy [q.v.], the original proprietor of the *Daily Telegraph*, and that of his son, Edward Levy-Lawson, first Baron Burnham [q.v.]. The latter was in full direction and control of the paper for more than thirty years before he was raised to the peerage in 1903, and Le Sage was his trusted right-hand man. Later, when the Hon. Harry Lawson, afterwards second Baron Burnham, took charge, Le Sage served the son as loyally as he had served both the father and the grandfather. For practically forty years Le Sage was managing editor, and, in his contacts with the staff in the daily conduct of the paper, the autocrat of Peterborough Court. He strongly maintained the traditions by which the *Daily Telegraph* had established its special position, which Edmund Yates once described as 'the organ of the knife-board of the omnibus'. Le Sage regarded the middle-class as the backbone of the country, and had little sympathy with the later developments of democracy. To let well alone was one of his working principles. News interested him more deeply than politics. The minutiae of any political controversy bored him. He liked it presented, as he said, 'in six lines'.

Le Sage made up his mind quickly—a sovereign editorial virtue. A good judge of men, he reposed great faith in what he called his 'journalistic instinct', which worked 'in flashes'. The criticism of outsiders he met with imperturbability. It was a fixed article of his creed that enemies of the *Daily Telegraph* always came, sooner or later, to a bad end.

Unquestionably, Le Sage's special gifts were better suited to the last two decades of the nineteenth century than to the first two of the twentieth. The rapid rise of the new journalism, just before and after the turn of the century, shook him. He responded gamely to the challenge, but with ever-increasing effort. Yet the anxieties and responsibilities of the European War of 1914-1918 served to give him new vigour. He did the day's work with unshaken resolution, and nothing but illness or holidays kept him, even when past his eightieth year, from his usual office routine. For many years he had rooms in Clement's Inn, and punctual to the minute, twice a day, he trod the Fleet

Street pavement—an erect, imposing, and well-groomed figure.

Outside Fleet Street Le Sage was hardly known. He never attended meetings: he cultivated few social and no political relationships; he never wrote a letter except under compulsion; and he never made speeches. He was a lieutenant of the City of London, but the only public recognition which he received was the knighthood bestowed upon him in 1918 in recognition of his long services to journalism and more especially of the *Daily Telegraph's* steady support of the national policy during the War.

In his younger days Le Sage travelled widely: in later life he enjoyed the gossip of the Garrick Club. An hour at Lord's on a sunny afternoon, with W. G. Grace at the wicket and scoring freely, was for years his ideal of recreation.

Le Sage retired from the *Daily Telegraph* in June 1923 and died 1 January 1926 at his home at Hurlingham. He married three times: the record of his first marriage is not available; he married secondly, in 1868, Clara Ellen (died 1873), daughter of Charles Henderson Scott, legal reporter, by whom he had one son and one daughter; thirdly, in 1874 Elizabeth Lord (died 1933), daughter of John Burton Martin, of London, by whom he had two sons.

[*Daily Telegraph*, 2 January 1926; personal knowledge.] J. B. FIRTH.

LESLIE, Sir BRADFORD (1831-1926), civil engineer, was born in London 18 August 1831, the second son of the painter, Charles Robert Leslie [q.v.], by his wife, Harriet Stone. He was named after Samuel T. Bradford, the senior partner of the publishing firm of Bradford & Inskeep, of Philadelphia, to which his father had been bound apprentice in 1808. He was educated at the Mercers' School, London, and at the age of sixteen was apprenticed for five years to the civil engineer, Isambard Kingdom Brunel [q.v.], who waived his fee of one thousand guineas in consideration of C. R. Leslie's painting him a picture or two. In 1851, while still an apprentice, Leslie was employed, as assistant engineer, on the construction of the bridge over the Wye at Chepstow on the Gloucester and Dean Forest Railway, and afterwards until 1853 on the Royal Albert bridge over the Tamar at Saltash. He also supervised for Brunel the erection of the Stony Creek and Salt

Water River railway bridges in Victoria, Australia, and assisted him in the construction of material for the Great Eastern and in the launch of that steamship on 31 January 1858.

In the same year Leslie entered the service of the Eastern Bengal Railway Company (to which Brunel was consulting engineer), acting under William Purdon in the capacity of resident engineer in charge of large bridges and viaducts. There he superintended the erection of the bridges in the Ganges delta over the Ichamati river and over the Kumar river at Alumdanga, on caissons founded by the pneumatic process. While employed on these he had to teach the native labourers how to rivet by hand, there being no machine tools, and at times he had himself to work in the cylinders. Leslie returned to England in 1862 and was appointed chief engineer of the Ogmore (or Ogwr) Valley Railway in Glamorganshire. After completing this work he re-entered the service of the Eastern Bengal Railway in 1865 as chief resident engineer for the extension of the line in the northern delta to the neighbourhood of Goalundo, begun in November 1867 and opened for service on 1 January 1871. The undertaking included Leslie's first great achievement in India, the bridge over the Gorai, the largest and most important deltaic branch of the Ganges. The bridge was supported on eight piers having two iron cylinders each, and was remarkable for the ingenious boring gear of his own invention by means of which the caissons were sunk in the shifting bed of the Gorai to a depth of nearly one hundred feet. For his paper describing this work, read before the Institution of Civil Engineers in February 1872 in the course of a short visit to England [*Proceedings* of the Institution of Civil Engineers, vol. xxxiv, 1871-1872], he was awarded a Telford medal and premium.

During his stay in England Leslie was appointed consulting engineer to the Oudh and Rohilkhand Railway Company, and in the same year he returned to India, at the invitation of the secretary of state, in order to inquire into the condition of the bridges over the rivers Beas, Jumna, and Sutlej on the Sind, Punjab, and Delhi Railway. At this time he became concerned in the construction of a bridge of a highly original character, which he had designed, crossing the Hugli between Calcutta and Howrah. The Hugli is a deep and rapid river, subject to big fluctuations

of level from tides and floods, with a large and varied ocean and river traffic, through which a bridge would be exposed to damage from shipping breaking adrift in cyclone and storm waves. In 1868 Leslie had designed and modelled parts of a floating bridge, which could be more cheaply and quickly built in the first instance, and more readily repaired in case of accident, than a fixed structure. His design and model were seen and approved by the viceroy, the Earl of Mayo, at the opening of the Gorai bridge. The viceroy tested the stability of the design by standing on the floating model, while the coolies agitated the water in which it was floating. In spite of some adverse official opinion the floating bridge was begun in January 1873 and opened for traffic in October 1874, when the assembled crowds sang ballads and hymns in praise of Leslie for having given them a means of crossing the sacred river. The floating portion of the bridge, which was 1,530 feet long and 60 feet wide, was carried on fourteen pairs of rectangular iron pontoons, and an opening of two hundred feet was provided in the centre for the passage of the larger vessels by making the two central pairs movable, so that they and their superstructure could be dropped downstream and hauled sideways out of the fairway. For his paper describing the structure read before the Institution of Civil Engineers on 5 March 1878 [*Proceedings*, vol. liii, 1878] Leslie was awarded a Watt medal and another Telford premium. In 1899, realizing that the bridge though structurally sound was becoming inadequate for the traffic, he visited India in order to induce the government to take up the question of its replacement. But it was only in 1910 that a bridge committee was appointed. In 1918, by request, he submitted a design for two larger one-way bridges on the same plan, but this was not accepted, and at the time of his death he had almost completed a design for a single cantilever bridge. Thus Leslie's original bridge is still standing (1934).

While the Hugli floating bridge was being constructed, the municipal engineer of Calcutta, William Clarke, was invalidated home, and Leslie succeeded him, resigning his position of consulting engineer to the Oudh and Rohilkhand Railway Company. In consequence, the floating bridge was for the most part constructed under his own supervision. He also completed the Calcutta city water supply and drainage schemes initiated by Clarke, besides taking

an active part in many other schemes. Leslie held this post until 1870, when he was appointed agent and chief engineer of the East Indian Railway Company.

This new appointment carried with it wide administrative duties. Leslie carried out a thorough inspection of the railway, replaced wooden wagons by iron ones of larger capacity, introduced cast-iron sleepers, and employed native drivers for goods trains, though the advisability of this last measure has been questioned. In order to bring the producers of the Ganges valley into direct touch with Calcutta, it was resolved to carry the railway over the Hugli at Naihati. Although Leslie's design for the necessary bridge, a model of which he presented afterwards to the Institution of Civil Engineers, was not accepted, he supervised the construction of the new bridge as consulting engineer. On 24 January 1888 he read a paper describing it to the Institution of Civil Engineers [*Proceedings*, vol. xcii, 1888], for which he was awarded a George Stephenson medal and a third Telford premium. The structure, known as the Jubilee bridge, was opened in 1887, when Leslie was created K.C.I.E. Almost immediately afterwards he was invalided home on account of malaria. During his long residence in India he distinguished himself not only by his originality, thoroughness, and resource, but by his constant care for the well-being of his assistants and subordinates, and by carrying out personally arduous and dangerous inspection work.

On his way to England in the *Tasmania* Leslie was shipwrecked off Corsica and received a permanent injury to his knee. In London, within three months, he began to practise as a consulting engineer, and in 1895 he was made chairman and engineering adviser to the Southern Punjab Railway Company and presided at the board meetings until October 1925. He never retired from work, but continued to practise and lecture to the end. He died in London, at his home, 171 Maida Vale, 21 March 1926, in his ninety-fifth year.

Leslie married in 1855 Mary Jane Eliza (died 1886), daughter of William Honey, civil engineer, of Plymouth, and had one son and four daughters; three of his daughters predeceased him.

Besides the three papers already mentioned, Leslie contributed to the Institution of Civil Engineers a communication, 'On an improved method of lighting vessels under way at night' [*Proceedings*, vol. lxxxiii, 1880].

Leslie's portrait, painted by his younger brother, George Dunlop Leslie, is in the possession of his granddaughter, Miss Lydia Spence.

[*The Times*, 22 and 23 March 1926; *The Engineer*, 26 March 1926; *Proceedings* of the Institution of Civil Engineers, vol. cccxiv, 1926-1927; private information.]

E. I. CARLYLE.

LEVER, WILLIAM HESKETH, first Viscount Leverhulme (1851-1925), soap manufacturer, was born in Wood Street, Bolton, Lancashire, 19 September 1851, the elder son of James Lever, wholesale and retail grocer, of Bolton, by his wife, Eliza, daughter of William Hesketh, a cotton-mill manager, of Manchester. After being for a time at a private school in Bolton, he became, at the age of thirteen, a pupil at the Church Institute. His father, although a nonconformist, was attracted by the teaching and influence of the headmaster of the Institute, William Tate Mason. It was his mother's wish that William Lever should study medicine, but it was decided that he should enter the family business, and in 1867, when he was sixteen, he began his commercial training.

The grocery firm, of which James Lever had, in 1864, become the sole proprietor, prospered and increased. When William Lever was admitted to a share in the undertaking in 1872 his partnership was worth £800 a year. At the same time he became engaged to Elizabeth Ellen, daughter of Crompton Hulme, linen-draper, a neighbour in Wood Street. The marriage took place in 1874, and the newly wedded couple went to live in Park Street, Bolton. The junior partner soon began to show that ardour for development which marked his career. A branch of the grocery business was opened at Wigan by the purchase of another firm, reforms in the organization were made, larger premises were built, and new commitments undertaken. The elder Lever, with the conservatism of age, was inclined to view with anxiety some of this progress, but its success disarmed opposition.

It was in 1884 that Lever decided to begin trading on his own account, and to specialize in soap. There was no particular reason, as he used to admit, for choosing this commodity, and he might just as well have chosen anything else. His brother, James Darey Lever, agreed to join him, but his father hesitated to support the scheme, although he eventually assisted the new firm with some additional

capital. Lever himself withdrew some of his money from the grocery company, and got together about £4,000 for the establishment of his new business. One of his earliest steps was to find for his new soap a name which would look and sound well in advertisements. The name 'Sunlight' was chosen and registered. The new soap was made largely from vegetable oils, instead of almost entirely from tallow, and in the first instance was supplied by other manufacturers for sale by Lever Brothers. But in 1885 the new firm purchased the soapworks of Winsor & Co. at Warrington, and in the following January began to make its own soap.

The demand for Sunlight soap grew rapidly. The output, which in the first year had been 20 tons a week, had increased in the second year to 450 tons a week, and the need for larger works became pressing. In 1887 the idea of founding a centre, where his works should be, and where his work-people should live, took shape in Lever's mind. He bought 52 acres of land—subsequently extended to 500 acres—conveniently situated on the Mersey, near Bebington, Cheshire, and on 3 March 1888 the first sod of the new town of Port Sunlight was cut by Mrs. Lever. Manufacture began in the new surroundings in January 1889.

About this time Lever travelled much, spreading his business overseas, opening branches or agencies in the colonies, the United States, and various European countries. In 1892 he contributed some articles on his tour round the world to a Birkenhead newspaper, and these were afterwards republished in book form under the title of *Following the Flag* (1893). Some of his foreign ventures made slow and disappointing progress at the start, but generally speaking, the profitable development of his affairs was continuous.

In 1890 Lever Brothers was made a limited company, and in 1894 this company was made public with a capital of £1,500,000, divided equally into preference and ordinary shares. The first issue of a portion of the preference capital was heavily over-subscribed. No ordinary shares were offered to the public, and Lever, who became chairman of the company, gradually acquired all these. It was his view that as the chief risk of the new enterprises would fall on the ordinary shares, he himself should carry that risk.

After the formation of the public company, a definite policy of amalgamation with other soap-making firms was fol-

lowed. The first business acquired was that of Benjamin Brooke & Co. in 1890, and the production of the soap was transferred to Port Sunlight. Other transactions, either by purchase or by interchange of shares, resulted in Lever exercising, during the opening years of the twentieth century, a wide control over the soap-making trade, and occupying the most prominent position in that industry.

In 1906 the increase in the cost of raw material, and the necessity for advancing prices, suggested to Lever further efforts in the direction of amalgamation. The proposed combine attracted the hostile attention of the *Daily Mail* and other newspapers under the management of Lord Northcliffe [q.v.]. For some months during the autumn of 1906 these newspapers indulged in violent criticism of Lever, against whom all kinds of startling accusations were launched, including that of fraudulent trading and bad treatment of his workpeople. The Sunlight soap business was seriously affected by these attacks, and certain firms which had agreed provisionally to a pooling of interests were alarmed into abandoning the arrangement. Counsel's opinion was taken, and an action for libel was brought by Lever Brothers against the newspapers concerned. The case came before the assize court at Liverpool on 15 July 1907. Lever was the first witness called for the plaintiffs, and in the course of examination and cross-examination had no difficulty in establishing that the charges brought against his company and himself were wholly unfounded, and had occasioned great harm to his trade. After this evidence it became clear that the only question left was the extent of the damages to which Lever Brothers were entitled, and rather than leave this to the jury the defendants offered a settlement. Lever consented to accept £50,000—the highest award ever made in a libel case—and he obtained a further £91,000 from certain Scottish newspapers owned by the defendants. He used a part of this sum for the purchase of the old Blue Coat school in Liverpool, and gave the balance to Liverpool University as an endowment for the school of tropical medicine and other educational objects.

Holding the position that he did, Lever naturally received several invitations to enter political life. He contested Birkenhead as a liberal three times without success, in 1892, 1894, and 1895. In 1900 he failed again in the Wirral division of

Cheshire, but in 1906, when there was a general reaction in favour of liberal views, he was returned for that constituency. He found the additional work too heavy, and retired in December 1909. He came forward, however, once more in the following month for the Ormskirk division of Lancashire, but did not win the seat. Although unsuited by temperament for party politics, he seems to have enjoyed electioneering, and, by practice on many platforms, he became a competent speaker. He was liked by his fellow members of parliament, and a striking incident in his short career in the House was the warm welcome which he received when he returned after winning his libel action.

When the European War broke out in 1914, Lever supported the recruiting activities of the government in his own district, and served himself for a time in the ranks of the Birkenhead battalion of the Cheshire regiment. Fulfilling duties more suitable for a man of his age (sixty-three), he was a member of several important committees, and acted as honorary treasurer of the Star and Garter Home for disabled soldiers at Richmond. In 1918 he was appointed honorary commandant of his battalion of the Cheshire regiment.

In pursuance of his aim to provide the raw materials for his own trade, Lever became interested in the supply of palm-oil and palm-kernel oil from West Africa. He began at once to experiment with modern machinery which should supersede the primitive methods used by the natives for obtaining these oils. In 1910 he established crushing mills in Nigeria, and, as large areas of forest were essential to secure continuity of supply, he obtained in the following year a concession of land and works in the Belgian Congo. After the War he extended his African policy, and was instrumental in the purchase of the shares of the Niger Company. The high price paid for these shares was unfortunate, for the transaction was followed by a disastrous fall in values, due to trade depression.

In his care for Port Sunlight, the model township of his own foundation, Lever was assiduous. However much his politics leaned to *laissez-faire* liberalism, and however much he disliked state interference, his government in practice was a benevolent autocracy. He introduced profit-sharing and benefit schemes, he planned houses and gardens, and inaugurated all kinds of social and sporting amenities for the benefit of those employed by his company. Later in his career he attempted

something of the same kind in another part of the kingdom. In 1917 he bought from Colonel Duncan Matheson the island of Lewis, and followed this up by the purchase in 1919 of the islands of North and South Harris. He hoped to be able, by a substantial outlay of capital, to develop the fishing industry and in this way to improve the circumstances of the crofter population. But difficulties arose, chiefly in connexion with the tenure and occupation of the land, and in 1923 he decided to abandon the scheme. When he left Lewis he offered as a gift to the town of Stornoway a considerable acreage of the land which he had acquired.

Lever was interested in architecture and in art generally. He was an enthusiastic collector, with resources that did not oblige him to be discriminating, of pictures, pottery, and old furniture. After his death there was a sale lasting fifteen days of the contents of the houses which he had filled with his purchases. His public munificence was constant. An important instance of this was his gift to the nation of Stafford House, St. James's, a house built by James Wyatt for the Duke of York, second son of George III, and afterwards the London residence of the Dukes of Sutherland. This building, under the name of Lancaster House, was opened to the public in 1914 as the London Museum, and contains exhibits relating to the history of the City. To Liverpool University he was a generous benefactor, and he also gave largely to his native town of Bolton, of which he was mayor in 1918-1919. On Port Sunlight he lavished many gifts, including an art gallery in memory of his wife.

The extent of Lever's business undertakings may be judged from the fact that in 1924 the capital of Lever Brothers amounted to nearly £57,000,000, and it had grown to be the largest commercial undertaking of its kind in the world. The controller of these vast interests was in some ways an exceptional figure among industrial leaders of the time. He had courage, foresight, and an untiring capacity for working himself, as well as the gift of obtaining loyal and effective service from others. But the interest of Lever's character and career lies as much in his few failures as in his many successes. His restless imagination seemed quite unable to contemplate inefficiency in any department of life without a burning desire to correct it regardless of cost or trouble to himself. To say

that there was a commercial motive behind his enterprises is a comment that might well have gratified him, for, although responsive to the claims of charity, he maintained, by precept as well as by example, that the best service to humanity was to give men the opportunity of improving their conditions by their own efforts.

Lever was created a baronet in 1911 and in 1917 was raised to the peerage as Baron Leverhulme. His title was a combination of his own and his wife's names. In 1922 he was advanced to a viscounty, and added to his title 'of the Western Isles'. His wife was a woman of character and of much kindness, and her support was of great value to her husband. She died in July 1913. In that year she went with him on an adventurous journey through central Africa, and shortly before her death she was elected a fellow of the Royal Geographical Society. There was one child of the marriage, a son, William Hulme Lever (born 1888), who succeeded his father as second viscount. Lord Leverhulme died at his house in Hampstead 7 May 1925.

LEVERHULME, first VISCOUNT (1851-1925), soap manufacturer. [See **LEVER**, **WILLIAM HESKETH**.]

LEWIS, **AGNES** (1843-1926), discoverer of the *Sinai Palimpsest*, the elder twin daughter of John Smith, solicitor, of Irvine, Ayrshire, was born at Irvine in 1843, and educated at Irvine Academy and at private schools in Birkenhead and London. In 1868 she travelled, with her sister Margaret Dunlop Smith, in Egypt and Palestine, and in 1870 published *Eastern Pilgrims*, an account of their experiences. In 1883 her sister married the Spanish translator, James Young Gibson [q.v.]; he died in 1886. In 1887 Agnes Smith married the antiquary, Samuel Savage Lewis [q.v.], librarian of Corpus Christi College, Cambridge. Her husband died suddenly in 1901. The twin sisters were very much alike, and after the deaths of their husbands always lived and travelled together, visiting Cyprus, Greece, and other Oriental lands. They had considerable proficiency in modern Greek.

In 1892 Mrs. Lewis and her sister were persuaded by Dr. James Rendel Harris to

visit the convent of St. Catherine on Mount Sinai, which Harris had visited in 1889 and where he had discovered a Syriac manuscript of the hitherto lost early Christian *Apology of Aristides*. It was in this convent that Tischendorf had discovered the famous Greek *Codex Sinaiticus*, but the room or closet which contained Syriac manuscripts had hitherto remained unknown to scholars. When Agnes Lewis and Margaret Gibson went to Sinai, their knowledge of conversational Greek was a passport to the good graces of the *hegumenos* (or prior), Galakteon, and he brought out the Syriac manuscripts for the inspection of the Western ladies. One manuscript specially struck them: it was written in A.D. 778, but underneath the eighth-century script older effaced writing was visible here and there, and from the headlines it was clearly a text of the Gospels. Thinking that so ancient a manuscript might be interesting, Agnes Lewis photographed several pages. When the sisters returned to Cambridge (Professor) F. C. Burkitt, of Trinity College, offered to try to read the photographs, and with the help of Professor Robert Lubbock Bensley [q.v.] a few pages were deciphered, enough to show that the manuscript was akin to those fragments in the British Museum which were discovered by and called after William Cureton [q.v.]. In 1893 Agnes Lewis and her sister, accompanied by Bensley, Rendel Harris, and Burkitt, with Mrs. Bensley and Mrs. Burkitt, visited Sinai and made a transcript of the Gospel from the manuscript, together with a better set of photographs, the result being published at Cambridge in 1904.

Agnes Lewis and her sister made two further visits to Sinai in the following years, copying manuscripts and taking photographs; good copies of those of the *Sinai Palimpsest* (as the manuscript is called) being presented by them to the University Library, Cambridge, and to Westminster College, Cambridge. She and her sister published a considerable number of Syriac and Christian Arabic texts in the following years, some of value; but nothing equalled the importance of their first discovery. Agnes Lewis received the gold medal of the Royal Asiatic Society in 1915, and obtained honorary doctor's degrees from the university of Halle, St. Andrews, Heidelberg, and Dublin. She and her sister were generous benefactors to Westminster College, where their portraits hang in the Hall.

Agnes Lewis died at her house, Castle Brac, Cambridge, 29 March 1920, having been for some years entirely incapacitated by paralysis. Her sister predeceased her 11 January 1920.

[Private information; personal knowledge.]
F. C. BUNKERT.

LINCOLNSHIRE, MARQUESS OF (1843-1928), politician. [See WYNN-CARRINGTON, CHARLES ROBERT.]

LINDSAY, DAVID (1856-1922), explorer, was born at Goolwa, South Australia, 20 June 1856, the younger son of John Scott Lindsay, master mariner, of Dundee, Scotland, and of Goolwa, by his wife, Catherine Reid. His father had come to Australia two years before Lindsay's birth in command of a schooner destined for the coasting trade. Lindsay was educated privately at Port Elliott, near Goolwa, and in 1878 entered the South Australian survey department, where he remained until 1882. He held the post of junior surveyor in the Northern Territory from 1878 to 1882. In 1883 he led an expedition across the north of Arnhem Land from Palmerston (Port Darwin) to Blue Mud Bay, and found land suitable for settlement. In 1885-1886 he continued his explorations in Central Australia between the Georgina river in Western Queensland and the Hay and Finke rivers to the east of the Macdonnell ranges and reported deposits of rubies in the Macdonnell ranges. Two years later he rode across Australia from north to south, and his report threw some light on unknown geographical features of the interior.

When in 1891 Sir Thomas Elder, of Adelaide, provided funds for a scientific exploration of the interior of Western Australia, Lindsay was chosen to command the expedition. The projected route was from Peake, on the railway, to the west of Lake Eyre, over the Everard range and the Great Victoria Desert to Lake Barlee, and thence to the Murchison river and the West coast, with a return journey across the Western desert to the Kimberley district of the North-West and thence to Tennants Creek (Northern Territory) on the overland telegraph line. The expedition was organized by the Royal Geographical Society of Australasia and its patron spared no expense. The results, however, largely because of a season of severe drought, fell far short of the ambitious programme. With the help of camels the expedition, starting in May 1891,

crossed the north of the Great Victoria Desert via the Everard and Blyth ranges, traversing 550 miles in 35 days to Lake Lefroy; thence it proceeded north-west to Geraldton. In January 1893 Lindsay left the expedition, handing over the command to L. A. Wells, who for two months continued explorations to Lake Wells and the Virginia range. The criticism of Lindsay's leadership, made by some of his staff, proved on investigation by the Royal Geographical Society of Australasia to have no foundation and he was completely exonerated. His journey revealed the existence of an auriferous area, and led to the opening up of the West Australian goldfield.

For the next few years Lindsay continued his explorations in Western Australia with the object of investigating the mineral resources, and his discoveries led to further prospecting and development. In 1895 he again explored in Arnhem Land. In 1913 he was appointed to serve on the Commonwealth royal commission, the object of which was to advise on the development of ports and railways in the Northern Territory, and in 1920 he reported good pastoral and agricultural land in Arnhem Land. It was in connexion with this work that he was engaged at Port Darwin when he died there 13 December 1922.

Lindsay married in 1881 Annie Theresa Stuart, daughter of Arthur Lindsay, civil servant, of Adelaide; four sons and one daughter were born of the marriage.

[*The Times*, 10 December 1922; *Journal of the Elder Scientific Exploring Expedition*, 1891-2, 1893; *Geographical Journal*, January 1893; *South Australian Register*, 11 July 1878; private information.] R. N. RUMMOSE BROWN.

LIVEING, GEORGE DOWNING (1827-1924), chemist, the eldest son of Edward Liveing, surgeon, of Nayland, Suffolk, by his wife Catherine, the only daughter of George Downing, of Lincoln's Inn, barrister-at-law, was born at Nayland 21 December 1827. He was admitted to St. John's College, Cambridge, in 1847, and was eleventh wrangler in the mathematical tripos of 1850. He then read for the newly established natural sciences tripos, and was placed at the head of six successful candidates in the first year of that tripos, 1851, with distinction in chemistry and mineralogy. Next he studied for a while with Karl Rammelsberg at Berlin, but soon returned to Cambridge. In 1852 he started the first

course of practical chemistry for medical students in a primitive laboratory fitted up in a cottage in Corn Exchange Street.

In 1853 Liveing was elected a fellow of St. John's College, and the college founded for him a lectureship in chemistry, and built a laboratory for his use. That he was an active and courageous junior fellow is clear from a pamphlet which he printed in 1857, attacking the existing system of government of the college and advocating measures of reform which almost exactly foreshadow those put into force many years later. In 1860 Liveing became professor of chemistry at the Staff College and at the Royal Military College, Sandhurst, though he continued to teach in Cambridge also. In the same year he married Catherine, second daughter of the Rev. Rowland Ingram, rector of Little Ellingham, Norfolk. He thereby vacated his fellowship at St. John's, though he retained his lectureship.

On the death in 1861 of the Rev. James Cumming [q.v.], professor of chemistry at Cambridge, Liveing was elected to succeed him. The salary was about £100 a year, and the material provision made by the university for the subject was meagre, consisting of one lecture room, which the professor of chemistry had to share with the professor of botany and the Jacksonian professor of experimental philosophy, and two small empty rooms which might be used for other purposes. But in 1863, after much controversy, the university began building laboratories, thus initiating the great development in experimental science which has transformed modern Cambridge. The first buildings were raised on land which, acquired in 1762, had been used as a botanic garden; and in the course of the years 1864 and 1865 accommodation was provided successively for zoology, anatomy, chemistry, mineralogy, and botany. In 1865 Liveing began to announce regular experimental courses in chemistry and, until physics were otherwise provided for, in heat. In 1875 (Sir) James Dewar [q.v.], was elected Jacksonian professor of experimental philosophy and directed the work of that chair to chemistry. He was thus brought into close association with Liveing. Collaboration cannot have been easy. As a colleague wrote in 1925: 'Liveing and Dewar were men of widely different temperaments and widely different ideals; and they were both quick-tempered. Nevertheless, a lifelong friendship was formed between them.' In 1878 they began a long series of spectro-

scopic investigations which continued till 1900. Their joint papers were republished as a single volume by the Cambridge University Press in 1915. This is the chief record of Liveing's scientific labours.

When Liveing and Dewar began their spectroscopic researches the subject was comparatively new. In ignorance of a previous experiment of J. B. L. Foucault, von Bunsen and G. R. Kirchhoff in 1859, in the course of the work which first put spectrum analysis on a sound footing, passed the continuous light from incandescent line through an alcohol flame in which common salt was vaporized, and found that a dark line appeared in the spectrum coinciding with the sodium line and with the corresponding dark line, Fraunhofer's D, in the solar spectrum. The dynamical explanation of this phenomenon was given by Sir George Gabriel Stokes [q.v.], who pointed out that a vibrating system absorbs energy of the same period of oscillation that it can itself emit. By these several investigations, the examination of the chemical composition of the sun and stars was made possible, for dark lines in the spectra of light from their interiors which passes through their cooler envelopes coincide with the bright lines of terrestrial elements. Most of the earlier work of Liveing and Dewar was concerned with this important point, eight papers 'On the Reversal of the Lines of Metallic Vapours' appearing in the *Proceedings* of the Royal Society between the years 1878 and 1881. After publishing in 1882 some work on the spectrum of carbon, they turned to ultra-violet spectra, on which a paper appeared in the *Philosophical Transactions* of the Royal Society in 1883. Two papers on sun spots followed, while Dewar's tastes may be traced in 'Spectroscopic Studies of Gaseous Explosions', in 'The Influence of Pressure on the Spectra of Flames', and in a series of papers on the spectra of the constituents of liquefied gases at very low temperatures. Finally, papers appeared between 1890 and 1904 on the absorption spectra of solutions, and on the spectra at the anode and cathode when an electric discharge is passed through gases. If these seventy-eight joint papers cannot be said to disclose any epoch-making discovery, they certainly chronicle careful, exact, and useful contributions to knowledge.

The only book published by Liveing was a thin volume on *Chemical Equilibrium the result of the Dissipation of Energy*, which appeared in 1885. This early recognition

of the importance of thermodynamics to chemistry clearly showed Living's insight into the fundamental principles of his science. It is worthy of note that he returned to this subject in later years, his last paper, read to the Cambridge Philosophical Society on 7 May 1923 (when he was ninety-six), being entitled 'The Recuperation of Energy in the Universe'.

In the 'eighties and early 'nineties Living was in the middle period of his career. Year by year he delivered lectures both to elementary and advanced students. To the former, he taught general chemistry, and to the latter, principles of chemistry and spectroscopy. The rest of the teaching was shared among an increasing staff, both in the university laboratory and in several college laboratories. Living's elementary lectures were attended by men conspicuous more for light-heartedness than love of learning. The lectures were illustrated with experiments, and his impatience with the laboratory attendants when the experiments went wrong was eagerly watched for by his youthful class. His advanced students found him somewhat difficult of approach; but when the approach was made he took great trouble and gave them individual attention: many distinguished chemists owe much to his teaching. By 1885 the number of students and staff had made the original university chemical laboratory, on the east side of the old botanic garden site, quite inadequate, and in 1888 the present laboratory was begun. Living took endless trouble over the plans, and the success of the building was largely due to his examination of other laboratories and careful studies of the whole problem. In 1888 also he arranged a course of lectures on agricultural chemistry, thus inaugurating activities which ultimately developed into the successful Cambridge school of agriculture. For many years that school owed much to Living's help and support.

In 1889 Living was elected a professorial fellow of St. John's College, and thus again brought into close association with his college. He was elected a fellow of the Royal Society in 1879, served on the council in 1891-1892 and again in 1903-1904, and was awarded the Davy medal in 1901. For many years he acted as the Cambridge correspondent of the chancellor of the university. He also took part in local affairs, and did good work as a county and borough magistrate.

In the year 1908, at the age of eighty-

one, Living resigned the professorship of chemistry, though he remained to the end of his life in touch with the laboratory and with research. Throughout his tenure of the chair he took full financial responsibilities for the maintenance of the laboratory, which in its early years must have caused a heavy drain on his private income. On retiring he was at once re-elected a fellow of St. John's, and in 1911 became president, an office corresponding to that of vice-master. In this final phase of his career he found, in some ways, his truest expression. He still lived a busy life between his house and garden at The Pightle (now Pytell), Newnham, the laboratory, and St. John's College. His character seemed to mellow with age, his asperities softened, and the patriarch of ninety seemed easier of access than the professor of fifty or sixty. His memories of days long past were of historic interest, both to chemists and to other members of the university. In 1923 he gave up his house at Newnham, and, after a short sojourn at the University Arms hotel, moved to Maid's Causeway. It seemed almost certain that he would complete his hundredth year, but, one October day, while walking to the laboratory, he was knocked down by a bicyclist, and, some two months later, 26 December 1924, he died of his injuries. His wife died in 1888. They had no children.

There is a portrait of Living by Sir George Reid at St. John's College.

[*The Times*, 27 December 1924; *Nature*, 24 January 1925; *Proceedings of the Royal Society*, vol. cix, A, 1925; *Year Books of the Royal Society*, 1880-1925; personal knowledge.]

W. C. D. DAMPIER.

LLOYD, MARIE (pseudonym), music-hall comedian. [See WOOD, MATILDA ALICE VICTORIA.]

LOCH, SIR CHARLES STEWART (1849-1923), social worker, was born 4 September 1849 at Baghalpur, Bengal, the fifth son of George Loch, judge of the High Court, Calcutta, by his first wife, Louisa Gordon. He was educated at Trinity College, Glenalmond, and proceeded to Balliol College, Oxford, in 1869. Ill-health, which had interrupted his work at school, continued to handicap him at the university. He obtained a third class in classical moderations in 1870 and a second class in the final school of modern history in 1873. His tutors were Professor Edwin Palmer and Thomas Hill Green. Loch was pro-

foundly influenced by Green's character and philosophy, and the two men remained intimate for life. Loch's chief friends at Balliol were Andrew Bradley, Bernard Bosanquet, and A. L. Smith. In 1874, during a period of residence at Oxford, while employed in London, he formed one of the gang of university men who constructed the 'Ruskin road' from Ferry Hinksey to Botley.

It had been Loch's original intention to enter the Indian civil service, but considerations of health stood in the way. Also, while at Balliol, he had been attracted to ideals of social service, both through Green's teaching and through the influence of Arnold Toynbee [q.v.]. Loch accordingly resolved to make his career in London, and in 1873 became clerk to the Royal College of Surgeons. He held the position for two years.

While engaged at the College of Surgeons, Loch maintained his interest in social questions, and became honorary secretary of the Islington branch of the Charity Organisation Society. In 1875 he was appointed secretary to the council of the Charity Organisation Society. This institution was founded in 1869. Small and unimportant at first, it steadily gained support. Its principal aims were to assist the needy to help themselves, to improve the conditions of the poor, and to promote the ideal of co-operative charity. Its administrative object was the co-ordination of charitable effort throughout London, and the prevention of 'overlapping' among the authorities and societies. Loch was a very successful administrator. Working with a small staff and extreme economy, he maintained an office which conducted a large amount of business with great efficiency. He was an enthusiastic idealist, whose idealism was accompanied by strong common sense. The charitable system of the Society was based on the principle of dealing with the individual. Help was given only after most careful inquiry concerning every single application for assistance. A file was kept for each 'case', and maintained as a permanent record. Branches of the Charity Organisation Society came into existence in every London borough; and new or already established societies were affiliated to it throughout the rest of the country. Contact was maintained with similar bodies overseas, especially in the United States, and with the French group of P. G. F. Le Play and Edmond Demolins.

Although the charitable work of the

Society was carried on upon scientific principles, it was anything but impersonal. Loch's method was to deal with all applications for relief through voluntary workers. Very soon he gathered together a large corps of volunteers, chiefly men and women of education, many of them of the leisured class, who devoted a large part of their time to investigation, and to visiting work for the Society. A man of great personal charm and lofty enthusiasm, Loch aroused like enthusiasm in all his associates, so that the work of the Society, both inside the office among the staff and outside among the volunteers, proceeded with extraordinary cheerfulness and zeal.

The influence of the Charity Organisation Society made itself felt in legislation. Loch was very active in writing pamphlets and letters to the press, in speaking in public, and in approaching central and local authorities. He also obtained the co-operation of influential people on the committee of the Society. The outcome of these efforts can be traced in a number of Acts of parliament concerned with social matters, such as the Mental Deficiency Act of 1913 and the Maternity and Child Welfare Act of 1918. Another practical result was the institution of almoners in hospitals whose function was to ensure that patients should contribute according to their ability. This system, which Loch regarded as a revival of a wholesome medieval practice, has been almost universally adopted.

In 1896 Loch spent three months in the United States, visiting the social groups called 'Associated Charities'—bodies similar to the London Charity Organisation Society. The contact thus made with American charitable work was maintained throughout Loch's life. He was an active member of certain royal commissions: on the aged poor (1893-1895), the care and control of the feeble-minded (1904-1908), and the poor laws (1908-1909). Loch signed the majority report on the poor laws which, in fact, was very largely his own work. The recommendations of the majority report, although at first neglected, were subsequently put into effect, partially at any rate, in the Local Government Act of 1929 and the Poor Law Act of 1930.

Although a liberal in politics, Loch had little sympathy with the social legislation of the liberal government of 1906-1914, which he criticized as placing responsibility upon the bureaucracy and the public treasury rather than upon the individual

or the family. His position as a thinker and teacher, as well as a worker in social affairs, was widely recognized. He held the position of Tooke professor of economic science and statistics at King's College, London, from 1904 to 1908. In 1905 the university of Oxford conferred upon him the honorary degree of D.C.L.

In October 1914, Loch retired, on account of illness, from the secretaryship of the Charity Organisation Society after thirty-nine years' service, refusing the pension which the Society voted to him. He was knighted in 1915. He died at Little Bookham, Surrey, 23 January 1923.

Loch was a man of powerful intellect and dominating personality, combined with great sweetness of disposition and complete tolerance of other people's point of view. At Oxford he had studied art under Ruskin; and throughout life he had a strong interest and catholic taste in schools of painting. He was essentially a philosophic radical of the school of John Stuart Mill, and he represented, on its most intellectual and practical plane, the great philanthropic effort of the Victorian age. He lived successively at Chelsea, Chiswick, Oxshott, and Little Bookham. He had a large circle of friends, including, besides friends from Balliol days, Frederick York Powell and Octavia Hill.

Loch's chief published works are: *How to help Cases of Distress* (1883) and *Charity and the Social Life* (1910), which is based on his long article on 'Charity and Charities' in the *Encyclopædia Britannica* (tenth edition, 1902). Some of his articles and addresses have been collected in a volume entitled *A Great Ideal and its Champion*, edited by Sir Arthur Clay (1923). He also published a volume of poems, *Things Within* (1922).

Loch married in 1876 Sophia Emma (died 1934), daughter of Edward Peters, of the Indian civil service, and had one son and one daughter.

A portrait of Loch by J. S. Sargent hangs in the offices of the Charity Organisation Society, Denison House, Vauxhall Bridge Road, London.

[Private information.] R. B. MOWAT.

LOCKE, WILLIAM JOHN (1863-1930), novelist, was born at Demerara, British Guiana, 20 March 1863, the elder son of John Locke, banker, of Barbados, by his wife, Sarah Elizabeth. His parents were English. In 1864 his family went to Trinidad, where he was educated at the

Queen's Royal College, and won an exhibition to St. John's College, Cambridge. He matriculated at Cambridge in 1881, and graduated with honours in the mathematical tripos of 1884. After leaving Cambridge he became a schoolmaster. His reticence in after years makes it difficult to trace his career as a teacher, but he is known to have been a master at the Oxford Military College at Temple Cowley in 1889 and 1890 and at Clifton College, Bristol, in 1890, and from 1891 to 1897 he was modern languages master at Trinity College, Glenalmond. He disliked teaching; and in 1890 he had a serious illness, which left him tuberculous for the rest of his life. From 1897 to 1907 he was secretary of the Royal Institute of British Architects, and lived in London. He resigned this position when his writings began to afford him a substantial income.

The earliest of Locke's numerous novels, *At the Gale of Samaria*, was published in 1895; but it was his ninth novel, *The Morals of Marcus Ordeyne* (1905), which first won him wide recognition. *The Beloved Vagabond* (1906), *Septimus* (1909), and *Simon the Jester* (1910) consolidated his reputation. His first venture in play-writing was a dramatization of *The Morals of Marcus Ordeyne* (1906); five other plays, some of which are based on his novels, followed in rapid succession between 1907 and 1912. They were all staged in London. In 1912 he published *The Joyous Adventures of Aristide Pujol*, perhaps the last of his more notable books. During the ensuing eighteen years, novels and short stories flowed rapidly from his pen. Scarcely a year passed without a novel, and often he produced two books in a year; but to the last he held the interest of his public.

From 1914 to 1918 Locke, at his own expense, converted his house at Hemel Hempstead into a hospital for soldiers from the ranks. He was also engaged untiringly in helping Belgian refugees; for this service he was made chevalier of the Belgian order of the crown. His health, always fragile, suffered from his overwork during these years, and in 1921 it became necessary for him to settle at Cannes. He regarded the remaining years of his life as years of exile in which he eagerly gathered round him a social circle of English and American visitors to the French Riviera. He died of tuberculosis at Cannes 15 May 1930. Several novels from his pen were published posthumously.

Locke can hardly be said to have left

any notable literary achievements, but the general quality of his novels and short stories is worthy of respect. Such books as *The Morals of Marcus Ordeyne*, *The Beloved Vagabond*, *The Glory of Clementina Wing*, and *The Joyous Adventures of Aristide Pujol* have a clear, sparkling gaiety and gentle charm which made an instant appeal. Moreover, his scenes and characters were looked upon as idealized presentments of the England of the time, and, if unappreciated by foreigners, they found a romantically minded and very sympathetic public in England and America both before and during the European War. Many of his books, however, especially the later ones, suffer from the extreme facility of his pen and are unsatisfying and artistically incomplete.

Locke was an attractive conversationalist, sympathetic, modest, and unassuming; yet his easy gaiety masked much patient suffering. In early life as a teacher he had had a hard struggle, and when wealth came to him, his sympathy with others less fortunate made him generous and self-effacing. His interest in architecture was lifelong, and he was a corresponding member of various British, Dutch, Spanish, Portuguese, and American architectural societies.

Locke married in 1911 Aimée Maxwell, daughter of Theodore Heath. The marriage was childless.

[*The Times*, 17, 19, 20, 21 May 1930; *The Glenalmond Register*, 1920; private information.]
E. O'BRIEN.

LOCKWOOD, AMELIUS MARK RICHARD, first **BARON LAMBOURNE** (1847-1928), politician, was born in London 17 August 1847, the eldest son of Lieutenant-General William Mark Wood, who had changed his name from Lockwood in 1838 on inheriting the property of his maternal uncle, Sir Mark Wood, of Gatton, Surrey, by his wife, Amelia Jane, daughter of Sir Robert Williams, ninth baronet, of Penrhyn, co. Carnarvon. Their son reverted to the original name of Lockwood in 1876. He was educated at Eton, first at Mr. Sam Evans's and then at Warre's. Entering the Coldstream Guards in 1866, he served as adjutant and as aide-de-camp to John Poyntz, fifth Earl Spencer [q.v.], lord-lieutenant of Ireland, retiring with the rank of lieutenant-colonel in 1893. In 1892 Lockwood entered parliament in the conservative interest as member for Epping, which con-

stituency he represented until 1917, when he was raised to the peerage as Baron Lambourne, of Lambourne, co. Essex. He was for many years chairman of the kitchen committee, and was very popular with all parties in the House of Commons, where he was known as 'Uncle Mark'. Afterwards he was equally popular in the House of Lords.

Although Lockwood took no very prominent part in politics and never held office, he came to be regarded as the typical country squire member of parliament, and exercised a considerable independent influence in the House of Commons. He never cared for racing, but was a keen sportsman and lover of horses and dogs, being for many years an active member of the Royal Society for the Prevention of Cruelty to Animals, of which he was vice-president.

Lockwood served on the royal commission on vivisection (1900-1908), a practice which he strongly disliked, although his views were not extreme. He was instrumental in securing the abolition of pigeon-shooting in England, and introduced, but failed to carry, a bill to stop the export of worn-out horses. He was a great horticulturalist and was for many years president of the Royal Horticultural Society, and a successful exhibitor at many shows. He was specially known for his carnations and his collection of flowering shrubs at his house, Bishop's Hall, near Romford. A well-known connoisseur of china, especially majolica, and of books, his library contained a valuable collection of county histories and topographical works. He was a prominent freemason both in grand lodge and in Essex, of which he was provincial grand master from 1902 until his death. He was interested in the prevention of corruption, and succeeded Sir Edward Fry as president of the Bribery and Secret Commissions Prevention League in 1918. He was a director of the London and North-Western Railway Company and a member of the council of the Railway Association.

Well known and popular as he was in London, Lord Lambourne was still more so in his native county, of which he became lord-lieutenant in 1910. At Bishop's Hall he was the most hospitable of hosts and entertained King Edward there in 1904. Besides holding the lord-lieutenancy of Essex, he was associated with almost all the activities of the county, being president of the Territorial Association, honorary colonel of the 4th Essex Regiment,

president of the Essex Hunt Club, and of the Essex Automobile Club, and a J.P. In 1928 Lord Lambourne refused to support the appeal for King George's Hospital at Becontree on the ground that this was a new town created by the London County Council without consulting Essex, but he withdrew his opposition immediately at the wish of the king.

Lord Lambourne died at Bishop's Hall, Romford, 26 December 1928 and was buried at Lambourne. He was sworn a privy councillor in 1905. He was created C.V.O. in 1905 and promoted G.C.V.O. in 1927. He married in 1876 Isabella (died 1923), daughter of Sir John Ralph Milbanke-Huskisson, eighth baronet. They had no children and the peerage became extinct on his death.

A cartoon of Lord Lambourne by 'Spy' appeared in *Vanity Fair* 6 September 1894.

ON SLOW.

LOGUE, MICHAEL (1840-1924), cardinal, was born at Carrigart, co. Donegal, 1 October 1840, the second in the family of six children of Michael Logue, innkeeper, of Carrigart, by his wife, Catherine Durnan. He was educated, first at Carrigart by a hedge-schoolmaster (to whom he owed a love of ships and a knowledge of sailing), and later at Kilmaecran by Mr. Craig, a former scholar of Trinity College, Dublin (who taught him Latin), and (1854-1857) at a private school at Buncrana under Mr. Campbell. Having decided to study for the priesthood, he entered Maynooth College in 1857, became leader of his class and a prizeman, and was ordained deacon in 1864. He was nominated to the Dunboyne establishment for advanced studies in 1865, but before completing the course he was appointed, in 1866, to the chair of dogmatic theology at the Irish College in Paris, receiving priest's orders in that year. He remained in Paris until 1874, having attended imperial levées at the Tuileries and having seen the Irish College converted into a hospital under the British flag during the siege of Paris in 1871.

In 1874 Logue, having failed to obtain a chair of theology at Maynooth, was sent as curate to Glenswilly parish, co. Donegal. There he laboured for two years, often

preaching in Irish, as he was bilingual. In 1876 he was appointed dean in Maynooth College, and was given the honorary chair of Irish, and, two years later, a chair of theology. In the following year (1879) he was elected bishop of Raphoe, and consecrated in the old cathedral at Letterkenny by Archbishop McGettigan, of Armagh. As bishop, Logue proved very active and influential. He raised funds in America in order to forestall and relieve the famine of 1880 in his diocese; he studied emigration and afforestation, planting 25,000 trees around Glenswilly; he collected the nucleus of a fund for building a new cathedral at Letterkenny; preached total abstinence in the endeavour to stamp out poteen-drinking; and took pains to examine personally every candidate for confirmation. Politically, his counsel and criticism carried much weight with the Irish nationalist party; while at Rome, which he visited in 1881 and 1885, he made his influence felt in the conferences of the Irish bishops held there in those years.

Early in 1887 Bishop Logue was elected coadjutor to Archbishop McGettigan. On the latter's death at the end of that year Logue succeeded to the archbishopric of Armagh. Five years later, in January 1893, he was created cardinal by Pope Leo XIII, with the title of Santa Maria della Pace.

As archbishop and cardinal, Logue continued to exercise great influence in Irish politics. At the time of the crisis in the nationalist party over the O'Shea divorce case, he denounced unsparingly both Parnell himself and a number of priests who still supported him; with the result that Parnell was eventually deposed from the leadership of the party. Logue remained suspicious of the Irish parliamentary party; disliked its alliance with the liberals, thinking that it endangered the position of Catholic schools in England; and kept a strong check on the party behind the scenes. He favoured the secession from the party of T. M. Healy, and supported him until he allied himself with William O'Brien [q.v.], whose 'plan of campaign' in the land agitation Logue regarded as a tactical mistake. Logue's support being withdrawn, Healy lost his seat in North Louth (1909). The cardinal's politics were national rather than nationalist. He was a patron of the Gaelic League and attended its *feiseanna*, and criticized the Intermediate Board of Education for not helping to promote the Irish language.

As primate, Logue was very regular in attending meetings whether of bishops, or of the Maynooth Union, or of the Catholic Truth Society. He generally had his way with the bishops, and he made a habit of talking down, humorously, proposals of which he disapproved. Educational questions, however, he usually left to be dealt with by Archbishop Walsh. He was on cordial terms with the English sovereigns, dining with Queen Victoria at the Viceregal Lodge in 1900, and receiving at Maynooth King Edward VII and King George V and Queen Mary on the occasion of their Irish visits in 1903 and 1911 respectively. In 1904 he celebrated his episcopal silver jubilee and witnessed the consecration by the papal delegate, Cardinal Vanutelli, of Armagh Cathedral; the foundation stone had been laid in the year of Logue's birth, but the decoration of the interior and the completion of the sacristy, library, and synod-hall were due to his labours in collecting a fund of £50,000. He was a great builder, and promoted the erection of fifteen new churches in his archdiocese. He visited the United States in 1908, and attended Eucharistic congresses in London (1908), Montreal (1910), Vienna (1912), and Lourdes (1914). At Rome he took part in three conclaves—for the election of Popes Pius X, Benedict XV, and Pius XI.

During and after the European War Cardinal Logue had a very difficult task. In a characteristic letter to Sir Horace Plunkett he denied that the Irish Catholic bishops were 'pro-German', adding that 'they preferred the tyrants they knew to the tyrants they knew not'. He exerted himself to help the Belgian refugees in Ireland, and to procure chaplains for Irish soldiers; but he opposed conscription on moral grounds. He denounced the Sinn Féin movement when it became a fighting force; but he criticized British methods and reprisals. During the troubles of the years 1919-1921 he endeavoured to mediate between the Irish people and the British government, and a letter addressed by him to Bishop Amigo of Southwark was quoted in the House of Lords by the archbishop of Canterbury (1921) and helped to pave the way to the peace of 1921. Logue accepted the terms of the treaty, having already made vigorous protest against partition. With the coming of peace in Ireland he began to set his house in order and, without consultation, indicated Bishop (afterwards Cardinal) O'Donnell, of Raphoe, as his successor.

Rome acquiesced, and he thereby again 'secured the red hat for Armagh'. He died 19 November 1924, and was buried at Armagh.

Logue had an Irish temper but was devoid of rancour. He was of the old school, loved telling his stories, and could quote Horace and Virgil to suit the occasion. He interpreted canon law very strictly for himself, but very liberally for others. He lived to consecrate the bishops of the Northern province two or three times over. In church ceremony he was described as 'slovenly but not careless, awkward but accurate'. He was a keen yachtsman, a good swimmer, and a fine shot, once defeating the musketry instructor at Dundalk. His love of birds—small birds would feed from his hand—induced him as a youth to give up wild-duck shooting. He enjoyed remarkable health, never spending a day of his life in bed. He published nothing except pastorals and an article in French in *Le Monde* (3 April 1870), refuting the view of Bishop Dupanloup on the subject of papal infallibility. His portrait by Sir John Lavery hangs in the Belfast Gallery.

[*Memoir* by Cardinal MacRory in *Centenary History of Maynooth, 1895; Life* (in preparation) by P. J. Toner; private information.]

S. LESLIE.

LONG, WALTER HUME, first Viscount Long of Wraxall (1854-1924), statesman, was born at Bath 13 July 1854, the eldest son of Richard Penruddocke Long, M.P., of Rood Ashton, Wiltshire, by his wife, Charlotte Anna, daughter of the Rt. Hon. William Wentworth Fitzwilliam Dick (formerly Hume), M.P., of Hume-wood, co. Wicklow. His ancestors had been Wiltshire landowners since the end of the fourteenth century; he had four brothers, of whom the eldest was created Baron Gisborough in 1917, and five sisters.

Walter Long was country born and bred, and a typical West country gentleman he remained until the end of his life. As a child he was brought up in a rural atmosphere, where he learned to ride horses, milk cows, look after hounds, and mix as an equal with his father's tenants and employees, with whose outlook and interests he identified himself from a very early age. From a private school he proceeded to Harrow, where he reached the sixth form, and played for the school both at football and cricket, distinguishing himself at Lord's in the Eton and Harrow match of 1873. In that year he went up

to Christ Church, Oxford, which he left without taking a degree. In his charming (and only) book, *My Memories* (1923), he gives vivid pictures of the life of an undergraduate of the time, commenting on the opportunities that it offered for every kind of manly sport, and dwelling with proper satisfaction upon the part that he was able to play in reducing the amount of drinking and gambling, which in his day was risking the reputation of the 'House'.

Even at Oxford Long was a politician, a conservative, of course. He took so prominent and useful a part in a by-election for Oxford city that the conservative party invited him, even as an undergraduate, to contest the seat at the next election. Equally flattering was the offer, during this period, of the mastership of the Vale of White Horse hounds. However, he accepted neither of these tributes to his political and sporting instincts, which nevertheless developed until he was elected to parliament as member for North Wiltshire at the general election of 1880. He now abandoned coaching, gave up polo, and, apart from an odd day's hunting in the winter or a cricket match in the summer, devoted himself for the next forty years to his duties as a member of parliament. During that long period he had ample opportunity of making himself acquainted with the needs and interests of all classes of his fellow citizens in town and country, and he took the fullest advantage of it. He sat for North Wiltshire from 1880 to 1885 and for East Wiltshire from 1885 to 1892; for the West Derby division of Liverpool from 1893 to 1900; for South Bristol from 1900 to 1906; for South County Dublin from 1906 to 1910; for the Strand division of Middlesex from 1910 to 1918 and, finally, for St. George's, Westminster, from 1918 to 1921, when he was raised to the peerage: a long, varied, but unbroken chain of parliamentary service worthy of his inherited tradition.

The parliament of 1880 contained many men of the same type as Walter Long; they were called 'the country party', and no name could have suited them better. Whole-hearted advocates of Disraelian imperialism, champions of law and order, they welcomed the addition to their ranks of this new recruit from the West country. Long did nothing of note during Mr. Gladstone's second parliament, but was recognized as a good, hard-working party man who knew everything about agriculture

and English country life. It was a matter of no surprise, therefore, to anybody except himself, when in 1880 Lord Salisbury invited him to join the government as parliamentary secretary to the Local Government Board. For this post he was very well suited, as his chief, Mr. Ritchie (afterwards Lord Ritchie of Dundee, q.v.), soon discovered. To Long was delegated the whole management of poor-law work both in and out of parliament. This experience proved of the greatest service to Long when, later in the same parliament, it fell to him to take a large part in framing and in getting through the House of Commons the Local Government Act of 1888, which created county councils throughout Great Britain. The London County Council Bill followed, though Long assumed no responsibility for that. His speeches, however, combined with the tact and skill that he exhibited in piloting these two important measures through parliament, brought him at once into the front rank of parliamentarians and marked him as a man who would soon reach Cabinet rank. This impression was deepened by his work in opposition during the following parliament, when he gave discriminating but invaluable assistance to the liberal president of the Local Government Board, Mr. G. J. Shaw-Lefevre (afterwards Lord Eversley, q.v.), in carrying through the Local Government Bill of 1894 which established parish councils.

When, in 1895, Lord Salisbury formed his third administration, Long was appointed president of the Board of Agriculture, with a seat in the Cabinet, at the age of forty, a very early age in those days. The selection of Long for this office was warmly applauded throughout the agricultural community. The farmers felt that they now had a 'man in possession' who was a complete master of their problems and requirements, one who would carry on Mr. Chaplin's wise policy of protecting British herds and flocks from infection at home and from imported disease. But Long's popularity was soon seriously impaired by his rigorous policy in combating the alarming spread of hydrophobia (*rabies*) throughout the country. After a scientific investigation in 1897, a diagnosis of the disease was officially declared and immediate preventive steps were ordered to be taken. Muzzling, quarantine for imported dogs, detention, and (where necessary) destruction were among the measures universally enforced and ruthlessly executed in the

teeth of violent organized opposition; Long himself was subjected to the fiercest criticism by hundreds of his hitherto warmest admirers. But he stuck to his guns, pursued his policy, and, as a result, rabies was stamped out of the country at the end of five years, and Long's reputation established as a fearless and just administrator. In 1900, after the general election and in the midst of the Boer War, he returned at Lord Salisbury's request to the Local Government Board as president; to the department in which he had served his official apprenticeship eleven years previously. Here, once more, his knowledge of administrative detail, his skill in debate, and above all his 'hands' in driving a very unruly team, were talents that required the fullest exercise in order to secure the passing of the Metropolitan Water Act (1902) against a sustained and bitter opposition, some of it coming from members of his own political party. The Bill was debated with great expert knowledge on both sides and with a pertinacity worthy of a measure fraught with important consequences. But it was characteristic of Walter Long that, however fiercely he fought in debate, he never overstepped the limits of parliamentary courtesy; and when his Bill passed into law, he had not lost a single friend among his former opponents but, on the contrary, was presented by some of them with a valuable souvenir of the occasion.

In 1902 Lord Salisbury retired; and Mr. Balfour became prime minister (1902-1905) during the troublous years which saw the birth of tariff reform, of which Walter Long was a moderate but convinced supporter. In 1905, when Lord Selborne, then first lord of the Admiralty, was appointed to be high commissioner for South Africa, Mr. Balfour was most anxious that Long should take promotion to the Admiralty, leaving the Local Government Board to which he was very much attached. The proposal was flattering, but Long preferred to remain where he was, and suggested the name of Lord Cawdor for the Admiralty. Long's career at the Local Government Board was, however, soon closed. Within a few weeks came the resignation of George Wyndham [q.v.] from the post of chief secretary for Ireland owing to a break-down in health and a serious disagreement with the government. It was a difficult and thankless post for the prime minister to offer to any of his colleagues at that moment. In offering it to Walter Long, Mr. Balfour

said: 'I do not ask you to go to Ireland; but if you accept the office of chief secretary you will be doing me a great service and rendering a still greater one to your country.' Such a message from his leader, for whom Long had high regard and great affection, was sufficient. He went to the chief secretary's lodge, Dublin, and remained there for nine important months, until the general election of 1906. During that time he restored harmony in the unionist party, confidence throughout the Irish constabulary and all branches of the administration, and law and order throughout Ireland, so effectively that his liberal successor in office, Mr. Birrell, declared that he arrived to find Ireland more peaceful, more contented, and more free from internal trouble than she had been for six hundred years. From beginning to end of this short but eventful term of office, in spite of threatening letters, plots, and police protection, there was no more popular personality in Ireland than Walter Long. He had all the qualities that endeared themselves to Irishmen; he was accessible to all classes; genial, courageous, firm, and just in administration; an agriculturist by instinct and training, and an all-round sportsman. It was a tribute to his universal popularity that at the general election of 1906 he should have been elected as the unionist member for South County Dublin and, a few weeks later, as leader of the Irish unionists in the House of Commons.

When the new parliament met in 1906 it was clearly recognized that Home Rule, of which nothing had been heard since 1893, would soon be resuscitated in one form or another, and Walter Long took immediate steps to deal with the situation. He created in 1907 the Union Defence League, an organization whose activities and influence grew steadily until the agitation against the Home Rule Bill of 1912 was suspended by the outbreak of the European War.

In 1909 Long went on a visit to South Africa. On his return he was immediately elected president of the Budget Protest League, formed in order to fight Mr. Lloyd George's budget of that year. Here again he exerted himself to the uttermost, even though his health was a matter of grave concern to his friends. Two general elections followed in 1910, and in the following year Mr. Balfour retired from the leadership of the unionist party. The choice of his successor lay between Walter Long and (Sir) Austen Chamberlain; the one, a

tory, a moderate tariff reformer, and the leader of the older men of the conservative party; the other, a liberal unionist, an extreme tariff reformer, and the leader of the younger generation. Between the supporters of the two candidates, though never between the candidates themselves, there were the makings of a bitter faction fight which would have gravely impaired the future usefulness of the unionist party. Recognizing this, Long offered to withdraw if Chamberlain would do likewise, and if they could find another man whom the whole party would consent to follow. Mr. Bonar Law was then proposed by Walter Long, seconded by Austen Chamberlain, and unanimously elected leader at a party meeting held in the Carlton Club.

Throughout the difficulties and political struggles of the next three years, when the House of Lords and the Union seemed to be in jeopardy, Walter Long took a foremost part by the side of his new leader. Then, after the outbreak of war, when Mr. Asquith formed the first Coalition government in 1915, Long was asked to return to the Local Government Board with Cabinet rank, a post which he felt bound to accept, against his doctor's advice. To his office was assigned the duty of framing the Conscription Acts, and also of caring for the thousands of Belgian refugees who landed in Great Britain; these duties the president carried out with complete success until the second Coalition government was formed in 1916, when he was appointed secretary of state for the Colonies. In this post, also, he made his mark as a statesman by organizing the Imperial War Conferences of 1917 and 1918; by introducing a system of weekly cables to the overseas prime ministers, giving them full accounts of what was happening in all the theatres of war; and by co-ordinating and controlling, with the help of Sir John Cadman, the oil supplies of the British Empire and of the Allies, which were in grave peril. Although previously an opponent of women's suffrage, Long introduced the Franchise Bill of 1917, which became law in the following year, and under which women over thirty were given the vote. It is probable that only those who were working with him during this desperately anxious period of the War knew how exacting and exhausting were the duties cast upon Long, at a time when his health was patently failing every day. In 1918 came the Armistice and a reconstruction of the Cabinet. Long had hoped

to be allowed to put off his official harness, but it was not to be—yet. In the new administration he became first lord of the Admiralty, the post which he had declined in 1905, and there he remained until he resigned through ill-health in 1921, having reduced the British navy from a war to a peace footing, and having secured for its officers and men a substantial increase in the rates of pay previously existing. He was created a viscount for his services, and few men can ever have deserved or received more sincere congratulations.

Long, who was lord-lieutenant of Wiltshire and president of the Marylebone Cricket Club, was elected a fellow of the Royal Society in 1902, and received the honorary LL.D. of Birmingham University. He died at Rood Ashton 26 September 1924.

Long married in 1878 Lady Dorothy (Doreen) Blanche, fourth daughter of Richard Edmund St. Lawrence Boyle, ninth Earl of Cork and Orrery, and had two sons and three daughters. The eldest son, Brigadier-General Walter Long, C.M.G., D.S.O. (2nd Dragoons), was killed in action in 1917. His son, Walter Francis David (born 1911), succeeded his grandfather as second viscount in 1924.

A portrait of Lord Long by A. H. Collins (1918) hangs at Rood Ashton, and a replica by the same artist in the Harrow war memorial hall.

[*The Times*, 27 September 1924; Viscount Long of Wraxall, *My Memories*, 1923; private information; personal knowledge.]

I. MALCOLM.

LOREBURN, EARL (1846-1923), lord chancellor. [See REID, ROBERT THRESHIE.]

LORIMER, SIR ROBERT STODART (1864-1929), architect, was born in Edinburgh 4 November 1864, the third and youngest son of James Lorimer [q.v.], regius professor of public law at Edinburgh University, by his wife, Hannah, daughter of John Riddell Stodart, writer to the signet. The latter's father, Robert Stodart, a celebrated piano-maker, invented the 'upright grand', and it was from the maternal side that Lorimer inherited much of his artistic and musical bent, though his father, too, was a competent amateur artist. He first showed an enthusiasm for building and for the companionship of craftsmen at the age of thirteen when his father bought and began to restore Kellie Castle, Fife. Educated

at Edinburgh Academy and University, where he cheerfully 'shirked his books', he was in 1885 apprenticed to the architect, Sir Rowand Anderson, with whom he remained for four and a half years. In 1889 he entered the office of George Frederick Bodley [q.v.] in London, where his romantic bias towards craftsmanship was encouraged and directed by Bodley's Gothic revival ideals.

In 1892 Lorimer returned to Edinburgh in order to take up his first notable commission, the restoration of Earls Hall, Fife, for his parents' friend, R. W. Mackenzie. This was the first of a long series of restorations which were among his most pleasing works, and in which he showed a faculty for the sympathetic preservation of the character of old buildings. Thenceforward Lorimer was well established as an architect in Scotland, engaged during the ensuing decade on small and medium-sized country houses, at first in the neighbourhood of Edinburgh, but after 1901 in England as well.

In 1903 Lorimer received his first commission for a large Scottish country house, Rowallan, Ayrshire, for Lord Rowallan (never finished), and in 1906 that for Ardkinglas, Argyll, for Sir Andrew Noble. In the latter house he remedied a certain lack of cohesion apparent in the former by adapting traditional Scottish features to a picturesque but compact style which became characteristic of him. The most successful example is at Formakin, Renfrewshire (1912-1914, unfinished) where he had much help from his client, Mr. J. A. Holms. Other notable houses of this period are Hill of Tarvit, Fife (1907), and Woodhill, Barry (1908), both in a version of the Scottish Georgian style. In 1907-1909 and again in 1911-1912 he was engaged on the restoration, with additions, of Lympne Castle, Kent, and on the reconstruction after fire of Monzie Castle, Crieff.

In 1906 Lorimer designed his first important church, St. Peter's Roman Catholic church, Morningside, Edinburgh (completed 1929), together with a priest's house and school. It had to be built cheaply, and for the interior he used brick, whitewashed above, in a simple, direct style which makes it the most original of his non-traditional works. In contrast, however, with St. Andrews University Library Annexe (1907) in the classical style, came a commission for the chapel of the Order of the Thistle, added to St. Giles's Cathedral, Edinburgh (1909-1911);

this established his reputation thereafter as essentially a Gothic architect.

The Thistle chapel is a remarkable example of a true revival of the medieval crafts. Into a setting of vigorous native Gothic, massively simple up to the flamboyant groining of the vault, Lorimer introduced the sculpture, wood-carving, and stained glass of a group of artificers whom he had been training to his requirements for some years. For the stone carving he employed Joseph Hayes, for the woodwork the brothers Clow, for the windows Louis Davis (the east window is by Douglas Strachan). In recognition of his work, the whole of which was performed within the estimated cost, Lorimer was knighted in 1911.

In 1911-1912 Sir Andrew Noble commissioned Lorimer to restore the ruined castle of Dunderave on Loch Fyne, Argyllshire. Other reconstructions at this time were Pittencrieff House and Lennoxlove (1912). In addition to Formakin, new houses were the Corner House, Gullane, and Laverockdale, Colinton. A town-planning scheme, involving a 'town centre' of strikingly romantic appearance, Cornmill Square, was instituted at Galashiels, and the restoration of Dunblane Cathedral was put in hand, notable especially for the rich woodwork introduced.

The War years (1914-1918) coincided with, although they largely hindered, the recognition of Lorimer as the leading architect of Scotland. He was occupied on the remodelling for Mr. R. F. McEwen of the William Adam mansion of Marchmont, Berwickshire, including a large music room adorned with an organ case which is one of the best works of the brothers Clow; on the building of Midfield, Lasswade, a Georgian style house; on the redecoration of Dunrobin Castle, Sutherland, after a fire; and on the restoration of Balmanno Castle, Perthshire, for Mr. W. S. Millar. The last, which Lorimer regarded as his most successful restoration, included the complete furnishing from his designs by Whytock and Reid, of Edinburgh, and much of the best plaster-work, which was executed for him by Samuel Wilson and Thomas Beattie.

After the War Lorimer was chiefly occupied on memorials, including, besides numerous personal monuments, those for Loretto and Westminster Schools, Edinburgh University, Galashiels, and Paisley (with Mrs. Meredith Williams as sculptor). For the Imperial War Graves Commission he visited the Italian front (designing all

the cemeteries there), Egypt, and Macedonia. In Macedonia he was responsible for all the principal cemeteries, the chief being the memorial to the missing at Lake Doiran. He also designed several cemeteries in Germany, including that at Cologne. In England he designed the naval war memorials at Chatham, Portsmouth, and Plymouth.

Lorimer's absorbing occupation between 1918 and 1927 was the Scottish National War Memorial, for the building of which his whole development proved to have been a preparation. His first scheme was for a Gothic memorial cloister attached by a low passage to a lofty octagonal shrine crowning the highest point of the Edinburgh Castle rock. This design is attached to the report (July 1919) of a committee appointed to consider the utilization of the castle for a national war memorial; the committee recommended using the site of part of a disused eighteenth-century barracks forming the north side of Crown Square. By 1922 the proposed cloister had been altered to a long low 'hall of the regiments' but, on a full-sized model being erected, a storm of protest was aroused by the height of the shrine and its alteration of the familiar skyline. Thereupon Lorimer, within a few days, produced the existing design, which uses the shell of the barracks as the hall, with the shrine, bisected and only half its former height, attached to it. Work was begun early in 1924 and the memorial was dedicated 14 July 1927. The combination of styles adopted is not unexceptionable to the purist; but, by inspiring his craftsmen with his own enthusiasm Lorimer succeeded in carrying out, in the face of many checks, a conception which fulfils to a remarkable degree the emotional requirements of a national war memorial. The popular response was profound and immediate. In 1928 Lorimer was made K.B.E.

Subsequent important works by Lorimer were the restorations of Paisley abbey and St. John's church, Perth (1923-1928); the building of Stowe School chapel (1927-1930) in which the pillars of an eighteenth-century temple were incorporated; and St. Andrew's church, Aldershot, which returns to the earlier simplicity of St. Peter's, Edinburgh.

In appearance Lorimer was handsome and alert, with large, keen eyes of grey-blue. Latterly he felt some resentment that he was not more fully employed, particularly in connexion with the Calton

Hill site at Edinburgh. His strength as an architect lay in an obstinate idealism and an instinctive perception of the elements on which the character and psychological effect of a design depended. Having little intellectual sense of form, he disliked and avoided classicism, but appreciated the more romantic aspects of functional modernism. Fundamentally a craftsman, his vigorous encouragement of fine hand-work constitutes him the saviour of the crafts in Scotland, which he found rapidly dying out but left as a flourishing school. Based on these and on national tradition, it was his achievement to restore to Scotland a vital and characteristic architecture.

Lorimer married in 1903 Violet, daughter of Edward Wyld, of Denham, Buckinghamshire, by whom he had three sons and one daughter. He was elected A.R.S.A. in 1903, A.R.A. in 1920, and R.S.A. in 1921. He died suddenly in Edinburgh after an operation 13 September 1929, and his ashes were placed in the family burial ground at Newburn, Fife.

[Architectural Supplement to *Country Life*, 27 September 1913; Sir Lawrence Weaver, *The Scottish National War Memorial*, 1928; *Journal of the Royal Institute of British Architects*, 21 February 1931; *Edinburgh Academy Chronicle*, December 1929; *Quarterly of Incorporation of Architects in Scotland*, No. 31, 1929; Christopher Hussey, *The Work of Sir Robert Lorimer*, 1931.] C. Hussey.

LUCY, SIR HENRY WILLIAM (1843-1924), journalist, was born at Crosby, Lancashire, the son of Robert Lucy, a rose-engine turner in the watch trade, by his wife, Margaret Ellen Kemp. The date of his birth is probably towards the end of March 1843, for he was baptized (as William Henry) on 23 April of that year. While he was still an infant the family removed to Everton, Liverpool, and he attended a private school called the Crescent School until August 1856; thereafter until 1864 he was junior clerk to Robert Smith, hide merchant, of Redcross Street, Liverpool.

Lucy began to write at an early age. During his clerkship he contributed verse to the *Liverpool Mercury*, and, having taught himself shorthand, he sought a post as reporter on one of the Liverpool papers. Eventually, without experience, but with a testimonial from (Sir) Edward Russell, then assistant editor of the *Liverpool Post*, he became in July 1864 chief reporter to the *Shrewsbury Chronicle*. He soon began to contribute leader-notes to the local

Observer and the *Shropshire News*. For a short time in 1865 he was editor and part-proprietor of the former. Then he became secretary to Richard Samuel France, railway contractor, and at the same time greatly enlarged his experience as a free-lance journalist.

From May to December 1869 Lucy lived in Paris, learning French; thereafter he was for a short time (January to June 1870) in London as a sub-editor on the newly founded morning edition of the *Pall Mall Gazette*, and for eighteen months (June 1870 to January 1872) in Exeter as assistant editor of the *Exeter Gazette*. Returning to London he was a free-lance for some months, until he secured a regular engagement on the *Daily News* in October 1872. He was soon in the full tide of success. (Sir) John Richard Robinson [q.v.] made him manager of the *Daily News* parliamentary staff and writer of its parliamentary summary; in addition he contributed London letters to several provincial papers. A journalistic venture of his own, *Mayfair*, started in December 1877, never paid its way, and after two years collapsed. In 1880 he began a connexion with *The Observer* which lasted for twenty-nine years, and in 1881 he succeeded Shirley Brooks as the writer of 'Essence of Parliament' for *Punch*, continuing to write as 'Toby, M.P.' until February 1916.

Lucy's industry, fertility, humour, and remarkable *flair* for politics and parliamentary affairs soon brought him to the front rank of his profession. Two further promotions were in store for him. In July 1885 Henry Labouchere offered him the editorship of the *Daily News*. He refused, out of loyalty to Frank Harrison Hill [q.v.], who was then editor; but in December, Hill having had his *congé*, Lucy took the post. He found editing distasteful, however, and in June 1887 resigned, and returned to the press gallery. Ten years later (April 1897) he again showed his loyalty, this time to (Sir) F. C. Burnand [q.v.], by refusing the editorship of *Punch*, offered to him by (Sir) William Agnew. Notwithstanding his copious output as a journalist, Lucy found time to write two novels and a collection of short stories, a study of W. E. Gladstone (1895, 2nd ed. 1898), popular handbooks on *Parliamentary Procedure* (1880) and the *Law and Practice of General Elections* (1900), six volumes of parliamentary diaries, and several of personal reminiscences. He was knighted in 1909. He died 20 February 1924 at Whitethorn, a country house which

he had built near Hythe in 1883, and at which he spent most of his week-ends. In London he lived at 42 Ashley Gardens, Westminster.

Lucy owed his rapid rise in his profession solely to his own ability and hard work. He was the most urbane, well-informed, and indefatigable of parliamentary chroniclers, and claimed that he was the first journalist to establish close personal relations with prominent politicians. This contact gave his work a first-hand quality which, combined with his lambent humour and undoubted probity, made him *persona grata* with men of all parties.

Lucy married in 1873 Emily Anne, daughter of his old schoolmaster at Liverpool, John White. There were no children of the marriage.

A portrait of Lucy by J. S. Sargent was bequeathed by Lucy to the *Punch* dining-room, with the proviso that after ten years it should be offered to the National Portrait Gallery. A cartoon by 'Spy' appeared in *Vanity Fair* 31 August 1905.

H. B. GRIMSDITCH.

LUKIN, Sir HENRY TIMSON (1860-1925), major-general, was born at Fulham 24 May 1860, the only son of Robert Henry Lukin, barrister-at-law, of St. Peter's-in-Thanet, by his wife, Ellen, daughter of Richard Watson, of Northampton. He was educated at Merchant Taylors' School from 1869 to 1875. The family had distinguished military associations, and the boy ardently desired to become a soldier, but failed to pass into the Royal Military College. It was typical of him that, on the prospect of war with the Zulus, he sailed for Durban in January 1879. He obtained a commission in Bengalough's Horse, a native cavalry contingent, thus entering by a 'side-door' the profession for which he was so well fitted. Severely wounded at the battle of Ulundi (4 July), Lukin saw no more of that campaign, but on 23 March 1881 he was gazetted lieutenant in the Cape Mounted Riflemen, and he served with that regiment in Basutoland in 1881 and, as field

adjutant in the Bechuanaland field force through the Langeberg operations, 1896-1897, which completely crushed the Bechuana rebellion. In the course of these services he was several times decorated and mentioned in dispatches.

In the South African War (1899-1902), Lukin particularly distinguished himself in command of the Cape Mounted Rifles' artillery in the defence of Wepener, Orange Free State, in April 1900, and was awarded the D.S.O. Subsequently, he commanded a mounted column in Cape Colony. When, in December 1901, the Cape government formed a colonial division, Lukin was given command of it. After the War he received the C.M.G. (1902). In 1904 he was appointed commandant-general of the Cape Colonial forces. In 1912 he was made inspector-general of the permanent force, Union of South Africa.

In the European War, Lukin was first given command of a mixed force in the operations in German South-West Africa (March to July 1915). On the conclusion of that campaign he organized and commanded the 1st South African Infantry brigade. After a few months in England this brigade was dispatched to Egypt in January 1916. The commander-in-chief in Egypt, Lieut.-General Sir John Maxwell [q.v.], had been obliged, largely for lack of experienced troops, to evacuate the coast between Matruh and Sollum in November 1915 on the threat of an invasion of Egypt by the Senussi. With the South African brigade available, he adopted a forward policy. At Agagiya on 26 February 1916 Lukin gained a remarkable victory over the enemy, capturing their able Turkish commander, Ja'far Pasha, and on 14 March he reoccupied Sollum. It was a brilliant desert campaign.

Under Lukin's command the South African brigade proceeded to France in April 1916, replacing the 28th brigade in the 9th (Scottish) division. In the battle of the Somme the brigade greatly distinguished itself in the capture of Delville Wood on 15 July. In December Lukin, promoted major-general, took command of the 9th division, thus keeping under his orders the brigade which he had raised and trained. He commanded the division in the battle of Arras in April 1917, and in the 'third battle' of Ypres in the following September and October. In January 1918 he was created K.C.B. He returned to England in February 1918, and was in command of the 64th division at home until the end of the War.

After his retirement in 1919, Lukin returned to South Africa and lived there until his death at Muizenburg, Cape Colony, 15 December 1925. Strong, independent, modest, and a born leader of men, he had become one of the most popular figures in the Union.

Lukin married in 1891 Lily, daughter of Michael Herbert Quinn, landowner, of Fort Hare, Victoria East, Cape Colony; there were no children of the marriage.

Johnston, *Ulundi to Delville Wood, the Life Story of Major-General Sir Henry Timson Lukin*, 1931; Sir George MacMunn and Cyril Falls, (Official) *History of the Great War. Military Operations. Egypt and Palestine*, vol. i, 1928; John Ewing, *The History of the 9th (Scottish) Division*, 1921.] C. B. FALLS.

LUSH, Sir CHARLES MONTAGUE (1853-1930), judge, the fourth son of Sir Robert Lush [q.v.], lord justice of appeal, by his wife, Elizabeth Ann, daughter of the Rev. Christopher Woollacott, a London Baptist minister, was born in London 7 December 1853. Educated at Westminster and at Trinity Hall, Cambridge, he obtained a first class in the classical tripos of 1876. Lush was called to the bar by Gray's Inn in 1879, and joined the North-Eastern circuit. On the passing of the Married Women's Property Act (1882) he produced an excellent treatise on *The Law of Husband and Wife*, which became and remains the standard work on the subject for students and practitioners. His progress at first was slow, but he gradually acquired a leading position at the common-law bar in London, and in 1902 he took silk.

Lush was generally recognized as a sound lawyer, and it was as such, rather than as an advocate, that he was expected to succeed. His small stature and his gentle tones seemed to disqualify him for a jury practice. But, to the surprise of his friends, he developed unsuspected gifts of advocacy, and for eight years was in great request in actions of all descriptions, and in particular in those coming before juries. Surrounded by formidable competitors, he held his own with such great leaders as Edward Carson, Rufus Isaacs, H. E. Duke, and John Lawson Walton; his 'lachrymatory eloquence'—as it was once described by Lord Birkenhead—combined with an appearance of complete simplicity and candour, often secured unexpected verdicts. The clashing of appointments did not disturb him, and he could be relied

upon to be on the spot in time to cross-examine the important witness or to make the final speech. In the Court of Appeal Lush was no less successful than in courts of first instance. He appeared in, amongst other notable actions, *Paquin Ltd. v. Beaucherk* (1906, husband's liability for goods supplied to his wife) and *Hulton & Co. v. Jones* (1910, liability for unintentional defamation).

In October 1910 Lush was appointed to a judgeship of the King's Bench division under the Additional Judges Act of that year, and received a knighthood. The bar warmly approved of his promotion. He seemed to possess all the qualifications necessary to ensure a great judicial career. But on the bench he hardly fulfilled the expectations formed of him by the profession. Courageous to a fault as a barrister, he appeared to lose confidence in himself as a judge. His anxiety to do justice was so great that he hesitated to arrive at a decision, and his subtle mind was inclined to detect difficult problems in cases which to others seemed simple enough. Sometimes he allowed his feelings to master his judgement. In the case which is reported in the House of Lords as *Harnett v. Bond* (1925) Lush was the trial judge. His sympathy with the plaintiff, who alleged that he had been wrongly detained as a lunatic, resulted in a verdict for £25,000 damages against the two defendants. The order for a new trial by the Court of Appeal was affirmed by the House of Lords.

Always careful and courteous, Lush was personally popular with the bar, and he was a kindly criminal judge. He sat occasionally as a temporary member of the Court of Appeal, and in 1915 he was appointed president of the railway and canal commission. Increasing deafness compelled him to retire in 1925. Although he was sworn a member of the Privy Council in that year he never sat as a member of the Judicial Committee. He was a bencher of Gray's Inn and an honorary fellow (1911) of his college. Lush died 22 June 1930 at Stanmore, Middlesex. He married in 1893 Margaret Abbie (died 1925), daughter of Sir Charles Brodie Locock, second baronet, and had four sons and two daughters.

[*The Times*, 23 June 1930; personal knowledge.] T. MATHEW.

MACARA, SIR CHARLES WRIGHT, first baronet (1845-1920), cotton spinner, was born at Strathmiglo, Fife, 11 January

1845, the only child of the Rev. William Macara, minister of the Free Church of Scotland, by his wife, Charlotte Grace, daughter of Thomas Cowpar, of Memus, Kerriemuir, Forfarshire, and niece of Sir Archibald Galloway [q.v.], sometime chairman of the East India Company. Macara's father was a Scottish divine of the old school, whose life, writes Macara in his *Recollections*, 'was a standing exhortation to me to find out what was good and hold on to it'. He refers also to the influence of his mother, an equally vivid personality.

Educated in his native village and at Edinburgh, Macara began work in 1862, at the age of seventeen, with a Scottish merchant in Manchester. In 1875 he married Marion, daughter of William Young, of Bournemouth, and granddaughter of one of the founders of the firm of Henry Bannerman & Sons, cotton spinners and merchants of Manchester, and cousin to Sir Henry Campbell-Bannerman. In 1880 Macara was made managing partner in this firm. In 1884 he fought a strike with ruthless success, and soon afterwards took a leading part in establishing the Manchester Cotton Employers' Association; but he also claims to have been 'one of the forces which have extended and solidified the operatives' unions'. His belief was that all workers and all employers should join their respective unions and organizations and that between employers and employees, so organized, there need be no ill feeling. In the famous twenty weeks' strike in the cotton-spinning industry in 1892-1893, which was ended by the signing of the Brooklands Agreement (March 1893), Macara had to fight the workers on the question of wages, which had originated the strike, and his fellow employers on the wider issue of full recognition of the workers' right to have a say in industry. The Brooklands Agreement provided rules for the settlement of future disputes by conciliatory methods and, in Macara's view, inaugurated a new era 'not in the cotton industry alone, but in all industry'.

In 1894 Macara was elected president of the Federation of Master Cotton Spinners' Associations, and he held this position till 1914. During all that time there occurred only one strike concerning wages (in 1910) which affected the whole industry; whereas before his presidency the industry was known as the cockpit of industrial strife. Macara took a leading part in all public movements connected with the cotton trade, including the

inauguration (1894) of the Manchester Cotton Association, which had for its object the direct importation of raw cotton to Manchester by the Ship Canal, and of the British Cotton Growing Association. In 1902 he headed a delegation, equally representative of capital and labour, to the China Shipping Conference, and succeeded in securing a reduction in freights which is calculated to have saved the Lancashire trade about £100,000 a year. Spurred on by the cotton crisis of 1903-1904, Macara founded in 1904 the International Federation of Master Cotton Spinners' and Manufacturers' Associations, of which he was chairman from 1904 to 1915, and which he regarded as one of the most important movements in the history of international co-operation. He also did much to assist the establishment of the International Institute of Agriculture.

Macara was created a baronet in 1911, and received many foreign decorations. He died at his home at Hale, Cheshire, 2 January 1929, leaving one son, who succeeded to the baronetcy, and four daughters.

Macara was the author of *Social and Industrial Reform* (1918), *In Search of a Peaceful World* (1921), *Recollections* (1921), *Getting the World to Work* (1922); and numerous articles on labour questions, organization of trade, philanthropic movements, and lifeboat work.

A cartoon of Macara appeared in *Vanity Fair* 13 March 1912.

[*The Times*, 8 January 1929; Sir C. W. Macara, *Recollections* (with portrait), 1921; private information.] H. WITHERS.

McCLURE, Sir JOHN DAVID (1860-1922), schoolmaster, was born at Wigan 9 February 1860, the eldest son of John McClure, of Wigan, a Congregationalist business man, whose ancestors came originally from Skye. His mother was Elizabeth, daughter of James Hyslop, who came from Kirkcudbrightshire and who lived for a time at Wigan. He was educated at Holly Mount College, near Bury (1874-1876), Owens College, Manchester (1876-1877), and Trinity College, Cambridge (1882-1886). In the intervening years he taught as an assistant master at Holly Mount (1877-1878) and at Hinckley grammar school, Leicestershire (1878-1882), and graduated B.A. of London University in 1878. During this period music became, as it remained, one of the dominant influences in his life. At Cambridge McClure read for the mathe-

matical tripos, and gave much time to the work of the Nonconformist Union, to lay preaching in neighbouring free churches, and to music; he took his degree with a second class in 1885, but remaining a further year at Trinity (as Walker prizeman), took his LL.B. in 1886, his M.A. in 1889, and entered the Inner Temple. At that time the Free Church ministry, the law, music, or education were all open to him as professions: he chose the last, and after five years of Extension lecturing was appointed headmaster of Mill Hill School in 1891. He also held, from 1889 to 1894, the chair of astronomy at Queen's College, London. Meanwhile, in 1889 he had married Mary, the daughter of James Johnstone, a Scotch business man living at Holcombe, near Bury; by her he had one son and two daughters.

McClure remained at Mill Hill until the end of his life, and saw it grow from a comparatively unknown Nonconformist school of sixty boys to a successful public school, with over three hundred names on its books. His impressive personality, his remarkable memory for names and faces, his sense of humour, and his unfailing fund of stories, of which he was a born raconteur, made him a popular and effective figure not only in the school, but in wide circles outside. He moved in many such circles, as an educationist, a musician, and one of the leading free churchmen of his time. He was called to the bar in 1890 and took the LL.D. degree at Cambridge in 1897. In 1900 he was elected a member of the senate of London University, and in 1902 a member of the council of Mansfield College, Oxford; he was joint honorary secretary of the Incorporated Association of Headmasters from 1904 to 1912, president in 1914-1915, and treasurer from 1920 to 1922. He became a Mus.B. of London University in 1903, a D.Mus. in 1909, was elected to the corporation of the Trinity College of Music in 1906, and became its chairman in 1920. The Congregational Union elected him to the chairmanship in 1919, and he was largely responsible for the compilation of its new hymnal between 1909 and 1916. He received the freedom of the borough of Wigan in 1920. The Teachers' Registration Council (now the Royal Society of Teachers) owes its foundation mainly to his work. For his services to education he was knighted in 1913. During the European War he served on many local committees, and did valuable work in the interests of teachers on the Professional Classes War Relief Council, of which

he was a founder. In 1921 he was invited to stand as a university representative in the House of Commons, but his health was beginning to fail. He died at Mill Hill, after a week's illness, 18 February 1922.

McClure's chief work was the making of Mill Hill School. But he made, also, important contributions to the educational, musical, and religious life of his time, all marked by a broad-mindedness and a devotion to truth which were characteristic; the former, indeed, sometimes tended to alienate him from the stricter Free Church circles, but made him an effective advocate of the cause of reunion and, in a different field, of the League of Nations, after the War. Sociable and of ready sympathies, he was much in demand for committee work; while his power of marshalling facts and of presenting a balanced and reasoned case made him a telling advocate, and some of his most effective public work was done as a mediator in difficult situations. He wrote no books, but contributed an article on 'Preparation for Practical Life' to *Cambridge Essays on Education*, edited by A. C. Benson; as he said in a speech addressed to the old boys of Mill Hill School: 'If I have written no books . . . my writings are happily more lasting, and they are round about me.'

[K. M. J. Ousey, *McClure of Mill Hill. A Memoir by his daughter*, 1927; private information.] M. L. JACKS.

MCCORMICK, SIR WILLIAM SYMINGTON (1859-1930), scholar and administrator, was born at Dumfries 29 April 1859, the elder son of William McCormick, an ironmonger and maker of agricultural implements in that town, by his wife, Agnes Ann, daughter of the Rev. William Symington [q.v.], professor of divinity in the Reformed Presbyterian Church of Scotland (the Cameronians), and niece of Andrew Symington [q.v.]. He was educated at Dumfries high school and at Glasgow University, graduating in 1880. For a short time he lectured in mathematics at Glasgow as assistant to Professor Hugh Blackburn; afterwards he went to the universities of Göttingen and Marburg in order to study literature. On his return to Glasgow, McCormick became in 1894 assistant to John Nichol [q.v.], professor of English literature, and after the transference of Queen Margaret College for women to the university in 1898 he was put in charge of the department of

English language and literature. For a time he was also in partnership with a Mr. Wilson in a publishing business.

In 1890 McCormick was appointed to the chair of English literature at University College, Dundee, to which was added later a lectureship in English at the university of St. Andrews, whither he transferred his home. He was an admirable lecturer, and he was continuously engaged in literary work and in university administration throughout this period of his life. He published a volume of *Three Lectures on Literature* (1889), edited *Troilus and Cressida* for the Globe edition of Chaucer's works (1901), and formulated his theory of English rhythms, based on the continuity of the Old English four-beat line, which, unfortunately, was never published. He also prepared a valuable *Report* for the General Medical Council on preliminary examinations for medical students (1900).

In 1901 McCormick was invited by Andrew Carnegie [q.v.] to become the first secretary of the Trust for the Universities of Scotland which he had endowed with a fund of £2,000,000. This changed the whole course of McCormick's life, for thenceforth he was to become primarily an administrator, although he never lost his interest in literature, especially in Chaucer. In his last years he prepared for the Clarendon Press, on the basis of photostat copies presented to him by the university of Chicago, a critical description of the known MSS. (57 complete and 28 fragmentary) of the *Canterbury Tales*, which shows the nature and order of the contents of each manuscript, with the divisions marked and headings supplied by the scribe, together with all additions, omissions, transpositions, and other structural variants from the text adopted as standard. McCormick was led to undertake this work (published in 1933 as *The MSS. of Chaucer's Canterbury Tales, a critical description*) in preparation for a full critical edition of the *Tales*, by a study of the Pardoner's Tale which he had made in 1900, which was printed but not published.

On his appointment as secretary of the Carnegie Trust, McCormick moved to Edinburgh, where he lived until he came to London in 1920. The new work revealed his administrative ability, and when the liberal government came into power in 1906, (Lord) Haldane, one of the Carnegie trustees, secured McCormick's appointment as a member of the Advisory

Committee set up 'to advise the Treasury as to the distribution of grants in aid of colleges furnishing education of a university standard'. From 1906 onwards McCormick was intimately connected with every important step taken by the government to aid university education. In 1907 he served on the departmental committee on the university of Wales and the Welsh colleges. From 1909 to 1913 he was a member of the royal commission on university education in London. In 1911 the Treasury Advisory Committee was transferred to the Board of Education, and McCormick became its chairman, in which office he was confirmed when it became the Treasury University Grants Committee in 1919. He held this post until his death.

In 1915 McCormick also became chairman of the Advisory Council for Scientific and Industrial Research, at first attached to the Board of Education, but transferred in 1916 to a new Department under the lord president. The experience gained in the European War, and the study made of the universities by McCormick and his committee, had convinced the government that systematic encouragement of scientific research was urgently needed in the national no less than in the industrial interest. McCormick was trusted by the universities, and his chairmanship of the Advisory Council mitigated from the beginning their suspicions of this bold undertaking and soon won their confidence and support. The industrial firms were more difficult to move, but the fund of a million sterling granted by the government, on McCormick's initiative, to the new Department towards the maintenance of co-operative research associations to be established and run by the industries themselves, greatly helped to overcome apathy. When McCormick died fifteen years later, the Department controlled an annual expenditure of over £700,000 upon a series of large national research stations and in support of research conducted in the universities and by industry. The Royal Society in 1928 admitted McCormick to be a fellow as a person who, in the opinion of the council, 'had rendered conspicuous service to the cause of science'.

McCormick was an original trustee of the Carnegie United Kingdom Trust, formed in 1913, and chairman of its music committee, which published Tudor and Elizabethan church music and the work of modern British composers, assisted the musical competition festivals, and helped to save the 'Old Vic' Theatre. As a mem-

ber of its library committee, he was active in the development of the rural libraries, the formation of the Central Library for Students, now the National Central Library in Malet Place, London, and the School of Librarianship at University College, London. He also became chairman of the British National Opera Company and a member of the committee of management of the 'Old Vic'. He was knighted in 1911 and created G.B.E. in 1929. He died at sea 23 March 1930.

McCormick married in 1897 Mabel Emily, younger daughter of Sir Frederick Lucas Cook, second baronet, head of the firm of Cook, Son & Co., warehousemen, St. Paul's Churchyard, and had one son and two daughters. A vivid portrait by his friend Sir William Orpen hangs in the Tate Gallery.

[*Proceedings of the Royal Society*, vol. cxxxii, A, 1931; private information; personal knowledge.]
H. F. HEATH.

MACDONALD, Sir JAMES RONALD LESLIE (1862-1927), major-general, the eldest son of Surgeon-Major James Macdonald, M.D., was born 8 February 1862. He was educated at the grammar school and the university of Aberdeen, and proceeded thence to the Royal Military Academy, Woolwich. There he quickly made his mark, and passed out in 1882 well ahead of the rest of his year, having gained many prizes, the Pollock medal, and the sword of merit. In November of the same year he was gazetted, as lieutenant, to the Royal Engineers, and entered upon the two years' course at Chatham. He spent part of his leisure in yachting and racquets, displaying in all that he did an energy and concentration which characterized his subsequent military career.

Macdonald sailed for India in 1884, and after a short period of attachment to the Bengal Sappers and Miners, was posted for duty to the Military Works Department. From 1885 to 1887 he was employed on survey work for the construction of the Harnai Railway in Baluchistan. The Hazara expedition of 1888 gave him his first experience of active service; for his part in it he was mentioned in dispatches and received the India frontier medal with clasp. Two years later he was promoted captain, and carried out the survey for the Kabul River Railway. He was next employed (1891) in the Zhob Valley Railway survey, and later in the same year

returned home on leave. Soon after reaching England he was offered and accepted the appointment of chief engineer on the preliminary survey for the projected railway between Mombasa and Lake Victoria Nyanza—the Uganda Railway. He had just completed this long and very arduous survey and was on his way back to the coast when he received urgent orders to return to Uganda, where civil war had broken out. During the next two years Macdonald was successively engaged in quelling a rebellion of Mohammedans, in expeditions by lake against the Wavuma, and in operations in Unyoro, when he acted as chief of staff to (Sir) Henry Edward Colvile [q.v.] during the expedition against King Kabarega, the slave-raider. He was made acting commissioner of the Uganda Protectorate in 1893. The story of these exciting and strenuous years is told by Macdonald in his *Soldiering and Surveying in British East Africa, 1891-1894* (1897). For his services he was rewarded with the brevet of major, and he also received two medals and the brilliant star of Zanzibar, second class.

Resuming duty in the Military Works Department, India, in 1894, Macdonald was attached to the head-quarters staff at Simla. In 1896 he returned to Chatham for the 'refresher' course for Royal Engineers serving in India. In 1897, while (Lord) Kitchener's conquest of the Sudan was in progress, it was decided to dispatch a British exploring expedition, under Macdonald's command, from Mombasa through East Africa to Fashoda. Macdonald landed at Mombasa early in July, but, owing to the mutiny of the Sudanese troops under his command and the revolt of Buganda Mohammedans, was unable to achieve his object. He was engaged for many months in operations against the mutineers and rebels over a very wide stretch of country. He laid siege to Luba's Fort in Usoga (18 October 1897), fought against and defeated King Mwangi in Ankole (19 January 1898), conducted successful operations near Lake Choga (28 January), and fought several other minor engagements which finally freed Uganda of the mutineers and assured the safety of that Protectorate. His expedition returned to the coast in April 1899, and for his valuable services Macdonald was made a C.B. (1900), gazetted brevet lieutenant-colonel, and received a medal with two clasps.

Shortly after the beginning of the South African War (October 1899) Macdonald,

now a major in the corps of Engineers, was put in charge of the balloon factory at Aldershot; but on the outbreak of the Boxer rebellion in the summer of 1900, he was sent out to China with a staff appointment as director of balloons. This post, however, provided insufficient scope for one of his experience and ability, and he was shortly given the post of director of railways for the China expeditionary force. His services in China were rewarded by a mention in dispatches, the China medal, and the brevet of colonel. On the disbanding of the China force Macdonald returned to India, where he was employed in military works at Quetta until 1903. In that year the government of India decided to dispatch a political mission to Tibet under (Sir) Francis Younghusband, in order to counter Russian intrigues and to stabilize relations with Tibet by means of a treaty. Lord Kitchener, commander-in-chief in India, selected Macdonald to command the military escort. The party crossed the Jelep pass and entered Tibet on 12 December 1903. The journey was broken by several engagements with the Tibetans, who resisted the advance of the mission during the next four months, especially in the neighbourhood of Gyantse. Gyantse fort itself was the scene of severe encounters and, although it surrendered without resistance on 12 April, the capture was not finally consolidated until 7 July, when the monastery and the rest of Gyantse were secured. The last stage of the march began on 13 July 1904, and on 3 August the mission arrived at Lhasa, where a treaty was duly concluded. For this arduous campaign, Macdonald was awarded the K.C.I.E. and received the medal and clasp of the expedition.

In 1905 Macdonald was promoted colonel and given the command of the presidency brigade at Calcutta, passing on two years later to the command of the Lucknow infantry brigade. In the following year (1908) he was made major-general, and in 1909 was appointed general officer commanding in Mauritius. He held this post until 1912, when under medical advice he resigned and returned to England. He was compelled, owing to failing health, to retire in the following year, and, although he offered his services immediately on the outbreak of the European War in 1914, he was unable to satisfy the medical authorities. Later, he was appointed military member of the Aberdeen District Emergency Committee, and he served on

that body with untiring zeal until the end of the War. In 1924 he was appointed colonel commandant of his own corps, the Royal Engineers. He also served as deputy-lieutenant for Aberdeenshire.

Macdonald married in 1894 Alice Margaret, youngest daughter of General George Pringle, Indian Staff Corps. They had no children. He died at Bournemouth 27 June 1927.

MACDONELL, ARTHUR ANTHONY (1854-1930), Sanskrit scholar, born 11 May 1854 at Muzaffarpur in Tirhut, North Bihar, India, was the elder son of Colonel Alexander Anthony Macdonell, of the 40th Bengal Native Infantry, by his wife, Margaret Jane Lachlan, of Rum. Sent to England with his mother in 1861, he was placed in a school in Dresden (Neustadt, 1860-1869), where a boyish adventure resulted in a permanent weakness of his lower limbs and led to the stimulation of his intellectual interests. After four years at the Göttingen gymnasium he matriculated (1875) in the university of that city, and under Professor Theodor Benfey began the study of Sanskrit and comparative philology. At Oxford, as an exhibitioner (1876) of Corpus Christi College, he obtained a second class in honour moderations (1878) and a third class in *literae humaniores* (1880). He also won the Taylorian scholarship in German (1876), the Davis Chinese scholarship (1877), and the Boden Sanskrit scholarship (1878), besides rowing in his college eight and taking an active share in the life of the college.

Having worked with Professor Friedrich Max Müller [q.v.], and having been appointed Taylorian lecturer in German (1880) and lecturer in Sanskrit to Indian civil service probationers in Balliol College (1884), Macdonell revisited Germany for the purpose of reading with the distinguished Sanskrit scholar Professor Rudolf von Roth, and graduated Ph.D. of Leipzig University. In 1888 he was appointed deputy to Sir Monier Monier-Williams [q.v.], the Boden professor of Sanskrit at Oxford and keeper of the Indian Institute. Upon that scholar's death in 1899 Macdonell was appointed his successor in both those offices and also in a professorial fellowship at Balliol College. Retiring in 1926, he received the title of emeritus professor, and in 1928 he was elected an

honorary fellow of Balliol. His connexion with Corpus Christi College had been restored in 1921 by his election to an honorary fellowship there.

As keeper of the Indian Institute, Macdonell was charged with the general administration, superintendence of the staff, library, and museum, correspondence, and provision for lectures, regular and occasional. With a succession of librarians he interested himself effectually in the development of the library: more occasional, and partly volunteer, assistants attended to the arrangement and classification of the museum, the growth of which was arrested about 1911. He also occupied himself with the administration of the Max Müller memorial fund, which he had raised in 1900, with the object of providing for subventions, acquisitions, and publications.

Outside Oxford, Macdonell was active in various ways. Elected in 1906 a fellow of the British Academy, he represented it from 1911 to 1913 upon a committee of the International Union of Academies which was concerned with promoting a critical edition of the great Sanskrit epic, the *Mahā-Bhārata*: he was a signatory to an appeal for funds, addressed to the princes and nobles of India, and subsequently, by means of an independent appeal in conjunction with a colleague, he elicited contributions amounting to about £1,500. He served on the council of the Royal Asiatic Society, being vice-president 1921-1924. In the quasi-triennial International Congresses of Orientalists Macdonell was usually, from 1881 to 1912, a participant; on the last of these occasions he secured assent for an Oxford congress, which, frustrated in 1915 by the European War, was realized in 1928, when he was no longer able to take an active part in it. Of two visits which he made to India, the first (1907-1908) led to the acquisition by the Bodleian Library of a large collection of Sanskrit manuscripts and produced some hundreds of mainly archaeological photographs, subsequently presented to the Indian Institute; it also inspired some comprehensive views regarding Indian temple architecture and iconic sculpture, which Macdonell expounded in lectures (1909) before the British Academy and the Royal Society of Arts. The second visit (1922-1923) was for the purpose of delivering in the Calcutta University a course of 'Stephanos Nirmalendu' lectures on comparative religion. In 1904 Macdonell represented the

Sanskrit language and literature at a Congress of Arts and Sciences held at St. Louis, Missouri, and in 1912 he visited Canada. His War service (1915-1920) was performed in the Intelligence Department of the Admiralty, for which he compiled three historical memoirs.

Macdonell received various honorary distinctions and degrees, and in 1913 he was chosen by the Bombay branch of the Royal Asiatic Society to receive its Campbell memorial medal, in which connexion he propounded, at a gathering in the rooms of the Society in London, the idea of an institute of research in India on the lines of the British School at Athens.

As a Sanskrit scholar Macdonell worked chiefly in the Vedic field, to which appertain his most important publications, namely his editions of two 'control' texts; *Sarvanukramanī* (1886) and *Byhad-devata* (2 vols., 1904), his *Vedic Mythology* (1897), *Vedic Grammar* (1910), *Vedic Index of Names and Subjects* (in collaboration with A. B. Keith, 2 vols., 1912), and one or two of his educational publications. But his *History of Sanskrit Literature* (1900), his *Lectures on Comparative Religion* (1925), and his *India's Past, a study of the Literatures, Languages, Religions, and Antiquities* (1927) contemplated a wider subject and public.

As a young man, Macdonell was distinguished by an abounding vitality, which made his various activities a proverb in Corpus Christi College. His physical defect was not incompatible with prowess as an oarsman: a love of aquatic adventure persisted into middle life and is attested by two published brochures (*Camping Voyages on German Rivers*, 1890, and *Camping Out*, 1892, 1893), while his humour and fondness for jocular anecdote enlivened both his conversation and the earnestness of his teaching. A stroke, following upon the exertions of his second Indian journey, resulted in his retirement (1920) from his professorship and seriously curtailed his powers of work; a second stroke, during the summer of 1930, was a premonition of the end, which came at Oxford on 28 December of that year.

Macdonell married in 1890 Marie Louise, youngest daughter of William Lowson, J.P., D.L., of Balthayock, Perthshire, who survived him with their two daughters. Their only son was killed in the European War in 1915.

[*The Times*, 29 December 1930 and 2 January 1931; *Oxford Mail*, 29 December 1930;

Oxford Magazine, 20 January 1931; *Proceedings of the British Academy*, vol. xvii, 1931.]
F. W. THOMAS.

MACDONNELL, ANTONY PATRICK, BARON MACDONNELL, of Swinford (1844-1925), statesman, the eldest son of Mark Garvey MacDonnell, landowner, of Shragh, co. Mayo, by his wife, Bedelia, daughter of Michael O'Hara, of Springtown, co. Roscommon, was born at Shragh 7 March 1844. He was educated at the Roman Catholic College, Summerhill, Athlone, and at Queen's College, Galway, where he won high honours in French and German and, in the words of the most distinguished of his teachers, gave evidence in the college debating society 'of high logical capacity, prompt argumentative resource, and a copious fund of picturesque and impassioned rhetoric'. In 1864 he graduated with honours, winning the Peel gold medal, and in the same year competed successfully for appointment to the Indian civil service. He was posted to Bengal, and passing out after a year's probation, arrived at Calcutta in November 1865. MacDonnell served in the executive line in various districts of Bengal and Bihar, and in Tirhut in 1873-1874 so distinguished himself in famine operations that he was complimented by the lieutenant-governor, Sir Richard Temple [q.v.], and was afterwards placed on special duty in the distressed districts. His book, *Food-Grain Supply and Famine Relief in Bihar and Bengal*, published by the government in 1876, increased his reputation. His health breaking down, he took furlough, and married in 1878 Henrietta, younger daughter of Ewen MacDonell, chief of the Keppoch branch of the clan Macdonald, who helped and supported him throughout all the difficulties and trials of his subsequent career.

After his return to India in 1881 MacDonnell served first as accountant-general and then as revenue secretary to the provincial government at Calcutta. In 1884 he took a prominent part in preparing legislation for the protection of the tenants of Bengal from rack-renting and arbitrary ejectment. The Tenancy Act of 1885, strongly opposed by the landlords, was largely his work. His sympathies throughout his public life were with the peasants who live on and by the land. Agrarian discontent too often provides a fertile field for political agitation; and convinced of this fact, MacDonnell laboured for its removal from Bengal with a zeal and fiery

energy which commanded the admiration of the anonymous author of *Letters to Eminent Indians*, published at Calcutta in 1885, who testifies that although his temper was 'very hot', his judgement was always cool. In 1886 Lord Dufferin appointed him home secretary to the central government, and on leaving India in 1888, commended him to Lord Lansdowne as a man 'without reproach, who could safely be conferred with on most delicate questions, and was likely to render invaluable service'. In the same year he had received the C.S.I.

In 1889 MacDonnell was selected to officiate for three months as chief commissioner of Burma, and in 1890 to be chief commissioner of the Central Provinces. While holding this post, he was in 1893 chosen to act for six months as lieutenant-governor of Bengal, and later on was called to a seat on the viceroy's executive council. In a letter to Lady MacDonnell, written after her husband's death more than thirty years later, Lord Lansdowne wrote: 'I look back wistfully to my five years in India, and there is no chapter of my Indian experience to which my thoughts turn with more satisfaction than that which brought me into close relations with your husband. There was no one with whom I liked better to work.' In January 1893 MacDonnell was created K.C.S.I.

In 1895 MacDonnell was nominated by Lord Elgin to be lieutenant-governor of the North-Western Provinces and Oudh, soon afterwards to be known as the United Provinces of Agra and Oudh. His period of administration was marked by severe visitations of plague and famine. At such times the people are prone to blame their rulers, and in particular they regarded with resentful suspicion measures taken to check and combat outbreaks of plague, such as disinfection and evacuation of dwellings. The opportunity was seized by political malcontents; and two British officers in anti-plague operations were murdered at Poona in 1897. Misunderstanding and discontent spread gradually, in the wake of plague, to the United Provinces, and eventually in April 1900 produced serious rioting and murders of policemen at Cawnpore. Times were anxious from the beginning of MacDonnell's administration, for the rains of 1895 had fallen short, and those of 1896 largely failed. Fears of famine were speedily justified. Though new to the people and to their language, and hardly at first appreci-

ating the degree to which conditions differ from those in Bengal, MacDonnell went everywhere, and was over-inclined to gather all authority into his own hands, ignoring the susceptibilities of his commissioners. When he gave his confidence, he was an inspiring and considerate chief. But he was slow to give it; and the younger men were better able than the older to appreciate his indefatigable energy and anxious enthusiasm. His secretaries were driven hard, but appreciated his great ability and knew that he never spared himself. The people respected and feared him. When famine came in November 1896, he took personal charge of relief operations instead of appointing a special commissioner, and travelled indefatigably to all distressed districts. The energy and ability of his famine administration was recognized by his appointment in June 1898 to be G.C.S.I., an honour hitherto unique for a lieutenant-governor while still in office. In March 1898 he refused a pressing invitation from Lord Elgin to take charge of Bengal. The transfer would have meant an extra three years of active service, and for that reason would have been welcome. But partly on account of Lady MacDonnell's indifferent health and partly because of his devotion to the tasks on which he was then engaged, he decided to stay in the United Provinces.

After six months' leave in Europe on medical certificate, MacDonnell began his second term of office, which was prolonged for an additional year on the recommendation of the viceroy, Lord Curzon, and ended in October 1901. He initiated and carried through his legislative council an Agra Tenancy Act, which afforded wider opportunities to cultivators of gaining and keeping occupancy rights, and was therefore vigorously opposed by the landholders. Another measure which provoked passing controversy was a government order permitting the presentation of petitions to the law courts in either the Nagari (Hindi) or the Persian Urdu character and directing that legal summonses and proclamations were to be bilingual. Court officials had henceforth to be able to read and write Hindi as well as Urdu. Until then Urdu alone had been employed for such purposes, a legacy of Moslem supremacy resented by a section of literary Hindus. The innovation was vehemently protested against by Mohammedans, but not for long, as in fact the concession appeared an unreal demand. The point once gained, no one cared to present

Hindi petitions, and the order became a dead letter.

At the beginning of 1901 MacDonnell was requested by the viceroy to undertake the chairmanship of an important famine commission. He consented, refusing an offer of relief from his ordinary responsibilities, and after making a rapid tour with his colleagues through various provinces, produced a report which remains the standard authority on famine prevention and relief. Before MacDonnell resigned office in November 1901 Lord Curzon wrote to him: 'It has been a great pleasure as well as an advantage to me to have had as one of my lieutenants, for nearly three years, an administrator of your unique experience and ability. . . . You are about to leave India with a record unapproached at the present moment, and equal to that of the most illustrious of Indian administrators in the past.' The tribute was not extravagant. Firmly resolved to maintain order, yet sympathetic towards Indian feeling and wishes, MacDonnell's energies had never flagged. An impetuous manner and a quick temper could not conceal his kindness of heart, and his qualities of character and leadership were recognized by all.

In September 1902 after being sworn of the Privy Council, MacDonnell accepted from the secretary of state a nomination to the Council of India, but soon afterwards was called to a new sphere of action. Much to his surprise, he was invited by George Wyndham [q.v.], chief secretary for Ireland in Mr. Balfour's government, to take the place of Sir David Harrel as permanent under-secretary at Dublin Castle. In a letter dated 22 September 1902 MacDonnell set forth the only conditions which, subject to his obligations to the India Office, would induce him to accept the appointment. Although he was an Irishman, a Roman Catholic, and a liberal, and did not see eye to eye with Wyndham on certain matters, there was a substantial measure of agreement between them, and he was greatly attracted by the chance of renewing ties with, and working for, his native Ireland. If appointed, his aims would be the maintenance of order, the solution of the land question on the basis of voluntary sale, the co-ordination, control, and direction of the detached and semi-detached boards into which the government of Ireland was then subdivided, and the promotion of education, economic reform, and administrative conciliation. He would require

'adequate opportunities of influencing the policy and acts of administration'. His best friends warned him that he was deluding himself. He would be abused by Orangemen as a Home Ruler and by Home Rulers as a renegade, and would retire disgusted within a year.

But MacDonnell had made up his mind. If his conditions were agreed to, he would 'try the business'. He had been recommended to Wyndham by Lord Lansdowne; and with the approval of the prime minister, his conditions were enthusiastically accepted. Wyndham considered that Ireland was 'now more plastic than at any time since 1887; many there were growing weary of barren conflict'. King Edward VII, Sir Sidney Lee has said, discovered in MacDonnell an influence for lifting the long-standing Irish quarrel above the bitterness of party warfare. This was indeed MacDonnell's aim; but, as his friends anticipated, his administration was regarded with suspicion by both parties in Ireland. He was able, however, to render valuable service to Wyndham in preparing and shaping the Irish Land Purchase Bill (1903), and on the occasion of the visit of the king and queen to Ireland in July 1903 he received the K.C.V.O. He had been informed by the chief secretary that he was wanted by Lord Curzon for the governorship of Bombay but could not be spared from Ireland. King Edward, too, was 'most earnest and emphatic' on this point and impressed his wishes personally on MacDonnell. So, at a heavy pecuniary sacrifice, MacDonnell stayed. Then the prospect clouded. The assistance which he gave to Lord Dunraven and the Irish Reform Association in preparing as a basis for discussion a scheme of 'devolution' which they had launched, led to a storm of Orange and Unionist protest. The scheme allowed Ireland a semi-elective financial board and a substantial measure of legislative control over her own affairs; and for these reasons was denounced as an insidious breach in the Unionist defences. It was repudiated by Wyndham; and a weak-kneed censure was passed by the Cabinet on MacDonnell. The latter, however, whose action had met with the full approval of the lord-lieutenant, Earl Dudley, and was vigorously defended by Lord Lansdowne in the House of Lords, resigned the lien on the India Council which till then he had retained, and resolutely stayed where he was. He had certainly been given ample grounds for supposing that such action as

he had taken would not be considered *ultra vires*. This was the expressed opinion of Wyndham's successor, Mr. (afterwards Viscount) Long.

With the advent of the liberals to power at the close of 1905, James (afterwards Viscount) Bryce [q.v.] became chief secretary for Ireland. The two men became friends for life. A scheme of devolution, prepared by MacDonnell, was approved by Bryce and formed the basis of the Irish Council Bill of 1907. But Bryce was transferred to Washington and was succeeded by Mr. Augustine Birrell, who in April 1907 described Ireland as being 'in a more peaceful condition than it had been in for 600 years'. Then the Council Bill was dropped as unwelcome to the Irish party in parliament. A university measure was indefinitely postponed, and MacDonnell found no support for his policy of firmly repressing the disorder which accompanied a grave recrudescence of cattle-driving agitation. In correspondence with the chief secretary he had expressed his faith in devolution, both administrative and financial, 'as a practical measure of regeneration which need not block the larger issue'. But to fail in stopping disorder could only result in measures which must 'accentuate that antagonistic state of feeling between the two countries which it is the incessant aim of certain agitators to promote'. He resigned office in July 1908 and was raised to the peerage as Baron MacDonnell, of Swinford, a town close to Shragh. In 1907 he had received the honorary degree of D.C.L. from Oxford University. Throughout his tenure of office at Dublin Castle he had retained King Edward's full confidence.

MacDonnell thus passed from public employment, but not from public life. From 1912 to 1914 he served as chairman of a royal commission on the civil service. In 1917 and 1918 he was an influential member of the Irish Convention. On 6 October 1918 he addressed a powerful and closely reasoned confidential letter to Lord French, then lord-lieutenant, on the necessity of abandoning conscription in Ireland. In 1921 he was offered, but refused with deep regret, a seat on the senate of Southern Ireland. He was consulted by Lord Morley [q.v.] on the Indian constitutional reforms of 1909, and by Edwin Montagu [q.v.] on those of 1919. He took exception to the former on two points only which he regarded as concessions tending to weaken executive authority in India. He also desired that the

opportunity should be seized for reconsideration of the Partition of Bengal, a measure which he had always regarded with disfavour. He considered Montagu's proposals dangerously crude and hasty, and denounced them vigorously in the House of Lords on 12 December 1919. His interest in Indian and Irish affairs only ceased with his life.

MacDonnell was offered many directorships of companies but accepted only two: those of the Midland Great Western Railway of Ireland, and the National Bank. In 1923 he was offered the chairmanship of the latter and accepted the vice-chairmanship. His assiduity in business and shrewd judgement were highly appreciated by his fellow directors. He died in London after a brief illness 9 June 1925. The strain of his last days was relieved for his family by the attentive sympathy of two of the most distinguished of his old Indian officials.

For the theoretic perfection of political institutions MacDonnell cared little; for the peace and social order which alone can give happiness to the masses he cared a great deal. He pursued his ideals inflexibly. The outlines of his character were firmly drawn. From childhood he was a convinced Roman Catholic. In private life he was generous and hospitable, always welcoming warmly his old lieutenants in India. He possessed an impressive literary style, but wrote two books only, *Food-grain Supply and Famine Relief in Bihar and Bengal* (Calcutta, 1876), already mentioned, and *Agricultural and Administrative Reform in Bengal*, by a *Bengal Civilian*, published anonymously in 1888.

MacDonnell was survived by his wife and their only surviving child, the Hon. Anne MacDonnell. On his death the barony became extinct. He was of medium height, squarely built, with light hair, a heavy moustache, and a fair complexion. His features were rugged, his eyebrows bushy, and his chin firm. His forehead was fine and massive, his eyes were hazel and his glance penetrating. His expression was keen, masterful, and intellectual. A portrait of MacDonnell by Sir William Orpen is in the Municipal Gallery of Modern Art, Dublin. Another, by H. Harris Brown, was exhibited at the Royal Academy in 1916. A cartoon of him by 'Spy' appeared in *Vanity Fair* 3 August 1905. A statue of MacDonnell by (Sir) George Frampton was erected at Lucknow by the Talukdars of Oudh in 1907.

H. V. LOVETT.

McEVROY, ARTHUR AMBROSE (1878-1927), painter, was born in Wiltshire 12 August 1878, the elder son of Captain Charles Ambrose McEvoy, by his wife, Jane Mary. The younger son, Charles, gained some distinction as a playwright. Their father was an Irish-American soldier of fortune, who after serving in the Confederate army in the American civil war, became an authority on submarine warfare, making many successful inventions, including an anti-submarine hydrophone in 1893, and later settled in England. Captain McEvoy was in close touch in London with the painter James McNeill Whistler (one of whose brothers had served with him in the Confederate army), and Whistler joined with him in encouraging Ambrose McEvoy's ambition to become a painter. At the age of fifteen McEvoy entered the Slade School of Fine Art, then under the direction of Professor Frederick Brown; with him, as fellow students, were (Sir) William Orpen and Augustus John. While at the Slade School he worked in the National Gallery, copying one work of each of the painters Titian, Rembrandt, Velasquez, Hogarth, and Gainsborough. He spent sketching holidays in Wales with Augustus John, and in 1909 was at Dieppe with Walter Sickert. By 1912 his painting began to show signs of the broader, looser treatment which was characteristic of his later work.

Beginning as a painter of poetical landscapes and of restful interiors ('The Engraving', 1901, 'The Book', 1903, and 'The Earring', 1911, the last-named being in the Tate Gallery), McEvoy became popular as a portrait-painter after exhibiting 'Madame' (Mrs. A. McEvoy, 1915, now in the Musée du Luxembourg, Paris) and 'Mrs. Walter Russell' (1910). In obtaining the flower-like fragrance, the freshness, and the dewy quality which are character-

istic of his work, McEvoy was prepared to sacrifice detail, but he never lost the underlying sense of form. His delicate and fluttering brush-work, his experiments in colour, tone, and surface quality, his preoccupation with lighting effects, his device of using mixed daylight and artificial lighting thrown up from below, all give strong individuality to every portrait, although the likeness may be more spiritual than actual. In his use of water-colour, a medium which made a distinct appeal to the emotional side of his nature, he would draw and paint solidly, then put his picture under running water, then scrub and scrape, adding accents in chalk or ink, and floating on colours which fused into delicate opalescent harmonies.

During the European War McEvoy was attached to the Royal Naval Division, spent three months on the Western front, and later was with the fleet in the North Sea. This accounts for a series of portraits, now in the Imperial War Museum at South Kensington, of which 'Lieutenant R. D. Sandford, R.N., V.C.' is a notable example. That he could render masculine qualities successfully is shown also in his striking studies of Lord D'Abernon (1916), Claude Johnson (1917), and Augustine Birrell (1918). But it is his subjective treatment of women's portraits which gives McEvoy a unique place among contemporary English portrait-painters. Further notable examples are 'The Artist's Mother' (1915), 'Silver and Grey' (Mrs. Charles McEvoy, 1915), 'Consuelo, Duchess of Marlborough' (1916), 'Blue and Gold' (Mrs. Claude Johnson, 1916), 'Mrs. Walter Rosen' (1921), 'The Viscountess Henri de Janzé' (1926), and 'Anna' (his daughter, 1926), the last picture he painted.

McEvoy was a member of the New English Art Club and of the International Society of Painters; he was elected A.R.A. in 1924, a member of the Royal Society of Portrait Painters in 1924, and an associate of the Royal Society of Painters in Water-Colours in 1926. Examples of his work are to be found in the Tate Gallery, British Museum, and Victoria and Albert Museum, and in the public galleries at Manchester, Dublin, Cork, Belfast, Ottawa, Johannesburg, and Pittsburg, as well as in the Musée du Luxembourg. An exhibition of his water-colours was held at the Leicester Galleries in 1927 and memorial exhibitions of his oils and water-colours took place at the Royal Academy Winter Exhibition in 1928, and at Manchester in 1933.

McEvoy married in 1902 Mary, daughter of Colonel Spencer Edwards, of Abbotsleigh, Freshford, Bath, by whom he had a son and a daughter. From 1906 until his death he lived at 107 Grosvenor Road, on the Embankment. He died of pneumonia, after a week's illness, at a nursing-home in London 4 January 1927, and his ashes are buried in the wall of All Saints' church, Grosvenor Road.

A self-portrait in oil of McEvoy, from the Claude Johnson collection, is owned by Mrs. Archibald Douglas, and an earlier self-portrait in pencil belongs to his widow.

M. HARDIE.

MACEWEN, Sir WILLIAM (1848-1924), surgeon, was born at Rothesay, Isle of Bute, Scotland, 22 June 1848, the youngest son of John Macewen, marine trader, of Bute, by his wife, Janet Stevenson. John Macewen gave his children such education as was then available in Rothesay. In 1865, at the age of seventeen, William Macewen, after having attended the Collegiate School in Glasgow for a brief period, entered the university of Glasgow as a student of medicine. He obtained the degree M.B., C.M., in 1869, at the early age of twenty-one. He had grown into a man of very fine physique—tall, well-proportioned, with clearly chiselled features and deep-set grey eyes, the characteristics of a stock which is found in the Western Highlands of Scotland. In his student days he was noted for his athletic attainments and gave no apparent promise of the great originality which he was afterwards to manifest. He came, however, under the influence of (Lord) Lister [q.v.], then regius professor of surgery in the university.

In the year in which Macewen began his medical studies Lister first applied his antiseptic method to the treatment of wounds in the wards of the Old Royal Infirmary of Glasgow, and in due time Macewen became a leading exponent of Listerism. When Macewen graduated in 1869 Lister succeeded James Syme [q.v.] as professor of clinical surgery in the

university of Edinburgh, his post in Glasgow being filled by his pupil (Sir) George H. B. Macleod [q.v.]. Macewen became house-surgeon to Macleod in the Old Infirmary, and twenty-two years later (1892) succeeded him as regius professor of surgery in the university and surgeon to the Royal Infirmary. On his appointment to the chair of surgery, he had to transfer his surgical activities from the Royal to the Western Infirmary. He retained his chair and surgeoncy until his death, which took place at Glasgow, 22 March 1924. Although then in his seventy-sixth year, he was still erect in carriage and vigorous in mind and body.

Macewen's surgical career began in 1875 when he was appointed assistant surgeon to the Royal Infirmary at Glasgow, becoming a full surgeon in 1877. In the years which elapsed before his appointment to the Royal Infirmary he had taken the degree of M.D. (1872), held several appointments, including the superintendence of a fever hospital (Belvidere), and had built up a nucleus of private practice. On his appointment to the Infirmary he devoted himself solely to surgery. By his thirtieth year he had made important advances in two branches of surgery—brain surgery and bone surgery. He was the first deliberately to operate for the relief of brain disorders. In 1876 he diagnosed the presence of an abscess in the frontal lobe of a boy, but was not permitted to operate; after the boy's death his diagnosis was found to be correct and an operation might have saved the lad's life. In 1878 he removed a tumour from the brain; in 1879 he operated for the relief of subdural hæmorrhage. He thus laid the basis of modern brain surgery. His next great advance was the result of his recognition that disease of the middle ear was the commonest cause of abscess of the brain. He introduced and perfected the methods of operating on cases of mastoid disease. His experience of this branch of surgery is summarized in *Pyogenic Infective Disease of the Brain and Spinal Cord* (1893) and the anatomical basis of his surgical procedure in an *Atlas of Head Sections* (1893).

Macewen was also a pioneer in bone surgery. He looked upon bone as a living tissue, and introduced the method of implanting small grafts to replace missing parts of limb-bones. In 1880 he sowed such grafts in the arm of a lad to replace the shaft of the humerus which had been destroyed by disease. The operation was

successful, and the lad regained a useful arm. In 1877 he introduced a new method of rectifying knock-knee by cutting through the thigh-bone just above the knee by a subcutaneous operation—a practice which has been followed by surgeons in all lands. Macewen became interested in the biology of bone and carried out a long and critical series of experiments on animals in order to determine the manner in which bones grow and the conditions underlying their repair. He came to the conclusion that the membrane which covers bone (periosteum) cannot produce bone. He published an account of his inquiries in *The Growth of Bone* (1912), reserving his observations on the natural history of bone for *The Growth and Shedding of the Antler of the Deer* which appeared in 1921.

These are the chief contributions which Macewen made to surgery, but there are also many minor improvements which stand to his credit. He was a pioneer in opening up the chest to surgical procedure. He proved that the fear of the human lung collapsing when the chest is opened was groundless, and he successfully resected the entire lung. He was one of the first to 'intubate' the larynx in order to keep the airway open instead of resorting to tracheotomy. He introduced and perfected a method of operating for the radical cure of inguinal hernia. He invented his own surgical tools and made his own catgut.

Macewen was a man of independent outlook, paying little attention to books or to accepted opinions. His teaching and practice were based on his own experience and on observations made by his own eyes. His personality was forceful and masterful; he pursued his career with fiery zeal and resolution. On Lord Lister's death in 1912 he became in the eyes of his fellows the leader amongst British surgeons. Glasgow University conferred on him the degree of LL.D. in 1890; he was elected a fellow of the Royal Society in 1895, and was made an honorary fellow of the Royal College of Surgeons of England in 1900. The universities of Oxford, Dublin, Liverpool, and Durham conferred honorary degrees on him; he received recognition from the leading surgical societies and academies of France, Italy, Germany, Russia, Hungary, and America. He was knighted in 1902. He rendered many public services, being consulting surgeon for naval forces in Scotland during the European War and training a band of pattern-makers to become expert in the

difficult art of fashioning artificial limbs for disabled men.

Macewen married in 1873 Mary Watson, daughter of Hugh Allen, of Crosshill, Glasgow, and had three sons and three daughters.

A. KEITH.

McGRATH, SIR PATRICK THOMAS (1868-1920), statesman and journalist, was born at St. John's, Newfoundland, 16 December 1868, the eldest son of William McGrath by his wife, Mary Birmingham. He was educated at the Christian Brothers Schools in St. John's, which he left at the age of fourteen. For seven years he was employed in a chemist's shop in St. John's; and when failing health made an outdoor occupation necessary, he joined the reporting staff of the *Newfoundland Evening Herald*. Thenceforth McGrath's career developed along two parallel lines, the one journalistic, the other political. In 1893 he became acting-editor of the *Evening Herald*, and from 1894 to 1907 he was its editor. He then established a journal called the *Evening Chronicle*, and in 1912, when the *Chronicle* and *Herald* were combined, he became the president of the newly formed company. From 1894 until his death he was Newfoundland correspondent for *The Times*, and he wrote extensively for British and American periodicals.

From 1897 to 1900 McGrath was assistant clerk in the Newfoundland House of Assembly, and from 1900 to 1911 chief clerk. In 1912 he retired in order to become a member of the Legislative Council, of which he was president from 1915 to 1919 and from 1925 until his death. At the Anglo-American conference held at Quebec in 1898 he acted as private secretary to Sir James Spearman Winter (q.v.), the premier of Newfoundland. McGrath assisted in preparing Newfoundland's case in the various fishery disputes with the United States and France; and he was Newfoundland's agent in the dispute with Canada over the boundary of Labrador, which was tried before the Privy Council in 1926-1927 and resulted in a decisive victory for Newfoundland. In 1914 he acted as secretary for Newfoundland in connexion with the visit of the Dominions royal commission to the colony. During

the European War he acted as honorary secretary of the Newfoundland Patriotic Fund, the Newfoundland Regiment Finance Committee, and the Newfoundland War Pensions Board, which he organized. In 1917 he was made chairman of the Cost-of-Living Commission.

In addition to many pamphlets on Newfoundland, McGrath wrote *From Ocean to Ocean, an account of a trip across Canada in 1911* (1911) and *Newfoundland in 1911* (a history and guide-book of the colony, 1911); he also contributed chapters on Newfoundland to the volume on *British America* (1923) in the 'Nations of To-day' series edited by John Buchan, and to Volume II of Sir Charles Lucas's *The Empire at War* (1923).

McGrath was created K.B.E. in 1918. He died, unmarried, at St. John's, Newfoundland, 14 June 1920. In spite of defects in his early education, he was both a reader and a thinker. He was a man of infinite humour, full of good stories, and to the last had a touch of the Irish gamin. More than once he won an election by his shrewd and biting tongue and pen, but neither in victory nor in defeat did he bear malice.

[*The Times*, 15 June 1920; *Who's Who in Newfoundland*; private information.]

W. L. GRANT.

MACGREGOR, SIR EVAN (1842-1926), civil servant, was born 31 March 1842 at Fernie Castle, Fife, the third son of Sir John Atholl Bannatyne Murray MacGregor, third baronet, of Lanriek and Balquhider, and great grandson of Lieutenant-General Sir John Murray MacGregor (1745-1822). The clan MacGregor had been under a ban during the greater part of the seventeenth and eighteenth centuries, and the use of the name was forbidden by penal statutes, repealed in 1661 and reimposed in 1693. When the penal Acts were finally repealed in 1774, the members of the clan acknowledged General John Murray as their chief, and he was created a baronet in 1795, resuming the name of MacGregor in 1822.

When Evan MacGregor was nine years old his father died at Tortola in the West Indies, as lieutenant-governor of the Virgin Islands. His mother, who was Mary Charlotte, youngest daughter and co-heir of Admiral Sir Thomas Masterman Hardy, first baronet [q.v.], who commanded the *Victory* at Trafalgar, was given by Queen Victoria a residence at Hampton Court,

and went to live there with her young family and her twice-widowed mother. MacGregor was sent to Mr. Walton's school at Hampton, and afterwards as a boarder to the Charterhouse, then in the City. In August 1860 his father's first cousin, Captain the Hon. James Drummond, R.N., procured for him a nomination from the Duke of Somerset (then first lord) to a temporary clerkship in the Admiralty.

MacGregor entered the Admiralty service thoroughly imbued with the traditions of the royal navy. Captain Drummond himself joined the board of Admiralty as junior naval lord in June 1861, and in the following year appointed his young cousin as his private secretary. On Drummond going to sea in 1866 Lord John Hay and Sir John Dalrymple Hay, who in succession filled the post of junior naval lord within a few months, both appointed MacGregor as their private secretary. In January 1869 he became private secretary to the senior naval lord, Admiral Sir Sidney Dacres. During the next ten years he continued as private secretary to successive senior naval lords, Sir Sidney Dacres, Sir Alexander Milne, Sir Hastings Yelverton, and Sir George Wellesley. In the meantime, he had been advanced through the various ranks of the department until, in January 1880, he was promoted to be principal clerk in the secretariat and was appointed head of the military branch which dealt with fleet operations and political work, and came directly under the supervision of the senior naval lord. Having reached this important position at the early age of thirty-seven, MacGregor soon had opportunity of proving his merit.

In 1880 a combined naval demonstration by the principal naval powers, under the command of the English admiral, Sir Beauchamp Seymour, was undertaken off the coast of Albania in order to compel the Porte to surrender Dulcigno to Montenegro, in accordance with the terms of the Treaty of Berlin. At the end of the year the Boer War broke out, and naval assistance was rendered by the landing at Durban of a naval brigade which served throughout the War. In 1882 the Egyptian War began, and the Admiralty was closely occupied with the naval operations involved by the bombardment of Alexandria, the subsequent landing of a naval brigade, and the steamboat work up the Nile. The head-quarters' administration of all this business under the direction of the

board fell upon MacGregor's branch, and his energy and efficiency was rewarded by the grant of the C.B. in 1882.

In 1877 the ancient office of permanent secretary of the Admiralty, which had been held continuously by civilians since Samuel Pepys was first appointed to it in 1673, was abolished by Mr. W. H. Smith, and a naval secretary took over the duties. This office was in turn abolished in May 1882 by Lord Northbrook, and (Sir) Robert Hamilton, accountant-general of the navy, was appointed permanent secretary. But almost immediately Hamilton was lent to the Irish government as permanent under-secretary, after the murder of Mr. T. H. Burke, and Captain (afterwards Admiral Sir) George Tryon was appointed to act during his absence. Hamilton never returned to the Admiralty, and Captain Tryon resigned in order to go to sea in 1884. Lord Northbrook then chose MacGregor to fill the post of permanent secretary, and he held the office for twenty-three years, with Lords Northbrook, Ripon, George Hamilton, Spencer, Goschen, Selborne, Cawdor, and Tweedmouth as his Cabinet chiefs.

The period 1884 to 1907 was one of immense development both in the fleet itself and in the administration of the navy. Under the Naval Defence Act (1889) of Lord George Hamilton [q.v.] the navy was almost entirely rebuilt, and under the Naval Works Acts from 1895 onwards new harbours, barracks, and dockyards were constructed all over the world; while before MacGregor retired, the reforms in naval education and training and in the distribution and organization of the fleet, promoted by Lord Fisher [q.v.], had been carried through, and the construction of the new great fleet, which was to determine the issue of the European War, had begun.

MacGregor saw great changes during his career both in the navy and in the Admiralty. When he joined the office, all the members of the board occupied residences in the Whitehall building, which also housed a total staff of 124, and the navy estimates amounted to £12,800,000; nearly a third of the ships afloat were still sailing-ships. When he retired the navy estimates had reached nearly £32,000,000, and the departmental staff under his control in Whitehall had grown to 1,080, and great new buildings had been constructed to house them, partly owing to the transfer of the subordinate navy departments from Somerset House.

MacGregor's early training and associations made him a faithful guardian of the interests of the naval service and a promoter of the policy of the sea lords with whom he served; he had little experience of, or interest in, finance or the civil side of his office, which he was content to leave in the hands of trusted colleagues and subordinates. He could not, in consequence, fill the role of close personal adviser to the Cabinet minister at the head of the department, which is usually the function of a permanent secretary in the public service; but his retentive memory and previous experience made him an invaluable ally, especially of the first sea lords who wished to introduce any new line of policy. He had the faculty of clear and incisive writing, and his letters and minutes were models of official correspondence. Endowed with a power of concentration on the business before him, he set to his rapidly growing staff an example of punctuality and thoroughness in the dispatch of official work and of single-minded devotion to the service. He was impartial in his own decisions and loyally accepted any overruling of his advice by superior authority. He neither was, nor wished to be the initiator of important reforms, but his shrewd counsel and loyal assistance were of the greatest advantage to successive naval administrators with whom he served.

MacGregor was promoted K.C.B. in 1892 and G.C.B. in 1906, and was one of the first to receive the Imperial Service Order when it was created in 1903. He married in 1884 Annie Louise (died 1922), daughter of Colonel William Alexander Middleton, C.B., and had one daughter.

Personally, MacGregor had an intense dislike of publicity and inherited the Scottish reserve, but he was devoted to his family and genial to friends of whatever rank of life. In his early days at Hampton Court rowing was his chief recreation, and he made many canoeing trips on the rivers of Central Europe, and even to the Norwegian fjords, where in later years he went annually for salmon fishing.

[*The Times*, 23 March 1926; Admiralty records; private information; personal knowledge.] V. W. BADDELEY.

MACKAY, MARY (1855-1924), novelist, known as MARIE CORELLI, was born in Gloucester Terrace, Bayswater, the only child of Charles Mackay, LL.D. [q.v.], by Mary Ellen Mills, who became his second

wife. While she was still a child, her parents moved from London to Fern Dell, a house under Box Hill, Surrey, with a garden abutting on that of Flint Cottage, recently acquired by George Meredith. Charles Mackay became friendly with Meredith, who took an interest in Mary Mackay, particularly encouraging her to persevere with her piano-playing, for which she showed a precocious talent. In 1876 Mrs. Mackay died, and to the household at Fern Dell was added Miss Bertha Vyver, a contemporary of Mary's and her friend since childhood. From that time onward these two were never separated. In 1883, for reasons of health, Charles Mackay left Box Hill and returned to London, taking a lease of 47 Longridge Road, Kensington.

Mary Mackay's pseudonym 'Marie Corelli' had been devised during the last years at Fern Dell for use in the musical career which she had planned for herself. She sang, and played both harp and mandolin, but her taste and gifts were for the piano, on which she came to improvise with a brilliance which astonished her hearers. The move to London suggested a beginning of professional activity, and in December 1884 she gave a successful concert of improvisations at a friend's house. This concert was followed by other public appearances; but for various reasons she did not pursue professional piano-playing, and in *Temple Bar* for July 1885 appeared her first published article. It was called 'One of the World's Wonders' and was signed 'Marie Corelli'. In February 1886 her first novel, *The Romance of Two Worlds*, was issued by the firm of Bentley.

Writing many years later [prologue to *The Life Everlasting*, 1911] of her debut as a novelist, Marie Corelli declared that 'it was solely on account of a strange psychical experience which chanced to myself when I stood upon the threshold of what is called "life" that I found myself producing my first book. . . . It was a rash experiment, but it was the direct result of an initiation into some few of the truths behind the veil of the Seeming Real. I did not then know why I was selected for such an initiation—and I do not know even now. . . . I was not compelled or persuaded into it, for being alone in the world and more or less friendless, I had no opportunity to seek advice or assistance . . .'. This extract is typical of Marie Corelli's inveterate tendency to dramatize her own life, personality, and

achievement. She was, in fact, thirty years of age when she wrote her first novel; was living with her father, her half-brother, Eric Mackay, and Miss Vyver; and had numerous friends on every side.

Neither her first book nor her second (*Vendella*, 1886) made much impression on the public, but with her third novel, *Thelma*, published in 1887, Marie Corelli made a mark. The story's rather naïve romanticism, its delineation of smart society, and the overwhelming rhetoric of its description of the 'land of the midnight sun', attracted wide, if uncritical, attention. In 1889 came *Ardath: The Story of a Dead Self*, which enchanted Mr. Gladstone, but left the public cold. *Wormwood* (1890), with its lurid picture of absinthe-sodden Paris, was more generally acceptable, although neither it, nor *The Soul of Lilith* (1892), nor an anonymous novel *The Silver Domino*, seemed to foretell the imminent emergence of a novelist destined to outsell all her competitors. But in 1893 came a book which for the first time achieved a popularity of inescapable significance. *Barabbas: A Dream of the World's Tragedy* seemed to the author's former publishers an over-daring treatment of the story of the Crucifixion; but the book was accepted by the comparatively new firm founded by (Sir) Algernon Methuen [q.v.], and its reception proved that Marie Corelli, if not a better judge of mass-taste in fiction than Messrs. Bentley, was instinctively more in sympathy with it. *Barabbas*, with its gorgeous scene-painting and its fervent religiosity, thrilled a vast public from the Prince of Wales downwards.

The popularity of *Barabbas* was, however, a mere desultory shouting beside the hysterical triumph of its successor, *The Sorrows of Satan* (1895). Everything conspired to give this book an immediate sale greater than that of any previous English novel. The story was at once topical, daring, and transcendental; it lashed the vices of the rich, while describing their manner of life in savoury detail; and it dealt melodramatically with a semi-sacred theme. Nevertheless, it may be doubted if *The Sorrows of Satan* would have attained a popularity which broke all records, but for the accident of its date in publishing history. It was among the early books of fiction which appeared in a single six-shilling volume, and in consequence benefited to an incalculable degree from public excitement over the collapse of the three-decker.

The appearance of *The Sorrows of Satan*

was in more than one respect the climax of Marie Corelli's career. It established her in the position she was to hold for a dozen years—that of the most popular novelist in Great Britain. Secondly, it marked her determination to flout the literary critics, who had been increasingly hostile toward her, and in their reviews of *Barabbas* had frankly expressed their low opinion of her literary quality. Their words shocked Marie Corelli rather than hurt her. She regarded hostile criticism of work which she genuinely believed to be inspired as a kind of blasphemy. Wherefore, when *The Sorrows of Satan* was published she caused to be printed at the head of the first chapter a statement that no copies had been or would be sent for review. The third element in *The Sorrows of Satan* which made the book a landmark in its author's life, related to this inward conviction of her own authority and message. An important part in the story is played by a woman writer, 'Mavis Clare', whose wonderful doings and serene spiritual personality are the chief opponents of the devil on earth. When, the very next year (1896), Marie Corelli in her new novel, *The Murder of Delicia*, created an almost similar character, whispers became open mockery, and she was accused of a vanity so irrational that it permitted her to describe herself in terms more divine than human. She indignantly denied the charge; and the denial, coming from one with her strange power of self-deception, was doubtless sincere. But, although she may not have known it, both 'Mavis Clare' and 'Delicia' were expressions of the ideal of womanly nobility to which she believed herself to have attained.

In 1901 Marie Corelli settled in Stratford-on-Avon, in which town she was to spend the rest of her life and a great deal of her now abundant wealth. Adoration of Shakespeare and a somewhat obstinate idealization of the antique for its own sake brought her into frequent conflict with the powers and personalities of the place. A little unwisely she counter-attacked in *God's Good Man* (1904), which was her only full-dress roman-à-clô. The book did not silence her local opponents, but merely blended anger with their ridicule. But her services to Stratford were undoubted. She was generous in her benefactions and, within the limits of her own taste, saved the town from reckless 'modernization' at a period when modernization was most disastrous.

When the European War began, Marie Corelli threw herself into patriotic activity of a characteristically confused and emotional kind. Her warm-heartedness moved her to deep and practical sympathy towards soldiers and their dependants; her love of an attitude tempted her to speech and writing which suggested a collaboration between Niobe and Britannia. Nevertheless, and cruelly enough, her local enemies caused her to be prosecuted in 1917 for food hoarding; and although she protested that her heavy sugar purchases were for jam-making and the jam destined for public consumption, she was convicted. She told her story in *My Little Bit* (1919), and one cannot doubt that her intentions had been above reproach.

Already before the War Marie Corelli had begun to lose her hold on the public. She continued to write, but sales steadily decreased. When, on 21 April 1924, she died at her home in Stratford, the public merely noted that a once popular novelist was dead.

The tragedy of Marie Corelli was her inability to understand either why she was popular or why she was unpopular. A warm-hearted, high-principled, and industrious woman, she thought herself a chosen vessel; a woman of talent, she thought herself a genius. Her great popularity, which she accepted as the inevitable tribute to her gifts and inspiration, was in fact due to her complete conformity to the middle-class type of her day. The hostility shown towards her in other quarters was the natural mixture of scorn and irritation provoked in critical minds by what seemed to be the pretentious mannerisms and autocratic ways of a woman fundamentally commonplace. Both as an individual and as a writer she was the victim of her own incompetence for self-criticism. Essentially emotional, but without the mental capacity to control emotion or test the suitability of its expression, she could only appreciate the excellence of her own motives, and was incapable of realizing that to others her fervour might seem either exhibitionist or ridiculous. For a time her sincerity, her aggressive morality, and her lavish use of scientific, philosophical, and religious jargon hypnotized the pre-War bourgeoisie, whose prejudices, sentimentalities, gentilities, and muddled well-meaning she so thoroughly shared. But as a new generation grew to maturity, with bigotries and sham refinements of its own, the work of Marie Corelli lost most of its meaning and

therefore its lure. For it had little intrinsic quality, but merely voiced the mass-sentiment of a particular class at a particular period.

Marie Corelli's principal works, in addition to those already mentioned, are: *The Mighty Atom* (1896), *Boy* (1900), *The Master Christian* (1900), *Temporal Power* (1902), *The Treasure of Heaven* (1906), *Holy Orders* (1908), *The Secret Power* (1921).

[Bertha Vyver, *Memoirs of Marie Corelli*, 1930; private information.] M. SADLER.

McKECHNIE, WILLIAM SHARP (1863-1930), constitutional historian, was born at Paisley 2 September 1863, the third and youngest son of William McKechnie, M.D., of Paisley, by his wife, Helen Landale Balfour. He was educated at Greenock Academy, and at the age of sixteen entered the university of Glasgow, where he graduated M.A. in 1883 with first-class honours in philosophy. Destined for the legal profession, he served his apprenticeship at Glasgow in the office of Sir James Robertson, whom he ultimately succeeded in the chair of conveyancing at Glasgow University. After being first prizeman in the classes of constitutional law, public law, and conveyancing, he proceeded in 1887 to the degree of LL.B. Forgoing his original intention of being called to the Scottish bar, he set up in business in Glasgow with a friend as solicitors under the name of McKechnie and Gray, a partnership which lasted from 1890 to 1915.

McKechnie's interests, however, were definitely academic, and his opportunity of satisfying them came in 1894, when he was appointed lecturer in constitutional law and history at Glasgow University. His students were drawn from the two faculties of law and arts. He gave far more than the allotted number of lectures in his ordinary course, and made possible the establishment of an honours group in history by voluntarily offering an honours course in his own subject. The only chair in constitutional law in Scotland is in Edinburgh University, and when that became vacant in 1909, McKechnie submitted his name. But the wide reputation which he had gained by this time from his published work did not avail to break the monopoly in an office hitherto reserved for members of the faculty of advocates.

In 1916 the chair of conveyancing in his own university fell vacant, and McKechnie

was persuaded to stand for it. His election meant the abandonment of the work with which he had especially identified his name, although he never gave up the hope of returning to it after retirement. A considerable part of the duty of his chair was that of acting as a kind of official referee in cases of disputed interpretations of deeds of conveyancing. McKechnie's lectures were prepared with a care similar to that which he had lavished on his course in constitutional history. But he had never built up a large practice nor specialized in the intricacies of the Scottish land law, and his anxious nature suffered under the strain. He fell into ill-health and resigned the chair in 1927. On his retirement the university conferred on him the degree of LL.D. He had already moved from Elderslie, where he had resided since 1879, into the neighbourhood of the university in Glasgow, and there he died 2 July 1930. He was buried in Woodside cemetery, Paisley.

McKechnie was modest and retiring by nature, and although a man of decided opinions, never made himself prominent in public life. He was in frequent correspondence with scholars in his own subject at home and abroad, but felt most at home in a small circle of intimate friends. He married in 1894 Elizabeth Cochran, daughter of John Malloch, J.P., of Elderslie, and they had one son and one daughter.

McKechnie's published work falls into three categories. As a student of political philosophy his earliest book on *The State and the Individual*, written as a thesis for the degree of doctor of philosophy which was conferred on him in 1895, was published in 1896 and was very favourably received. In 1906 he made another excursion into the same domain with an article on George Buchanan's tractate *De Jure Regni*, contributed to *George Buchanan: Glasgow Quatercentenary Studies*. Holding strong political views, he felt that an historian of the British constitution should express an opinion on the important constitutional question at issue in 1908-1909. A series of articles contributed to the *Glasgow Herald* (there was a later series in the *Morning Post*) appeared in book form in 1909, entitled *The Reform of the House of Lords*. It was admitted even by opponents of his views to be 'an informing and suggestive little book'. In 1912 his alarm at the alteration in the balance of the British constitution wrought by the measures of the liberal party, wrung from him a confession of political faith in a book

entitled *The New Democracy and the Constitution*. His work as a constitutional historian is represented by his great volume on *Magna Carta*, which appeared in 1905 and was greeted both at home and abroad with almost universal praise. It represents the reaction from Bishop Stubbs's view that 'the Great Charter is the first public act of the nation, after it has realized its own identity'. To McKeehnie the Charter is, rather, a feudal document only accidentally serving the interests of others than the baronial class. Its fame rests on sentiment, on what later generations read into it. The most serious criticism of the book pointed to its neglect of some important work of foreign writers on the period. This and other defects were rectified in the second edition issued in 1914, in which, without any change in the main thesis, the book was subjected to a thorough revision. The most emphatic tribute to its merits was the invitation to the author from the Royal Historical Society to deliver the introductory lecture at the commemoration in 1915 of the seven hundredth anniversary of the grant of the Charter.

[*The Times*, 5 July 1930; private information; personal knowledge.] D. J. MEDLEY.

MACKENZIE, SIR JAMES (1858-1925), physician and clinical researcher, was the second son of Robert Mackenzie by his wife, Jean Campbell Menzies. He was born at his father's farm of Pickstonhill at Seone, Perthshire, 12 April 1853. Educated at Perth Academy and at the university of Edinburgh, he graduated in 1878 and became doctor of medicine in 1882. In 1879 he settled in general practice at Burnley, Lancashire, and was appointed physician to the Victoria Hospital. At Burnley he married in 1887 Frances Belamy, daughter of George Jackson, of Boston, Lincolnshire, by whom he had two daughters. While at Burnley he began the patient and exhaustive clinical studies which were to be continued fruitfully until his death. In 1907 he moved to London and entered consulting practice in which he won unusual success. He became consulting physician to the London Hospital (1913), was elected a fellow of the Royal Society (1915), was knighted (1915), and received many other honours.

During the European War Mackenzie acted as consulting physician to the Military Heart Hospital, an institution formed chiefly at his suggestion. In 1918 he

moved to St. Andrews, there to found a clinical institute in which the development of disease was to be studied; but he was already in ill-health, and the cold of the North drove him back to London after a few years and before his self-appointed task was done.

Mackenzie's earliest work was upon herpes zoster (shingles); he made use of the phenomena displayed by this disease to map out areas of the skin supplied by the spinal nerves. Out of these observations in large part grew his later observations upon *pain and tenderness*, and upon symptoms viewed more generally; these were collected and published in a monograph of remarkable originality, *Symptoms and their Interpretation* (1909, 3rd ed. 1918). From the same basal observations were developed his studies and views of angina pectoris, published in a book of that title in 1923. He is best known, however, for his long-continued researches into the nature of irregularities of the heart's rhythm; for these studies first aroused widespread interest in the man and his work. He graphically recorded the movements of the jugular veins and used these records in conjunction with others in an elaborate and acute analysis of the movements of the heart's separate chambers. His 'polygraph', an instrument devised to take his records, was invented with the aid of a Lancashire watchmaker. His book *The Study of the Pulse* (1902), in which the earlier observations were collected, gave the impetus to much work of the same kind by others. The fuller studies of the pulsations, his rich experiences of cardiovascular disease from other points of view, and the general philosophy underlying his work, were displayed in *Diseases of the Heart* (1908), a book which quickly ran through several editions, and which, like *Symptoms and their Interpretation*, was translated into several languages. Mackenzie provided striking examples of exact observation upon patients and of simple and accurate deductions from these. He was intensely interested in the mechanism of disease and of the symptoms displayed by disease. He did more, perhaps, than any other man before him to place upon a rational basis forecasts of the course of heart disease in individual patients, and the treatment of heart disease by digitalis.

Mackenzie's vigorous and impressive personality, blunt but enlivening humour, combative form of argumentation, and clear vision of essentials, combined to

make him a teacher of great stimulating power. An uncommon faculty of criticism, a deep-rooted distrust of authoritative statement, gave him rare discrimination between the known and the unknown; this, associated in unusual degree with originality of mind, a retentive memory, and determined purpose, underlay his success as an investigator. A true appreciation of his character and of his work can be obtained only if it is remembered that his chief discoveries were made in time snatched during the routine of a heavy industrial practice, and that during the last fifteen years of his life he suffered much from the malady angina pectoris, which he had done so much to elucidate, and from which he eventually died in London, 20 January 1925, in his seventy-second year.

[*Heart*, vol. xii, 1925-1926 (portrait); personal knowledge.] T. LEWIS.

MACKENZIE, SIR WILLIAM (1849-1923), Canadian financier and railway builder, was born in Kirkfield, Upper Canada (now Ontario) 30 October 1849, the fifth son of John Mackenzie, farmer, by his wife, Mary, daughter of John MacLaughlin, who had come after their marriage from Inverness-shire, Scotland. He was educated at the local primary school and at the Lindsay grammar school. In his early days he was a primary school teacher, but soon became a carpenter and lumber-merchant, and ultimately in 1871 a contractor. He constructed part of the Victoria Railway (afterwards the midland division of the Canadian National Railways), and part of the mountain division of the Canadian Pacific Railway.

In 1886 Mackenzie entered into partnership with (Sir) Donald Mann. Their first line was the Lake Manitoba Railway and Canal Company, 125 miles in length, from Gladstone through Dauphin to Winnipegosis, built to connect with existing lines, and to carry part of the rapidly increasing grain crop. The first train was operated on this line in December 1896, and its success fired the partners' ambition. In 1899 the Canadian Northern Railway Company was incorporated: all through Canada other lines were gradually bought or built, and connected. On 1 January 1902 the line was completed from Port Arthur to Winnipeg; in December 1905 from Winnipeg to Edmonton; and in November 1915 trains were running from Montreal to Vancouver. In one year over

600 miles of track were laid, and in all, including branches, the system comprised not less than 9,500 miles of railway. Mackenzie was the financier of these operations, and gradually succeeded in selling about £65,000,000 of bonds in Great Britain, while retaining practically all the common stock in the hands of his partner and himself. In most cases the guarantees of either the Dominion or of provincial governments were secured, and in addition large subsidies were obtained. This was an era of great building activity in Canada; between 1900 and 1915 the railway mileage increased from 17,657 miles to 34,882 miles.

In 1903 the Grand Trunk Railway entered into arrangements with the Canadian government under Sir Wilfrid Laurier [q.v.] to build in co-operation the Grand Trunk Pacific and National Transcontinental Railways. An attempt was made to bring together Mackenzie and the Grand Trunk directors, but this failed through the fault of the grandees of the older company, who greatly underestimated the ability and constructive genius of Mackenzie. In 1911, disappointed in his attempt to obtain from Laurier the promise of a subsidy for his Rocky Mountains section, Mackenzie threw all his weight into the conservative scale, and was partly responsible for the defeat of Laurier in the general election of that year. With the conservatives in power, the subsidy was granted, and in 1915 Mackenzie saw his ambition fulfilled. But the European War threw everything into confusion: the influx of settlers and capital from Europe ceased abruptly; the profits of the prairie section of the line, although considerable, were insufficient to carry the vast expense of the mountain section; and in 1917-1918 the Canadian Northern was taken over by the Dominion government and eventually merged in the National Railways. Little was paid for the common stock, but every British bondholder was paid in full.

Mackenzie's enterprise had long before sought other directions. In 1889 he founded the São Paulo Tramway, Light and Power Company, the first of numerous Canadian enterprises in Brazil. In 1891 he obtained the franchise for the Toronto Street Railway, which proved to be very profitable; but he quarrelled with the city, and on the expiry of the franchise in 1921 the line was taken over by the city and placed under a commission. In 1910 a line of steamers from Montreal to Bristol

was established in connexion with the Canadian National Railways.

Mackenzie married in 1872 Margaret (died 1917), daughter of John Merry, of Kirkfield, Ontario; one son and six daughters survived him, two other sons predeceasing their father. He and his partner, Mann, were created knights bachelor on 1 January 1911. He died at Toronto of pneumonia 5 December 1923.

Mackenzie was of medium height, thick-set, dark and vivid in colouring, with deep blue, restless eyes. No man in Canadian life has been more variously judged. By his enemies he was accused of never hesitating either to bribe a newspaper or to corrupt a legislature [W.T.R. Preston, *My Generation of Politics and Politicians*, 1927, chap. xxxiv]. To his friends he was the trail-blazer, the nation-builder. 'For sheer tenacity, for courage which attacked the most formidable obstacles without a quail: for capacity to bring things to pass, I think Canada has not yet begotten his equal' [D. B. Hanna and Arthur Hawkes, *Trains of Recollection*, 1924, p. 241]. Like his Highland ancestors he was both dreamer and freebooter; but his passion for construction made him one of the great railway builders of North America.

[H. J. Morgan, *Canadian Men and Women of the Time* (editions of 1898 and 1912); Hanna, *op. cit.*; *Toronto Daily Globe and Daily Mail and Empire*, 6 December 1923; private information.] W. L. GRANT.

MACKINNON, Sir WILLIAM HENRY (1852-1929), general, was born in London 15 December 1852, the younger son of William Alexander Mackinnon, F.R.S., of Aeryse Park, Kent, the thirty-fourth chief of clan Fingon (Mackinnon) and member of parliament for Rye 1852-1853 and for Lynton 1857-1868. His mother was Margaret Sophia, daughter of Francis Willes. William Henry Mackinnon was educated at Harrow, and while still there was appointed to the Grenadier Guards in 1870. Six years later he became adjutant to his regiment, and held the post until 1880. In 1884 he was appointed military secretary to the governor of Malta (General Sir John Lintorn Simmons), and in the following year went on to India in order to become private secretary to the governor of Madras (Sir Mountstuart Grant Duff). He was promoted colonel in 1889. From July 1893, Mackinnon spent five years as assistant adjutant-general, London district, vacat-

ing the post, after the usual period of duty, in 1898. When, however, the South African War broke out in October of the following year, he returned to the appointment as a temporary expedient.

The City of London Imperial Volunteers, with which Mackinnon's name will always be associated, were formed in December 1899, and Mackinnon was appointed colonel commandant. The unit, which consisted of three parts, an infantry battalion, mounted infantry, and a field artillery battery, went out to South Africa in January 1900, and took part in various engagements in the Orange Free State and the Transvaal. The mounted infantry, attached with other units as divisional troops to the 9th division, played a minor part in the movements which led to the relief of Kimberley on 15 February 1900, and assisted in the capture of Jacobsdal, which post was held as a strategic position in the investment of General Piet Cronje's laager. In the following month the same detachment played its part in the action at Karee siding which restored to the British troops the use of the railway bridge over the Modder river. During the advance from Bloemfontein to Kroonstad the City Imperial Volunteers battalion was in support of the 21st brigade, and, in the advance from Kroonstad to Pretoria, it led the way in the battle of Doornkop on 29 May, carrying a hill after a sharp fight, and putting to flight about 500 of the enemy. In this brilliant affair the City Imperial Volunteers acquitted themselves well, but a much sterner task lay before them when, in the following month, they were called upon to attack Kleinfontein ridge as a preliminary to the battle of Diamond Hill. With the help of the Royal Sussex Regiment, the ridge was captured on 11 June, and next day Diamond Hill itself was carried. In Western Transvaal the C.I.V. (as the unit was habitually styled) formed part of the force commanded by (Sir) Horace Smith-Dorrien [q.v.] in pursuit of the elusive General Christiaan De Wet [q.v.], while in the Orange River Colony their battery assisted in the holding of Bloemfontein, and they were represented in July at the affair of Bakenkop, where they were very heavily engaged. The mounted infantry, still with Smith-Dorrien's brigade, took part in the advance to Komati Poort in September, while in the previous month the battalion arrived for the third time at Pretoria. The most outstanding of the City Imperial Volunteers' experiences were the battles

of Doornkop and Diamond Hill, but all their achievements completely justified the faith of their commandant, Mackinnon, whose own military reputation was enhanced by the exploits of his splendid unit. The City Imperial Volunteers left South Africa early in October 1900, and on reaching England received an enthusiastic welcome on their march through London to a special thanksgiving service at St. Paul's Cathedral. Mackinnon was mentioned in dispatches and awarded the C.B. for his services in this campaign; he subsequently published *The Journal of the C.I.V. in South Africa* (1901).

Mackinnon, now a major-general, on returning to England was appointed to command the Imperial Yeomanry at Aldershot in 1901. Three years later he was made director of auxiliary forces, and in 1908 was chosen to fill the post of director-general of the newly formed Territorial Force. In that year he was promoted lieutenant-general, and two years later (1910) went to the Western command as general officer commanding-in-chief. He was promoted full general in 1913. In February 1916, in the middle of the European War, he was appointed director of recruiting at the War Office, but was succeeded in that post by Sir Auckland Geddes in the following May.

Mackinnon, whose honours included the C.V.O. (1903), K.C.B. and K.C.V.O. (1908), G.C.B. (1916), and the colonelcy of the Liverpool Regiment, retired in 1919, but although his distinguished and useful career in the army then came to an end, his activities by no means abated, for he took up or continued to hold many important positions in philanthropic institutions and movements in which he showed a deep and, indeed, lifelong interest. He was, for instance, chairman of the Heatherwood Hospital, Weybridge, and of the Royal Soldiers' Daughters' Home, Hampstead, vice-president of the Officers' Association, British Legion, a member of the councils of the United Service Fund, the Royal United Kingdom Beneficent Association, and the Gordon Boys' Home, a trustee of the Guards' Home, and the senior churchwarden of the Guards' chapel, Wellington barracks. He was possessed of high ideals and was incapable of a mean thought or an unkind word—a simple, unassuming, and charming personality.

Mackinnon's term of service at the War Office before the European War coincided with the important reforms of Mr. (afterwards Viscount) Haldane [q.v.]; and when

the formation of a Territorial Force was under consideration, the advice of so experienced a commander of volunteers, both in the field and as director-general in peace time, was of the highest value. When the Territorial Force came into being in 1908 Mackinnon, by his fairness and courtesy, was able to smooth away many difficulties which his experience as a citizen-soldier enabled him to foresee and to appreciate. A more self-assertive or apparently strong soldier might easily have failed where the kindly tact of the first director-general of the Territorial Force ensured success.

Mackinnon married in 1881 Madeleine Frances, daughter of Villiers La Touche Hatton, of Clonard, by whom he had one daughter. He died in London 17 March 1920.

A cartoon of Mackinnon by 'Spy' appeared in *Vanity Fair* 7 February 1901.

C. V. OWEN.

MACKINTOSH, CHARLES RENNIE (1868-1928), architect and painter, was born 7 January 1868 in Dennistoun, Glasgow, the second son of William Mackintosh, superintendent of police, by his wife, Margaret Rennie. From Alan Glen's school he went in 1885 to the Glasgow School of Art, where he studied under Francis Newbery until 1892, though he was apprenticed for two years to John Hutchinson, a local architect, in 1887, before joining the Glasgow firm of Honeyman and Keppie, of which he became a partner in 1902. The Alexander (Greek) Thomson travelling scholarship which he gained in 1890 enabled him to visit France and Italy. He was awarded the Soane gold medal of the Royal Institute of British Architects in 1902, and was elected a fellow of that body in 1906.

Mackintosh's designs won the limited competition held in 1894 for the new building of the Glasgow School of Art, which was partly opened in 1899 but not completed until 1909. Though his first independent work, it evinced a consummate originality which owed nothing to any traditional style. It remains his most abiding title to fame as an architect. This building, the Scotland Street school (finished by another architect), Queen's Cross church, and two or three houses

outside Glasgow represent almost the sum total of Mackintosh's structural work, since his intense conscientiousness and sensitive individuality made him difficult for anybody to deal with who did not understand his temperament. In 1897 Mackintosh and George Walton undertook the complete decoration and furnishing of the first of their four celebrated Miss Cranston's Tea-Rooms in Glasgow. These were in the order of their dates of opening: 98 Buchanan Street (April 1898); 144 Argyle Street (1899); 205 Ingram Street, the only one that now survives (1900); and 'The Willow Tea-Rooms', 217 Sauchiehall Street (1904). The result was the earliest, though an entirely mature, embodiment of the curiously elongated formalism which in Germany was soon hailed as the 'Glasgow School style'.

In 1900 Mackintosh was invited to exhibit at the Wiener Sezession. While in Vienna Fritz Wärndorfer, of the 'Wiener Werkstätte,' commissioned him to design 'A Room for a Music-Lover'. This was included in the set of plans and drawings by Mackintosh, Charles Rennie Mackintosh, Glasgow, *The House of an Art Lover*, published in 1902 by Alexander Koch, of Darmstadt, with Hermann Muthesius's enthusiastic introduction. The Scottish Pavilion at the Turin Exhibition of 1902, which Mackintosh designed and virtually filled, led to Mackintosh exhibitions in Venice, Munich, Dresden, Budapest, and Moscow, where everything he showed was eagerly bought up. Mackintosh's influence on Continental design during the pre-War decade can hardly be exaggerated.

After 1910, when he finished his most important house, The Hill House, Helensburgh, Mackintosh's architectural work was really over. He resigned his partnership in Glasgow in 1913, and moved to London. During the European War he lived partly in Chelsea, making designs for textiles, and partly in Suffolk, where he worked at landscape-painting and flower studies. Subsequently he devoted himself to water-colours, spending much of his time round Port Vendres in the Eastern Pyrenees. 'La Rue du Soleil' and 'Le Fort Maillet' (1927) are perhaps the ripest achievements of a man who will probably rank among the greatest British water-colour painters and as the first master of modern abstract design.

By an irony of fate, Mackintosh, who had no followers in Great Britain, founded a foreign school (the so-called *Jugendstil*), and was the first British architect since

Robert Adam whose name was a household word abroad. Himself a pioneer of *art nouveau*, Mackintosh was the first anywhere to translate its mannerisms into an architectural idiom, and so to free architecture from the last remnants of historical reminiscence. But as his essentially decorative genius knew no development, there is no direct link between his modernism and the structural evolution of modern architecture.

Mackintosh married in 1900 a fellow art student, Margaret, daughter of John Macdonald, consulting engineer, of Glasgow, but had no children. His wife, though of decidedly inferior artistic calibre, was his constant inspiration and his collaborator in all his decorative work. Mackintosh died, almost forgotten, in London 10 December 1928.

P. MORRISON STUART.

MACMAHON, PERCY ALEXANDER (1854-1920), mathematician, was born in Malta 26 September 1854, the second son of Colonel Patrick William MacMahon by his wife, Ellen, daughter of George Savage Curtis, of Teignmouth. He was sent to Cheltenham College, whence he proceeded early in 1871 to the Royal Military Academy, Woolwich. He joined the Royal Artillery at Madras in 1873 as lieutenant, and was promoted captain in 1881 and major in 1889. His battery took part in 1877 with the Punjab frontier force in a punitive expedition against the Jawaki Afridis, penetrating into their country and capturing several villages.

MacMahon left India on medical certificate in 1877, was posted to the 9th brigade at Dover, and in 1882 returned to the Royal Military Academy, Woolwich, as instructor in mathematics. This post brought him into touch with (Sir) George Greenhill, then professor of mathematics at the Artillery College, Woolwich, whose friendship changed the current of MacMahon's life. In 1890 he was appointed professor of physics at the Ordnance College, and he held this post until 1897. He retired from the army in 1898, and thereafter devoted himself to mathematical and scientific pursuits. From 1904 to 1920 he was deputy warden of the standards under the Board of Trade, a

post which brought in due course membership from 1920 onwards of the Conférence Générale and of the Comité Internationale des Poids et Mesures which were held in Paris. For twelve years (1902-1914) he was one of the general secretaries of the British Association. His easy address and power in extempore talk upon a mathematical theme made him a welcome and prominent member of learned societies. He was elected a fellow of the Royal Society in 1890, and he received the Society's highest honours, the royal medal (1900) and the Sylvester medal (1919). The London Mathematical Society, of which he was president 1894-1896, awarded him the De Morgan medal in 1923. He received honorary degrees from several universities, was president of the Royal Astronomical Society (1917), and was a member of the Permanent Eclipse Committee and of the council of the Royal Society of Arts.

On his return to Woolwich in 1882 MacMahon entered into a mathematical heritage peculiarly fitted to his powers. The theory of algebraic forms was in the full flight of development owing to the activities of Arthur Cayley [q.v.], James Joseph Sylvester [q.v.], and George Salmon [q.v.], this being the one predominantly British domain in the vast range of modern abstract mathematics. From the outset MacMahon was captivated: the subject came to him as a kind of chess algebra, demanding lightness of touch and a daring playfulness combined with an abiding sense of form. So complete was his absorption that his military friends would refer to him in chaff as 'a good soldier spoiled'. But he won their admiration, as, indeed, he did that of the scientific world into which he had so thoroughly forced an entrance.

MacMahon's writings are scattered through journals and volumes of transactions of scientific societies, covering a period of nearly fifty years. While they adhere closely to combinatory analysis, that department of abstract algebra which his genius so conspicuously developed, they continually show the writer to be no isolated philosopher. 'I do not believe in any branch of science being destitute of connexion with other branches,' he said at a meeting of the British Association in Glasgow (1901). This isolation was particularly characteristic of a certain tract of pure mathematics which appeared to be in a 'forlorn condition'. The timeliness of MacMahon's masterly rescue of this department, which includes problems of

the nature of the magic squares of the ancients, has become the more evident as the twentieth century has advanced, in its capital significance for the theory of groups and the quantum theory.

For many years MacMahon resided in London. In 1907 he married Grace Elizabeth, daughter of C. R. Howard, of 32 Gloucester Place, London: they had no children. His charming personality, his human sympathy, and the hospitality of his home in Westminster endeared him to a wide circle of friends. He was also an expert billiards player at the Athenæum Club, of which he was elected a member under Rule II in 1903. In 1922 MacMahon gave up most of his London associations and retired to Cambridge, becoming a member of St. John's College, to which, on receiving from Cambridge University the honorary degree of Sc.D. in 1904, he had attached himself by invitation. Although his absorption in scientific problems became more pronounced in later life, he mixed very willingly in social gatherings, until ill-health compelled his retirement to Bognor; there he died on Christmas Day 1920.

In 1915 MacMahon brought together the substance of his principal discoveries in a two-volume work *Combinatory Analysis*, a ripe and penetrating account of a favourite theme, which retains throughout the impress of his personality. There followed *An Introduction to Combinatory Analysis* (1920) and *New Mathematical Pastimes* (1921). This last is in lighter vein, a book which gives the geometrical by-products of his characteristic algebra, as manifested in the construction of repeated patterns. The whole subject of mathematics was enriched and adorned by the contributions made to it by MacMahon, who proved a worthy successor to Cayley and Sylvester, and encouraged many a younger mathematician by his infectious enthusiasm for algebra.

[*The Times*, 28 and 31 December 1920; *Monthly Notices* of the Royal Astronomical Society, vol. xc, no. 4, 1930; *Proceedings* of the Royal Society, vol. cxxvii, A, 1930 (portrait).]
H. W. TURNBULL.

MACNEILL, JOHN GORDON SWIFT (1840-1926), Irish politician and jurist, was born in Dublin 11 March 1840, the only son of the Rev. John Gordon Swift MacNeill, curate of St. James's church, Dublin, by his wife, Susan Colpoys, daughter of the Rev. Henry Tweedy. His father's mother, Anna Maria Swift,

was the daughter of Godwin Swift, grandson of Godwin Smith who was uncle and guardian of Jonathan Swift. Thus all Swift MacNeill's connexions were with protestant Ireland. His nationalism was Irish in much the same sense as Swift's was, and neither his interest in Irish history nor his knowledge of it went back far beyond the reign of William III. In 1806 he went to Trinity College, Dublin, but after a year migrated to Oxford, where he gained an exhibition at Christ Church, and obtained second classes in classical moderations (1870) and the final school of law and modern history (1872). He then proceeded to read for the Irish bar, was called in 1875, and in 1882 was elected professor of constitutional and criminal law at the King's Inns, Dublin, a post which he held until 1888. He took silk in 1893.

MacNeill's taste for politics and public speaking had made him active in the Historical Society at Trinity and at the Union at Oxford, and in 1875, he became auditor of the Law Students' Debating Society. He joined the Home Government Association founded by Isaac Butt [q.v.] in 1870 and became a member of its council, being present at its meeting in 1874 when the offer made by Charles Stewart Parnell [q.v.] to contest county Dublin at his own expense was adopted, and at the subsequent meeting in the Rotunda when Parnell made his first public appearance and broke down in speaking. MacNeill himself records that in 1870 he was asked by Parnell to enter the House of Commons, and that he could have been returned for an Irish constituency before that date if he had wished. But, although a seat in the House of Commons was the ambition of his life, he 'thought the time premature' until Mr. Gladstone was definitely committed to Home Rule in 1886. No seat being available at the general election of that year, he was chosen at a by-election to represent South Donegal, and he remained member for that constituency during thirty-one years (1887-1918). He had already published a propagandist work, *The Irish Parliament: what it was, and what it did* (1885), which earned Mr. Gladstone's commendation; and he was recognized from the first as an addition to the nationalist party by his knowledge of constitutional history. Three of its members, already prominent, T. M. Healy and the two Redmonds, had attended his lectures at the King's Inns. But MacNeill

found a new object for his erudition in a close study of the rules of parliament. This knowledge was necessary for the business of obstruction, the chief object of the Irish members in the parliament of 1886 to 1892. MacNeill became conspicuous in the art, and his oddities of appearance and manner kept caricaturists busy. But when Mr. Harry Furniss published an especially outrageous drawing, the victim, although a confirmed pacifist, retorted by a physical assault in the lobby.

MacNeill differed from almost all his colleagues in having a real veneration for parliament, and a desire to uphold its best traditions. He fought a long fight, ultimately successful, to establish the principle that ministers must not be the directors of public companies. In March 1892 Lord Salisbury's government was defeated on a motion of MacNeill's that the votes of three members in favour of a grant to the British East Africa Company of which they were directors should be disallowed. In 1906, when the flogging of boys in the navy was finally abolished, Sir Henry Campbell-Bannerman paid a tribute to MacNeill's long efforts for this reform. The last of the personal achievements on which he prided himself was the passing in 1917 of an Act to take from the princes of hostile countries the British titles which they held.

On the establishment of the National University in Ireland in 1909 MacNeill was appointed professor of constitutional law, and in 1910 he became clerk to convocation. At the end of 1918, after the Sinn Féin movement had begun to sweep over Ireland, he did not stand again for South Donegal, and the House lost one of its best-known figures. He accepted the Irish Free State without enthusiasm, but his latest historical work, *Studies in the Constitution of the Irish Free State* (1925), was a distinct service to Mr. Cosgrave's government. The last years of his life, spent at his home in Dublin, in the society of his sister, his lifelong companion—for he never married—and of their cats and dogs, among his mass of books and curiosities, were chiefly occupied in completing his amusing memoirs, *What I have Seen and Heard* (1925). He died in Dublin 24 August 1926.

Whether in public speech or private conversation, MacNeill was an exuberant and untidy talker; enthusiasms, information, and gossip tumbled pell-mell from a loose-hung mouth set between a ragged beard and prominent, excited light-blue

eyes. But his good nature, his courtesy, and his outflowing humanity made him widely beloved. Nobody delighted more to do the honours of parliament; and his erudition there and elsewhere, though not always exact, was generously available. Few figures in the House of Commons were better known or better liked than this eccentric, warm-hearted Irish protestant gentleman.

A cartoon of MacNeill by 'Spy' appeared in *Vanity Fair* 13 March 1902.

[*The Times*, 25 August 1926; J. G. S. MacNeill, *What I have Seen and Heard*, 1925; private information; personal knowledge.]
S. G. WYNN.

M'TAGGART, JOHN M'TAGGART ELLIS (1866-1925), philosopher, was born at 28 Norfolk Square, London, 8 September 1866, the second son of Francis Ellis M'Taggart, county court judge, by his wife, Caroline Ellis. He was educated at Clifton College and Trinity College, Cambridge. At Cambridge he studied the moral sciences under Henry Sidgwick [q.v.] and James Ward [q.v.] and was placed alone in the first class of the moral sciences tripos in 1888. He was an active member of the Union Society, of which he was elected president in 1890. He continued to be a member of the library committee of this society until his death, and his long connexion with it is commemorated in the library by a bookcase of eighteenth-century memoirs, purchased by subscription, and by a brass memorial plate. In 1891 he was elected to a prize fellowship at Trinity, and in 1897 he was appointed college lecturer in the moral sciences.

M'Taggart's writings fall into three groups. His earlier work was devoted to expounding and defending the method, and some of the results, of Hegel's *Logic*. The dissertation by which M'Taggart gained his fellowship dealt with the dialectical method, and his first book, *Studies in the Hegelian Dialectic* (1896), was an expanded form of this dissertation. This was followed in 1901 by *Studies in Hegelian Cosmology*. In this book M'Taggart discusses and criticizes certain applications which Hegel and others had made of Hegelianism to ethics, politics, and religion. He also attempts to determine by Hegelian methods, more definitely than Hegel himself had done, the nature and structure of the Absolute. In 1910 M'Taggart published his *Commentary on Hegel's*

Logic. In this he takes the detailed argument of Hegel's *Greater Logic* category by category from Pure Being to the Absolute Idea. He tries to expound in intelligible English the characteristic content of each category, and to explain and criticize the transitions from one category to another. M'Taggart considered that the dialectical method, within the *Logic*, can be defended, both as to its validity and its fruitfulness, if it be regarded as a means of gradually making explicit what is implicit in every rational mind. He also held that Hegel's transition from *Logic*, through *Nature*, to *Spirit* can be defended on similar lines. He was convinced that the Absolute Idea, the highest category of the *Logic*, as interpreted by himself, expresses the complete nature of reality, so far as this can be determined by purely *a priori* reasoning. But he rejected many of Hegel's particular steps; he thought that Hegel often deceived himself and his readers by giving to his categories names taken from concrete empirical facts; and he rejected almost all the applications which have been made of Hegelianism to ethics, politics, and religion.

The second group of M'Taggart's writings contains only one book—*Some Dogmas of Religion*, published in 1906. This is the only popular philosophical work which he wrote. M'Taggart was at once an atheist and a convinced believer in human immortality. He held, on philosophical grounds which he developed in his *Hegelian Cosmology* and his *Nature of Existence* (1921 and 1927), that the Absolute is a perfect society of spirits, each of whom loves one or more of the others. He also held that each of these spirits is eternal, and that each human mind, as it really is, is one of these spirits. He thought it most probable that the eternal and timeless existence of these spirits would appear, under the partly delusive form of time, as a series of successive lives of finite duration. In *Some Dogmas of Religion* he takes the doctrine of pre-existence, rebirth, and post-existence as an hypothesis, and defends it with great ingenuity against the more obvious objections. In this book he also discusses Free Will and Determinism, arriving at a completely deterministic conclusion, and the Omnipotence of God. On the latter subject he concludes that the existence of a non-omnipotent and non-creative God is the utmost that can be granted to be philosophically possible. In *The Nature of Existence* his conclusions are even more definitely atheistic.

The later years of M'Taggart's life were spent in elaborating his own system of constructive metaphysics. This is contained in *The Nature of Existence*, the first volume of which appeared in 1921, the second and concluding volume being published posthumously in 1927. This is a complete system of deductive philosophy of extreme acuteness and ingenuity. It arrives at much the same conclusions as the writings of the Hegelian period by an entirely different method. The turning-point of the argument is a principle about the endless divisibility of substance, which M'Taggart called the Principle of Determining Correspondence. The work is remarkable for the strenuous attempt which the author makes to deal satisfactorily with the existence of error and illusion, particularly the illusion of time and change, in a world of eternal beings perfectly related to each other. A clear but highly condensed account of the system will be found in M'Taggart's contribution to *Contemporary British Philosophy* (edited by J. H. Muirhead, vol. i, 1924).

M'Taggart married in 1899 Margaret Elizabeth, daughter of Joseph Bird, civil servant, of Taranaki, New Zealand. They had no children. He retired from his lectureship at Trinity College in 1923, after completing twenty-five years' service. He continued to give some of his courses of lectures until his death, which took place, after a short illness, 18 January 1925 in a nursing home in London.

M'Taggart was a man of great wit and great business ability. He felt a passionate affection for his friends, for his country, and for his school and college. He was for many years an active member of the governing body of Clifton College, and he gave great help to Trinity College in drawing up the new statutes imposed upon it by the statutory commission. Although an atheist, he was a keen supporter of the Church of England, being in ecclesiastical matters an Erastian whig. In national politics he was a free-trade unionist, in university politics a strong feminist. He had an extraordinary knowledge of English novels, both past and contemporary, and of eighteenth-century memoirs. The honorary degree of LL.D. was conferred on him by the university of St. Andrews in 1911 and he was elected a fellow of the British Academy in 1906. A portrait of M'Taggart by his friend, Roger Fry, was presented to Trinity College by his widow, and hangs in his old lecture-room. In the college chapel there is a brass to his

memory, near to those of Sidgwick and Ward, with his favourite quotation—*Homo liber de nulla re minus quam de morte cogitat; et ejus sapientia non mortis sed vite meditatio est*—from Spinoza and an inscription by his friend, Nathaniel Wedd, of King's College.

[C. D. Broad, J. M. E. M'Taggart, 1866-1925, in *Proceedings of the British Academy*, vol. xiii, 1927.] C. D. BROAD.

MAGRATH, JOHN RICHARD (1839-1930), provost of Queen's College, Oxford, was born at St. Peter Port in Guernsey 29 January 1839, the third son of Nicholas Magrath, surgeon in the royal navy, by his wife, Sarah Mauger Monk. He was educated at Elizabeth College, Guernsey, whence he won, at the age of seventeen, a classical scholarship at Oriel College, Oxford. At Oxford he followed a custom then not unusual, of reading both classics and mathematics, with the result that he obtained a first class in *literae humaniores* and a fourth class in mathematics in 1860. The same year he won the Stanhope essay prize, his subject being 'The Fall of the Republic of Florence', and was elected a fellow of Queen's College. In 1861 he began to read theology, and won the Johnson theological scholarship, finding time also to be president of the Union. He was ordained deacon in 1863 and priest in 1864. His tastes lay mainly in the direction of *literae humaniores*, especially Aristotelian philosophy, and for some years he was well known as a 'Greats' tutor, numbering amongst his pupils Edward Talbot, afterwards warden of Keble College and bishop of Winchester, and W. G. F. (afterwards Lord) Phillimore. These, and many more, looked back with gratitude to Magrath's long vacation reading parties at Beddgelert.

In 1864 Magrath succeeded to a tutorship at Queen's College, and thenceforward for many years he confined his academic activities to that college. From 1864 till 1877 he held the office of dean, and drastically, but with tact and patience, reformed the discipline of the college. He was also chaplain of the college from 1867 to 1878, and in 1874 he assumed the office of bursar, which then combined the work which is now divided between the estates and the domestic bursars. But although he was bursar only for four years, he retained to the end of his life a knowledge of the college estates of which successive bursars were glad to

avail themselves. As if this were not enough, in 1876 he became senior proctor. Magrath brought to this last office the same industry and efficiency and the same combination of firmness and geniality which had made him such a success as dean and tutor of his college.

In the following year (1877) Dr. William Jackson, the provost of Queen's, appointed Magrath to assist him as pro-provost, and a year later Magrath succeeded Jackson as provost. Thenceforth his whole time was taken up with college administration and with university business. He was elected a member of the Hebdomadal Council in 1878, and served on it for twenty-one years. He was curator of the University Chest from 1885 to 1908, and was for many years also a curator of the Sheldonian Theatre, and a delegate of the Common University Fund and of the University Museum (1903-1912). He did particularly valuable work as a delegate of the University Press from 1894 to 1920. It was during his chairmanship of this body that he made himself responsible for the authorization of the proposal made by Henry Frowde [q.v.] in 1896 for the foundation of a branch of the Press in New York, a courageous measure from which the Press has reaped substantial benefits. In 1894 Magrath became vice-chancellor of the university, and for four years he carried out the duties and maintained the traditions of this office with dignity and ability. He was now at the height of his powers, and made a picturesque figure, with his flowing beard, his keen but kindly eyes, and his courtly bearing.

Throughout his life Magrath took a keen interest in municipal affairs, and was, in fact, the first Oxford don to accept civic office, first as a member of the Oxford local board, of which he was chairman from 1882 to 1887, and then, on its dissolution and the reconstitution of the city council, as alderman from 1889 to 1895. He was a J.P. for Oxfordshire from 1883. In Magrath's earlier days, when Oxford was still a country town, the city was decidedly dominated by the university, and somewhat resented its subservience. There was often unpleasant friction between 'town and gown', and there is no doubt that Magrath did good and lasting work in mediating between them.

In politics Magrath was a liberal, a supporter and personal friend of Lord Rosbery, and a devoted admirer of Mr. Gladstone. In education, also, he was progressive up to a point. He was

wholeheartedly in favour of the movement for the higher education of women. Miss Dorothea Beale [q.v.], in her pioneer work at Cheltenham Ladies' College, found in him her chief supporter, and he was among the earliest friends of Somerville and St. Hilda's Colleges at Oxford. He also had a deep sympathy with the poor scholar. In the foundation of Lady Elizabeth Hastings [q.v.], which linked Queen's College by valuable exhibitions to a number of schools in Yorkshire, Cumberland, and Westmorland, he found an instrument ready to his hand. With the cordial support of the fellows of Queen's he gradually raised the status of these exhibitioners and the standard of the examination by which they were elected. Moreover, he visited the northern schools in person, accompanied by some fellow of the college, and it is not too much to say that these visits saved from extinction some distant outposts of the 'humanities'. Especially great were his services to St. Bees School, Cumberland; he was chairman of the governors for many years and was largely responsible for a policy of expansion by which the school was developed from a small country grammar school into a public school with some three hundred boarders.

At Oxford Magrath generally identified himself with the reforms of the Statutory Commission of 1877. These included the gradual absorption of the halls into the colleges. St. Alban Hall was taken into Merton College, St. Mary Hall into Oriel College, New Inn Hall into Balliol College, and in 1882 the commissioners made a statute for the absorption of St. Edmund Hall into Queen's College, which was to take effect at the next vacancy of the principalship. When therefore Dr. Edward Moore [q.v.] was nominated to a canonry in Canterbury Cathedral in 1903, Magrath sought to put the statute into operation. To this proposal, however, there was strong opposition, which came as much from Queen's College as from the Hall, and a short but sharp contention took place between old friends. But eventually, owing in large measure to the mediation of Lord Curzon as chancellor, and to the influence of the Hebdomadal Council, Magrath withdrew his scheme. St. Edmund Hall was finally secured in its separate identity in 1913 by a university statute which received the approval of the King in Council in that year, and no one rejoiced more unfeignedly than Magrath at the subsequent development

and increasing success of the Hall. One other modern development at Oxford was strongly supported by Magrath, namely, the school of medicine; he was a valued member of the board of that faculty from 1890 to 1912.

There was, however, much in the trend of modern education which Magrath viewed with apprehension. Particularly he feared that the classics were being gradually ousted by other subjects from their position at Oxford as the chief instrument of education, and he was strongly opposed to the abolition of Greek as a compulsory subject for admission to the university. He believed, in fact, that without such a support, Greek would not survive in the northern grammar schools for more than a generation. Moreover, he dreaded lest the 'Huxley ladder' from the elementary school to the university should be made too easy. He also deplored what seemed to him the excessive interference of local education authorities with the independence of schools and schoolmasters and their governing bodies. These views he expressed with no uncertain voice from time to time in his annual progress round the northern schools, and however much people might disagree with and criticize them, his utterances on education created a profound impression in the North of England.

As a writer, Magrath will chiefly be remembered by his history of *The Queen's College* (2 vols., 1921), at which he worked for many years, assisted by Mr. Charles Stainer. He also edited *The Flemings in Oxford* (vol. i, 1904, vol. ii, 1913, vol. iii, 1924) for the Oxford Historical Society, and contributed the section on Queen's College to Andrew Clark's *Colleges of Oxford* (1891). He published in 1910 a sumptuous edition of the *Liber Obituarius Aulae Reginae in Oxonia*, and presented a copy to every member of the college past and present.

Magrath was a sportsman in the truest sense of the word, but his innate conservatism limited his activities to rowing and to the kindred sport of swimming. He had a distant respect for cricketers, but none for spectators of games, and for this reason he took little interest in football, until his college gained prestige on the football field as well as on the cricket field and on the river. He himself as a fellow both rowed for the college and was captain of the boats, and for many years he was a conspicuous figure in the 'Ancient Mariners' crew, stroked by W. L. Courtney,

and comprising among its members A. L. Smith, L. R. Farnell, and W. E. Sherwood. Magrath was a familiar sight, too, at 'Parsons' Pleasure', diving from a tree rather taller than himself, and instructing Magdalen schoolboys to do the same. He was one of the earliest and keenest supporters of the Volunteer movement, and for seventeen years held the rank of sergeant in the university corps.

Magrath married in 1887 Georgiana (died 1890), third daughter of his predecessor in the provostship, the Ven. William Jackson. They had no children. On his wife's death his niece, Miss Eva Lefroy, kept house for him and carried on his tradition of hospitality. He was a most entertaining host, and Queen's men of all generations enjoyed his conversation on things grave and gay and his tales of by-gone Oxford.

In 1911, at Magrath's request, a provost of Queen's was appointed, first the well-known historian, Edward Armstrong [q.v.], a clever man of affairs, and one of the most popular figures in Oxford society; and, on his resignation in 1922, the Rev. E. M. Walker, who served with unswerving loyalty and conspicuous ability until, on Magrath's death, which occurred at Oxford at the age of ninety-one, 1 August 1930, he succeeded to the position of provost.

A portrait of Magrath, painted by the Hon. John Collier in 1898, and presented by some old members of Queen's College, hangs in the college hall.

[Personal knowledge.] H. A. P. SAWYER.

MAGUIRE, JAMES ROCHFORD (1855-1925), sometime president of the British South Africa Company, was born at Kilkeedy, county Limerick, 4 October 1855, the second son of the Rev. John Mulock Maguire by his wife, Anne Jane Humphries. He was educated at Cheltenham College and at Merton College, Oxford, where he obtained first classes in mathematical moderations (1875) and mathematical finals (1877) and also in jurisprudence (1879). In the last-mentioned year he was elected to a fellowship at All Souls College. He was called to the bar by the Inner Temple in 1883.

While at Merton, Maguire became a close friend of Cecil John Rhodes [q.v.], then an undergraduate of Oriel College. This friendship was destined to last until Rhodes's death in 1902, and to determine the whole course of Maguire's career. Maguire became associated with Rhodes's

projects for the federation and extension of the British Empire, and, in particular, with his scheme for securing for the British Empire, through the medium of a powerful British commercial corporation, that part of South Central Africa which lay to the north of the Transvaal Republic and is now named Rhodesia, then a savage territory under native rulers, of whom the most powerful was the Matabele chief, Lobengula.

Rhodes, who was in sympathy with the Irish nationalist party's demand for Home Rule, but was opposed to Gladstone's Home Rule Bill of 1886 because it would have excluded Irish representatives from the House of Commons, was at that time in frequent communication with Charles Stewart Parnell [q.v.]. Maguire, who shared Rhodes's admiration for Parnell, became the chief connecting link between Rhodes and the nationalist party. In 1890 he was returned unopposed to the House of Commons as Parnellite member for North Donegal. At the general election of 1892 he was elected for West Clare, but was defeated in 1895, and did not again enter parliament.

Meanwhile Rhodes's schemes of British expansion in South Africa were being carried through. A concession granted by Lobengula over all the minerals in his territory formed the basis for Rhodes's projected company. This concession was obtained, not without great difficulty and considerable personal danger, by Maguire and two other emissaries, C. D. Rudd and F. R. Thompson, who were sent up by Rhodes for the purpose to Lobengula's kraal at Bulawayo in 1883. After the grant of the concession, Maguire had to remain in Bulawayo lest Lobengula should be persuaded to revoke his action. The ever-increasing danger of his position forced Maguire to leave for the south in April 1889, but by this time Rhodes's purpose was achieved, and in the following October the British South Africa Company was incorporated by royal charter with governmental as well as commercial powers.

In 1895 Maguire married the Hon. Julia Peel, eldest daughter of Arthur Wellesley, first Viscount Peel [q.v.], formerly Speaker of the House of Commons. At the end of the same year (29 December) the Jameson Raid took place. It is probable that Rhodes had made Maguire privy to his plans in connexion with the revolutionary 'reform movement' in Johannesburg, but Maguire was no party to the actual incursion of (Sir) Leander Starr Jameson [q.v.] into the

Transvaal, and he strongly disapproved of it. With Rhodes, and accompanied by his wife, Maguire went through the siege of Kimberley in the South African War (October 1899-February 1900). This was the last of his active adventures.

After the death of Rhodes in March 1902, Maguire devoted himself to the business of the British South Africa Company, of which he became vice-president in 1906 and president in 1923, and of its associated railway companies, of which he was chairman. It was largely through his efforts that these companies were brought through great difficulties to a position of sound prosperity; and it was under his presidency, in October 1923, that the present colonial governments of Southern and Northern Rhodesia succeeded to the administration of the British South Africa Company.

Maguire died in London 18 April 1925, leaving no children.

D. O. MALCOLM.

MAHON, SIR BRYAN THOMAS (1862-1930), general, the eldest son of Henry Blake Mahon, of Belleville, county Galway, by his wife, Matilda, second daughter of Colonel Thomas Seymour, of Ballymore Castle, county Galway, was born at Belleville 2 April 1862. He was educated in Ireland, and joined the fourth (militia) battalion, Connaught Rangers, whence he was gazetted lieutenant in the 21st Hussars in January 1883. Three weeks later he was transferred to the 8th (King's Royal Irish) Hussars. After five years' service in India, he returned to England in 1888 and was promoted captain. Two years later he was appointed adjutant of his regiment, but resigned in 1893, when he obtained employment with the Egyptian army. For the next seven years he served in Egypt, playing an active part in the operations which led to the final destruction of Dervish power (1896-1899). As staff officer of mounted troops, Mahon shared in the campaign which ended in the recovery of the province of Dongola in the summer of 1896, and was awarded the D.S.O. He served in the operations in the Nile valley early in 1897, being promoted major in that year, and was present at the battles of Atbara (8 April 1898) and Omdurman (2 September 1898); in the latter engagement he was erroneously reported killed. He remained at the front after (Lord) Kitch-

ener's occupation of Khartoum, holding the appointment of assistant adjutant-general. He was also head of the intelligence branch of the flying column which finally defeated the Khalifa in Kordofan in November 1899. For his services in the campaign he received the brevet of lieutenant-colonel in 1898 and the brevet-colonelcy in 1899.

In January 1900, three months after the outbreak of the South African War, Mahon left Egypt for South Africa on special service. He first received the command of the colonial mounted troops of the Kimberley relief force. In May, with the rank of brigadier-general, he was given the command of a column and entrusted with the task of directing the movements for the relief of Mafeking, where Colonel (afterwards Lord) Baden-Powell, with a small force, had shut himself up in order to detain in comparative inactivity as large a number of the enemy as possible. The town had been closely invested since 13 October 1899 by a Boer force of about 6,750 men. The British garrison, even with the town guard and railway employees and others who volunteered their services, numbered only about twelve hundred effectives; but Baden-Powell improvised such a spirited defence that it withstood all the efforts of the enemy. On 15 May news reached the town that a relief column was on its way from the south. This was Mahon's column, consisting of two colonial mounted corps, one hundred British infantry, four field-guns, and two pom-poms—a fighting force about eleven hundred strong. Starting from Barkly West on 4 May, Mahon, by the afternoon of 15 May, had covered 230 miles and reached Massibi to the west and abreast of Mafeking, having been forced to make a detour by the presence of a body of the enemy. The Boers had discovered his change of direction and sharply attacked him, but did not succeed in delaying his advance for more than an hour. At Massibi, Mahon effected a junction with a force of Rhodesian levies under Lieutenant-Colonel (afterwards Lord) Plumer, and joint operations were undertaken the next day for the immediate relief of Mafeking. The combined force was divided into two brigades, one under Plumer and the other under Lt.-Colonel A. H. M. Edwards, of the Imperial Light Horse, with Mahon in command. The enemy was now alive to the new situation, and General De la Rey, who had just assumed command, interposed a strong Boer force between Mafeking and the relieving columns. The latter came under

fire soon after noon on 16 May, and although their progress was slow, it was never really checked. Edwards on the left broke up all opposition before him, and a patrol of the Imperial Light Horse rode into Mafeking shortly before 6 p.m. Plumer on the right, had to meet sterner opposition, especially at Israel's Farm, where he was temporarily checked. Mahon organized a successful attack on the place, and soon all opposition ceased. Collecting his forces, Mahon finally advanced on Mafeking, seven miles distant, and at 3.30 a.m. on 17 May entered the town. Thus was achieved the relief of Mafeking—a notable operation upon which Mahon's reputation chiefly rests. The event was hailed at home with extraordinary enthusiasm, and in London especially occasioned scenes of almost delirious rejoicing.

Mahon was engaged in further operations in the Transvaal during the ensuing summer, acting successively under the orders of Lieutenant-Generals Sir Archibald Hunter and (Lord) French. In August 1900 he was gazetted to the command of the 12th Lancers, but he never actively served with that unit. Late in that year he returned to England, being awarded the C.B. for his services.

After one year's absence, Mahon arrived back in Egypt in January 1901, and was appointed to the governorship of Kordofan, a post which he held for just over three years. In April 1904 he was promoted to the substantive rank of colonel, and left Egypt for India in order to take command of the district of Belgaum. Two years later he was advanced to major-general, and in 1909 was given the command of the Lucknow division. At the end of his term in that command he returned to England (1913), was promoted lieutenant-general, and created K.C.V.O.

Mahon was holding no appointment when the European War broke out, but his services were soon engaged, for he was appointed to command the 10th (Irish) division of the new armies. In a history of that division it is recorded of Mahon that 'everything about him appealed to them (the Irishmen)—his great reputation, the horse he rode, his Irish name, and his Irish nature all went to their hearts' [Bryan Cooper, *The 10th (Irish) Division in Gallipoli*, 1918, p. 5]. In July 1915 the 10th division, under the command of Mahon, was dispatched to Gallipoli, after completing its training first at the Curragh and then at Basingstoke. In the following month the division took part in the severe

fighting at Suvla. So heavily was it engaged there that dispersion of his troops left Mahon at one time with only a single brigade. Continuous fighting throughout September preceded the withdrawal of the division to Mudros, whence it was transferred to Salonika for the new campaign against the Bulgarians (5 October 1915). At Salonika Mahon and his division were joined shortly afterwards by three French divisions, and General Sarraill was placed in chief command of the Allied force. The first attempt to save the Serbian army was not successful; the French were driven back and the British, faced by heavy odds, were forced to retire, after a very gallant struggle, to the south of the line Guevgheli-Doiran. The next four months were spent in establishing the ever increasing British army, in organizing the 'entrenched camp' of Salonika, and in maintaining contact with the enemy nearer the Greek frontier. In May 1916, after accomplishing all that was possible in most difficult circumstances, Mahon was succeeded as British commander-in-chief by Sir George Milne.

Once more Mahon went to Egypt, and there commanded for a month the Western Frontier force. He then returned to England, and towards the end of 1916 was sent to Ireland as commander-in-chief. This appointment was made in the hope that Mahon's knowledge of his fellow countrymen and his long established popularity would help to relieve the situation in Ireland after the bitterness aroused by the Easter Rebellion. The appointment was fully justified, but Mahon was not destined to hold it long, for when Lord French was appointed viceroy of Ireland in May 1918, he requested that Sir Frederick Shaw should be appointed commander-in-chief. Mahon therefore returned to England, and in the following October took over the duties of military commander at Lille. Here he remained in what proved to be his last active appointment, until March 1919.

Retiring in 1921, Mahon went to live in Ireland, and in the following year became a senator of the newly formed Irish Free State. He was sworn of the Privy Council of Ireland in 1917, became colonel of his own regiment, and received the K.C.B. in 1922. He was a grand officer of the legion of honour, and held the grand cross of the white eagle of Serbia.

Mahon married in 1920 Amelia (died 1927), daughter of the Hon. Charles Frederick Crichton, and widow of Lieutenant-Colonel Sir John Milbanke, tenth baronet. He had no children.

Mahon was essentially a cavalry leader. He was fond of shooting, hunting, pig-sticking, and polo, and was a fine steeplechase rider. In 1925 he took over the management of the Punchestown race meeting, and showed himself a very efficient administrator of turf affairs. He also became chairman of the committee for the control of mechanical betting in Ireland. He died in Dublin 24 September 1930.

OWEN.

MALLOCK, WILLIAM HURRELL (1849-1923), author, was born at Cheriton Bishop, near Crediton, Devonshire, 7 February 1849. He was the eldest son of the Rev. William Mallock, rector of Cheriton Bishop, who belonged to an old Devonshire family, the Mallocks of Cockington Court, near Torquay. His mother was Margaret, daughter of the Ven. Robert Hurrell Froude, archdeacon of Totnes, and sister of Richard Hurrell Froude [q.v.], William Froude [q.v.], and James Anthony Froude [q.v.].

Mallock was not sent to a public school, but went from a private tutor, the Rev. W. B. Philpot, of Littlehampton, to Balliol College, Oxford, in 1869. At Oxford he won the Newdigate prize in 1871 with a poem on the Isthmus of Suez. Although fond of the classics, Mallock only obtained a third class in honour moderations (1871) and a second class in *literae humaniores* (1874). Benjamin Jowett, then master of Balliol, thought little of him, regarding him as a mere dilettante.

Shortly after leaving the university, Mallock published *The New Republic* (1877), a book which had a considerable success. He had found the orthodox views in which he had been brought up disturbed by the religious liberalism of Oxford. In *The New Republic* a number of friends are gathered at a country-house party and discuss, in the manner of Plato's dialogues, problems of religion and society. The principal speakers are drawn without disguise from well-known men—Jowett, Ruskin, Matthew Arnold, Pater, and others. The arguments of most of these leaders of thought are pushed to lengths and conclusions which,

in the author's view, demonstrate the impossible position of undogmatic belief. He applies in fact the method of *reductio ad absurdum* to everything. Mallock followed this book with *The New Paul and Virginia, or Positivism on an Island* (1878), a short satirical sketch which is considered by many to be the most amusing of his works, and *Is Life worth Living?* (1879), a treatise in which the values of life and their connexion with religious faith are submitted to scientific analysis.

His writings had attracted attention, and as a clever young man Mallock found an immediate welcome in fashionable society, a mode of life which to the end of his days he appreciated and enjoyed. He spent much of his time in London, on the Riviera, and in country-house visits, but in spite of these distractions he worked with industry, and was continually engaged upon different subjects. He wrote philosophical and political treatises as well as several novels. In these works of fiction of which, perhaps, *The Old Order Changes* (1886) was the most popular, he usually attempted to illustrate some particular view or theory of human life, and to rouse interest rather by the development of character than by intricate plot or dramatic episode. He also produced a small volume of *Poems* (1880), and *Lucretius on Life and Death in the Metre of [FitzGerald's] Omar Khayyám* (1900). He had already (1878) published a handbook on Lucretius in Blackwood's 'Ancient Classics for English Readers' series, including some translations of his own.

Mallock combined with his satires, novels, and philosophical books, some political literature of a different kind. About 1881 his attention was attracted by the spread of revolutionary views about the distribution of wealth, and he became convinced, to quote his own words, that such views were based upon a serious distortion of historical facts and figures. He published a short book called *Social Equality* (1882) in which his object was to show that the various efforts which produce wealth are not only essentially unequal in themselves, but can only be stimulated by unequal circumstances. Especially as regards the ownership of land did he set himself to refute erroneous statements by statistical evidence which he collected and tabulated with much labour. When, as a result of his *Social Equality*, he accepted provisionally an invitation to stand as a conservative for a Scottish constituency, he held a number of meetings at which large dia-

grams were exhibited contrasting the amounts of rentals, as they were represented by Henry George and other opponents of the land system, with the amounts as they actually were. Although in the end he withdrew in favour of another candidate, and did not himself attempt to enter parliament, he continued for many years his careful study of political problems. His *Labour and the Popular Welfare* (1893) was followed by *Aristocracy and Evolution* (1898), and much of the information which he gathered was circulated in leaflet form for the instruction of speakers and audiences. In 1907 he went to the United States on a lecturing tour, and delivered a series of addresses which he afterwards collected and published in a book called *A Critical Examination of Socialism* (1908). Occupied as he was with these inquiries, he maintained a constant interest in religion and religious discussion. He published *Doctrine and Doctrinal Disruption* (1900), *Religion as a Credible Doctrine* (1903), and *The Reconstruction of Belief* (1905).

Towards the end of his life, Mallock wrote his autobiography—*Memoirs of Life and Literature* (1920)—in which he described the progress of his opinions from youth to age. From this retrospect it may be learned how extensive and varied was his literary output. He always wrote well, putting his points with clearness, and often with humour. He took great pains with his style, and would rewrite sentences until their rhythm satisfied him.

Mallock, who was never married, died at Wincanton, Somerset, 2 April 1923. On his death-bed he accepted the ministrations of the Roman Catholic Church.

[W. H. Mallock, *Memoirs of Life and Literature*, 1920; personal knowledge.]

A. COCHRANE.

MALLORY, GEORGE LEIGH (1886-1924), mountaineer, was born at Mobberley, Cheshire, 18 June 1886, the elder son of the Rev. Herbert Leigh Mallory by his wife, Annie Beridge Jebb. The Mallorys had for several generations been squire-parsons at Mobberley, owners of the advowson of the living as well as of the manorial rights of the parish. George Mallory, the eldest of a family of four, two sons and two daughters, intended to take orders. From a preparatory school at Eastbourne he won a scholarship to Winchester College in 1900, whence he proceeded as an exhibitor in history to Magdalene College, Cambridge, in 1905. Arthur Christopher Benson [q.v.] had

recently been elected a fellow of Magdalen, and Mallory came much under his influence. While at Cambridge, Mallory abandoned the intention of taking orders. His tastes were strongly literary and historical, and under Benson's influence he turned eagerly to the idea of teaching such subjects at a public school. In 1909 he published a study of James Boswell, the biographer, and in the following year was appointed an assistant master at Charterhouse, where he remained until he joined the army in 1915. He returned to Charterhouse in 1919, but although still keenly interested in the wider aspects of education, he decided after a few years to give up being a schoolmaster. He had married in 1914 Ruth, second daughter of Hugh Thackeray Turner, architect, of Godalming. After the interruption of his school work caused by his joining the expeditions to the Himalayas in 1921 and 1922, he moved in 1923 with his wife and three children, two daughters and a son, to Cambridge, and took up a post as lecturer and assistant-secretary for the Board of Extra-Mural Studies in the university.

While still at school Mallory had been introduced by a Winchester master, R. L. G. Irving, to the sport of climbing in the high Alps. He rapidly made his mark among expert mountaineers, both as a rock-climber in Great Britain and on ice and snow in the Alps. Almost every holiday he returned to the mountains, and when away from them he would talk, think, and dream about them. By the year 1920 Mallory was known as one of the leading young mountaineers of the day, and when the project of climbing Mount Everest took shape, he was invited to form one of the party chosen for the attempt. On the first expedition, organized by the Mount Everest Committee and led by Lieutenant-Colonel C. K. Howard-Bury in 1921, the climbing party for the preliminary survey of the mountain was a small one, and it fell to Mallory and his companion, C. H. Bullock, to carry through the main reconnaissance almost unassisted, except by eighteen native porters whose language they could not speak. As the natural sequel to this pioneer work, Mallory took part in the first main attempt to reach the summit in the following year. The route followed was the one discovered and surveyed by him and his small party the year before. On 21 May 1922, in company with Major E. F. Norton and Dr. T. H.

Somervell, Mallory reached the record height of 26,085 feet, but any further ascent was prevented by the early arrival of the monsoon. In 1924 he found himself for the third time at the Rongbuk glacier, the base of the expedition, preparing for the great climb. This year all seemed propitious for success. The party was ideally composed, the equipment very complete, and the stages of the climb had been thought out in the minutest detail. Hopes of success ran high, if only the weather should be reasonably good. But this was not to be. The Himalayas that year were repeatedly swept by storms in a way unknown in living memory. Twice the whole expedition had to retire to their base-camp to recuperate after the most terrible hardships from snow and icy winds. For the third advance, the party was much depleted and all the carefully laid plans had to be given up for lack of men to carry them out. Two attempts upon the summit were made. On the first, Mallory's companions, Lieutenant-Colonel E. F. Norton and Dr. Somervell, reached the highest recorded point, 28,126 feet (4 June). From the second, made on 8 June, Mallory and his companion, the young climber, A. C. Irvine, of Merton College, Oxford, never returned. They had slept at a height of 26,000 feet and were last seen at 12.50 p.m. the next day, going well, and about 800 feet below the summit. Then the clouds gathered round and hid the final scene of Mallory's greatest mountaineering achievement.

MANN, ARTHUR HENRY (1850-1929), organist, was born at Norwich 16 May 1850, the youngest child, in a family of three sons and two daughters, of Henry James Mann, musician, of Norwich, by his wife, Anne Couzens. He entered the choir of Norwich Cathedral as a very small boy. His ability was early apparent, for at the age of eight he played a service at the cathedral. The choirmaster was Zachariah Buck [q.v.], who used the cane freely on boys who omitted to practise the 'shake', and encouraged the open mouth by a curious apparatus 'placed between the teeth during singing exercise'. Mann was appointed organist of St. Peter's, Wolverhampton, in 1870 and of Tottenhall parish church in 1871. He matriculated at New College, Oxford, in 1872, and took the degree of B.Mus. in 1874 and that of D.Mus in 1882. He was

appointed organist of Beverley Minster in 1875, and after a few months there went to King's College, Cambridge, in 1876 and stayed there fifty-three years.

At this time the choir of King's College chapel consisted of lay clerks and boys from the town, like that of a cathedral. By degrees, and with Mann's active co-operation, this was changed. Choral scholars replaced the lay clerks, and a residential school for the boys opened the door to a wider source of supply. Mann had ideas of his own about vocal quality, speed, and style, with which some critics did not agree; but he understood what sounded best in that wonderful building, and the standard of performance was always high, sometimes remarkably so. He was an excellent organist, and played the best music from Bach to C. M. Widor, with fluency and good taste. His extempore voluntary at the beginning of a service was unique. It was impossible either to imitate it, or remember it. There was no tune, no form, no development, but it seemed to be part of the chapel, as it rose to a climax, and died down on a solitary note of extreme depth.

Mann's relation with the choir, boys and men, was strongly personal. The rehearsals were not easy occasions, but kindly goodwill reigned. To members of the choir, as to all his friends, Mann was 'Daddy', but he was not to be trifled with. During the European War it was touching to see young officers, on a few days' leave from France, coming back to Cambridge just to sing once more, and for the last time it might be, in a service at King's.

Mann conducted many fine performances of great works on a larger scale in King's chapel. His Festival Choir was established in 1857, and continued under his name until 1912. This chorus with a large London orchestra—often the London Symphony Orchestra—presented a fine series of works, such as Elgar's 'Apostles' (12 June 1900), 'The Kingdom' (11 June 1907), 'Dream of Gerontius' (15 June 1900); Beethoven's Mass in D (16 June 1903); Brahms's Requiem (14 June 1910, for King Edward VII), to which may be added Beethoven's 'Choral Symphony', played in the Guildhall at Cambridge 16 March 1911. Another interesting production was Tallis's great motet in 40 vocal parts—'Spem in alium'—which Mann printed on his own responsibility, and conducted in London (1898) and in Cambridge (1899). Besides these efforts, he gave eight symphony concerts in Cam-

bridge during the years 1910 to 1912, when three London orchestras were conducted by Sir Edward Elgar, (Sir) Landon Ronald, Sir Henry Wood, and (Sir) Thomas Beecham. The programmes consisted of works by Mozart, Debussy, Berlioz, Wagner, Beethoven, Tchaikowsky, Brahms, Haydn, Elgar, Schubert, Bizet, and included twelve symphonies by seven composers. Thus it is clear that Mann's view of music was broad and deep, and by no means confined to Handel, as some people thought.

Mann was choirmaster of the Norwich Festival in and after 1902, and director of music at Leys School, Cambridge, from 1894 to 1922. He became organist to the university of Cambridge in 1897 and received the honorary degree of M.A. in 1910. In 1892 he became a freeman of the city of Norwich. He was an early member of the Royal College of Organists. An institution very near his heart was the Incorporated Society of Musicians, of which he was a moving spirit for many years.

A valuable work of an entirely different sort was the rearrangement by Mann of the Handel MSS. at the Fitzwilliam Museum. The manuscripts were kept partly in parcels, partly in six bound volumes of 'sketches', in no sort of order. Mann spent much time and labour from 1889 to 1892 in putting them into shape, and, as far as possible, identifying the numberless scraps, sometimes consisting only of a few notes, with the corresponding passages in Handel's complete works. His work fills 70 pages of the printed catalogue. In 1894 Mann conducted a performance of the 'Messiah' in King's chapel with a reconstructed score including the original wind parts which had been discovered at the Foundling Hospital.

Mann was a great collector of early hymn books, concert programmes and tickets, and other *miscellanea* connected with music. He possessed a mass of remains connected with Dr. William Crotch [q.v.], first principal of the Royal Academy of Music, including water-colours painted by Crotch himself.

After his wife's death, which occurred in 1918, when he was nearly 70, Mann lived in King's College, and became a great favourite with all the residents, some of whom had not known him intimately before. In 1922 he was elected a fellow of the college. Mann's life was happy, and his death no less so. His eightieth year half over, he sang in the Latin motet for

Advent on Sunday afternoon 17 November 1929. He died early on the Tuesday following (19 November).

Mann married in 1874 Sarah, daughter of John Ransford, a yeoman farmer, and had one son (who died in infancy) and three daughters.

E. W. NAYLOR.

MANSFIELD, KATHERINE (pseudonym), writer. [See MURRY, KATHLEEN.]

MANSON, Sir PATRICK (1844-1922), physician and parasitologist, was born 3 October 1844, the second son of John Manson, of Cromlet Hill, Oldmeldrum, Aberdeenshire, laird of Fingask and manager of the local branch of the British Linen Bank, by his wife, Elizabeth, daughter of Patrick Blaikie. Mrs. Manson was a woman of very happy and resourceful disposition and of artistic temperament. Manson was educated at the Gymnasium and later at the West End Academy, both in Aberdeen, whither his parents had moved in 1857. He was at first apprenticed to an engineering firm in Aberdeen, but convalescence from an illness gave him the opportunity of gratifying his taste for natural history, and this soon led him to abandon engineering and take up the study of medicine. He entered Aberdeen University in 1860, and in 1865 graduated M.B. and C.M., taking his M.D. degree in 1866. In this year, through the interest of his elder brother who was already in Shanghai, Manson was appointed medical officer for Formosa to the Chinese Imperial Maritime Customs.

Owing to the political unrest in Formosa, Manson left the island in 1871 and went to Amoy. It was there, while in charge of a missionary society's hospital and dispensary, and busy with his private practice, that he made those observations which were to bring him fame in the future.

His surgical work in the removal of the massive tumours of elephantiasis, and the prevalence of this and allied conditions among the Chinese, impressed Manson with the importance of these diseases, the cause of which at that date was unknown. While in England in 1875 he heard of the discovery in Calcutta in 1870

and 1872 by Timothy Richards Lewis (1841-1886) of microscopic nematode worms (*micro-filariae*) in the blood of patients suffering from diseases allied to elephantiasis; later discoveries, in 1876 by Joseph Bancroft, of Brisbane, and in 1877 by Lewis in Calcutta, revealed the adult worms corresponding to the embryonic blood forms.

On his return to China early in 1876 Manson made a series of observations which convinced him of the causal relationship of *filaria* worms to elephantoid diseases, and he brought to light the remarkable fact that the embryonic forms of the worm do not appear in the blood until sunset, that they increase in number until midnight, and then decrease, disappearing about 9-10 a.m. He began now to speculate on the fate of these embryonic blood *filariae*—how they get out of the body. By a fortunate accident, thinking at that time—erroneously, as is now known—that the geographical range of mosquitoes and of filarial disease is identical, Manson selected mosquitoes as the probable means by which the embryos escaped. He consequently proceeded to feed mosquitoes on a patient whose blood teemed with embryo *filariae*. 'After many months of work', he wrote in the *China Customs Medical Reports* for September 1877, 'often following up false scents, I ultimately succeeded in tracing the filaria through the stomach wall into the abdominal cavity, and then into the thoracic muscles, of the mosquito. I ascertained that during this passage the little parasite increased enormously in size. It developed a mouth, an alimentary canal and other organs. . . . Manifestly it was on the road to a new human host.'

Unfortunately here Manson took the wrong turning. 'A regrettable mistake, the result of a want of books, was my belief that the mosquito died soon after laying her eggs' [*Life*, 57]. He had not, before leaving England in 1883, seen the suggestion of an anonymous reviewer in the *Veterinarian* [vol. lvi, p. 178, 1883] that 'the parent worm is in the first instance introduced into the body from without, and it may be deposited by the mosquito in the act of biting'. He conjectured that the filarial larva got into water at the death of the 'short-lived' mosquito, and thence in some unknown way back to man. 'This unfortunate error just prevented Manson from rounding off his investigation as a perfect piece of research. But none the less, this great and fundamental

discovery of a developmental phase in the life of a parasite in the tissues of a blood-sucking insect, was to have important results.

In December 1883 Manson left Amoy and settled in Hong Kong, where he soon built up a large private practice, became a leader in public work, and instituted a school of medicine which developed into the university and medical school of Hong Kong. In 1886 he received the honorary LL.D. degree of Aberdeen University—the first official recognition of his scientific work.

Manson retired from practice in 1889, left China, and went to live in Scotland. A year later, however, he was compelled, through financial losses, to take up practice again in London. His appointment in 1892 as physician to the Seamen's Hospital Society gave him the opportunity of continuing his researches into tropical diseases. It was while holding this post that he first observed the malaria parasite, which had been discovered by A. Laveran in 1880. Before the discovery of the malaria parasite, many writers had expressed the view that mosquitoes might be concerned in the transmission of malaria; but Manson's discovery, in the case of *filaria*, that the development of a blood worm occurred in the body of a mosquito led him to argue, by analogy, that the malaria parasite had a similar intermediate host. He was now familiar with certain forms of the malaria parasite which behaved in a peculiar manner when examined under the microscope. Motile filaments developed on some of these, and the filaments broke loose and moved through the blood fluid. The importance of this phenomenon was not lost on Manson. He would not have it that these motile bodies were functionless, but inferred that they were meant by nature to occur while the parasite was in the body of an intermediate host, e.g. in the stomach of a mosquito. This was the essence of Manson's mosquito-malaria theory. In 1897 W. G. MacCallum, of Baltimore, discovered what these motile filaments really were, viz. male elements prepared to fertilize female forms, similar in appearance, but without motile filaments [*Lancet*, 1897, vol. ii, p. 1240]. Thus Manson's induction became firmly established. Though the function of the motile filaments was now known, there was still no clue as to what happened next. It was (Sir) Ronald Ross who traced the subsequent stages. 'His brilliant induction',

Ross writes of Manson, 'so accurately indicated the true line of research, that it has been my part merely to follow its direction.'

In 1894 Manson began to give public lectures in London on the subject of tropical diseases, and in 1897 he was appointed physician and medical adviser to the Colonial Office. He was thereby brought into close association with Joseph Chamberlain [q.v.], at that time secretary of state for the Colonies, in the reform of the system of medical reports from the Colonies, in the reorganization of the West African medical service, and finally in the foundation (1899) of the London School of Tropical Medicine. The last-named was the outcome of a scheme drawn up by Manson in 1897 for systematic instruction in the diagnosis, treatment, and prevention of tropical disease; he had been appalled at the ignorance of, and the lack of training in, the subject with which practitioners had hitherto proceeded to the tropics.

In 1896 Manson delivered the Goulstonian lectures on 'The Life History of the Malarial Germ outside the Body' [*British Medical Journal*, 1896, vol. i, pp. 641, 712, 774; *Lancet*, 1896, vol. i, pp. 695, 751, 831], and in 1898 was published his *Tropical Diseases: a Manual of the Diseases of Warm Climates*, a work founded on his large experience and numerous original researches made while in China. Later important contributions to the subject were his *Lectures on Tropical Diseases* (the Lane lectures delivered at San Francisco, 1905) and in 1908 (with C. W. Daniels) *Diet in the Diseases of Hot Climates*.

Manson, who had been elected a fellow of the Royal Society in 1900, was created K.C.M.G. in 1903, and promoted G.C.M.G. on his retirement from the Colonial Office in 1912. He received the honorary degree of D.Sc. from the university of Oxford in 1904. At the International Congress of Medicine held in London in 1913 he was described as the 'father of tropical medicine'—a recognition of his achievement which can hardly fail to be endorsed by future generations. He died in London 9 April 1922, and was buried in Allenvale cemetery, Aberdeen.

Manson married in 1875 Henrietta Isabella, second daughter of Captain James Ptolemy Thurnburn, R.N., of Norwood, and had three sons and three daughters. There is a portrait of Manson at Manson House, 26 Portland Place, in oil, by J. Young Hunter (1911), and another at the London School of Hygiene

and Tropical Medicine, in water-colour, by M. Lucy Gee [Mrs. Coxeter].

J. W. W. STEPHENS.

MARSHALL, ALFRED (1842-1924), economist, was born at Clapham 26 July 1842, the second son of William Marshall, a cashier in the Bank of England, by his wife, Rebecca Oliver. The Marshalls were a West of England family, many members of which since the seventeenth century had been clergymen. His great-grandfather was the Rev. John Marshall, headmaster of Exeter grammar school, who married Mary, daughter of Charles Hawtrey, canon of Exeter, and aunt of Edward Craven Hawtrey, provost of Eton. At the age of nine he was sent to Merchant Taylors' School with a nomination obtained by his father from a director of the Bank of England, and, rising to be third monitor, he became entitled in 1861 to a scholarship at St. John's College, Oxford, in the last year of the old statutes, which would have qualified him to proceed in due course to a fellowship. This would have meant his continuing to work at the classics, as the first step towards ordination, which was his father's wish. But Marshall was determined to turn towards mathematics, for which he had already shown at school some genius; and a small loan from an Australian uncle made it possible for him to go to St. John's College, Cambridge, with the Parkin's exhibition of £40 a year. He graduated as second wrangler in 1865, the year in which J. W. Strutt (afterwards Lord Rayleigh) was senior wrangler, and was immediately elected to a fellowship at his college. He proposed at that time to devote himself to the study of molecular physics. Meanwhile he earned his living for a short period as a mathematical master at Clifton College, and afterwards by coaching at Cambridge for the mathematical tripos.

It was at about this time (1867) that Marshall first came into the intellectual circle of which Henry Sidgwick [q.v.] was the centre. As a member of the Grote and Eranus clubs he came into contact not only with Sidgwick, but with F. D. Maurice, John Venn, J. R. Mozley, W. K. Clifford, Henry Fawcett, Henry Jackson, and J. F. Moulton. Under these influences there came a crisis in his mental development, of which he often spoke in later years as the turning-point in his life. His

design to study physics was, in his own words, 'cut short by the sudden rise of a deep interest in the philosophical foundation of knowledge, especially in relation to theology'. At that time the philosophical world of Cambridge was passing, with painful doubts and hesitations, away from the Christian dogma, which a few years previously had in that atmosphere been scarcely questioned. Then, or a little earlier, Leslie Stephen was an Anglican clergyman, James Ward a nonconformist minister, Alfred Marshall a candidate for holy orders, W. K. Clifford a high churchman. A little later none of these could have been called Christians. But Marshall continued in sympathy with Christian morals and Christian ideals and incentives, and little or nothing is to be found in his writings or teaching of a tendency to influence his readers or pupils one way or the other in matters of belief. After a short metaphysical period, Marshall turned his mind to ethics. He accepted, on the whole, the Utilitarian ideas which had dominated the previous generation of economists, but with great caution and qualifications. Whilst his work was much concerned with ideals of social service, his treatment neither of economic theory nor even of economic motive is linked up with, or dependent upon, any particular ethical theory. His final transition to the choice of economics as the subject of his life's study is described in his own words in an unpublished autobiographical fragment written about 1917: 'I gave myself for a time to the study of metaphysics; but soon passed to what seemed to be the more progressive study of psychology. Its fascinating inquiries into the possibilities of the higher and more rapid development of human faculties brought me into touch with the question: how far do the conditions of life of the British (and other) working classes generally suffice for fullness of life? Older and wiser men told me that the resources of production do not suffice for affording to the great body of the people the leisure and the opportunity for study; and they told me that I needed to study political economy.'

In 1868 Marshall was appointed to a lectureship in moral science at St. John's College, and was soon able to specialize in economics. For nine years he remained fellow and lecturer of the college, laying the foundations of his subsequent work but publishing nothing beyond one or two occasional articles. Meanwhile, he was helping Henry Fawcett [q.v.], the professor

of political economy, and Henry Sidgwick to establish political economy as a serious study in the university of Cambridge.

After returning from a visit to the United States (1875), Marshall married in 1877 Mary, daughter of the Rev. Thomas Paley, and great granddaughter of Archdeacon William Paley [q.v.]. Miss Paley, who was a former pupil of his and a lecturer in economics at Newnham College, was one of the small band of five pioneers who in 1871, before the foundation of Newnham, came into lodgings in Cambridge under the control of Miss A. J. Clough [q.v.]. Marshall's first book, *The Economics of Industry* (1879), was written in collaboration with his wife. For forty-seven years of married life he was completely dependent on her devotion and understanding. His marriage involved the loss of his fellowship and made it necessary for him to find a new means of livelihood. Accordingly he went to Bristol in 1877 as the first principal of University College and as professor of political economy. Soon after his marriage his health and nerves began to break down, chiefly as a result of stone in the kidney, and he resigned the position of principal in 1881. After nearly a year spent in Italy, he returned to Bristol, where he still held his professorship, with his health much restored. But he remained for the rest of his life somewhat hypochondriacal. His nervous equilibrium was easily upset by unusual exertion or excitement or by controversy, and he never felt his physical strength equal to the claims which the activity of his mind put upon it. In 1883, on the death of Arnold Toynbee, Marshall was invited by Balliol College to succeed him as fellow and lecturer in political economy. In 1885 Marshall returned to Cambridge as the successor of Fawcett in the chair of political economy, which he held until his retirement in 1908 at the age of sixty-six. He continued thereafter to reside in Cambridge and to keep in close touch with the school of economics up to his death, which took place at Cambridge 13 July 1924, a fortnight before his eighty-second birthday. He had no children.

The progress of Marshall's most characteristic contributions to economic theory is a little obscure, owing to the long periods between the dates at which much of his most original work was carried out and the dates at which it was published. His serious study of the subject began in 1867; many of his characteristic doctrines

had been shaped by 1875; and by 1883 they were taking their final form. No part of his work was published in any adequate form until the appearance of his *Principles of Economics* in 1890, whilst his *Money, Credit and Commerce* did not appear until 1923. But long before they were formally made public, Marshall was in the habit of sharing his ideas without reserve in lecture and in talk with friends and pupils. In 1879 a pamphlet was privately printed in which some fundamental principles were briefly outlined, while some of his most characteristic contributions to economic theory first found their way into print in the evidence which he gave before royal commissions. Thus, by the time Marshall's doctrines were actually published, they were already in a sense familiar and their influence was already observable in the work of his English pupils and contemporaries. None the less, when at length it saw the light, his *Principles of Economics* was readily accepted as the greatest economic treatise of his generation; and for more than thirty years most serious work on the subject was built on his foundations. By the end of 1928 some forty thousand copies of the book had been sold in English, it had been translated into many languages, and its influence had penetrated to all schools of economic thought in every part of the world.

Marshall served on the royal commission on labour (1891-1894), and he spent much time on the preparation of evidence for the royal commission on the aged poor (1893), the Indian currency committee (1899), and the royal commission on local taxation (1899). In 1903, during the tariff reform controversy, he wrote a *Memorandum on the Fiscal Policy of International Trade* at the request of the Treasury, which was printed in 1908 as a White Paper. But it was not until 1919 that the next section of his main life's work, *Industry and Trade*, was given to the world. Finally in 1923 there appeared the third section, *Money, Credit and Commerce*. The postponement of his only treatise on money until after he was eighty years of age was an extraordinary example of Marshall's hesitation in allowing his work to reach the world; for the theory of money had been one of his earliest subjects of study, much of the material published in 1923 having been nearly complete forty years earlier, and some of it going back quite fifty years.

Some explanation of these long delays is to be found in the great pains which

Marshall took with his more promising pupils. The number of students of economics at Cambridge in his time was never great. But there were generally a few of good quality, and in these Marshall was nearly always successful in developing what was strongest and most fruitful. The development of the school of economics at Cambridge was carried by him a stage farther, shortly before his retirement, by the foundation of the economics tripos in 1903. As early as 1888 Professor Foxwell was able to claim that Marshall's pupils already occupied half the economic chairs in the United Kingdom, and that the share taken by them in general economic instruction in England was even more preponderant. At the time of his death he was recognized as the father of economic science as it then existed in England.

Marshall's letters and scattered writings have been collected in *Memorials of Alfred Marshall* (edited by A. C. Pigou, 1925), and his contributions to the reports of royal commissions in *Official Papers of Alfred Marshall* (edited by J. M. Keynes, 1926). A portrait by William Rothenstein hangs in the hall of St. John's College, Cambridge; and a replica in the Marshall Library, Cambridge, an extensive library for students of economics, the nucleus of which was formed by Marshall's bequest of his own books and later increased by Mrs. Marshall's benefactions in accordance with his wishes.

[Obituary notices reprinted in *Memorials of Alfred Marshall* (with bibliographical list of his writings) and in J. M. Keynes's *Essays in Biography*, 1933; private information; personal knowledge.] J. M. KEYNES.

MARSHALL HALL, SIR EDWARD (1858-1929), lawyer. [See HALL.]

MASON, ARTHUR JAMES (1851-1928), theological scholar and preacher, was born at Langherne, Carmarthenshire, 4 May 1851, the third son and fifth child of George William Mason, of Morton Hall, Retford, D.L., J.P. for Nottinghamshire and sometime high sheriff of the county, by his wife, Marianne Atherton, daughter of Captain Joseph George Mitford, of the East India Company's Service. He was educated at Repton School, and proceeded as a scholar to Trinity College, Cambridge, where he graduated as eighth classic in the tripos of 1872, and was elected a fellow in 1873. A short time spent as assistant master at Wellington College

was notable chiefly as the beginning of his devoted, almost romantic, friendship with the headmaster, Edward White Benson [q.v.], afterwards successively bishop of Truro and archbishop of Canterbury—a friendship which greatly influenced Mason's future career. In 1874 he returned to Cambridge as assistant tutor of Trinity, and in the following year accepted from his college the charge of St. Michael's church, Cambridge. This was really a preaching ship, and here Mason, a man of graceful figure, attractive face, voice, and manner, at once weighty and persuasive, found scope for his pastoral and devotional instincts. He showed an unusual power and quality of preaching, which was still further developed when, in 1878, Dr. Benson drew him to Cornwall as honorary canon of Truro Cathedral and diocesan missionary without stipend. Mason's missionary work in the new diocese was of lasting value. Years afterwards Archbishop Davidson, speaking in Canterbury Cathedral, recalled 'the lithe, spare figure' which 'passed to and fro among the wind-swept villages of Cornwall . . . as if a mission priest had stepped out from the Celtic centuries into our own'.

In 1884 Dr. Benson, who had become archbishop of Canterbury in 1882, invited Mason to All Hallows, Barking-by-the-Tower—a benefice with few parishioners and large endowment—in order to establish there a kind of college of mission-preachers for work in London among the more educated classes. This was a new idea, justified by success at least as regards Mason himself, for he was in great request as lecturer and preacher all the eleven years he was there. In 1893 he was appointed an honorary canon of Canterbury Cathedral (resigning Truro), and examining chaplain to the archbishop.

In 1895 the scholarship and wide theological learning which he was known to possess led to Mason's election as Lady Margaret's professor of divinity at Cambridge, where he accepted a professorial fellowship at Jesus College: in the same year Dr. Benson appointed him a residentiary canon of Canterbury. In earlier life he had been closely connected with religious activities of an ascetic type, but in 1899 he married. His wife was Mary Margaret, daughter of the Rev. George John Blore, D.D., headmaster of the King's School and honorary canon of Canterbury; they had two sons and two daughters.

In 1903, while retaining his canonry

at Canterbury, Mason resigned his professorship at Cambridge in order to become master of Pembroke College. As master of the college and as vice-chancellor of the university (1908-1910) he showed himself well able to deal with administrative affairs and an excellent representative of the college and the university on all occasions; he also gave free play, by benefactions to the college and in other ways, to his natural generosity and love of hospitality. But all this work was exacting, and Mason could not leave any of it undone. Canterbury stood first in his affections, both because Benson had, as he said, 'put' him there, and because its historical associations attracted his own ecclesiastical and artistic interests. In 1912, therefore, finding the responsibilities of the two offices too much for his strength, he resigned the mastership (he was at once elected an honorary fellow of the college) and withdrew to Canterbury. Except for six months (1915-1916) during the European War, when he went to Alexandria on a preaching and lecturing mission, he lived at Canterbury for the rest of his life, taking an active part in all the work of the cathedral and in matters affecting the religious, educational, and social welfare of the city.

All the offices which Mason held he filled with distinction. If he produced no literary work of outstanding importance, his many published writings show delicate scholarship and insight and an easy command of historical, theological, and antiquarian learning. Among them are: on early Christian history, *The Persecution of Diocletian* (1876) and *The Historic Martyrs of the Primitive Church* (1905); on Christian theology, *The Faith of the Gospel* (1888) and *The Five Theological Orations of Gregory of Nazianzus* (1899, in the series of Cambridge Patristic Texts, of which he was editor); on the Reformation settlement of the Church of England, *Thomas Cranmer* (1898), *The Church of England and Episcopacy* (1914), and *What became of the bones of St. Thomas?* (1920); and memoirs of two of his friends, Bishop G. H. Wilkinson (1909) and Bishop W. E. Collins (1912), the latter of whom owed much in his earlier life to Mason's beneficence, teaching, and example. He also wrote short articles of a specialist character, for example, on the ancient glass of Canterbury Cathedral and on the hymns of St. Hilary. Five hymns of his own composition are included in *Hymns Ancient and Modern*, and several volumes of verse show

the poetical outlook which was one of his characteristics.

Throughout his life much of Mason's time and energy was given to current ecclesiastical affairs behind the scenes, e.g. in connexion with the archbishop's mission to the Assyrian Christians, the discussions on reunion with the Church of Rome and with other Churches (such as that of Sweden, whose language he knew), the archbishop's commissions on 'spiritual healing' and 'the ministry of women', and the questions raised in the Kikuyu controversy. In all these matters Mason was the trusted adviser and helper of successive archbishops. He was appointed an honorary chaplain to the king in 1911.

Ecclesiastically Mason was in line with the older school of 'high' churchmen, avowedly both catholic and protestant, convinced that the Church of England with its Prayer Book as settled at the Restoration retained the true catholic faith and tradition. None the less, he favoured wider use in the Church of England of practices and institutions such as private confession and community life. Orthodoxy, ancient custom, stately worship, picturesque ceremonial—all these appealed to him. He shrank from 'modernity' of any kind. Learning and scholarship were used by him to elucidate and confirm the historical tradition, and his great gifts as a preacher to bring learned and simple folk alike to an evangelical trust in Christ. He died at Canterbury after a short illness 24 April 1928.

[*The Times*, 25 April 1928; *Kentish Gazette and Canterbury Press*, 28 April 1928; private information; personal knowledge.]

J. F. BETHUNE-BAKER.

MASSEY, WILLIAM FERGUSON (1856-1925), prime minister of New Zealand, was born at Linavady, co. Londonderry, 26 March 1856, the eldest son of John Massey, farmer, by his wife, Marian, daughter of William Ferguson. He was educated first at the national school and later at a private school at Londonderry. He lived with his grandmother, and subsequently with his uncle, his parents having emigrated to New Zealand in 1862.

Massey joined his parents in New Zealand in 1870, and took up farming, after gaining some experience in Canterbury, at Mangere, near Auckland. He soon began to take a prominent part in the local affairs of the district. He was an active member of the farmers' club, the local road board, the school committee, and other bodies,

and became president of the Auckland Agricultural and Pastoral Association in 1891. He was defeated by a narrow majority in his first contest for a seat in the New Zealand house of representatives in 1893, but was elected member in the conservative interest for Waitemata in 1894. He held that seat until 1898, when he was elected for Franklin, which seat he held until his death in 1925.

Massey's first important political post was that of chief opposition whip, which he held from 1895 to 1903. From 1903 to 1912 he was leader of the conservative opposition to Richard John Seddon [q.v.] and Sir Joseph George Ward [q.v.] in succession to Sir William Russell. In 1904 the opposition adopted the name 'reform party', and it was as leader of the reform party that Massey, on the defeat of the ministry of (Sir) Thomas Mackenzie, became prime minister of New Zealand in July 1912. He held office until his death thirteen years later, his term including the exacting period of the European War. Of the many offices which he held, the departments of lands and agriculture were the most congenial to him. Massey was a sincere and persistent advocate of freehold tenure in New Zealand, and in its first session the reform government passed the necessary legislation to enable holders of Crown leases in perpetuity to acquire the freehold on favourable terms. In 1913 his government dealt successfully with a great strike of transport workers, seamen, and miners.

In August 1915 Massey formed a national government, composed of the two chief parties, reform and liberal. He was joined, among other colleagues, by Sir Joseph Ward, as minister of finance and postmaster-general, and he led New Zealand through the War with great ability and firmness. His attendances at the Imperial War Cabinet and Conference of 1917-1918, at the Imperial Conference of 1921, and at the Imperial and Economic Conferences of 1923, gave him opportunities of getting to know intimately the leading statesmen of the British Empire, and New Zealand benefited in no small degree by the knowledge which he thus gained. He was also a plenipotentiary to the Paris Peace Conference of 1919, and he signed the Treaty of Versailles on behalf of New Zealand.

Massey was admitted a privy councillor in 1914. He was granted the freedom of ten cities, including London, Edinburgh, Glasgow, Belfast, York, Cardiff, and

Manchester. He received honorary degrees from the universities of Cambridge, Edinburgh, and Belfast, and he was the first overseas statesman to receive the freedom of the city of Londonderry. He was also the first colonial freeman to exercise his right and privilege to vote at an election of sheriffs for the city of London.

Massey's health failed after the Imperial Conference of 1923, and although he recovered sufficiently to be able to continue his work for a time, he died at Wellington 10 May 1925. He married in 1882 Christina, eldest daughter of Walter Paul, farmer, of Mangere, and had three sons and two daughters.

Physically, Massey was a very strong man; mentally, he was alert, capable, and ready for a political encounter at all times. His opponents always found him a fair, if vigorous, antagonist, and although he cannot be said to have been a great speaker, he was fluent in his delivery, with a natural power of repartee and very ready with biblical quotations, and definite in his opinions. But the greatest interest of his life was politics. He will be remembered, both in England and in New Zealand, as a strong purposeful man, who, once having come to a decision, never faltered.

[*The Times*, 11 May 1925; New Zealand Parliamentary Record, 1840-1925.]

T. M. WILFORD.

MASSINGHAM, HENRY WILLIAM (1860-1924), journalist, was born 25 May 1860 at Old Catton, Norwich, the second son of Joseph Massingham, private secretary to a member of the Gurney family, and a Methodist preacher, by his wife, Marianne Riehes. He was educated at King Edward VI's School, Norwich, under Dr. Augustus Jessopp [q.v.], from whose teaching and influence he acquired his lifelong love and critical judgement of literature.

At the age of seventeen Massingham joined the staff of the *Eastern Daily Press* as a reporter. There he met 'Mark Rutherford' (William Hale White, q.v.), whom he greatly admired, and whom, on coming to London in 1883, he succeeded as 'London letter' writer for the same paper. For a short time Massingham was a contributor to and then editor of the *National Press Agency*, and in 1888 he joined the staff of the *Star*, recently founded by T. P. O'Connor [q.v.], becoming editor for a few months in 1890. He next became editor of the *Labour World* in 1891. Early

in the following year, Massingham entered a wider sphere of influence as successively literary editor, special parliamentary representative, assistant editor, and finally editor, after the resignation of A. E. Fletcher in 1895, of the *Daily Chronicle*. He edited that paper for four years, raising it to a position of great influence as the exponent of advanced liberal opinions in home and foreign politics, while maintaining the high level of its daily literary page. In November 1899, however, he was driven to resign owing to the unpopularity of his strong opposition to the South African War. For a time he worked in London for the *Manchester Guardian*, and then for the *Daily News*, writing the 'Pictures in Parliament' in succession to (Sir) Henry William Lucy [q.v.], and contributing a series of articles upon South Africa, which he visited in 1905.

In March 1907 Massingham was appointed editor of the *Nation*, a liberal weekly journal which had been developed out of the *Speaker*. During the European War he strongly advocated an earlier peace, in support of the letter written by Lord Lansdowne [q.v.] in November 1917. He remained editor until April 1923, when he resigned owing to a change in the political aspect of the paper on its sale to other proprietors. He definitely joined the labour party in November 1923, and transferred his 'Wayfarer's Diary' to the *New Statesman*. But he deeply, although silently, lamented the loss of the editorship of the *Nation*, the paper which he had created and formed into a powerful organ of advanced but independent opinion. The sixteen years of his editorship of the *Nation* must be accounted the most effective period of Massingham's journalistic career, although his impetuous spirit would have preferred the medium of a daily paper, such as the old *Daily Chronicle*, in which he could get in his successive blows more rapidly. The objection to a weekly publication was even stronger in regard to the *Christian Science Monitor* (published in Boston, U.S.A.), to which for a time he contributed a weekly 'London letter'.

Massingham used to say, with a shade of regret, that he had given up everything for journalism, and certainly he found in journalism the expression of his ardent and impatient spirit. His interests were versatile, and as a journalist he wrote with eager appreciation of everything in which he discerned excellence, whether in literature, drama, or pictorial art. As

far as self-expression goes, his literary and dramatic criticisms are among his best work. In all the arts he was indifferent to precise refinements of thought and word, but he delighted in virile writers who could move and influence mankind in general. Like Tolstoy, whom he greatly admired, he was always on the look-out for the ethical rather than the strictly artistic, and the same was true of his own style in writing. His articles, whether 'leaders' or 'middles', were written with intense vigour and breadth. He cared nothing for epigrams or delicate subtleties. Every sentence had to seize the reader at once; none the less, his care for minute accuracy, even to the last comma, was as remarkable as it was unexpected.

His passionate energy for human welfare was Massingham's highest distinction. Even as an advanced liberal he never worked for party, and he was never guided by theory. He appreciated fine personality in any party, and would choose one hero after another, usually to be disappointed in each. Regarding official Tories and Liberals as hidebound by obsolete dogmas, he turned to the labour party and a kind of 'practicable socialism', but there, too, he was disappointed by the narrow, material aims of the Trade Unionists. His hatred of what he deemed injustice to a subordinate race lost him the editorship of the *Daily Chronicle*; his hatred of injustice to the working people lost him that of the *Nation*; and to the service of these two papers his existence had been devoted. At the well-known *Nation* lunches, attended by his permanent staff and a visitor or two, he would listen quietly to a debate upon some leading question of the day, and then would strike at the very centre of the problem. With all his humour and sympathetic attractiveness, he kept a veil drawn over his inmost self, and although friends and admirers surrounded him, few, if any, felt themselves really intimate with him.

Massingham was the author of two pamphlets, *The Greedore Hunt* (dealing with the Irish land war, 1889) and *Humphrey's Orchard* (dealing with an English eviction, 1894). He also wrote 'The London Daily Press' (articles for the *Leisure Hour*, 1892), and introductions to *Labour and Protection* (a symposium, 1903), to Winston Churchill's *Liberatism and the Social Problem* (1909), and to the memorial edition of the *Works of Mark Rutherford* (1923), a notice of whom Massingham contributed to this Dictionary.

Massingham married twice: first, in 1887 Emma Jane (died 1905), daughter of Henry Snowdon, of Norwich; secondly, in 1907, her sister, Ellen. He had five sons and one daughter by his first wife. He died suddenly at Tintagel, Cornwall, 28 August 1924.

[*H. W. M.: a Selection from the Writings of H. W. Massingham*, edited by H. J. Massingham, with introductory essays by J. L. Hammond, H. N. Brailsford, H. M. Tomlinson, H. W. Nevinson (members of the *Nation* staff), Vaughan Nash (of the *Daily Chronicle*), and G. Bernard Shaw, 1925; personal knowledge.]
H. W. NEVINSON.

MASTERMAN, CHARLES FREDERICK GURNEY (1874-1927), politician, author, and journalist, the fourth son of Thomas William Masterman, of Rotherfield Hall, Sussex, by his wife, Margaret Hanson, daughter of Thomas Gurney, of New Park Lodge, Brixton Hill, was born at Spencer Hill, Wimbledon, 25 October 1874. He was educated at Weymouth College and at Christ's College, Cambridge. His career at Cambridge was a brilliant one. He obtained first classes both in the natural science tripos (1895) and in the moral science tripos, part II (1896). He was one of the best speakers at the Cambridge Union, and became president of the Society in 1896. In 1900 he was elected a fellow of his college. At Cambridge Masterman associated chiefly with members of the liberal and progressive school of thought which found expression in *The Heart of the Empire* (1901), a collection of essays by Masterman, G. M. Trevelyan, Noel Buxton, G. P. Gooch, and others.

Masterman's liberalism was strongly tinged with Christian socialism, then under the leadership of men like Bishop Westcott, Canon Scott Holland, and (Bishop) Gore. The appalling contrast between the squalor of the slums and the luxury of Mayfair stirred his emotional nature, and an indignant pessimism inspired his next two books, *From the Abyss* (1902) and *In Peril of Change* (1905). These writings and his success as a platform speaker made Masterman a welcome recruit to the political liberalism which began to dominate England after the Boer War. He soon gained a footing in Fleet Street, and contributed to the *Independent Review*, the *Pilot*, the *Commonweal*, the *Daily News*, of which he became literary editor, the *Speaker*, then under the editorship of J. L. Hammond, and afterwards to the

Nation under the editorship of H. W. Massingham [q.v.]. At the well-known *Nation* lunches his witty and often cynical sayings found an appreciative audience.

In 1903 Masterman stood for parliament, contesting Dulwich unsuccessfully. With the assistance, however, of Mr. John Burns, then a power in London, he was returned for West Ham (North) in 1906. At first, Masterman was fortunate in his political career. His party had an unprecedented majority and his talents were recognized by Mr. Asquith, who succeeded Sir Henry Campbell-Bannerman as prime minister in April 1908 and offered Masterman the under-secretaryship of the Local Government Board, of which Mr. Burns was then president. Masterman accepted the office, and in his new capacity helped Mr. Burns to carry the important Housing and Town Planning Act of 1909. But the two men did not always work in harmony, and in July 1909 Masterman was appointed under-secretary of state for the Home department, where, in 1910, Mr. Winston Churchill became his political chief. In 1912 he was promoted to be financial secretary to the Treasury. Masterman had laboured indefatigably on Mr. Lloyd George's national insurance scheme, under the fire of bitter opposition from die-hard conservatives; and after the Insurance Act became law in 1911, he was appointed first chairman of the national insurance commission and guided a difficult and complicated measure into smooth waters.

For his conspicuous support of the National Insurance Bill, Masterman suffered; for in February 1914, when he was appointed chancellor of the duchy of Lancaster with a seat in the Cabinet, and had to seek re-election, the whole artillery of the opposition was turned upon him. In 1911 he had been unseated on petition at West Ham (North), owing to irregularities committed by his agent in the election of 1910, and had subsequently been elected member for South-West Bethnal Green. He was now defeated there by twenty-four votes. In spite of his ability as a platform speaker, he was not a good electioneer. He lacked the knack of either winning or retaining a seat. Perhaps his failure was partly due to ill luck, or perhaps it was that his high churchmanship repelled the nonconformists, who formed the backbone of the liberal party even in the days of its supremacy. However that may be, for nearly ten months after joining the Cabinet Masterman had to suffer the mortification of being unable

to find a seat. He was, none the less, a member of the Cabinet which took the fateful resolution of declaring war in August 1914. He was proud, as he wrote afterwards in a letter to the prime minister, to be associated with a government which had faced the situation and had chosen war as the only alternative to dishonour.

When, after disappointments at several by-elections, Masterman was passed over for a vacancy in the Shipley division of the West Riding of Yorkshire, Mr. Asquith in February 1915 reluctantly accepted his resignation, requesting him to remain on the war committees to which he was attached. He was director of Wellington House (propaganda department) from 1914 to 1918, and in the latter year was made director of the literary department of the Ministry of Information.

After the War, Masterman continued his attempts to re-enter parliament and was at last successful for the Rusholme division of Manchester in 1923, but lost his seat at the general election in the following year. After this his health, which had begun to fail, became gradually worse, and he died in London 17 November 1927. He married in 1908 Lucy Blanche, daughter of General Sir Neville Lytton, and had one son and two daughters.

As a writer Masterman may be judged by his most popular book, *The Condition of England*, which appeared in 1909. His style at its best was vigorous and fluent, resembling in many ways the ease and energy of his conversation.

[*The Times*, 18 November 1927; private information; personal knowledge.]

F. W. HUNT.

MATTHEWS, SIR WILLIAM (1844-1922), civil engineer, born at Penzance 8 March 1844, was the eldest son of John Matthews, borough surveyor of Penzance, by his wife, Alice, daughter of Thomas Richards, of Penzance. He was educated locally at a school kept by a Mr. Teague, and on leaving served a short part of his apprenticeship in the engineering works of Sandys, Vivian, & Co., near Hayle, Cornwall. Later he entered his father's office, where he worked for some years. When he was about twenty, he executed for the use of (Sir) John Cooke [q.v.], the harbour engineer, a survey of Penzance harbour, and as a result was invited to become a pupil in Cooke's

London office, and later was given a post on his staff. Matthews speedily rose to be chief assistant, and he was entrusted in time with the control of the office and home connexion when Cooke was abroad. In 1892, the year of Cooke's death, Matthews was made a partner of Sir John and his son, J. C. Cooke, the firm taking the style of Cooke, Son, & Matthews. It was subsequently reconstructed in 1912 and 1921.

The firm, of which Matthews was senior consulting engineer for nearly forty years, acted as consulting engineers to the Crown agents for the Colonies. They were frequently employed by the Admiralty in connexion with works at naval bases. Thus, they were chief engineers for the naval harbour at Dover, a work which occupied thirteen years (1896-1909). They were also consulted by the Board of Trade, the India Office, the Mersey Conservancy, the Humber Conservancy, the Tyne Commissioners, and other public bodies. Matthews was engaged in the construction of a wet dock and a graving-dock at Singapore, and in the reconstruction of the main wharf. He visited and inspected these works in 1901 and 1905. At the same time he advised the Straits Settlements administration as to the advisability of taking over the works of the Tanjong Pagar Dock Company. Matthews was also appointed by the Admiralty in 1900 to report upon the naval harbour in Malta, and he served on a committee appointed by the Admiralty in 1901 to inquire into the naval works at Gibraltar. He also visited and inspected harbour works in progress in Ceylon, Hong Kong, Cyprus, and at the Cape. For his services in connexion with colonial harbours he was awarded the C.M.G. in 1901, and created K.C.M.G. in 1906. He was also made an officer of the order of Leopold for services in connexion with the harbour of Zeebrugge in 1894.

Matthews was a member of the royal commission on coast erosion (1906), of the International Technical Commission on the Suez Canal (1908), and of the royal commission on oil fuel and engines (1912), and he acted as chairman of the British Standards Cement Committee (1912). He retired from active work at the end of 1917. He died, unmarried, at his home at Hampstead 8 January 1922.

Matthews became an associate of the Institution of Civil Engineers in 1870 and a member in 1876, and was elected president in 1907.

A portrait of Matthews by Stanhope

Alexander Forbes is in the gallery of the Institution of Civil Engineers.

[*The Times*, 10 January 1922; *Proceedings of the Institution of Civil Engineers*, 1922, vol. cxxiii, 418; G. C. Boase and W. P. Courtney, *Bibliotheca Cornubiensis*, vol. iii, 1882.]

E. I. CARLYLE.

MAXWELL, SIR JOHN GRENFELL (1859-1929), general, was born at Aigburth, Liverpool, 11 July 1859, the second son of Robert Maxwell, senior partner in the firm of A. F. and R. Maxwell, merchants, of Liverpool, by his wife, Maria Emma, daughter of Vice-Admiral John Pascoe Grenfell [q.v.] and cousin of Field-Marshal Francis Wallace Grenfell, first Baron Grenfell [q.v.]. The marriage of Mrs. Maxwell's sister Sophia to Pascoe Grenfell, Lord Grenfell's eldest brother, greatly strengthened the intimacy which arose between young Maxwell and the field-marshal. John spent his boyhood with his father's parents and was educated at Cheltenham College, whence he entered the Royal Military College, Sandhurst, in 1878, and was gazetted into the 42nd Foot (Royal Highlanders, now 1st Battalion, the Black Watch) in 1879. When Sir Garnet Wolseley went to Egypt in 1882, the 42nd formed part of the expeditionary force, and Maxwell was chosen by Major-General Sir Archibald Alison [q.v.] to act as his aide-de-camp for the battle of Tel-el-Kebir (13 September), remaining in that position until Alison's departure for England in 1883. But Maxwell then stayed in Egypt with Sir Evelyn Wood as assistant-provost-marshal. In that capacity, and as camp commandant, he spent the winter of 1884-1885 up the Nile with Wolseley in the latter's fruitless attempt to relieve General Gordon, then besieged in Khartoum. When, in April 1885, Sir Francis Grenfell succeeded Wood as sirdar of the Egyptian army, he summoned his young kinsman to his staff, first as aide-de-camp and then as assistant military-secretary, although the appointment was not to be made permanent until September 1886. In that capacity Maxwell took part in the Sudan frontier operations, being present at the action of Giniss (30 December 1885), for which he received the D.S.O., at the engagement at Gamaiza, outside Suakin (20 December 1888), which brought him the order of Osmanieh, and lastly (8 August 1889) at the more decisive battle of Toski, after which he was awarded a brevet-majority.

When Sir Herbert (afterwards Earl) Kitchener [q.v.] succeeded Grenfell as sirdar in 1892, he retained Maxwell on his own staff, and there sprang up a close association and lasting friendship between the two men. The next few years were spent in planning the re-conquest of the Sudan, until the crushing defeat of the Italians by the Abyssinians at Adowa on 1 March 1896 necessitated a hastening of the advance. This straightway led to the battle of Firket (7 June) in which Maxwell commanded the third Egyptian infantry brigade, retaining this position until the recapture of Dongola on 23 September. During 1897 he acted as 'governor of Nubia', and in this office administered the area in which the railway was being pushed forward. Finally, during the operations of 1898, he commanded the 1st Sudanese brigade at the battle of Atbara (8 April), and was transferred to the 2nd brigade for the battle of Omdurman (2 September). He was mentioned in dispatches and received the thanks of parliament. After the Dervish collapse he filled the onerous position of governor of Omdurman, receiving the brevet of lieutenant-colonel for his services.

On the outbreak of war in South Africa in October 1899, Maxwell was still in the Sudan, but in February 1900 he proceeded to the Cape. There he received command of the 14th infantry brigade, which he led to Pretoria, distinguishing himself on the Zand River. After the capture of the Boer capital (5 June) he was appointed military governor of Pretoria and thus administered a large area of the Transvaal. He fulfilled this task with tact and humanity, being created K.C.B. for his services and appointed temporary major-general in 1900; subsequently, in 1902, he received a brevet colonelcy and the C.M.G. In the latter year, before the end of hostilities, he was given the command of a column based on Vryburg, where he remained after the conclusion of peace on 31 May.

In the autumn of 1902 Maxwell was chosen by the Duke of Connaught, then acting as commander-in-chief in Ireland, to be his chief staff officer at Dublin. There he remained until May 1904, when the duke became inspector-general of the forces, and Maxwell followed his chief to London. At the end of 1907 the duke was transferred to Malta as commander-in-chief and chief commissioner in the Mediterranean; Maxwell once more accompanied him, and served with him until

September 1908. He had been promoted major-general at the end of 1906.

Maxwell left Malta in order to assume command of the British troops in Egypt, a position which fell to him as a reward for his service with the duke. His tenure of office in Egypt lasted until November 1912, that is, shortly after his promotion to lieutenant-general. It was not marked by any incident of note, although the Italo-Turkish War of 1912 caused him some preoccupation. After leaving this appointment he went on half-pay.

On the outbreak of the European War Maxwell was dispatched to French headquarters as head of the British military mission. There he served until the opening of the battle of the Marne, when, finding little scope for his activities, he was glad to resume command in September 1914 of all the troops in Egypt. The position proved to be both important and exacting. In February 1915 the Turks appeared on the Suez Canal after an arduous desert march, and were easily driven back. Events, however, rapidly increased Maxwell's responsibilities. Egypt became the base for the Gallipoli operations during 1915; subsequently, after the evacuation of the peninsula, the troops were withdrawn to Egypt in order to be refitted before being sent to the Salonika front. The Palestine expedition of 1916 was also based on Egypt. Maxwell's personal position was further complicated by the system of command which grew up around him. No less than 400,000 men were quartered in or based on Egypt, whilst three different groups of higher authorities were concerned in their command and administration. After repelling an attack by the fanatic Senussi in the Western desert in January 1916, Maxwell pressed for his own recall home in March. He had been created K.C.M.G. in 1915.

Shortly after Maxwell's return to England, on Easter Monday, 24 April 1916, the Sinn Féin rebellion broke out in Dublin. He was thereupon appointed commander-in-chief in Ireland with very extensive powers for the purpose of re-establishing order. This he accomplished in the course of a few days, during which thirteen rebels were shot by sentence of court martial. For the next few months Maxwell virtually governed Ireland through the army and the Royal Irish Constabulary under a proclamation of martial law. His administration proved just and humane, but the situation was far from easy and exposed him to fierce

criticism both in Ireland and in England. He received the G.C.B. as his reward in November 1916, when he was appointed commander-in-chief, Northern command, at York. There he remained until after the end of the War, when he was sent to Egypt as a member of Lord Milner's mission (December 1919 to March 1920) which was to define the future relations of Great Britain with that country. He had been promoted general in June 1919, but was not re-employed, and went on retired pay in 1922. He died at Cape Town 20 February 1929.

Maxwell, although not a student nor a deeply read man, possessed an uncommon sense of proportion in dealing with concrete matters, and he excelled in handling administrative problems. His career never afforded him an opportunity of showing himself a great leader in the field, but his readiness to take action on his own responsibility never forsook him in any emergency. In private life he was a sincere and staunch friend, generous as far as his purse allowed. He was also an Egyptologist of considerable repute.

Maxwell married in 1892 Louise, daughter of Charles William Bonyngce, of New York and Dublin, and had one daughter.

[*The Times*, 22 February 1929; Sir George Arthur, *General Sir John Maxwell*, 1932; Army Lists; personal knowledge.]

H. DE WATTEVILLE.

MAY, SIR WILLIAM HENRY (1849-1930), admiral of the fleet, was born at Liscard, Cheshire, 31 July 1849, the third son in the family of ten children of Job William Seaburne May, by his wife, Anne Jane Freckleton. Since the seventeenth century the family had lived in Holland, where an ancestor, John May, had settled in the profession of naval architect. William Henry May's grandfather, an admiral in the Dutch navy and at the same time captain in the British navy, had assisted in restoring Prince William of Orange to the throne of Holland in 1813. His father left Holland in 1840 and established himself in business on the stock exchange in Liverpool, where he acted as consul for the Netherlands.

May was educated first at the Royal Institution School, Liverpool, and later, when he had decided to enter the royal navy, at Mr. Eastman's academy at Portsea. Passing into the training ship *Britannia* in the twenty-second place out of fifty entrants in 1868, he passed out a

year later in the fourth place, and embarked at once, at the age of fifteen, on board the *Victoria*, flagship of the Mediterranean fleet. After three years he was transferred to the frigate *Liffey*, in which he served the remaining eighteen months of his midshipman's time. A sub-lieutenant in 1869, May passed his examinations in that rank with so much credit that, as a reward, he was appointed, after a few months in the *Hercules*, to the royal yacht *Victoria and Albert*. He was advanced to lieutenant after two and a half years, gaining promotion before many of his seniors. Returning to the *Hercules*, he served on board her for two years (1872-1874) and was then appointed to the gunnery-school ship *Excellent* to qualify as a specialist in gunnery. So far his career had been on the usual lines, but now an opportunity was presented of taking part in the Arctic expedition fitting out (1875) under Captain (Sir) George Strong Nares [q.v.]. May at once volunteered, and was accepted for this service as navigating officer of H.M.S. *Alert*. He served throughout the expedition until its return in 1876, having taken part in the sledging expeditions to Lincoln Bay and in relief of the party led by Commander (Sir) Albert Hastings Markham [q.v.] and in the search for a practicable overland route to Cape Prevost. He was engaged in much surveying work, for which he was commended by Sir George Nares in his official report.

On his return from the Arctic expedition May joined the torpedo-school ship *Vernon*. There he played a prominent and important part in developing the Whitehead torpedo and an underwater discharging apparatus. After three and a half years (1877-1880) in the *Vernon* and a few months in the frigate *Inconstant*, he was promoted to commander, after only nine and a half year's service in lieutenant's rank, and was at once given command of the new torpedo-ram ship *Polyphemus*. He held this command for two and a half years (1881-1884) and for the next three years was second in command of the royal yacht. At the age of thirty-eight he was promoted to captain.

In March 1888 May went to China as flag captain to Admiral Sir Nowell Salmon in the *Impératrice*. On the voyage to the East he took possession, acting on secret orders, of Christmas Island. He returned to England at the end of the commission in December 1890, and received the appointment of naval attaché to the

European states. Two and a half years were spent in this service, principally in France, Russia, and Germany, followed, without any intermission, by appointment to the Admiralty as assistant director of torpedoes. In January 1895 he went as chief of staff to Admiral Sir Michael Culme Seymour [q.v.] on the Mediterranean station, where he gave evidence of a very high degree of organizing ability. After two years' service in the Mediterranean he returned to England and was at once appointed flag captain to Admiral Sir Nowell Salmon, commander-in-chief at Portsmouth, acting as chief of staff during the jubilee celebrations of 1897. On the conclusion of the celebrations, May went to the gunnery school *Excellent*, which he commanded until January 1901. He was then appointed director of naval ordnance and torpedoes.

In April 1901, at the age of fifty-one, May reached flag rank, having a month earlier been made third sea lord and controller of the navy. During the four years of his controllership many far-reaching changes in naval construction and dockyard administration took place. The *Dreadnought* policy [see WARRE, Sir Philip] was initiated, though May was not a member of the 'committee of design' appointed in October 1904 to consider the characteristics of the new type; a greater sea-going capacity was given to the torpedo-boat destroyer class; the use of oil sprayed upon coal was introduced, and ships' machinery underwent great alterations. In February 1905 May, who had been created K.C.V.O. in 1904, was appointed to the command of the recently formed Atlantic fleet with his flag on board the *King Edward VII*. In July it fell to him to take the fleet to Brest, where a naval demonstration of the *entente cordiale* took place. May's presence and personality, his knowledge of French, and his able handling of the fleet in entering and leaving Brest harbour left a very good impression upon French naval officers.

After two years in command of the Atlantic fleet, May returned to the Admiralty as second sea lord. At this time (1907) great efforts were being made to cut down naval expenditure, and a reduction of £1,000,000 was ordered by the Cabinet of Sir H. Campbell-Bannerman. When a further reduction of three-quarters of a million was proposed, May, together with the third and fourth sea lords, sent a memorandum to the first sea lord, Sir John (afterwards Lord) Fisher [q.v.], intimating

that if this was done they must resign. The reduction was not carried out.

In 1909 May was appointed to the command of the Home fleet with his flag in the *Dreadnought*. This command included all the ships in home waters, and was, in May's opinion, too large. He concentrated his attention upon the investigation of the many tactical problems which the recent growth of the fleet in numbers and size, and the addition to the sea-going fleet of a fighting flotilla, had brought into existence. Gunnery, under the impulse of (Sir) Percy Moreton Scott [q.v.], had made great advances, though it still was far short of what came to be demanded of it in 1914. The torpedo had increased in both range and speed, and presented a new element in tactics. Many officers serving under May's command were dissatisfied with the existing tactical doctrines, and advocated new systems of handling the large and heterogeneous body of ships which formed a modern fleet command. May was always open to receive new ideas, to discuss them, and to try them. He initiated an extensive series of tactical exercises on a scale and with a comprehensiveness not hitherto attempted; the cruising formations from which deployment into battle formation could most rapidly be made; the use of flotillas in a tactical offensive; the employment of fast squadrons in action; the alternative of squadronal command in place of the single line under one command—these were prominent among the tactical matters to which May devoted attention. A man of an essentially practical turn of mind, he submitted to trial new theories and suggestions 'on the scale of twelve inches to the foot'. On hauling down his flag in March 1911 May was appointed commander-in-chief at Devonport. He held this command until promoted admiral of the fleet in March 1913, when his flag came down for the last time.

During the European War May served as a member of the Dardanelles Commission (1916-1917) which sat under the chairmanship of the Earl of Cromer, as chairman of the Reconstruction Committee which dealt, in anticipation, with the problems of the reductions to be made after the war, and on a sub-committee on fisheries. After his retirement he lived at Coldstream, where he took an active part in all local affairs. He died 7 October 1930 in his eighty-second year.

Few flag officers of his time had more continuous employment than Sir William

May. In the forty-four years of his service he spent but twenty months in all on half pay, and at no time was longer unemployed than seven months. In person he was tall, strikingly handsome, and physically active and powerful. He rowed in a race in a fleet regatta in his sixty-first year; he hunted until his horses were taken for the War; he shot, and played golf until within ten days of his death. He possessed the great gift of eliciting the opinions and theories of his officers, encouraging their suggestions, and giving them his unbiased consideration.

May married in 1878 Kinbarra Swene, daughter of William John Marrow, merchant, and had two sons. He received the legion of honour in 1905, the K.C.B. in 1906, and was promoted G.C.V.O. in 1909 and G.C.B. in 1911. A private memoir prepared for the immediate circle of his friends is the only hitherto published record of his career.

A cartoon of May by 'Spy' appeared in *Vanity Fair* 26 March 1903.

MEATH, twelfth EARL OF (1841-1929). [See BRABAZON, REGINALD.]

MELCHETT, first BARON (1868-1930), industrialist, financier, and politician. [See MOND, ALFRED MORTZ.]

MEREDITH, SIR WILLIAM RALPH (1840-1923), Canadian politician, was born in the township of Westminster, Middlesex, Upper Canada (now Ontario), 31 March 1840, the eldest son of John Walsingham Cooke Meredith, of London, Ontario, by his wife, Sarah, daughter of Anthony Pegler, of the same town. His father was of Irish birth, and a graduate of Trinity College, Dublin. Meredith was educated at the London district grammar school; in 1859 he won a two-year scholarship in the Toronto law school, and in 1861 was called to the bar of Upper Canada. He soon rose in his profession, but found time to study for and take the degree of LL.B. at the university of Toronto (1867). He practised law in London, Ontario, becoming Q.C. in 1875, and a bencher of the Law Society of Upper Canada in 1876. In 1888 he moved to Toronto, where from February to October 1894 he held the office of corporation counsel and head of the legal department of the city.

Meanwhile, in 1872, Meredith had been elected to represent London as a conservative in the legislative assembly of Ontario, and in 1878 he became leader of the opposition in that body. Although a distinguished speaker and a man of great powers of work, Meredith was not wholly a success in politics. He had not the political subtlety of (Sir) Oliver Mowat [q.v.], the liberal leader in the provincial house, and his opinions were really much more radical than conservative. As early as 1875 he advocated manhood suffrage, and soon after made the compensation of working-men for accidents a plank in his platform. He had too much independence of mind to see eye to eye with Sir John Alexander Macdonald [q.v.], the conservative leader in the federal house. At the same time he was compelled to support Macdonald in his fight with Mowat on the question of provincial rights and the ownership of the Crown lands. By doing so, Meredith lessened his local popularity; for Mowat was fighting for the importance of the province, and was ultimately successful, after the question had been taken before the Judicial Committee of the Privy Council.

In education Meredith opposed the liberal policy of placing the department of education under a political minister, with a seat in the cabinet, and urged that control should be given to a non-political superintendent. He also came into conflict with the Catholic Church over educational policy, since he wished to curtail the power of the clergy over the separate (Catholic) schools. His dialectical triumph in 1894 in a conflict with an ultramontane bishop was not very agreeable to his federal leader, who depended largely upon the support of an ultramontane Quebec.

In 1894 Meredith retired from political life, and was appointed by the federal (conservative) government to be chief justice of the common pleas division of the high court of justice of Ontario. During the break-up of the federal (conservative) government in 1895-1896, repeated efforts were made, especially by Sir Charles Tupper [q.v.], to induce him to leave the bench and to take a portfolio in the ministry, but without success [J. S. Willison, *Sir Wilfred Laurier*, ii. 222, 253]. In 1912 he became chief justice of Ontario and thereby president *ex officio* of the appellate division. As a judge, Meredith took an important part in codifying the laws of the province. In 1896 he had been appointed a member of the

commission for the revision of the provincial statutes, and did most of the work upon it. In 1910 he was the chairman of a provincial commission on whose report was based the existing provincial statute awarding compensation to working-men for injuries.

Meredith also played an important part in educational affairs. In 1895 he was appointed to the senate of the university of Toronto, and in 1900 was elected its chancellor, a position which he held until his death. In 1904 the conservatives came into power in the province, after thirty-three years of opposition, and one of their first acts was to appoint a commission under Meredith's chairmanship to look into the affairs of the provincial university (known as the university of Toronto), which had long been hampered by undue political interference. The report of the commission, which was largely due to Meredith, took shape in the Act of 1906, by which the university was placed under an independent board of governors, and given greatly increased financial support. Since then its growth has been steady and rapid, and until his death Meredith was the power behind the scenes, and the adviser of the government in all matters relating to the university.

Meredith was knighted in 1896. He was a man of fine presence, great industry, and unblemished integrity, with an extraordinary grasp both of the details and the principles of the law in a great variety of subjects. In religion he was an Anglican. He died in Montreal 21 August 1923, of a chill brought on by sea-bathing.

Meredith married in 1862 Mary (died 1930), daughter of Marcus Holmes, of London, Ontario. His only son died on active service during the European War; three daughters survived him. He belonged to a very able family: his brother, Sir Vincent Meredith, first baronet (1850-1920), became president of the Bank of Montreal, and another brother, Richard Martin (born 1847), was also chief justice of the common pleas and president of the high court division of the Supreme Court of Ontario.

W. L. GRANT.

MERRIMAN, JOHN XAVIER (1841-1920), South African statesman, the eldest

son of Nathaniel James Merriman [q.v.], vicar of Street, Somerset, and later bishop of Grahamstown, by his wife, Julia Potter, was born at Street 15 March 1841. His parents removed in 1848 to South Africa, where Merriman received his early education at the diocesan school at Rondebosch. Later he was sent to Radley College, where he rowed in the race of 1858 against Eton, and gained a proficiency in the classics which he retained to the end of his life. After a year or two spent in a London business house, Merriman returned to the Cape in 1861, became qualified, and practised as a land surveyor. In 1869 he was elected to the Cape house of assembly as member for Aliwal North, and he soon distinguished himself as a leading opponent of responsible government, for which he thought the country was not yet ripe. After the Cape had obtained self-government in 1872, however, Merriman became its staunchest upholder, and was soon to show his dislike for imperial interference in any form. In 1871 he became a diamond dealer in Kimberley as the representative of a Cape Town syndicate, and at the diamond fields he met, and soon became on the closest terms of friendship with, Cecil Rhodes. During the years 1874 to 1875 he carried on business as a wine merchant in Cape Town, and also was the first to experiment in the canning of the Cape lobster or crayfish.

Merriman gave up this occupation in 1875 when (Sir) John C. Molteno [q.v.], who had formed the first Cape ministry in 1872, invited him to join his cabinet as commissioner of Crown lands and public works. From the outset Merriman became Molteno's chief lieutenant in opposition to the scheme of confederation for South Africa proposed by the British colonial secretary, the fourth Earl of Carnarvon [q.v.]. His lively and mordant pen was useful in framing the cabinet's replies to the Colonial Office; in fact, he got into trouble for a speech at Uitenhage in which he described the activities of J. A. Froude [q.v.] in Cape Colony and the Orange Free State in 1875 as an 'agitation by an imperial agent which was very embarrassing to the government'. At this time a correspondence was begun with Goldwin Smith [q.v.] at Toronto on the working of the Canadian constitution, a correspondence which went far to convince Merriman of the superiority of the unitary principle which he was to advocate so strongly at the National Union Convention over thirty years later.

Meantime a constitutional issue of more immediate importance arose. The Kaffir War of 1877-1878 had broken out, and to Merriman the cabinet deputed the duties of a secretary for war. The governor of the Cape, Sir Bartle Frere [q.v.], demanded that the colonial levies should be placed under the British officer commanding at the Cape, and expressed doubts whether the commissioner of public works could legally exercise powers which normally belonged to the colonial secretary. Molteno and Merriman put forward a view of ministerial responsibility in advance of the time, and the cabinet was summarily dismissed. When parliament met, Merriman moved a vote of censure on the new ministry for accepting office.

Merriman now began a long association with Jacobus Wilhelmus Sauer which lasted until the death of the latter in 1913. Together they served in the ministries of (Sir) C. T. Seantlen (1881-1884), Cecil Rhodes (1890-1893), W. P. Schreiner (1893-1900), and in Merriman's own ministry (1908-1910). Merriman's interest in the relations between the Cape Colony and her neighbours began during the Seantlen ministry, in which he was again commissioner of public works. Unlike Rhodes, who believed that in the possession of the hinterland lay the key to hegemony in South Africa, Merriman was anxious to see the ports in British hands. His was the chief influence behind Seantlen in urging Lord Derby to proclaim a protectorate over South-West Africa in 1883-1884, and, in the Rhodes ministry, he made tentative efforts to secure the sale or lease of the Portuguese possessions south of Sofala, but especially of Delagoa Bay. In 1890 Merriman took the treasurer's portfolio, which he retained in each subsequent term of office. Always finding a deficit and the stocks depressed, he was always successful in leaving the finances in order and the Cape's credit high.

Out of office, Merriman was back in Kimberley in 1885, first straightening the affairs of the Mining Board for the banks, and then attempting the amalgamation of the mines on behalf of French interests. On the opening of the Transvaal goldfields he engaged in mining. In 1892 he bought the wine and fruit farm 'Schoon-gezicht' at Stellenbosch, becoming a pioneer in the export of fresh deciduous fruit. Sympathizing with the Uitlanders on the Rand in their grievances, Merriman strongly disapproved of their methods. He drafted the report of the Cape select

committee which inquired into the Jameson Raid in 1896, and moved the address calling for the revocation of the charter of the British South Africa Company. He used all his influence with President Steyn, of the Orange Free State, and other leaders in the northern republics to avert the Boer War. He differed with the premier, W. P. Schreiner [q.v.], over the treatment of the Cape rebels, desiring a complete amnesty after the Canadian precedent. This caused a split in the cabinet and led to its resignation in 1900.

In 1901 Merriman and Sauer went on a fruitless mission to try to persuade the English government and people to grant the Boer republics autonomy under their own flags coupled with a scheme of general confederation for South Africa. In 1904 Merriman was defeated at Wodehouse through the disfranchisement of many of his supporters, and was out of parliament for a few weeks—the only break in a parliamentary career extending over fifty-five years. He was returned for Victoria West at a by-election. When the new colonies gained responsible governments, he entered on a correspondence (1907-1908) with President Steyn and General Smuts in anticipation of the union which the Boers were ready to welcome as soon as there were similar governments in the Cape Colony, Transvaal, and Orange River Colony.

In February 1908 Merriman succeeded (Sir) L. S. Jameson as prime minister, and immediately set about the twofold task of hastening forward union and extricating the finances of Cape Colony from the chaos into which they had fallen since the Boer War. In May the Customs Conference at Pretoria appointed him convener of the National Convention which was to meet in Durban. As leader of the Cape delegation, Merriman played a notable part in the discussions which led to union. He moved the resolution which adopted the unitary principle as against the federal, and sacrificed much for the sake of safeguarding the Cape native franchise. He formed one of the delegation which took the Union Bill to England in 1909. Passed over when the first Union prime minister was chosen, Merriman refused General Botha's invitation to join his cabinet, preferring to remain a candid friend of the administration. On the secession of General Hertzog and the formation of the nationalist party, Merriman gave fuller support to the administration, and during the European War assisted Generals Botha

and Smuts with advice and all the eloquence at his command. He died at Schoongezicht 2 August 1926, his last years being clouded by a stroke which had seized him on the death of his wife in September 1923.

Merriman was responsible for the Cape Irrigation (1877) and Banking (1891) laws; but his chief political service to South Africa was the promotion of a high standard of financial and public rectitude. He also took a leading part in the cultural development of South Africa. During his first period of office he had moved for a select committee to investigate the Cape archives, and as prime minister he appointed an archives commission; subsequently he himself accepted membership of a commission appointed by the Union government. He was one of the chief movers in the foundation of the South African Philosophical Society and was co-founder and first president of the Van Riebeeck Society for the publication of South African historical documents.

Merriman married in 1874 Agnes, daughter of Joseph Vincent, a member of the Cape legislative council. There were no children of the marriage.

[Merriman MSS. in the South African Library, Cape Town; Sir Perceval Laurence, *Life of John Xavier Merriman*, 1930; E. A. Walker, *Lord De Villiers and his Times*, 1925, and *A History of South Africa*, 1928; personal knowledge.] A. C. G. LLOYD.

MERRY DEL VAL, RAFAEL (1865-1930), cardinal, was born in London 10 October 1865, the second of the four sons of Don Rafael Merry del Val, then secretary of the Spanish legation in London, afterwards Spanish ambassador in Vienna and to the Holy See, by his wife, Sofia Josefina, daughter of Pedro José de Zulueta, second Count de Torre Diaz. Their eldest son, Alfonso, was Spanish ambassador in London 1913-1931. Merry del Val belonged on his father's side to a family of Irish origin which had emigrated to Spain and become completely Spanish. His maternal grandmother was Scottish. He was educated at Bayliss House, near Slough (1874-1876), and at the Jesuit colleges in Namur and Brussels (1876-1883), but the strong English influence on his early development was shown by the choice of Ushaw College, Durham, for his first priestly studies (1883-1885). Thence he passed to the Roman Pontificia Accademia dei Nobili Ecclesiastici (1885-1891), and attended classes at the Gregorian

University. He was ordained priest, of the diocese of Westminster, in December 1888 and graduated doctor of theology in 1890.

Merry del Val's desire had been to become a simple priest, if not a religious, in England, but from his first arrival in Rome he was singled out for the papal service by Leo XIII, who insisted on his immediate transference from the Scots College, for which he had been entered, to the Accademia. Even before ordination he was sent on complimentary missions, in 1887 to London for Queen Victoria's jubilee, and in 1888 to Berlin; his studies completed, he was in December 1891 moved to the Vatican as *cameriere segreto partecipante*. In 1896 he was appointed secretary to the historic papal commission of inquiry on Anglican orders, and in 1897 he was sent to Canada, as apostolic delegate, to report on the controversy which had arisen over the Catholic schools. On his report the Holy See accepted concessions which previously had not satisfied Catholics. In 1898 he became president of the Accademia, and in 1900 was consecrated titular archbishop of Nicea.

During the last illness of Leo XIII in 1903 the secretary of the College of Cardinals died suddenly; Merry del Val succeeded him. His conduct of the conclave and of the interregnum in the secretariate of state brought him into contact with the new pope, Pius X, who retained him, most exceptionally, as secretary of state. In November 1903, when he was just thirty-eight, he was created cardinal priest with the titular church of Santa Prassede. The critical questions of this pontificate (1903-1914) were political anticlericalism and modernism. Anti-clericalism came to a head in France with the unilateral renunciation of the concordat and the *Loi de Séparation* (1905). Acceptance of the *Associations Cultuelles* would have destroyed the hierarchical constitution of the Church. Similarly, failure to condemn modernism (1907) would have been an abandonment by Rome of her secular tradition. To both questions the papal answer was an utterly uncompromising assertion of principle. It was the right answer, as is now admitted, but at the time it was much criticized, and the secretary of state was held responsible. This was to misunderstand both his personal and his official relation to the pope; but doubtless he was at one with Pius X in recognizing the sharpness of the issues and the necessity for heroic measures.

The integral Catholicism for which chiefly he had been chosen left him no alternative.

In January 1914 Merry del Val was appointed archpriest of St. Peter's, but on Pius X's death in August of that year he ceased, as a matter of course, to be secretary of state. From October 1914 until his own sudden death at Rome 26 February 1930 he was, under Benedict XV and Pius XI, secretary of the Holy Office. Charged with the discipline of the whole Church, as an exceptionally experienced and senior, though in years comparatively young, member of the principal Congregations, he exercised great, if unobtrusive, influence. But although he was freely spoken of as a possible successor of Benedict XV, his election was never probable. His conduct of the ceremonies at St. Peter's was deeply impressive.

This career thwarted Merry del Val's constant pastoral aspirations. Yet by lifelong direction he developed into an important institution a boys' and men's club which he had, as a young priest, founded in a poor district of Rome, the Association of the Sacred Heart in Trastevere. His charity to the poor was boundless. The confessional, the sermons, and retreats of his earlier years had to be abandoned, but all his life he pursued an active apostolate by personal intercourse and correspondence. His knowledge of England remained intimate, and his special affection for English people never waned. He was the author of a small controversial book, *The Truth of Papal Claims* (1902), and composed the popular prayer for the conversion of England. On his tomb in the crypt of St. Peter's are inscribed, by his desire, the fitting words: *Da mihi animas. Caetera tolle*.

There are portraits of Merry del Val by B. Georgiev in the Treasury of St. Peter's and by R. D' Ignazio in the Holy Office.

[P. Cenci, *Il Cardinale Raffaele Merry del Val*, Rome, 1933; F. A. Forbes, *Raffaello, Cardinal Merry del Val*, 1922; personal knowledge.]
F. DE ZULUETA.

MERSEY, first VISCOUNT (1840-1929), judge. [See BIGHAM, JOHN CHARLES.]

METCALFE, SIR CHARLES HERBERT THEOPHILUS, sixth baronet (1853-1928), civil engineer, born at Simla 8 September 1853, was the only child of Sir Theophilus John Metcalfe, fifth baronet [q.v.], and great-nephew of Charles Theophilus Metcalfe, Baron Metcalfe [q.v.]. His mother, Charlotte (died 26 September

1853), daughter of Lieutenant-General Sir John Low [q.v.], was his father's first wife. His great-grandfather, Sir Thomas Theophilus Metcalfe, a director of the East India Company, was created a baronet in 1802. In 1867 Charles Metcalfe was sent to Harrow, where he was in Mr. Bull's house, and he matriculated from University College, Oxford, in 1874. He obtained a third class in classical moderations in 1876 and a second class in law and history in 1877, graduating B.A. and M.A. in 1881. He played in the university rugby football team in 1875 and ran for Oxford in the quarter-mile in 1876 and 1877. He succeeded to the baronetcy on his father's death in 1883.

Metcalf served his articles to the engineering firm of Fox and Sons [see Fox, Sir Charles, and Fox Sir Francis] from 1878 to 1881, and was then engaged as their assistant engineer in the construction of the Southern Railway of Ireland and on the West Lancashire Railway. In 1882 and 1883 he was resident engineer on the Southport and Cheshire Lines Railway and for the reclamation of the Hesketh Marsh, and in 1884 on the Liverpool, Southport, and Preston Junction Railway. In 1886 he and (Sir) Douglas Fox, second son of Sir Charles Fox, were jointly appointed consulting engineers for the Liverpool and St. Helens and South Lancashire Railway.

Metcalf's most important work was accomplished in South Africa. From 1882 to 1914 he lived there more and more continuously, personally locating projected railway lines, and taking charge of their construction. Much of the work was done on foot, sometimes from necessity, sometimes from choice. He and Douglas Fox were engineers for the continuation of the Cape Town Railway through Bechuanaland from Kimberley to Vryberg, and Metcalfe was in charge of the survey from 1888 to 1891. This work brought him into touch with Cecil Rhodes [q.v.], with whom he had been friendly at Oxford. He accompanied Rhodes on the campaign against the Matabele in 1896, and remained closely associated with him until Rhodes's death in 1902. Metcalfe was one of the two or three friends who were present at Rhodes's funeral in the Matopos. It was Metcalfe's railway work which converted into reality Rhodes's dreams of northward expansion in Africa; for in laying out his routes Metcalfe had in mind not only physical facilities but also the economic development of the country.

Metcalf and the firm of Sir Douglas Fox and Partners acted jointly as consulting engineers for the various lines constituting the Rhodesia railway system, which links up northwards with the Belgian Congo railways, and southwards with the railways of the Union of South Africa, providing through communication with Cape Town, and forming the centre of a trans-continental connexion joining east to west. The system was inaugurated on 24 May 1893 with the registration of the Bechuanaland Railway Company, the name being changed to Rhodesia Railways on 1 June 1899. The line was begun at Vryberg in May 1893, reached Mafeking in October 1894, and Buluwayo in October 1897. It was intended at that time to carry the railway via Gwelo to the southern end of Lake Tanganyika. Work on the section from Buluwayo to Gwelo was begun in June 1899, but suspended on the outbreak of the Boer War in October. A more detailed survey and the discovery of coal at Wankie led Metcalfe to recommend that, for commercial reasons, the main line should be diverted westward to the Victoria Falls. The Falls were reached in April 1904. The Zambesi was crossed below the falls by the Victoria Falls bridge and in January 1906 the line was opened to the copper mines of Broken Hill. Thence it was carried to the frontier of the Belgian Congo by the Rhodesia-Katanga Junction Railway, completed in 1909, but this section was purchased in 1928 by the Rhodesia and Mashona Railway Company. The eastern branch line was completed from Salisbury to Umtali, on the Portuguese frontier, in May 1899 and from Buluwayo to Salisbury in October 1902.

Metcalf and Sir Douglas Fox's firm also acted as consulting engineers for the Benguela Railway through Portuguese West Africa, a development which was due to the enterprise of Rhodes's friend, (Sir) Robert Williams. The company was constituted in Lisbon on 28 May 1903 under a concession granted by the Portuguese government in November 1902. The railway was begun from Lobito Bay in 1903 and was completed to the Congo frontier on 28 August 1928. This line is important not only because it is a western outlet for Northern Rhodesia and for the Katanga copper fields, but also because it is designed to be a section of a trans-continental system of which the Rhodesian railways will form the centre, Lobito Bay and Walvis Bay the western, and Beira and Dar-es-Salaam the eastern ports.

Metcalfe was also very largely concerned in establishing communication by rail between British Nyasaland and the port of Beira in Portuguese East Africa. He was joint consulting engineer for the construction of the Shiré Highlands Railway, from Blantyre to Port Herald, which was registered on 25 April 1905, begun in 1904, completed in 1908, and incorporated, together with the Central Africa Railway from Port Herald to Chindio on the Zambesi, in the Nyasaland Railways Company in 1931; and for the survey of the Trans-Zambesia Railway from Beira to Muracca on the Zambesi, which was not completed until 1922, eight years after Metcalfe had left Africa. Since the completion, early in 1935, of the Zambesi bridge on the Lower Zambesi, through railway communication has been established between Blantyre and Beira.

Metcalfe was elected an associate of the Institution of Civil Engineers in 1885, and a member in 1897, and served on the council from 1904 to 1906. He was a director of the Victoria Falls Power Company (which in 1909 became the Victoria Falls and Transvaal Company) from its registration on 17 October 1906. After retiring from Africa in 1914 he took up his residence at Winkworth Hill, Hascombe, near Godalming, Surrey, where he cultivated his hobby of gardening and successfully experimented in colour photography. In 1919 he visited Palestine in order to report to the Zionist organization on the future development of the country. He died, unmarried, at Winkworth Hill 29 December 1928, and was buried at Busbridge, Godalming. He was a bon-vivant, loved good company, and shone in it. Yet most of his life was arduous and solitary. In an emergency he was cool and resourceful. He was succeeded as seventh baronet by his cousin, Theophilus John Massie Metcalfe (born 1866).

[*The Times*, 1 January 1929; *Proceedings of the Institution of Civil Engineers*, 1929, vol. cxxviii, 852; Union Castle Company's *South and East Africa Year Book and Guide*.] E. I. CARLYLE.

METHUEN, SIR ALGIERNON METHUEN MARSHALL, baronet (1856-1924), publisher, was born at 171 Union Street, Southwark, 23 February 1856, the third son of John Buck Stedman, F.R.C.S., of Godalming, at one time mayor of that town, by his wife, Jane Elizabeth, daughter of Richard Marshall, of King's Lynn. He changed his surname from Stedman to

Methuen in 1899. He was educated at Berkhamsted School and at Wadham College, Oxford, where he took his B.A. degree in 1878 and proceeded M.A. in 1881. While at Oxford he wrote a book about the University, entitled *Oxford Life*, which was not very favourably received by the authorities. On leaving Oxford he acted for a while as tutor in a coaching establishment, and in 1880 opened a private school of his own at Millford, Surrey. In 1884 he married Emily Caroline, daughter of Edwin Bedford, solicitor, of Ladbroke Terrace, London. They had no children. During his period as a schoolmaster he wrote a number of text-books of elementary Latin, Greek, and French, of which some twenty are still in print. It was primarily with the idea that he might handle these little books more profitably himself that, in June 1889, under the style Methuen & Co., he opened a small publishing office in Bury Street, London, with a manager in charge. From the beginning educational works were an important part of his production, but the business of the firm was gradually extended to every department of letters.

The first important success of the firm of Methuen was the publication in 1892 of Rudyard Kipling's *Barrack-Room Ballads*. In 1895 Stedman gave up his school and concentrated on publishing. Kipling's poetry continued to be published by him, and the popularity of the novels of Marie Corelli [q.v.], most of which bore the Methuen imprint, was another source of profit. Others of the firm's successful authors were F. W. Bain, Hilaire Belloc, 'George Birmingham', A. G. Bradley, J. B. Bury (with his edition of Gibbon), G. K. Chesterton, A. Clutton Brock, Joseph Conrad, Kenneth Grahame, A. P. Herbert, 'Anthony Hope', Edward Hutton, W. W. Jacobs, E. V. Knox, Sir E. Ray Lankester, Sir Oliver Lodge, E. V. Lucas (with his edition of Charles Lamb and miscellaneous works), Robert Lynd, Maurice Maeterlinck, Sir John Marriott, John Masefield, A. A. Milne, Sir Charles Oman, Sir Gilbert Parker, Sir Flinders Petrie, R. L. Stevenson, and Oscar Wilde. The firm also issued a *History of England* in seven volumes (1904-1913) by leading historians, which met with marked success. Methuen's range was catholic, but if he may be said to have had one special leaning it was towards topography. He was particular that every book and every edition issued by his firm should bear the year of

publication. The office of the firm was moved to Essex Street, Strand, in 1895, and the business was turned into a limited liability company in 1910.

In politics, of which he was a constant observer, Methuen was at one time a tariff reformer and follower of Joseph Chamberlain; he changed his mind, however, and in 1905 wrote, under the title *England's Ruin*, a pamphlet in favour of free trade. In 1910 he contested the Guildford division of Surrey as a liberal, but was unsuccessful. Two other political works from his pen were, in 1901, a pamphlet on the Boer War, called *Peace or War in South Africa*, afterwards expanded into *The Tragedy of South Africa* (1905), and in 1911, *A Simple Plan for a New House of Lords*. In 1921 he compiled *An Anthology of English Verse*, following it in 1922 with a sequel, *Shakespeare to Hardy*, both of which met with a warm welcome. His only other non-political work was a little book on rock plants, entitled *An Alpine A.B.C.* (1922), gardening being the constant delight of his spare hours. He was created a baronet in 1916. He died 20 September 1924 at Haslemere, where he was buried.

In business Methuen was vigilant, imaginative, and constructive, concealing under a diffident and even detached manner great shrewdness. In private life he was urbane and philanthropic, much concerned in schemes for social welfare. By his will he left large sums to Berkhamsted School and to Wadham College.

[*Sir Algernon Methuen, Baronet: a Memoir*, privately issued in 1925; private information.]

E. V. LUCAS.

MEUX (formerly LAMBTON), SIR HEDWORTH (1856-1920), admiral of the fleet, was born in London 5 July 1856, the third son of George Frederick D'Arcy Lambton, second Earl of Durham, by his wife, Lady Beatrix Frances, second daughter of James Hamilton, first Duke of Abercorn [q.v.]. He was educated at Cheam School and entered the *Britannia* as a naval cadet in 1870. He went to sea in December 1871 in the *Endymion*, frigate, of the Channel squadron, being transferred to the flagship *Agincourt*, under Sir Beauchamp Seymour, in August 1874. At the beginning of 1875 he went to the *Undaunted*, flagship, in the East Indies until his promotion to sub-lieutenant at the end of that year. From the end of 1876 to March 1879 he served in the *Alexandra*, flagship, in the Mediterranean under Sir Geoffrey Hornby. He was

promoted lieutenant in February 1879, and in 1880 returned to the *Alexandra* as flag-lieutenant to his old chief, Sir Beauchamp Seymour, under whom he was present at the bombardment of *Alexandria* (11 July 1882) and took part in the ensuing operations on the coast of Egypt. Admiral Seymour (created Lord Alcester for his services), on leaving his command to join the board of Admiralty in March 1883, secured a 'haul-down' promotion for his flag-lieutenant. On returning home, Commander Lambton went to Dublin as aide-de-camp to the lord-lieutenant, the fifth Earl Spencer. In July 1886 he returned to the Mediterranean in command of the *Dolphin*, sloop; and in February 1888 he was appointed to the command of the royal yacht *Osborne*, a post which he held until his promotion to captain in 1889. From 1890 to 1892 he was flag-captain to (Sir) Charles Hotham in the *Warspite* on the Pacific station.

In July 1894 Earl Spencer, then first lord of the Admiralty, appointed Lambton his naval private secretary, and Lambton retained the post under Spencer's successor, Viscount Goschen, until 1897. In this important office both ministers placed the greatest reliance on his independent and fearless judgement on the claims of senior officers for appointments; indeed, on more than one occasion Lambton advised his chief to make high appointments to which the sea lords objected, but which in the event were fully justified. He failed, however, to make himself popular with the officers with whom he had to deal through the lack of consideration which he showed them, although he was far junior to most of them in rank and to all of them in age.

In 1897 Lambton went to the China station in command of the cruiser *Powerful*, and on his voyage home in her in October 1899 he was sent to Durban, at a critical moment in the early stages of the South African War. On his way thither he called at Mauritius, and on his own initiative embarked the 2nd battalion of the South Yorkshire Regiment. Sir George Stuart White [q.v.], in command of the defence of Ladysmith, had been sending urgent messages for the supply of more powerful guns. Captain (Sir) Percy Scott [q.v.] in the cruiser *Terrible*, which had arrived at the Cape on its way to replace the *Powerful* on the China station, devised gun-carriages for 12-pounder and 4.7 naval guns, and with these powerful reinforcements Lambton landed with a naval brigade and arrived at Ladysmith on 30

October just in time. The naval guns kept down the Boer artillery throughout the subsequent siege; and Lambton was, in Sir George White's words, 'the life of the garrison' until its ultimate relief (28 February). Lambton was awarded a C.B. for his services, and on the arrival of the *Powerful* in England was welcomed with great popular enthusiasm. At the end of that year he was persuaded by Lord Rosebery and by his brother, Lord Durham, to stand at the general election, in the liberal interest, for Newcastle-upon-Tyne; but he was unsuccessful. In April 1901 he was appointed to the command of the royal yacht *Victoria and Albert*, and three months later he was made commodore in charge of the king's yachts; he retained this command until April 1903, having been promoted to rear-admiral in October 1902. From June 1903 he had a year's service afloat as second in command to Lord Charles Beresford in the Channel fleet, and from November 1904 to December 1906 he commanded the cruiser division of the Mediterranean fleet. In January 1908 he was appointed vice-admiral and commander-in-chief in China, returning home in April 1910.

At this stage in Lambton's career occurred a great change in his private affairs. A few days after hauling down his flag he married Mildred, third daughter of the first Baron Alington [q.v.] and widow of Viscount Chelsea (died 1908), second son of the fifth Earl Cadogan [q.v.]. In the following December he came into a large fortune under the will of Valerie Susie, widow of Sir Henry Brent Meux, brewer, third baronet, of Theobald's Park, Waltham Cross. During the South African War Lady Meux, on hearing of the landing of the naval guns for the defence of Ladysmith, had ordered six naval 12-pounder guns, mounted on travelling carriages, to be made at Elswick and sent out to the commander-in-chief in South Africa, Lord Roberts. They were known as the Elswick battery. On his return to England later in that year, Lambton had called upon Lady Meux, described the work of his guns at Ladysmith, and praised her patriotic action in sending similar guns to the front. Touched by this tribute, Lady Meux, after making many wills, decided to make Lambton her heir on the sole condition that he changed his name to Meux. This he did by royal licence in September 1911. He was promoted admiral in March 1911 and remained on half-pay until his appointment in July 1912 to be commander-

in-chief at Portsmouth, an office which he retained until February 1916, having been selected for the rank of admiral of the fleet in March 1915.

On the outbreak of the European War, Meux's principal duty was to secure the safe passage of the transports conveying the British Expeditionary Force to France, and to guard the army's main line of communication from Southampton to Havre. This anxious work was carried out with complete success; moreover, on his own initiative, Meux organized a life-saving patrol service composed of yachts and other small craft, sailing under the blue ensign with a red cross at the main. On giving up his command he was persuaded to enter parliament, without contest, as conservative member for Portsmouth, in the vacancy caused by Lord Charles Beresford's elevation to the peerage. He was a popular figure in the House of Commons and several times intervened with vigorous speeches on naval subjects; but he was not really interested in parliamentary work, and retired at the general election of 1918.

Meux was now free to devote himself to the turf, which since his boyhood had been his greatest interest outside the navy. He had started breeding blood stock in 1882, and had had some good horses trained by Tom Green at Stapleton Park, Pontefract. He won the Grand Military gold cup with 'Ruy Lopez' in 1895, and was elected to the Jockey Club in 1906. On inheriting Theobald's Park, where Lady Meux had a racing stable, he bred his own horses there, and with them won the Hardwicke stakes at Ascot three times, the Manchester November Handicap (top weight), the Liverpool cup, the Chester cup, and many other races. He was a very shrewd judge of racing and breeding and of all turf matters, and would have been an even more successful owner had he not been too fond of his horses to part with them.

Meux was a man of strong and independent character, though by no means a typical naval officer; in fact, the service was for him an interest rather than a profession. He carried out his duties with marked ability and won the confidence not only of King Edward VII but of all his associates in the service. He was created C.V.O. in 1901 and K.C.V.O. in 1906. He was promoted K.C.B. in 1908 and G.C.B. in 1913. He died 20 September 1929 at Danebury, an estate which he had bought near Stockbridge. His will was

proved at £910,465 gross, with net personality £734,265. He had no children, and he left his fortune, subject to his widow's interest, to her grandson, Ian Hedworth Gilnour.

There are portraits of Meux, painted by P. A. de László and Ambrose McEvoy, in the possession of his widow, who subsequently married Lord Charles Montagu. A cartoon of him by 'Spy' appeared in *Vanity Fair* 28 June 1900.

[Official records; private information.]

V. W. BADDELEY.

MEW, CHARLOTTE MARY (1860-1928), poet, the eldest daughter of Frederick Mew, an architect, by his wife, Anne, daughter of Henry Edward Kendall, an architect well known in the middle of the nineteenth century, was born in Doughty Street, London, 15 November 1860. She was educated privately, and later attended lectures at University College, London. She passed almost the whole of her life in Bloomsbury, and lived for over thirty years at 9 Gordon Street. In 1923 she was awarded a civil list pension of £75. Shortly afterwards her much loved sister and companion, Anne Mew, was smitten with a mortal illness of which she died in 1927. From this blow Charlotte Mew was unable to rally, and she died by her own hand in a nursing home in London 24 March 1928.

Early in her life Charlotte Mew showed an unusual talent for writing verse and prose, and from her twentieth to her thirtieth year she was a regular contributor to *Temple Bar*. She published one excellent story, 'Passed', in the *Yellow Book*, July 1894. Her poems, stories, essays, and studies appeared in periodicals from time to time, mainly in *The Nation*, *The New Statesman*, *The Englishwoman*, and *The Chap-book*. Her work was admired by her contemporaries, notably by Thomas Hardy, who greatly valued it and considered her to be the best woman poet of her day.

Although Charlotte Mew continued to write throughout her life, only two small books of her verse have been published—*The Farmer's Bride* (1915) and *The Rambling Sailor*, which appeared posthumously in 1920. Her fastidious self-criticism prevented her even from preserving anything that did not conform to the standard which she had set for herself. The appearance of her first book brought her immediate recognition. The title poem exhibits to the full her peculiar powers of condensation and her dramatic and psycho-

logical insight. She had a particularly individual manner and mode of expression. Her verse is characterized by a tense fine-drawn rhythm which varies according to the emotion of the poem. It is clear, concise, and remarkably direct. Her passionate insistence on facing the truth is particularly evident in *Madeleine in Church*; her uncanny power of arousing in her readers the same emotion as had inspired her own poem makes *In Nunhead Cemetery* almost too piercing; and *Sea Love* is a notable example of lyrical condensation.

[*The Times*, 20 March 1928; personal knowledge.] A. MONRO.

MEYER, FREDERICK BROTHERTON (1847-1920), Baptist divine, the only son of Frederick Meyer, merchant, of London, and great-grandson of John Sebastian Meyer, who migrated from Worms to London early in the eighteenth century, was born at Clapham 8 April 1847. His mother was Ann, daughter of Henry Sturt, of London. He was educated at Brighton College. Home influences and associations with Baptist churches in Bloomsbury and afterwards in New Park Road, London, where he was baptized in 1864, awakened in Meyer a desire to become a minister. Before entering upon special training he spent two years in an office in Billiter Square. In 1866 he entered Regent's Park (Baptist) College, and in 1869 graduated B.A. of London University. In 1870 he became assistant to the Rev. Charles Mitchell Birrell, of Liverpool, the father of Augustine Birrell, and a man of considerable culture. In May 1872 he was called to the ministry of the Baptist chapel in York, where he came into contact with the well-known American evangelist Dwight Lyman Moody, whose influence proved deep and lasting. In 1874 Meyer became pastor of Victoria Road Baptist church, Leicester, but 'the amalgam of Birrell and Moody' was unable to find in its forms of service adequate scope for his powers, and he therefore resigned in 1878. Melbourne Hall, Leicester, was then built for him as the centre of the social and religious activities of a new pastorate, and it is still the home of a flourishing community. Meyer's later London ministry was exercised in two churches—Regent's Park chapel (1888-1892 and 1909-1915) and Christ Church, Westminster Bridge Road (1892-1907 and 1915-1921). He remained 'pastor emeritus' of the latter until his death. In

1911 the McMaster University of Canada conferred upon him the honorary degree of D.D.

For more than half a century Meyer carried on a unique ministry. His industry was extraordinary, and he served in many capacities with distinction. In 1904-1905 and in 1920-1921 he was president of the National Free Church Council; in 1906-1907 president of the Baptist Union; he presided at the World's Sunday School Convention held at Washington in 1908, and he served other movements with similar energy and ability. He was a prolific writer of devotional and expository books, sermons, pamphlets, and articles. Some seventy volumes came from his pen, and of these several have been published in other languages. It has been estimated that at the time of Meyer's death 5,000,000 copies of his books and tracts had been circulated. He travelled widely, visiting Germany, Canada, North and Central America, the Near and Far East, South Africa, and Australia, always with a religious purpose. He took a large part in social and philanthropic work, and his outspoken protests against public evils occasionally exposed him to severe criticism. But he lived the gospel that he preached. His deep sincerity, his emphasis upon the experience of the Holy Spirit, and his frank unveiling of his inner life in the effort to help others impressed his contemporaries, and made him widely respected outside nonconformist circles. In conferences such as those held at Keswick and at Northfield, Massachusetts, he was an ever-welcome figure. He died 28 March 1920 at Bournemouth.

Meyer married in 1871 Jane Eliza Jones, of Birkenhead (died January 1929), and had one daughter.

[*The Times*, 30 March 1920; *The Baptist Year Book*, 1930; W. Y. Fullerton, *F. B. Meyer, a Biography*, 1929.]

J. H. RUSHBROOKE.

MEYER, SIR WILLIAM STEVENSON (1860-1922), Indian civil servant, was born at Galatz, Moldavia, during a temporary visit of his parents, 13 February 1860. He was the elder son of the Rev. Theodore Jonah Meyer, a minister of the Presbyterian Church of England, who was naturalized as a British subject in 1855, by his wife, Jane Ann, daughter of William Stevenson. He was educated at a mission school at Blackheath, at University College School, and at University College, London; and in the open

competition for the Indian civil service held in 1879 he obtained the third place. Two years later Meyer joined the service in Madras. His first post outside the Presidency, where his ability and industry had soon been marked, was that of deputy secretary, finance department, government of India (1898). Throughout his long connexion with that department, Meyer's work was distinguished by great critical power, which sometimes offended through its mordancy, and by a comprehensive grasp of detail which never obscured his perception of the broad features of a case.

In 1902 Meyer succeeded Sir Herbert Risley as Indian editor of the *Imperial Gazetteer of India* (third edition), a post which he held till 1905. Although he was not an Oriental scholar, his clear historical sense, based on wide study of ancient and modern history, enabled him to guide on right lines a number of contributors of unequal merit. After he had become financial secretary, government of India, in 1905, the controversy between Lord Curzon [q.v.] as viceroy and Lord Kitchener [q.v.] as commander-in-chief led to the abolition of the post of military member of the viceroy's council. Meyer was appointed in 1906 to the newly created post of secretary of military finance, which involved important and delicate duties as *liaison* officer between the civil and military departments. Here his knowledge of finance and powers of organization were especially useful during Lord Kitchener's rearrangement of the army in India. He was subsequently (1907-1909) a member of a royal commission which inquired into the possibility of decentralizing control in almost all departments of the civil administration of India, and had important results in freeing local bodies from official restraint.

After serving (1912-1913) on a small committee, presided over by Field-Marshal Lord Nicholson, which inquired into military expenditure in India, Meyer succeeded Sir Guy Fleetwood Wilson in 1913 as finance member of the government of India, and held that post throughout the European War. His administration of military finance was charged with parsimony leading to disaster, especially in the *Report* of the royal commission on the Mesopotamia Campaign (1917), which referred to 'indications of reluctance on the part of the Indian government to recognize the indisputable fact, that war means extra expenditure' (p. 106). But

the criticisms were largely unjust so far as Meyer was concerned, for in India real and final responsibility attaches to the viceroy and commander-in-chief whose policy binds the finance member. The Government of India Act (1858) had contemplated an army in India organized only for internal security and for frontier defence, and during fifty years successive secretaries of state had resisted expenditure beyond what they considered sufficient for those purposes. In spite of restriction, expenditure had risen from 10 million sterling at the time of the Boer War to nearly 20 million in 1913-1914, and was regularly challenged as excessive by Indian politicians. The measures which Meyer took to reduce the dislocation caused by the War through fluctuating exchange, deficiency of currency, loss of confidence, diminished trade, and increased expenditure were generally approved. He changed the system of income tax by introducing a sliding scale instead of flat rates; and when the customs tariff had to be raised, he framed it, in accordance with Indian desires, so as to give some preference to Indian industries, especially cotton and iron. His services as first president of the central recruiting board were also notable, and he enlarged the field of recruitment by changing it from a regimental to a civil agency.

Towards Indian aspirations for a larger share in the control of their own affairs Meyer's attitude was liberal and optimistic, though cautious, especially in the matter of finance. He is reported to have coined the term 'dyarchy' in reference to the method of administration introduced by the Government of India Act (1919) in which a provincial government includes both members appointed by the crown and ministers chosen from elected members of the legislative council.

Meyer, who retired from the Indian civil service in 1918, was appointed in October 1920 first high commissioner of India, to take over from the secretary of state functions of agency analogous to those performed by the high commissioners of the Dominions. His organization of this important and difficult office was very successful. Mainly at his suggestion, the Indian government has declared an open market, without preference for British manufactures, for its requirements of material not available in India.

Meyer now took some part in international affairs. He represented the

British and Indian governments at the International Opium Conference at The Hague (1911-1912), and he headed the Indian delegations at the first and second assemblies of the League of Nations (1920-1921). His financial experience prompted the decision that an external committee should control the estimates and accounts of the League, and his plea that India should be represented on the governing body of the International Labour Organization was accepted later. He was also chairman of the finance sub-committee of Earl Haig's Officers' Association and a member of the Imperial Shipping Committee.

During the early years of his service Meyer was interested in the affairs of the Madras University, to which he left a legacy; and he translated and revised J. Chailley's *L'Inde Britannique as Administrative Problems of British India* (1910). His ready wit in private life made him an attractive companion to those who escaped his caustic judgements. In recognition of his public services he was made K.C.I.E. (1909), K.C.S.I. (1915), and G.C.I.E. (1918). He married in 1895 Mabel Henrietta (died 1914), daughter of Major William W. Jackson, Indian army. Their son and daughter predeceased him, the deaths of both being due to tragic accidents. His own death, which occurred in London 19 October 1922, was sudden. A crayon portrait by 'Spy Junior' is at India House, the office of the high commissioner for India, Aldwych, London.

[*The Times*, 20 October 1922; *India Office List*, 1922; *Mesopotamia Commission Report*, 1917, Cd. 8610; private information; personal knowledge.] R. BURN.

MEYNELL, ALICE CHRISTIANA GERTRUDE (1847-1922), poet, essayist and journalist, was born at Barnes 22 September 1847, the younger of the two daughters of Thomas James Thompson, by his wife, Christiana, daughter of Thomas Edward Weller. The elder daughter, Elizabeth, well known later as a painter of battle-scenes, married Lieutenant-General Sir William Francis Butler [q.v.]. The Thompsons lived almost as much in Italy and France as in England. Mr. Thompson, a Cambridge man, a friend of Charles Dickens (by whom he was introduced to Christiana Weller), and a life-long dilettante, devoted himself to his daughters' education, and Alice Meynell has recorded in a memorable essay and in a poem her indebtedness to his intellect

and character. Mrs. Thompson became a Roman Catholic about 1870; her example was followed by Alice about 1872, by Elizabeth a year later, and by their father shortly before his death in 1881. Their change of religion brought Alice into touch with the circle that included Aubrey de Vere, who introduced her to Tennyson and encouraged her to publish; and her first volume of poems, *Preludes*, appeared in 1875, when she was twenty-eight.

In 1877 Alice Thompson married Wilfrid Meynell, and became his helpmate in journalism, the births of eight children between 1879 and 1891 still leaving her time for much writing. In 1880 the Meynells took over a short-lived magazine, *The Pen*, and here are to be found essays on Tennyson, Ruskin, Browning, Rossetti, and Swinburne, which anticipate the convictions and style of Alice Meynell's later writing. From 1881 to 1898 Wilfrid Meynell, with his wife's help, edited *The Weekly Register*. From 1883 to 1895 they edited *Merry England*, a monthly, and this, too, is full of writing recognizable as Alice Meynell's even when unsigned or pseudonymous, including essays on Trollope, Charles Reade, George Eliot, the Carlyles, Coventry Patmore, and Aubrey de Vere. (Another source for her unprinted prose is the *Dublin Review* from 1900 to 1922.) She also contributed to the *Scots Observer* (after 1891 the *National Observer*) from 1880 to 1894 during the editorship of W. E. Henley [q.v.], and her first volume of essays, *The Rhythm of Life* (1893), was almost entirely reprinted from these two periodicals. About 1892 she became personally acquainted with Coventry Patmore, whose genius she had long recognized, and who now proclaimed her genius with equal ardour. In 1894 she undertook to write a weekly article in the *Pall Mall Gazette*, at first anonymously, and afterwards under the initials 'A. M.' George Meredith sought out the acquaintance of the writer of these articles, and her second volume of essays, *The Colour of Life* (1896), all, except one, reprinted from the *Pall Mall Gazette*, was reviewed both by Patmore and Meredith. Their championship, and Francis Thompson's poems to her, 'Love in Dian's Lap' (*Poems*, 1893), did much to secure for her writing that prestige which its own depth and reticence might have longer delayed.

In 1893 a collection of Alice Meynell's *Poems* was published at the same time as her first volume of essays. The former comprised mostly the *Preludes* of 1875.

This volume was followed by *Other Poems* (privately printed, 1896), *Later Poems* (1902), *A Father of Women and other Poems* (1917), and posthumously, *Last Poems* (1923). It is likely that Alice Meynell will rank among women poets with Emily Brontë, Elizabeth Barrett Browning, and Christina Rossetti. There is a marked difference between her earlier and later poems, and her public will often be divided into admirers of one or the other. She herself depreciated her earlier work, with its mournful sweetness. Her later verse is generally (as her prose always) packed close with subtle and original thought.

Further volumes of reprinted essays are *The Children* (1897), *The Spirit of Place* (1899), *Ceres' Runaway* (1900), *Hearts of Controversy* (1917: essays on Tennyson, Swinburne, Dickens, and the Brontës), and *The Second Person Singular* (1921). In 1901-1902, during a visit to the United States, she lectured on Dickens, the Brontës, and seventeenth-century poetry.

Of her volumes of prose only one or two were written as books: the first was *John Ruskin* (1900), a discussion of his teachings and contentions, considered book by book. The other was *Mary, The Mother of Jesus* (1912), essays on the Blessed Virgin in theology, tradition, morality, art, and poetry. Even these were commissioned by publishers, not spontaneously undertaken by herself; which is no more than to say that her life was conditioned by necessity: almost all her prose was journalism, but all her journalism was literature.

Two enterprises, however, she must have undertaken with all her heart: the first, an anthology from Patmore, *The Poetry of Pathos and Delight* (1895); the second, an anthology of English lyric poetry, *The Flower of the Mind* (1897), with notes which are sometimes miniature essays. She also wrote prefaces to over a dozen volumes of selections from individual poets, and to one seventeenth-century anthology (*The Red Letter Library*, 1902-1906). Her last work, published posthumously, was *The School of Poetry*, an anthology for children, with delightful notes. All these bear witness to her passion for poetry, and pre-eminently for the poetry of the seventeenth century.

The rareness of Alice Meynell's prose and later verse arose from her exact use of words, and her subtle senses. Her eyes and ears were extraordinarily acute; her sense of justice insatiable—with some very human lapses. Her Christianity meant

not 'the uneasy certainties of the bigot' (her own phrase), nor the certitude of the mystic; it meant firm but difficult faith.

'Thou art the Way.

Hadst Thou been nothing but the goal
I cannot say

If Thou hadst ever met my soul.'

(*Later Poems*, 'I am the Way'.)

Religion, with whatever innocent alleviations of 'the burthen of the mystery', makes the thought of much of her poetry and provides the subjects of many of her essays. The alleviations being most real, she has appreciations, a delight, and a most unusual gaiety of spirit. And every one who knew her—the non-Christian Meredith no less than the Catholic Patmore—testified to her evident sanctity.

Alice Meynell died in London 27 November 1922. A water-colour sketch of her, made by Adrian Stokes in 1877, is in the possession of Mr. Wilfrid Meynell. An etching of this made by Tristram Ellis has been much reproduced. A nearly full-length pencil-drawing of her by John Sargent (1895) is in the National Portrait Gallery.

MICHELL, SIR LEWIS LOYD (1842-1928), South African banker and politician, was born at Plymouth 11 August 1842, the second son of John Michell, solicitor, of Ilfracombe, a member of an old Cornish family, by his wife, Mary Bryan. He was named after Lewis Loyd, the banker (father of Samuel Jones Loyd, first Baron Overstone, q.v.), through whose instrumentality he was sent to school at Christ's Hospital, then situated in Newgate Street, London. In 1859 he entered Bolitho's Bank at Penzance, and after four years' training there was transferred to the London and South African Bank. In 1864 he was sent to Port Elizabeth, Cape Colony, where he was destined to remain for twenty-one years. About 1872 he left the London and South African Bank in order to become manager of the Standard Bank of South Africa at Port Elizabeth. His life at Port Elizabeth seems to have been peaceful enough, until the outbreak in 1880 of the first Boer War, at the conclusion of which, in 1881, he met Presidents Kruger and Brand and secured the insertion in the convention then made with the British government of a clause safeguarding banking interests in the Transvaal. In 1885 he was trans-

ferred to Cape Town, which then became his permanent head-quarters.

About this time Michell made the acquaintance of Cecil Rhodes [q.v.], who was then engaged in trying to convince the British government of the necessity of preventing the Boer republics from occupying Bechuanaland and closing the trade route to the North. Michell was deeply impressed with the views and character of Rhodes. 'I loved Rhodes', he said, 'as I have never loved any other man'; and Rhodes, on his side, had implicit faith in Michell's judgement. For ten years before Rhodes's death in 1902 Michell held his general power of attorney and, during Rhodes's frequent periods of absence from South Africa, acted for him in matters relating to the affairs of the British South Africa Company. In 1897 Rhodes asked Michell to become one of his executors, and obtained from him a promise that on his death he would retire from the Standard Bank and succeed him as chairman of De Beers Consolidated Mines, and become a director of the British South Africa Company.

Meanwhile Michell's influence in the banking world steadily increased. In 1893 he attended a conference called to consider the adoption of a single coinage for South Africa. The conference broke down, as Dr. Leyds, who represented the Transvaal, insisted that the proposed coinage should bear the head of President Kruger. It was on the occasion of this conference that Kruger asked Michell why he could not speak Dutch, an attack which Michell countered by suggesting that, as the president had been born at Colesberg, in British territory, he should be familiar with the English language. In recognition of his services at this conference Michell was presented by the Cape government with a silver salver, and in 1895 he became sole general manager in South Africa of the Standard Bank.

Michell's account, in his *Life of Rhodes*, of the events connected with the Jameson Raid (29 December 1895) shows that it was not until Rhodes saw him shortly after the Raid that Rhodes explained how his policy of federation had been marred by 'the precipitancy of the Raid, the unpreparedness of the Rand and the timidity of Mr. Hofmeyr'. In Michell's view the Raid was not the cause of the War which broke out in 1899, but was 'a picturesque and irregular episode in the long duel between Republican aspirations and the settled convictions of those who

preferred British institutions'. The Raid, he argued, retarded rather than accelerated the final struggle, in that it tied for a while the hands of the paramount power.

Throughout the South African War, on behalf of the British War Office, Michell directed the financing of the army's requirements in South Africa, and at the close of the War, after attending Rhodes's funeral in the Matoppo Hills, near Bulawayo, in March 1902, in fulfilment of his promise, he retired from the Standard Bank, receiving a grant of £5,000 from a grateful board of directors, and was appointed chairman of De Beers Consolidated Mines and a director of the British South Africa Company. At this time (1902) Michell was knighted in recognition of his services as chairman of the Cape martial law board, which had been appointed to consider the cases of British subjects who had been guilty of treasonable practices during the War.

Michell was now elected a member of the Cape House of Assembly, and in 1903 became minister without portfolio in (Sir) Leander Starr Jameson's cabinet. Parliamentary life, however, in no way appealed to him, and in 1905 he resigned his seat, and also the chairmanship of De Beers. From this time his attention was chiefly concentrated on the business of the Rhodes Trust and of the British South Africa Company, which entailed frequent visits to London and Rhodesia, although his interest in public affairs was by no means diminished. Together with Sir William Milton and Sir Charles Coghlan [q.v.] he represented Rhodesia at the national convention (October 1908-May 1909) which preceded the formation of the Union of South Africa. In 1910 he published his *Life of Rhodes*, with the object, as he said, of showing that Rhodes was a great Englishman.

At this period Michell's health was giving him cause for anxiety, and in 1917 he resigned his position of Rhodes trustee. With advancing age his activities naturally decreased, but he retained to the last his directorship of the British South Africa Company and his close connexion with all Rhodesian affairs. He died at Cape Town 20 October 1928.

Michell married in 1871 Maria Agnes, daughter of Edward Philpott, magistrate at Uitenhage, and they had four sons and three daughters.

D. CHAPLIN.

MILLIGAN, SIR WILLIAM (1864-1929), laryngologist and otologist, was born at Aberdeen 24 August 1864, the son of the Very Rev. William Milligan [q.v.], professor of biblical criticism, Aberdeen University, 1860-1893, by his wife, Annie Mary, daughter of David Macbeth Moir [q.v.], physician and author. He was educated at Aberdeen University, graduating M.B., C.M., in 1886 and M.D. with the highest honours in 1892. He was demonstrator of anatomy in the Aberdeen medical school, and subsequently served for a time as house surgeon at the Northern Hospital, Liverpool. He then proceeded to study oto-laryngology at Göttingen and Vienna, finally settling in Manchester, then at the zenith of its prosperity.

Milligan had the opportunity of introducing more scientific methods, especially those of pathology, into a subject which was then in the stage of primitive empiricism. He became aural surgeon to the Manchester Ear Hospital, aurist and laryngologist to the Royal Infirmary and Christie Hospital, Manchester, and lecturer on diseases of the ear and throat to the Victoria University. He was president of the laryngological and otological sections of the Royal Society of Medicine (1911 and 1921). He possessed all the attributes of the successful surgeon—impressive personality, sound judgement born of ripe experience, and the power of putting his opinion into action with his hands. He was eager in trying new methods, and was a firm believer in the employment of radium. He delighted in a carpenter's shop, but cared little for sport. His interests were wide and were justified by his ability. They extended from the Radium Institute at Manchester to a financial trust which he founded in Edinburgh and of which he was chairman. A lifelong liberal, he unsuccessfully contested the West division of Salford in 1922.

During the War Milligan was appointed consulting surgeon for the throat and ear in the North-Western area, serving with the rank of major in the Royal Army Medical Corps (Territorial Force). In 1914 he was knighted for his work in the investigation of cancer. His publications include *A Practical Handbook of the Diseases of the Ear* (1911). He married in 1890 Bertha Warden, daughter of James Anderson, of Frogmal Park, Hampstead, and Hilton House, Aberdeenshire, and had one son and one daughter. He died of pneumonia in a nursing home in Manchester 19 December 1929.

Milligan was a distinguished-looking man, well-built, with slightly aquiline features and fair hair. Well-dressed, with charming and dignified manners, he was as successful in the financial world as in medicine: he left some £100,000 at his death.

[Personal knowledge.] E. A. PETERS.

MILNER, ALFRED, VISCOUNT MILNER (1854-1925), statesman, was born at Giessen, Hesse-Darmstadt, 23 March 1854, the only son of Charles Milner, M.D., by his wife, Mary Jerne, daughter of Major-General John Ready, successively governor of Prince Edward's Island and of the Isle of Man, and widow of St. George Cromie. His father, coming of a Lancashire business family, was a man of brilliant parts—'twice my brains', Milner said of him—but with interests too varied to make him a success in his chosen profession. His mother, nearly twenty years older than her second husband, was a woman of rare elevation of character, noted, too, for her frank and joyous laugh; she died when her son was only fifteen, yet old enough to remember her always as an inspiration for his own life.

Milner's first four years were spent with his parents in Germany; then, after eight years in Chelsea, where his father set up with moderate success as a doctor, he returned with his family to Germany and was sent to school for three years at the gymnasium of Tübingen. These three years at school at Tübingen, of which Milner always spoke with appreciation, and the fact that his paternal grandmother, Sophie von Rappard, was a German, gave a handle to his detractors in after-life for reproaching him with being more German than English in his outlook. But, although he always had in him something of the German precision and logical consistency, in the main his education and outlook were thoroughly English. By his mother's wish he was brought back to England after her death and put in special charge of her brother, Colonel Charles Ready; and at the early age of fifteen he was entered as a student at King's College, London. There he did brilliantly, carrying off nearly every available prize in classics, history, and literature, as well as making his mark in the debating society: so great, indeed, was his reputation there that in 1878, six years after he had left, the professor of classics, J. B. Mayor, invited him to take over some of his classes. But

it was a hard and lonely life: his means were very slender, and, as his father had gone back to live in Germany, he was boarded with a cousin, Mr. Malcolm. Yet there were compensations: he and his cousin's daughter, Marianne, struck up a close friendship, never broken in after-life; and during the holidays he often went for long walking tours with his father. The most memorable of these was in 1870, during the Franco-Prussian War, when they followed in the wake of the German army and actually saw something of the siege of Strasburg: the impression then made on young Milner by what he saw of the military and political preparedness of the Germans, as contrasted with the chaotic state of the French, was lasting and greatly influenced his whole political outlook.

Two years later (1872) Milner won the first scholarship at Balliol College, and for the next four years his nature could unfold itself in the genial atmosphere of Oxford; it may, in fact, be said that during these pregnant four years he formed or developed the principles on which his whole future life was to be based. The Oxford to which he came, as he himself once said, was marked by 'a very striking change in the social and political philosophy of the place, a change which has since reproduced itself on the larger stage of the world'. The rector of Lincoln College, Mark Pattison, it is true, still represented among the dons the cynicism of an older generation, with its uses, perhaps, as a corrective of youth's exuberant enthusiasm; but at Balliol there were R. L. Nettleship, 'so great in his humility and humble in his greatness', as has been well said of him, T. H. Green, afterwards Whyte's professor of moral philosophy, Francis de Paravicini, Milner's special tutor, sympathetic guides in drawing out the best of youth's generous instincts and giving them a basis of scholarship and deep thought; and, above all, the master, Benjamin Jowett, with his catholic outlook on life and his bracing Socratic irony. Balliol, in Milner's first year, was at the height of its fame and achievement, with seven out of ten university scholarships and prizes to its credit. Milner himself soon took no small part in these triumphs, obtaining a first class in classical moderations (1874) and winning successively the Hertford (1874), the Craven (1877), the Eldon (1878), and the Derby (1878) scholarships, and narrowly missing the Ireland scholarship owing to his diffidence. At the Union he

spoke rarely and then only on matters which deeply interested him, then and thereafter, such as the subject of imperial relations. But although his speeches were infrequent and not marked by great eloquence, they carried more weight, says a contemporary, than those of any other man of his time: and he was accordingly elected president in 1875. It is also recorded that at a meeting of the Palmerston Club he attacked Gladstone to his face for his 'Little-England' views. In 1876 he obtained a first class in *literae humaniores* and was elected to a fellowship at New College.

Academic honours, however, were the least part of what Milner gained from Oxford: far more came to him from such friends and contemporaries as H. H. Asquith, Herbert Warren, Sidney Ball, Charles Gore, E. B. Iwan-Müller, Leonard Montefiore, J. M. Rendel, and, especially, Arnold Toynbee. In this earnest, stimulating society Milner found just the sympathy he needed with the passion already latent in him for public work, political and social. Even there, however, he sometimes seemed precociously aloof, precociously master of his own counsel, and already in his third year the young president of the Union is described by a visitor to Oxford as 'tall, dignified, and grave beyond his years, weighing evidence on every subject, anxious for the maintenance of absolute justice, eager to organize rather than to influence, and fearful to give generous impulses full rein'. At any rate at Oxford, by his scholarships and his fellowship, Milner gained freedom from the grinding fear of poverty which had haunted him in the past, lost his sense of loneliness, profited to the full from friendships and leisure for thought, and developed a saving sense of humour and enjoyment of life. Oxford, and in Oxford Balliol and especially New College, his home there after 1876, always remained especially dear to him. When, in later life, he sought for young men to help him in his South African labours, it was from Oxford almost entirely that he drew them. And Oxford responded to his affection. In 1906, when he had returned to England to find a coldly critical attitude in many of his old supporters, she showed her faith in him by conferring upon him the honorary degree of D.C.L., and in the last month of his life elected him, without opposition, to the chancellorship of the University.

Yet, devoted son as he was of Oxford,

after taking his degree Milner had ambitions beyond that of the tutorship offered him by New College. He was already conscious that his bent was for a life of 'public usefulness', as he expressed it in his diary; so in 1879 he betook himself to London, staying at first with the Malcolms in Claverton Street, ate dinners at the Inner Temple, and was called to the bar in 1881. But briefs were scarce, and he turned to journalism as a means of livelihood, working on the old *Pall Mall Gazette*, first under John (afterwards Viscount) Morley [q.v.] and in 1883 as assistant editor to William Thomas Stead [q.v.], a chief with whose imperialist views on foreign and colonial policy and enthusiasm for social reform he was in complete accord. At first he even entered into the fun of Stead's revolutionary escapades in journalism, but their crude sensationalism became more than he could stomach, and in 1885 he resigned his connexion with the *Pall Mall*. Journalism, in fact, as he himself used to say, 'neither suited him nor he it'.

More important, however, for Milner's ultimate purpose in life than journalism or any other method of earning a livelihood during these early days in London was the association which he maintained with some of his old Oxford friends and with a few new-comers of the same stamp. It is a tribute to Milner's persistence and to the core of warm affection, veiled to outsiders by his somewhat cold exterior, that his deepest friendships were enduring and were nearly all made during his Oxford days or in the early years in London. Such friends were Arnold Toynbee [q.v.], first and foremost, (Sir) Edward Tyas Cook [q.v.], whom he brought on to the *Pall Mall Gazette*, Henry Birchenough, with whom he set up in rooms in St. James's in 1884, Iwan-Müller, Clinton Dawkins, the Montefiores, Lyttelton Gell, and a few others. Some of these used to continue the *noctes Oxonienses* at a little discussion society in the Temple founded by Arnold Toynbee, who of all Milner's friends exercised the most decisive influence upon him, no less after his premature death in 1883 than during the brief years of their friendship. 'In spite of the lapse of years', Milner said in an address eleven years later, 'his thought, his aspirations, his manner of speech, yea, the very expression of his countenance and the tone of his voice, are so vividly present to me, and seem to me still, though I am long past the age of illusions, no less noble and inspiring than they did in the radiant

days of youthful idealism, when we first were friends.' By Toynbee Milner and his friends at Oxford or at the Temple 'were deeply impressed', to quote Milner's own words again, 'with their individual duty as citizens and filled with enthusiasm for social equality, which led them to bridge the gulf between the educated and the wage-earning class'. Under this influence and that of Samuel Augustus Barnett [q.v.], 'one of the best men that ever lived, a really noble and beautiful character', as Milner wrote of him in 1913, one of the first things Milner did when he came to London was to take a large part in the then novel *University Extension Society* founded by Barnett and his wife in Whitechapel, acting as its joint secretary and giving several courses of lectures. In the list of lecturers at Whitechapel on behalf of this society, besides the names of William Stubbs, James Bryce, and Arnold Toynbee, appears that of Milner with a course on 'The State and the duties of Rulers'; and two years later (1882) he gave six lectures on 'Socialism', posthumously published in the *National Review* in 1931. In 1884, as a result of a meeting in Sidney Ball's rooms at St. John's College, Oxford, addressed by Barnett on the subject of founding a university settlement in East London 'to bring the classes into relation' and 'to enable University men to live with the poor', the well-known settlement named after Milner's closest friend, Toynbee, was inaugurated in Whitechapel. Milner himself eagerly co-operated in its foundation, and for the rest of his life was one of its most devoted supporters. Even after his return from South Africa he lectured there on trade boards, and from 1911 until his death was chairman of the governing body. To commemorate his connexion with Toynbee Hall and the friend who inspired him and its other founders, plaques of Milner and Arnold Toynbee were unveiled there in 1931.

In the same year that Toynbee Hall was founded Milner, while still retaining his post on the *Pall Mall Gazette*, became private secretary to Mr. G. J. (afterwards Viscount) Goschen [q.v.] and thus came into touch with the man destined to start him on the career for which he was most fitted. Goschen, although he had been a member of Lord Russell's last and Mr. Gladstone's first ministries, was never a strong party man and had refused to join Gladstone's second ministry: convinced of the great part which England should play

in the world, he was bitterly opposed to Gladstone's foreign and imperial policy, and in domestic affairs was antagonized by the doctrine of 'ransom', with its implied class warfare, propounded by Joseph Chamberlain [q.v.]. At the same time he was deeply interested in such new social experiments as were being made by the Barnetts in Whitechapel, where in 1879 he had proclaimed the principle implicit in the future Toynbee Hall, 'to provide people with the means of life rather than of livelihood'. Thus there was a natural affinity between Goschen and Milner, whose interests, then and throughout his life, were mainly social reform as expounded by his friend Toynbee and as exemplified by the whole conception of Toynbee Hall, and England's paramount duty of leadership in foreign and colonial affairs, so vociferously proclaimed in the *Pall Mall Gazette* under W. T. Stead. During the year of this first intimate connexion between Goschen and Milner, the secretary was more 'a colleague and adviser' [Hon. A. R. D. Elliot, *Life of G. J. Goschen*, i, 289] than a subordinate, urging Goschen on to deliver, and with infectious enthusiasm collaborating in the preparation of, the two notable speeches which won him the seat at Edinburgh in November 1885. At the same time, however, Milner had to give up this secretaryship, partly because he himself stood as liberal candidate for Harrow. In this election Milner made over ninety speeches, all excellently reasoned, but, as he prided himself, without once mentioning Gladstone's name, and not impassioned enough to rouse electoral audiences; it was said of him that he could not speak with real effect until he was 'hit in the eye'. At any rate, in spite of a gallant fight, he was beaten by 1,000 votes, in this his first and last attempt to enter the House of Commons. But this was not the end of his connexion with Goschen and with party politics. In 1886 Gladstone had finally disrupted the old liberal party by his Home Rule proposals, and Goschen was one of the most active in forming the new Liberal Unionist Association; but for sheer hard work in organizing and obtaining recruits to the new Association Milner was unsurpassed. At the inaugural meeting he was elected to the general committee, and to him was due the general supervision of the arrangements by services 'impossible', said one of the members, 'to over-estimate'. He himself, describing his own zeal and that of such

helpers as Albert (afterwards fourth Earl) Grey [q.v.] and Alexander Craig Sellar [q.v.] at this crisis, declared that 'for the Liberal-Unionist propaganda we slaved ourselves to shreds. We poured out pamphlets and leaflets. When we were all nearly dead, we used to say to each other, "Never mind; go on; Dagon must be thrown down."'

When Lord Randolph Churchill, on his sudden resignation of the chancellorship of the Exchequer in December 1886, 'had forgotten Goschen', Milner was one of the foremost in urging his friend to put the country's interests above old party ties and take Churchill's place in a conservative government. The new chancellor of the Exchequer at once made him his official private secretary. In this post Milner was in his element: he had the rare capacity of assimilating figures even quicker than words: as he said of himself, 'when I have once read a balance sheet or a budget, the figures seem to be written on the wall in front of my eyes'; and he had a gift also for the wider aspects of national finance. Thus he proved an invaluable helper to Goschen, especially during the famous conversion of the National Debt from 3 per cent. to 2½ per cent. in 1888.

In the following year Goschen, who felt in parting with Milner that he had 'lost his right hand', gave him his chance of independent work by procuring for him the post of director-general of accounts in Egypt, where six months later, in 1890, he was promoted to the office of under-secretary in the finance ministry of Khedive Tewfik. Here, wrote his chief, Sir Evelyn Baring (afterwards Lord Cromer, q.v.), Milner proved himself 'one of the most able Englishmen who have served the Egyptian government; not only was he versed in all the technicalities of his own department, but he had a wide grasp of the larger aspects of Egyptian affairs.' He revelled in his financial work for a country where, as he wrote himself, 'economic causes produce their theoretically correct result with a swiftness and exactitude not easily visible in other lands', and where the connexion of 'economics with politics and with morality' was so apparent. But probably the greatest service that Milner rendered to his country's task in Egypt was by his book *England in Egypt*, written in six months and published shortly after his return home in 1892. In this book he for the first time gave a vivid and convincing

account of the complicated problems of Egyptian government, for the solution of which Great Britain had assumed responsibility. He made it clear why the British were there, why they must remain there till their task was accomplished, and what were the prospects of Egypt being able eventually to stand on her own feet. The book is written with a deep sense of responsibility, albeit with a light touch, illuminated by sympathy and kindly humour; above all, he puts the temporary presence of the British in Egypt upon the only justifiable ground: 'It is not only, or principally, upon what Englishmen do for Egypt that the case for England rests. It is upon what England is helping the Egyptians to do for themselves.'

Milner was called back to England by Goschen in 1892 in order to take over the chairmanship of the Board of Inland Revenue, a post bringing him into the closest touch with the chancellor of the Exchequer in his most important duty of preparing the budget. But in this duty Milner was not to serve his old friend, for in the same year the conservative government was defeated and Sir William Harcourt [q.v.] took Goschen's place. Milner accordingly had the chief part in putting into shape Harcourt's ideas for his budget of 1894, introducing the new form of death duties, which have been continued, and increased far beyond the conception of the original framers, to the present day. Harcourt was enthusiastic over Milner's work, speaking of him as 'a man deserving of all praise and affection', while Harcourt's successor, Sir Michael Hicks Beach (afterwards Earl St. Aldwyn, q.v.), was so fully convinced of his merits that he even had thoughts of opposing Mr. Chamberlain's choice of Milner for a higher post on the ground that he could not be spared from the Board. For his services there Milner was created C.B. in 1894 and K.C.B. in 1895.

In 1897 the difficulties created by President Kruger's illiberal policy on the Rand and accentuated by the Jameson Raid of 1895 showed no sign of solution: Lord Rosmead [q.v.] as high commissioner for South Africa, responsible for dealings with the South African Republic (Transvaal), had not proved a success, and was due to retire; it was therefore essential to find a successor eminently qualified for this difficult post by strength of character and diplomatic gifts. Chamberlain, the secretary of state for the Colonies, had met Milner in Egypt, and had been impressed

by his ability, as he was later by the wide and conciliatory outlook revealed in *England in Egypt*. Accordingly in January 1897 he summoned him to the Colonial Office. Would Milner, he first asked, to try the ground, accept the post of under-secretary for the Colonies about to be vacated by Sir Robert Meade? To this Milner unhesitatingly replied, 'No'. 'Well then,' said Chamberlain, 'will you go to South Africa?' After a moment's reflection Milner replied, 'I'll do it.' Lord Salisbury had already approved of the suggestion, Queen Victoria gave her consent, Hicks Beach's objection to the loss of so valuable a financial expert was tactfully overcome, and the appointment was enthusiastically welcomed by friends and statesmen of all parties, who gave Milner a send-off dinner marked by extraordinary warmth of affection and confidence. This confidence was strengthened by Milner's own speech declaring his passionate devotion to the conception of imperial union: to succeed in forwarding such an ideal, 'to render any substantial service to any part of our world-wide state, would', he said, 'be all that in my most audacious dreams I had ever ventured to aspire to'; and no less by his definition of the task immediately awaiting him: 'to reconcile and to persuade to live together in peace and goodwill two races whose common interests are immeasurably greater than any differences that unfortunately exist.' Earlier he had written to his friend R. B. Brett (afterwards Viscount Esher) with almost boyish enthusiasm for the great task: "There is many a slip"; so I shall believe in the thing when I land at Cape Town. But I hope there will be no slip, for, though I know perfectly well that I may break my neck over it, I am wild to go'; and in a graver tone to his old friend Iwan-Müller: 'I run a great risk of growing conceited, and, if I had not such a profound *oïsus* of the High Gods, on whose knees it all lies, I might be exposed to the danger of failure from over-confidence.'

When Milner landed at Cape Town on 5 May 1897, he came with an open mind as to the rights in the dispute between Boers and Britons and resolved to form his own judgement on the spot. Indeed, it is characteristic of him that on the eve of his departure, when an old friend had wished to impress upon him his very strong anti-Boer views, he refused even to discuss the matter; and for nearly a year he gave no public indication of his opinions, 'struggling', as he said, 'successfully

against the temptation to say anything of substantial importance'. He learned Dutch, in order that he might be able to read the Dutch as well as the English newspapers, and also the *taal* which enabled him to talk to the Boer country folk; he made tours through Cape Colony, Bechuanaland, Rhodesia, and Basutoland; with the help of J. H. (afterwards Lord) de Villiers [q.v.], the great chief justice of Cape Colony, he tried to enter into friendly and informal relations with Kruger; with Cecil Rhodes, the other dominating figure in South Africa, although at first very much on his guard, he gradually came to an understanding, when he had made it plain that the high commissioner was second to none in South Africa. But, while non-committal in his public utterances, he had been thinking the more. Although before his arrival Chamberlain had induced Kruger to withdraw the Aliens Immigration Act as contrary to the Convention of London (1884), Milner soon began to realize that the difficulties of the Uitlanders in Johannesburg were no nearer solution. They were still without any voice even in their own municipal affairs; Kotze, the one judge with independence of character, was summarily dismissed; large sums, almost entirely obtained from taxation of the Uitlanders, were spent in arming the Transvaal for a conflict which could only be against Great Britain; above all, the re-election of Kruger to the presidency in February 1898 had taken away all hope of a more conciliatory and reforming spirit in the republic. In addition there were difficulties in Cape Colony, where many of the Dutch, in enjoyment of the full liberties denied to the Uitlanders in the Transvaal, almost openly sympathized with Kruger's despotic and anti-British policy.

By the end of February 1898 Milner had come to the grave conclusion that 'there is no way out of the political troubles of South Africa except reform in the Transvaal, or war. And at present the chances of reform in the Transvaal are worse than ever.' So he wrote in a private letter to Chamberlain on 23 February. Ten days later he for the first time gave public expression to his belief in his famous speech at Graaff Reinet, which was not so much an attack on the Transvaal as a warning to the Cape Dutch against disloyalty. This speech came almost as a thunderclap in a clear sky. In South Africa the British in Cape Colony and the Uitlanders in the Transvaal

realized that in Milner they had at last found a champion who meant business: at home, however, doubts began to assail some of those who had lately been most enthusiastic about 'the safe man with a cross-bench mind', when they discovered in him, as was said, at once the queen's representative and 'a great party-leader of the British race against the Dutch'. Milner was slow and deliberate in forming his convictions; but once he had formed them he was immovable. Not only that, but he became rigid in his methods of attaining his object. Here for the first time appears a difference between him and his chief Chamberlain. The objects of both were identical: to secure justice and reasonable liberty for the Uitlanders, such as were enjoyed by the Dutch in the Cape, and to ensure that Great Britain's right under the London Convention to be alone responsible for the whole of South Africa's external relations should not be impaired. But Chamberlain at the centre had to take account of the political situation in England and of her difficulties with foreign powers no less than those in South Africa; he was also more elastic and adaptable in diplomacy, and more inclined to display patience and restraint in the details of negotiation until some overwhelmingly important issue had to be faced. Milner, on the other hand, immersed as he was in his own extraordinarily difficult task, was naturally not so conscious of external difficulties, nor had he, at this stage of his career, schooled his mind to exercise the patience and elasticity of method quite compatible with an unyielding grasp of the main objects of policy; and accordingly he was more inclined to rush the issue. Shortly after the Graaff Reinet speech Milner's difficulties were increased by a hotly contested general election at the Cape, in which the prime minister, Sir John Gordon Sprigg [q.v.], lost his majority and in October 1898 gave place to William Philip Schreiner [q.v.] with a ministry largely Afrikaner Bond in complexion.

Immediately after the installation of Schreiner, Milner returned to England for a couple of months, partly to rest from the strain of his first eighteen months, but chiefly to discuss with Chamberlain the question—as he put it in an interview with a journalist—'Am I to work a passive and dilatory policy with the best credit I can, or am I to go back to pursue an active and resolute policy even at the risk of its leading to war?' But although the laconic

entry in his diary on the day of his arrival was 'Home, happy!', he got little satisfaction for his more forward policy from Chamberlain or the Cabinet, and he returned to the Cape at the end of January 1899 convinced that it was useless to 'force his views upon others at this stage'. By a strange irony of fate, too, during his absence in England General Sir William Butler [q.v.], acting in his place as high commissioner, having been appointed to the command by the War Office against the wish of Milner and even of Chamberlain, had been pursuing a policy diametrically opposed to his own and representing the grievances of the Uitlanders as artificially exaggerated by the capitalists for their own purposes.

But without any interference from Milner events soon began to move rapidly to a crisis. Already in December the shooting of an Englishman, named Edgar, by one of the Boer policemen in Johannesburg had stirred up bitter resentment among the rank and file of Uitlanders; and grievances were accumulating without sign of redress. Lippert's dynamite monopoly, involving outrageous costs for one of the essentials of gold-mining, the refusal of representation in the volksraad to the Johannesburg community, which contributed most of the state's taxation, or even of a representative municipality, at last convinced the Uitlanders that they could not hope for redress without a direct appeal to the Crown. Accordingly on 24 March 1899 a petition signed by over 20,000 people on the Rand was sent to Milner for submission to the queen. It recounted the grievances of the Uitlanders, deprived of all rights as citizens, at the mercy of a hostile police-force and hostile juries, overawed by a ring of forts round Johannesburg, and hampered in their daily lives, even to the education of their children, by vexatious legislation. Milner at once forwarded the petition to Chamberlain, who asked him to send by cable a dispatch summing up the position for publication at the same time as the petition. The result was Milner's famous cable of 4 May in which, with words of burning indignation, he set forth all the grievances against the Transvaal government. The most salient passages are: 'South Africa can prosper under two, three, or six governments, though the fewer the better, but not under two absolutely conflicting social and political systems, perfect equality for Dutch and British in the British Colonies, side by

side with permanent subjection of British to Dutch in one of the Republics. . . . The spectacle of thousands of British subjects kept permanently in the position of helots, constantly chafing under undoubted grievances, and calling vainly to H.M. Government for redress, does steadily undermine the influence and reputation of Great Britain and the respect for the British Government within its own dominions; and lastly, 'The case for intervention is overwhelming.'

So downright a dispatch was perhaps hardly what Chamberlain wanted, since he still hoped to achieve his ends by negotiation, so he delayed its publication and eagerly seized on a hint sent by Milner six days later that Kruger might be willing to discuss the whole question in conference with himself. As a result Milner met Kruger in conference at Bloemfontein on 31 May in order to discuss proposals put forward by the Transvaal government for dealing with the Uitlanders' grievances. But the conference was doomed to failure from the outset, for the two negotiators were men unyielding on any matter on which they had made up their minds. Milner made the initial mistake of ignoring Chamberlain's suggestion that he should take with him Schreiner, the Cape prime minister, who understood and could rival Boer methods of arguing almost interminably round a question before coming to a decision, whereas Milner, with his clear-cut and decisive mind, could not brook such shilly-shallying. The whole discussion turned on how far Kruger was willing to give immediate and genuine effect to proposals made for representation of the Uitlanders in the volksraad: he was all for whittling down and delaying the concession, for he feared that a large Uitlander vote would give them control of his beloved country. Milner, equally rigid in his determination to procure them their full rights of suffrage without delay, would accept no compromise. Finally, after five days' discussion (5 June), Kruger, with tears in his eyes, said, 'It is my country you want.' Milner broke off with the fateful words, 'This conference is absolutely at an end, and there is no obligation on either side arising out of it.' The two great antagonists never met again. This abrupt ending disappointed Chamberlain, and he urged that further attempts should be made to attain their common aim by peaceful means, while Milner himself admitted, 'I think I was wrong in breaking off

the conference quite as quickly as I did.' Accordingly negotiations still continued, at times with some prospects of success, especially when Johannes Smuts, the new attorney-general of the Transvaal, intervened; but at the last moment Kruger always withdrew any temporary concession. Finally, after a categorical demand from Chamberlain that he should remedy the Uitlanders' grievances, Kruger, hoping to strike a decisive blow before British reinforcements had landed, on 9 October sent an ultimatum which amounted to a declaration of war.

At the outbreak of war, whereas the Boers had been accumulating armaments for months and were prepared for an immediate invasion of British territory, the British colonies, in spite of Milner's urgent representations, were almost defenceless. Happily the arrival in September of Sir George Stuart White [q.v.] with troops enabled Natal to put herself in a posture of defence, and, largely owing to Milner's insistence, Kimberley and Mafeking were able to hold out. But the arrival of Sir Redvers Buller [q.v.] on 31 October, followed by an army corps in the latter part of November, owing to that general's ill-judged strategy and ineffective tactics, did little to relieve the situation. Milner's anxieties were increased by risings in Cape Colony in support of the republics and by the hardly disguised sympathy with the Boer cause of some of Schreiner's ministers: nor was the home government always sympathetic to his suggestions. A proposal of his to cut off the Transvaal's source of supplies by a blockade of the Portuguese port of Delagoa Bay was emphatically rejected, as was his remedy for domestic difficulties in the Cape by suspending the Cape constitution and substituting for it Crown Colony government. On this proposal Chamberlain minuted at the time that 'the drastic views of Sir Alfred Milner seem to me impolitic and unnecessary', and he explained to Milner himself that such a policy would not only create a storm in parliament but also alarm in Canada and Australia. But Milner was not to be shaken, and reverted twice to this unfortunate suggestion. However, with the arrival of Lord Roberts [q.v.] in January 1900, followed by his victorious march up country and the capture of Pretoria on 5 June, many of Milner's difficulties vanished. His troubles at the Cape were greatly relieved in the same month by the resignation of Schreiner's ministry.

Schreiner himself, as Milner admitted, had 'honesty, sincerity, and courage', but his 'interminable sermons' were a trouble to a harassed governor, while his ministry was difficult, if not dangerous in war time: Sprigg's platitudes and his more docile cabinet gave far less trouble. By the beginning of October 1900, when the last compact and centrally organized Boer force seemed to have been dispersed, Roberts was of opinion that the War was practically concluded. How erroneous was that belief soon appeared by the resumption of guerrilla warfare which continued for another eighteen months.

Almost from the beginning of the War Milner had been in consultation with Chamberlain as to the government of the two Boer states now formally annexed to the British Empire, and on 8 October 1900 he was appointed administrator of the Orange River Colony and the Transvaal. Milner was anxious at the earliest possible moment to begin to create the fabric of civil administration. In March 1901 he took up his residence at Sunnyside on the outskirts of Johannesburg, where he encouraged the return of the civil population and the resumption of work on the mines; he also appointed a small executive council for the Transvaal and a town council for Johannesburg. In the Orange River Colony his deputy, (Sir) Hamilton Goold-Adams, carried out a similar policy. He linked the two new colonies by amalgamating their railways under one management and by creating a common police force, the South African constabulary. But while the War lasted the military were in supreme command in the area of hostilities, and Milner was hampered by military necessities and to some extent by military policy. He disapproved of the indiscriminate farm-burning ordered by Lord Roberts as a warning against guerrilla warfare, and of (Lord) Kitchener's scheme of concentration camps for the Boer fighters' women and children, both of which policies aroused opposition in England. On the other hand, Milner was not prepared to go as far as Kitchener in concessions to the Boers at the abortive Middelburg negotiations of February-March 1901.

Having done all he could for the time being, in the following May Milner went to England on leave for four months. There, as an answer to the violent campaign for his recall made by Bond partisans at the Cape and a section of the liberals in England, he was received with

extraordinary honour; he was welcomed on arrival by the Cabinet and immediately taken to see King Edward VII, who raised him to the peerage as Baron Milner, of St. James's, London, and Cape Town; a few weeks later he received the freedom of the City. But strict business was his chief object. He arranged with Chamberlain that a grant of £5,500,000 should be voted for the cost of administration in the new colonies, for railway repairs, and for land purchase for English settlers, that the railways should ultimately be bought by the government, and, lastly, that a war indemnity of £50,000,000 (in 1903 reduced to £30,000,000 and in 1907 abandoned altogether) should be a charge on the Transvaal mines. He also chose a band of able and keen young men, fresh from Oxford or Toynbee Hall, soon to be famous as 'Milner's kindergarten', to help him in starting his schemes of reorganization and social reform in the new colonies. On his return to South Africa in August he was thus enabled to perfect his preparations for peace. A beginning was made with education by sending out teachers to hold classes for the Boer children in the concentration camps; and schemes for the rehabilitation of the new colonies were carefully planned.

At last in March 1902 the Boer leaders made fresh overtures for peace. Negotiations, however, dragged on for another three months. Milner himself would have preferred that the War should end by the process of attrition, and he distrusted Kitchener, with whom he was associated in the negotiations, as willing to be content with much less precise and stringent terms than he himself thought advisable. The actual treaty of Vereeniging was signed by Kitchener and Milner and ten of the Boer leaders on 31 May 1902: 'It has been an awful ten days, but I saved more than I expected', was Milner's report to a friend. After the peace Kitchener returned to England; and Milner, advanced to a viscountcy on 15 July, assumed full powers, not only as high commissioner, but as governor of the Transvaal and Orange River Colony, where his lieutenant-governors, Goold-Adams at Bloemfontein and (Sir) Arthur Lawley a few months later at Pretoria, relieved him of some of the details of administration. Milner and Kitchener were poles apart in character and methods. Kitchener concentrated on his object and was comparatively indifferent to the methods by which he attained it, and so was more rough and

ready in his procedure and more inclined to compromise on what seemed to him unessentials. Milner, at this stage of his career—although later he became more adaptable—was more rigid, from his habit of not only planning the result but also every step by which it was logically to be attained, and so was impatient of loose ends and anything in the nature of a compromise; he also had in mind the fact that he, not Kitchener, would have to give effect to the terms of the treaty and work the new régime. But, although they had their differences, each could appreciate the other's qualities, and twelve years later, on an even greater emergency, Milner was one of the first to insist on the necessity of securing Kitchener's services.

'People think the War decided that South Africa should remain for good and all part of the British Empire. I never took that view. . . . It only made that result possible—at most probable. To make it certain requires years of strong, patient policy.' So wrote Milner in 1905, and by his actions after Vereeniging he showed that he already had his 'strong, patient policy' mapped out. The first business was to repatriate the Boers on their farms. This was not merely a question of bringing back to their homes the prisoners of war from Ceylon and elsewhere, the burghers left in the field, and their women and children from the concentration camps, but of rebuilding those homes, sowing crops to feed the population, providing them with horses and cattle and ploughs, in a country devastated by three years' war; and to add to the difficulties there was an unusually prolonged drought in 1902. In spite of all this, however, within exactly a year of the peace the main work of repatriation had been accomplished and a population of some 200,000 burghers had been replaced on their farms and given the means of living. Simultaneously with repatriation a permanent system of education was organized. The teachers from the concentration camps, reinforced by others from various parts of the Empire, were sent out to the country districts to establish schools, at first, until building materials became accessible, often in marquees, to which the children could be brought from their farms. High schools were established in some of the larger towns and an advanced technical college in Johannesburg and another college at Bloemfontein. The chief difficulty was found to be with

regard to the language. Milner was determined to establish English as the medium of instruction, with concessions to the *taal* in the elementary stages; he thereby roused opposition from some of the Boer leaders and most of the *predikants* (Dutch clergy), who insisted on equality for both languages. Otherwise, the Boers were very well satisfied with the methods of instruction given them, far superior to any which they had enjoyed before. Two years after peace Milner was able to record that in the Transvaal schools there were 29,000 children as compared with only 14,000 under the Boer government. Roads, prisons, the treatment of lunatics, were improved, a new and badly needed water-supply was made for Johannesburg, which was also cleared of some disgraceful slums, and in the principal towns self-governing municipalities were established.

Two matters very dear to Milner's heart were agriculture and land settlement. To encourage better methods and results in farming he brought from overseas a small band of experts to improve the breeds of cattle, to make suggestions for better scientific methods of crop-raising and for exterminating the pests and diseases rife in the country, and to start irrigation schemes and experimental farms. Land settlement by British farmers he was anxious to stimulate mainly in order to introduce English ideas to the country districts, which were almost entirely Boer preserves. But owing to the limited amount of money available and the difficulty of securing the most suitable settlers, his land settlement schemes were not as successful as he had hoped, although a few farms, some government-owned, some privately owned, have proved permanent and beneficial to their neighbours, especially in the Orange River Colony. Always, too, Milner had as an ultimate aim the union of all the South African colonies. In order to prepare the way for this he set up an Inter-Colonial Council for dealing with affairs common to the two new colonies, such as the railways and the constabulary; and within a year of the peace he was presiding at Bloemfontein over a conference of all the South African colonies, old and new, which resulted in a customs union and other co-operative measures, notably in a commission for securing a uniform policy in dealing with the natives throughout South Africa. In this tremendous task of re-making a country laid waste by war and introducing

higher standards of public work, Milner's financial ability was not the least of his gifts. Already in three years from the peace he had provided for the interest and sinking fund charge on a loan of £30,000,000 advanced by the British government for development, without impairing the recuperative powers of the country by increased taxation.

On two matters, however, Milner's action aroused acute controversy. The first was on the old question of suspending the Cape constitution. Shortly after the end of the War the progressive party at the Cape sent to Milner a petition for suspension: he replied unofficially in sympathetic terms and his reply was published in the *Cape Times*. Chamberlain was naturally annoyed at Milner's public encouragement of a policy which he had himself already rejected, but after a frank admission of regret by Milner and a magnanimous defence of him by Chamberlain in the House of Commons, the affair blew over. At the end of 1902 Chamberlain himself went out to South Africa, and the two men found themselves in general accord on South African policy. This visit was the last time they met officially, for after his return to England (March 1903) Chamberlain resigned from the Cabinet on the tariff question. The loss to Milner was great, for no man could have been a more considerate, a more loyal chief than Chamberlain, who also had that sound instinct for the politically possible as a corrective to Milner's more unbending logic. Chamberlain, too, for his part, although sometimes differing from Milner in method, was fortunate in having such an agent to carry out the policy, on the main lines of which both agreed. As has been well said, 'It is doubtful if any two strong men, separated by 6,000 miles, ever worked so well together at a time of appalling strain and difficulties.'

The second extremely controversial matter was the question of Chinese labour in the mines. Milner was convinced that the success of the new colonies depended largely on the rapid recovery of the mining industry, so that what he called the 'overspill' of a prosperous Rand should fructify the whole country, just as Rhodesia owed its foundation to the 'overspill' of Kimberley. But the mines were seriously handicapped by the deficiency of native labour; white labour to take its place was found impracticable; so, at first reluctantly, Milner agreed to supply the deficiency by importing labourers under indenture from

China. So urgent did the need appear to him that in September 1903 he paid a flying visit to England in order to try to convince not only the government but his old liberal friends Sir Edward Grey, Mr. Asquith, and (Lord) Haldane. Chamberlain was opposed to the proposal, but had just left office. The prime minister, Mr. Balfour, at once urged Milner to take Chamberlain's place at the Colonial Office. The offer was tempting, for the post would have given him full scope for his ideas of imperial development and would not have been so arduous as his position in South Africa: nevertheless, Milner characteristically and decisively rejected the offer because, tired as he was, he felt that his paramount duty was to complete the South African work to which he had set his hand. Failing him, Alfred Lyttelton [q.v.] was appointed, and from him Milner obtained consent for the importation of Chinese labour. The scheme, however, aroused intense opposition from a large section of opinion in England; the whole liberal party joined in the anti-Chinese campaign; and it was one of the causes of the rout of the conservatives at the general election of 1906.

The last great question which occupied Milner in South Africa was that of a constitution for the two new colonies. Both he and Alfred Lyttelton had come to the conclusion that a step forward must be made towards the responsible government promised at Vereeniging as the ultimate goal. Milner, however, felt very strongly that the final step must be delayed for some time, especially in the Orange River Colony where the population was overwhelmingly Boer, and at least until the Boers had acquiesced in membership of the British Empire; but that representative institutions might safely be given as a first step to the Transvaal. As these views coincided with those of the home government, letters patent establishing an elective legislative assembly to take the place of Milner's nominated legislature for the Transvaal were issued on 10 May 1905.

By this time Milner himself had left South Africa. He had been working continuously at the highest pressure for eight years in circumstances as difficult as any man could well be faced with for so long. In his farewell speech at Johannesburg on 31 March 1905 he said: 'I shall live in the memories of people here . . . in connexion with the great struggle to keep this country within the limits of the British Empire . . . I was from head to foot one glowing mass

of conviction of the rightness of our cause. . . . But', he added, 'I should prefer to be remembered for the tremendous effort . . . made after the war, not only to repair its ravages, but also to re-start the new colonies on a far higher plane of civilization than they had ever previously attained.' This was a noble aspiration, but the way in which it was expressed helps perhaps to indicate why Milner himself became disappointed with the result. He sought to impose a new order on a very dogged people, with whom he was never entirely in sympathy. His ideals were high indeed, but he had thought them out by himself, and he had not the faculty possessed by other less candid and direct people of inducing those for whom he was working to think that his ideals coincided with their own wishes. Materially he had given the new colonies such a standard of civilization as they had never had before and which had proved lasting; moreover, he had not only proclaimed the need of South African union; he had also shown the way to its accomplishment. It is true also that he had touched the hearts and fired the imagination of the British in South Africa, who regarded him as their bulwark. But he had not touched the hearts or won the confidence of his Boer fellow citizens; perhaps no one who had fought so strenuously against them as he had early in his South African career could have done so. Yet they respected him as one who in the end had their interests at heart, even if it was not in their own way.

In April 1905 Milner sailed from South Africa by the east coast route, visiting Zanzibar, Mombasa, and Nairobi, and paying a long visit to his old chief, Lord Cromer, in Egypt. Thence he returned to England in July—an England strangely altered for him from that whence he had sailed eight years before for South Africa with the confidence and good wishes of every party in the state. The government which had supported him throughout was now tottering; many of his old liberal friends looked askance at him; posters about 'Chinese slavery' met him on every hoarding; and in January 1906 Sir Henry Campbell-Bannerman's new ministry obtained a record majority in parliament. It was not long before Milner's adversaries attacked him openly. Before he left South Africa he had sanctioned the flogging of Chinese coolies in certain cases, and some instances of ill treatment had occurred under the regulation, which was rescinded by the colonial

secretary as soon as he heard of it; on 27 February 1906 Milner himself in the House of Lords had, characteristically, taken full responsibility for the error he now admitted. On 21 March a radical member seized on the incident for a motion of censure on Milner, a motion passed in a modified form by the House of Commons. A week later, however, the House of Lords recorded 'its high appreciation of the services rendered by Lord Milner to South Africa and the Empire'. Already he had protested in the House of Lords against the declared intention of the new government to grant full responsible government forthwith to both of the new colonies. When this promise took effect he regarded it as the death-blow to all his hopes for South Africa, and to the end of his life he never ceased to regret it as premature. But he never showed a trace of personal bitterness.

For some time after his return Milner took little part in politics. He was impoverished by his expenses in South Africa and refused to ask for a pension or grant, which would assuredly have been bestowed on him—he even declined the gift of a country house offered him by his friends—so that he was obliged to take up remunerative work in the City, where his financial ability was invaluable, especially in his management of the Rio Tinto Company's affairs. But he did not refuse such public work as that of member of the Port of London Authority; and he devoted himself especially to the congenial work of the Rhodes Trust, of which he had been named by Rhodes an original member. For the rest of his life he was the most influential trustee, working out with his old Oxford friend, Sir George Robert Parkin [q.v.], the best method of selecting scholars, managing the Trust's finances, and making grants out of the surplus revenue for such objects as imperial forestry, the study of tropical medicine, and other educational purposes. He was always ready to discuss national questions on a non-party basis, joining with former members of his South African 'kindergarten' in their 'moot', from which originated the political review, *The Round Table*, and in a more heterogeneous society, the 'Coefficients', where he discussed social and imperial problems with such curiously assorted members as L. S. Amery, H. G. Wells, (Lord) Haldane, Sir Edward Grey, (Sir) Michael Sadler, Bernard Shaw, J. L. Garvin, William Pember Reeves, and W. A. S. Hewins.

Of all the members Wells 'oddly enough, found Milner the most satisfactory intelligence among us. He knew we had to make a new world. . . so that he fell into Imperialistic Monarchist forms, which a partly German education may have made easier for him. But upon many minor issues we were apt to agree' [H. G. Wells, *Experiment in Biography*, ii, 765].

'Always avowedly a free lance,' as Milner said of himself, 'and unhampered by the obligation to adhere strictly to the limits of any "authorized programme", I could afford to devote myself to those subjects on which I really felt strongly.' Thus he warmly supported Lord Roberts in his campaign in favour of national service, as necessary for the defence of the British Empire, and Chamberlain's tariff reform movement, as an essential measure for drawing the different parts of Empire into closer relations. He had, indeed, managed to introduce a preference to the mother country in his South African customs union in support of that movement. Anything, too, which stimulated a better apprehension of Great Britain's imperial responsibilities appealed to him. He took up warmly a suggestion made by (Sir) Sidney Low for promoting imperial studies, then almost entirely ignored in the universities, and presided over a committee set up by the university of London with that object. As a result of its work a scheme of public lectures on those and similar topics was inaugurated, and the Rhodes chair of imperial studies was established at King's College in 1919. Even the Institute of Historical Research partly owes its genesis to this committee, which Milner guided in so broad-minded a spirit that it incidentally tended to smooth away many of the inter-collegiate rivalries and jealousies which had in the past been so great a bane to London University.

On only two definite issues separating the great political parties did Milner take a decisive line. The first was Mr. Lloyd George's budget of 1909, which he advised the Lords to reject and not flinch from the consequences, and its outcome the Parliament Bill of 1911, which he strenuously opposed. The second was Home Rule, which, as in 1886, he abhorred as disruptive of the Empire; in order to combat it he offered his services to Sir Edward Carson and helped to organize in England a league of 'Covenanters' pledged to support Ulster's resistance to separation. Throughout this period, between 1906 and 1912, he made many speeches,

chiefly on imperial subjects but also on social questions such as sweated industries and industrial law, not only in Great Britain but also during two tours in Canada (1908 and 1912), speeches which he published in 1913 in a volume entitled *The Nation and the Empire*. He even arranged to write a life of Chamberlain in collaboration with his friend L. S. Amery, a plan stopped by the outbreak of the European War in 1914.

When, half-way through the War, it was suggested that Milner should become prime minister, a diarist commented on this as a stupid suggestion, for 'rightly or wrongly few men in the country are more distrusted than Milner'. The diarist lived to see his mistake; but already Milner had been proving that he was well prepared for the tasks awaiting Great Britain. In fact the country's danger and the need of definite action seemed to give him a fresh lease of youthful energy. In the first year of the War he presided over a committee to increase the food production of the country, and within a month of its formation, so deeply had he thought out the question beforehand, the committee produced a scheme for putting a million more acres under wheat with a promise of a guaranteed price to the farmer. Although Mr. Asquith's government rejected the scheme, it was put into operation in 1917 with surprisingly successful results. Milner was next asked to tackle the problem of coal production and to secure some harmony between the conflicting interests of miners, exporters, and government and home producers. When Mr. Lloyd George became prime minister at the end of 1916, he at once picked out Milner to be a member of his small War Cabinet, whose principal business it was not only to deal with big questions on the general conduct of the War, but also with matters affecting several departments of state. With a man of Milner's administrative capacity and his long preparedness for such a crisis this system worked well; and whenever a difficult problem presented itself, Milner, 'the only synoptic person in the Cabinet', as he said of himself, was called upon to solve it. He had to settle the allocation of shipping tonnage between various contending departments; the amount of beer to be brewed, the 'buying out' of the spirit trade in order to secure alcohol for munitions; a programme for the reduction of imports owing to the losses of shipping; and he also took a part in getting the convoy system established. He was chair-

man of the committee on post-war reconstruction, and was chiefly responsible for the establishment of the new Ministry of Health in 1919, with an enlightened programme for dealing with social questions hitherto neglected. He, too, was mainly responsible for the inclusion in the War Cabinet of the prime ministers of the Dominions and a representative of India as regular members, an important step which secured not only closer co-operation between the constituent parts of the Empire, but also complete unity in war plans and peace aims.

Milner was often called upon to undertake missions to various seats of war; he went with Mr. Lloyd George to the Allied Conference in Rome in January 1917 and thence he was sent to Russia in order to arrange about munition supplies, unfortunately on the eve of the Russian revolution, the drastic nature of which he hardly foresaw; but his most notable mission was to France at the blackest period of the War. When, by 23 March 1918, the Germans in their last great attack had pierced the British lines near Amiens and so broken the connexion between them and the French, Milner was sent to the Amiens front in order to report on the serious state of affairs and on the break-down of co-operation between the two Allied commands. Attempts had already been made to pool the reserves available for either army, but there was no directing mind to allocate this reserve in an emergency, especially as Sir Douglas (afterwards Earl) Haig [q.v.] and General Pétain, the French commander-in-chief, did not always see eye to eye, while General Foch's committee of the Supreme War Council, nominally charged with the duty, had little real power of making decisions. Milner reached France on the evening of 24 March and, realizing the imperative need of immediate action, took upon himself full responsibility for the momentous decision for enforcing unity of command. It was plain to him that one man should be responsible for co-ordinating the efforts of the Allies, but who should it be? Pétain was perhaps the obvious man, as being in command of the largest force on the Western front, but in the conferences which took place he seemed too cautious and niggardly of his reserves, and, indeed, too pessimistic at such a crisis, whereas Foch, whom Milner had hardly known before, appeared to him to possess just the right spirit. A short talk with M. Clemenceau, an old friend of Milner's, who

had hitherto been inclined to favour Pétain rather than Foch, and the thing was done. The decision, to which Haig gave his hearty support and Pétain his loyal assent, is recorded in the two terse sentences of the agreement reached at the Allied conference held at the Hôtel de Ville, Doullens, north of Amiens, on 26 March:

'Le général Foch est chargé par les gouvernements britanniques et français de coordonner l'action des armées alliées sur le front ouest. Il s'entendra à cet effet avec les généraux en chef, qui sont invités à lui fournir tous les renseignements nécessaires.

Doullens, le 26 Mars 1918

G. Clemenceau.

Milner.'

This little bit of paper, entirely due to Milner's initiative, securing thereafter the harmonious co-operation of the Allied forces, marks the turning-point in the War.

This was the last of Milner's great services as a member of the small War Cabinet, for on 10 April he was induced reluctantly to accept the post of secretary of state for war. At the War Office his tact and good sense in smoothing out difficulties and appeasing jealousies had already proved invaluable. He was still in the closest touch with Mr. Lloyd George in planning the last great efforts of the War, and the combination of the latter's resiliency with Milner's balance and grasp of essentials proved invincible. In administration Milner's great reform was to inaugurate a carefully thought-out Army Education branch, primarily to train the soldiers both at the front and at home for civilian employment on their discharge at the end of the War, but also as a permanent institution for the same object in peace time.

In all his great and manifold war-work Milner hardly appeared before the public at all; and only those at the centre could fully appreciate its value. Only once did he attract public attention and then to his great credit. About a month before the signing of the Armistice on 11 November 1918 he was questioned by a journalist as to his conception of complete victory and of the best form of peace. Before all other forms of victory he put the destruction of Prussian militarism and the disappearance of the Hohenzollern régime for ever. This, he said, could best be attained by an armistice admitting the complete military superiority of the Allies, without the tremendous losses and time involved in marching to Berlin. At the

same time he protested against the 'fulminations . . . denouncing the whole German nation as monsters of iniquity', and indicated that in his view peace should not be made an instrument for 'punishing Germany or gratifying our own feelings of anger or indignation against her, however justified'. In the excited feelings of the time, this sane and prudent utterance drew down upon Milner much vituperative criticism from persons who cited his remote family connexion with, and his early schooling in, Germany in order to dub him as 'pro-German'. Milner could afford to despise calumny, but he was nevertheless pleased when the whole band of men who had learned under him in South Africa to appreciate his patriotism united to testify to him their affectionate respect.

In December 1918, on the reconstruction of the ministry, Milner was transferred, again with considerable reluctance, to the Colonial Office. He was then worn out, and as the negotiations for peace proceeded, felt less and less in sympathy with Mr. Lloyd George. At Versailles he was unfortunately not one of the chief British delegates, and attended only to speak on matters affecting his department: but when he did appear, his influence and great weight, General Smuts has said, were 'all for a fair and generous peace, a peace of understanding which might be lasting, and which would heal the dreadful wounds the war had caused'. Had he been a constant delegate his profound knowledge and his mellow sanity might have helped to make a better business of the treaty.

At the Colonial Office Milner had too short a term to make a deep impression, but, with the help of his under-secretary, Mr. Amery, he was able to promote several of the schemes which he had at heart, such as the development of imperial resources in Africa and in the West Indies, where he inaugurated an Imperial College of Agriculture at Trinidad, inter-imperial migration, and the new dyarchic constitution for Malta. While he was colonial secretary he was entrusted with the task of reporting on the future relations of Great Britain with Egypt, and had to spend over four months (November 1919 to March 1920) in that country and afterwards to conduct in London long negotiations with Zaghilul Pasha and other nationalist leaders. He reported in favour of independence for Egypt in alliance with Great Britain, with certain safeguards for British interests solemnly guaranteed by an Egyptian national assembly. This report was re-

jected by the Cabinet, although it was subsequently accepted without even the national assembly's guarantee. Partly owing to its rejection, partly too from exhaustion after another spell of seven years' exacting labours, Milner resigned on 7 February 1921, and so brought his official career to a close. To mark the value of his services he was created K.G.

Milner had never married, for quite early in life he had decided that he must choose between marriage which might bring private happiness and the public usefulness which he had most at heart. Now, however, less than three weeks after his final resignation, when he was nearing seventy, he married, on 26 February, Violet Georgina, younger daughter of his old friend Admiral Frederick Augustus Maxse [q.v.] and widow of Lord Edward Herbert Gascoyne-Cecil [q.v.]. This marriage opened the way to four years of happiness which they shared with their friends, in London and at their country home, Sturry Court, near Canterbury. This property was given by Lady Milner after her husband's death to the King's School, Canterbury.

Yet even after his marriage Milner did not take the rest which he had earned. He resumed his work in the City, consented to preside over a tariff committee which Mr. Stanley Baldwin had proposed to set up in 1924, had he returned to power, but, above all, devoted himself to writing on the social and imperial questions which had been his main interest through life. These essays were published in book form as *Questions of the Hour* in 1923 and re-issued (1925) by Lady Milner after his death, with the addition of his 'Credo', found among his papers and embodying his imperialist creed.

In the autumn of 1924 Lord and Lady Milner paid a visit to South Africa, where he had some joy in seeing some results of his great recuperative schemes for the country, but still more disappointment at the conviction that much of his political work had been thrown away by the action of a liberal government in 1906. Shortly after his return he was attacked by sleepy sickness, probably caught in South Africa. His illness was mercifully short, and he died at Sturry Court, with the knowledge that his name had been accepted as chancellor-elect of Oxford University, 13 May 1925. He was buried at Saleshurst, near Robertsbridge, after a service conducted by Archbishop Davidson in Canterbury Cathedral, where the chapel of St. Martin

of Tours was subsequently restored in his memory. The peerage became extinct on his death without heir.

Milner was a great public servant—few more devoted have appeared in British annals—most in his element when he had some definite task to perform, as in the finance ministry in Egypt, in concentrating on the issues between Great Britain and the Boer Republics, or in trying to realize a plan of reorganization thought-out to the minutest details for the new Colonies, and lastly, during the War, in his clear grasp of the essential objectives and his consummate ability in carrying out the measures required to attain them. His chief contribution to the political thought of his generation is to be found in his passionate conviction of the need for imperial unity, a conviction not divorced from a sympathetic understanding of distinctive national feelings in each of the Empire's widely scattered parts. This passionate feeling is expressed or implicit in all his public action, in his speeches, in his writings, but, above all, in the influence which he exercised privately on all, especially the young, who looked up to him as mentor. He had not, however, the qualities of a great political leader, partly because he stood outside any political party and so could never have gained an effective political following to carry out his ideas; but chiefly owing to a want of elasticity in his temperament, which made it impossible for him to yield a point or be satisfied with less than the whole, which is rarely attainable in politics. Curiously enough he realized this defect in Mr. Gladstone, whom he criticized for disregarding Hesiod's maxim *πλέον ἤμιν πάντος*, without recognizing it in himself. On the other hand, these very defects, which denied him the gift to rule debates and lead the multitude, arose from one of his noblest characteristics, a deep sincerity which made it impossible for him to compromise on what he regarded as the truth. To this quality above all he owed his superlative gift of making and keeping friends and attracting loyalties. As one would expect in a man so determined to think out a policy in all its aspects and implications for himself, he worked best with young men, ready to take their cue from him; even they often found it difficult to relieve him of the drudgery of small details; but he inspired them with his ideals of work and high ambition and made of them a notable band for influencing public life long after they had left

his service. His chief friends were nearly all friends of youth and were lifelong. He had, too, one characteristic rare in most men, rarer still in those of his temperament, that he was never soured by disappointments, even over his most cherished objects: indeed the older he grew the more tolerant of opposition he became. General Smuts, one of his most effective opponents in South Africa, noted, after meeting him once more in war-time, twelve years later, besides 'his great personal modesty and reserve', which he always had, how he had found him in spite, or because, of cares and sorrows, 'matured and deepened . . . broadened in outlook and sympathy' [*The Times*, 15 May 1925].

There is a bronze bust of Milner by François Sicard at Doullens, another casting of which is also at Doullens, and a third in the possession of Lady Milner; a posthumous bust by Lady (Hilton) Young (afterwards Lady Kennet) is at Rhodes House, Oxford; and a portrait plaque is in Westminster Abbey, a replica being at Toynbee Hall, Whitechapel. There are portraits by Max Balfour (said to be the best likeness) at New College, Oxford, by Theodore Roussel at Johannesburg, by Hugh Glazebrook in the National Portrait Gallery, and by Sir William Orpen, painted for Sir Abe Bailey; a drawing of him was also made by J. S. Sargent. A cartoon of him by 'Spy' appeared in *Vanity Fair* 15 April 1897.

[*The Milner Papers*, edited by Cecil Headlam, 2 vols., 1931-1933 (deals almost exclusively with the South African period: Milner's original South African papers are at New College); W. S. Amery, 7 vols., 1900-1909 (especially vols. i and vi); private information; personal knowledge.] B. WILLIAMS.

MOND, ALFRED MORITZ, first BARON MELCHETT (1868-1930), industrialist, financier, and politician, was born at Farnworth, Lancashire, 23 October 1868, the younger son of Ludwig Mond [q.v.], a gifted Jew who had come to England from Cassel in 1862 and with (Sir) John Tomlinson Brunner had founded and built up the great chemical industry

which in 1881 was formed into a public joint-stock company as Brunner, Mond & Co. His mother was Frida, daughter of Adolph Meyer Löwenthal, of Cologne, a cousin of his father and a highly cultivated woman.

Mond was educated at Cheltenham College, St. John's College, Cambridge (where he was ploughed in the natural science tripos), and Edinburgh University. He was called to the bar by the Inner Temple in 1894 and practised for a time on the North Wales and Cheshire circuit. Up to this time his ambitions had been entirely political, and he looked upon the law as the high way to a parliamentary career. His father's business, however, had stronger claims on his energies, and in 1895 he became a director and, a little later, managing director.

It was in his capacity of active manager of a great manufacturing corporation that Mond made a deep mark on the industrial history of his time as an earnest exponent of the need for organization and research, later as a successful champion of the process of rationalization and amalgamation, and finally as a strenuous advocate of close co-operation between employers and employed. His width of vision and imagination, applied to industrial problems, showed him that the way to success in production lay through control of raw material, diversity of enterprise, and harmonious relations between all parties at work on the process of supply. Contemptuous of the doctrine of *laissez-faire* and of all that it implied, he was convinced that the planning of great enterprises, to be carried out by big industrial battalions, was the only line of future development; and that the competition of a number of small units was less effective, even from the point of view of the consumer, than co-operative effort which aimed at procuring cheap supplies of materials by large-scale buying and at providing cheap articles by large-scale distribution. 'The trend of all modern industry', he wrote, 'is towards greater units, greater co-ordination for the more effective use of resources' [*Industry and Politics*, p. 9].

While thus eagerly advocating combination rather than competition as the basis of industrial enterprise, Mond was equally emphatic on the need for the abolition of the lock-out and strike as methods of settling disputes between capital and labour, and for the development of measures, such as profit-sharing and employee-shareholding, by which the

essential partnership between proprietors and workers might be made more apparent and binding and the divergence of their interests less wide. In the introduction to his *Industry and Politics*, published in 1927, he gives the results of his personal contact with workers, in an executive capacity, over more than a generation. 'In the industry in which I am mainly interested', he writes, 'we have succeeded in avoiding for a period of over fifty years any serious industrial dispute. This has been largely due to a liberal, far-seeing policy, which did not consist in waiting for claims to be made and then yielding them reluctantly, but in foreseeing reasonable demands and in granting them even before they were asked' [*ibid.*, p. 3].

Working persistently to further these principles of co-ordination and co-operation, Mond was prominent not only on account of the number and importance of the enterprises with which he was connected, but also by reason of the vast—perhaps grandiose—scale of the amalgamations which were eventually (1926) consolidated in the firm of Imperial Chemical Industries, Ltd., with its £95,000,000 of authorized capital and its immense ramifications and alliances. He was also chairman of the Amalgamated Anthracite Collieries, a company in which he had embodied the control of the greater part of the Welsh anthracite field, and a director of the International Nickel Company of Canada (formed in 1928), the Mond Nickel Company, the South Staffordshire Mond Gas (Power and Heating) Company, the Westminster Bank, and the Industrial Financial Investment Corporation.

It is noteworthy that Mond himself in his criticism of nationalized industry pointed to the self-same weakness that has been alleged against the vastness of his own conceptions. 'One of your chief difficulties', he said, apostrophizing the socialists in a speech mentioned below [*ibid.*, p. 314], 'is magnitude. I have deliberately come to the conclusion that it is quite impossible for human beings to control any industry beyond a certain magnitude.' Time will show whether, under his leadership, industry made the mistake with which he charged the schemes of the socialists. Whatever may be the ultimate verdict on Mond's industrial and financial ideals, there can be no question that his work for conciliation between capital and labour, and the admirable arrangements for the comfort and

welfare of employees at the Brunner-Mond works at Droitwich, at the Imperial Chemicals head-quarters at Westminster, and at other factories where he was able to have a say in this matter, successfully promoted the harmony and goodwill which are essential to prosperous industry. His most notable effort for this end was the formation of a committee of employers to meet representatives of the general council of the Trades Union Congress in 1927, when the Mond-Turner conferences, as they were called (Mr. Ben Turner being the Trades Union Congress chairman at the time) endeavoured, in the light of the bitter lessons of the strikes of 1926, to open a new chapter in the history of the relations between employers and employed. These conferences have since been followed by discussion and joint action between the general council of the Trades Unions and the two chief bodies representing the industrial employers.

Mond's success in dealing with the representatives of labour was a remarkable tribute to his sincerity, for he had many difficulties to overcome. A typical Jew in appearance, with a harsh half-German voice and accent, he had none of the suave Hebrew adroitness that often disarms opposition. Blunt, direct, sometimes rather blustering, and occasionally distinctly ill-mannered, he carried his point by his strength of character and by his power of getting down to essentials. These qualities also finally gained for him the ear of the House of Commons, where his career began in 1906 as liberal member for Chester. From 1910 to 1923 he represented Swansea, and from 1924 to 1928, when he was raised to the peerage, Carmarthen. Neither his virtues nor his disadvantages were conducive to success as a party politician, but he applied his business capacity as first commissioner of works from 1916 to 1921 in Mr. Lloyd George's coalition ministry, and as minister of health from 1921 to 1922 in the next ministry he effectively cleared up the confused condition into which the housing problem had been allowed to fall.

In the House of Commons Mond was listened to at first critically and with impatience, but finally with the attention which is always paid to those who show that they know their subject, talk in the light of first-hand experience, and keep to the point. His outstanding parliamentary success was a speech on socialism, delivered on 20 March 1923 in answer to an indictment of the capitalist system uttered

by (Viscount) Snowden. This speech was considered by many to have been one of the most damaging criticisms of the socialist ideal ever heard in the House. Perhaps the most telling passage in it was the account of the daring and determination with which, in the teeth of immense risks and discouragements, his father and his partner had created their business and given work to thousands—an enterprise which could 'never have been commenced under any Socialist system that I have ever known' (printed in Mond's *Industry and Politics*, p. 313).

Having begun his political life as a liberal, and a highly effective exponent of the blessings of free trade, Mond, like many other free traders, was converted by after-war conditions to the view that, with economic nationalism rampant all over the world, it was no longer possible to keep England's market open as the general dumping ground. In 1926 his objections to Mr. Lloyd George's land policy drove him into the ranks of the conservatives, but he was invited by his constituents at Carmarthen to remain their representative, and did so until he became a peer. His zeal as a newly converted protectionist expressed itself chiefly in the ardour and thoroughness with which he threw himself into the campaign for imperial economic unity. In his *Imperial Economic Unity* (1930) he urged the application of the principles of rationalization to inter-imperial business relations. He became chairman of the Empire Economic Union, and a visit to South Africa in the course of the same year (1930) confirmed his determination to work for the cause of trade co-operation within the Empire. But his premature death, which took place at his London house in Lowndes Square 27 December 1930, at the age of sixty-two, robbed this cause of one of its most effective advocates.

Business and political activities by no means exhausted Mond's energies, or rather, his capacity for getting things done without apparent effort; for, thanks to his power of concentrating on essentials, he gave the impression of one who took life easily and had plenty of time for appreciation of its amenities. Although his manner with strangers was shy and by no means genial, he was extremely kind and charitable, and his keen sense of humour enabled him to enjoy and collect the numerous caricatures which his features invited. As an enthusiastic Zionist, he visited Palestine in 1921, contributed £100,000 to the Jewish

Colonization Corporation for Palestine, and wrote sundry articles for Zionist publications. He had a genuine love of art and music, and took a deep and practical interest in his father's bequest of forty-two pictures to the National Gallery (1924) and provided a large part of the cost of the room in which it is housed. In 1920 he bought a piece of ground in Chelsea for the Chelsea Health Society, of which his wife was president.

Mond was created a baronet in 1910, sworn of the Privy Council in 1913, and raised to the peerage in 1928 as Baron Melchett, of Landford, co. Southampton. He was elected a fellow of the Royal Society in 1930, and received honorary degrees from several universities, including Oxford and Paris. He married in 1894 Violet Florence Mabel, daughter of James Henry Goetze, coffee merchant, of Mining Lane, London, and had one son, Henry Ludwig (born 1898), who succeeded him as second baron, and three daughters.

There is a portrait of Mond by Sir John Lavery in the possession of Violet, Lady Melchett.

[*The Times*, 20 December 1930; H. H. Bolitho, *Alfred Mond, first Lord Melchett*, 1932; Melchett's own writings; private information.] H. WITNERS.

MONRO, SIR CHARLES CARMICHAEL, baronet (1860-1929), general, was born at sea in ss. *Maid of Judah* 15 June 1860, the sixth son of Henry Monro, of Craiglochart, near Edinburgh, who had gone to Australia as a young man, by his wife, Catherine, daughter of Alexander Power, of Clonmult, co. Cork. He belonged to an old Scottish family, best known in the medical world, his grandfather having been Alexander Monro, tertius (1773-1859, q.v.), the last of the distinguished trio of that name who, from father to son, had held the chair of anatomy at the university of Edinburgh from 1720 down to 1846. Charles Monro was educated at Sherborne School and at Sandhurst, whence he was gazetted in August 1870 into the 2nd Foot, now 1st battalion The Queen's (West Surrey) Regiment. In 1881 he was appointed adjutant, and held that office for five years. He obtained his company in July 1889, having just passed the entrance examination into the Staff College, where he was a student during the years 1880-1890. His chief distinction at Camberley was his captaincy of the cricket eleven. He next spent some time in Malta, acting

first as aide-de-camp to the governor and then as brigade-major. In 1897 he went to India, where he served with his battalion in the Malakand Field Force, next with the expedition into the Mohmand country, and finally with the Tirah Expeditionary Force. In February 1898 he was promoted major, and in November received the appointment of brigade-major at Gibraltar. In April 1899, however, he was advanced to the post of deputy assistant adjutant-general in Guernsey.

On the outbreak of the South African War in 1899 Monro was transferred to Aldershot in order to continue his appointment with the 6th division, which began to mobilize on receipt of the news of Lord Methuen's reverse at Magersfontein (11 December). He arrived in Africa in time to take part in Lord Roberts's march to Pretoria, and was present at General Piet Cronje's surrender at Paardeberg on 27 February 1900 and also at the actions of Poplar Grove (7 March) and Dreifontein (10 March). After the capture of Pretoria he continued working with his division in Cape Colony south of the Orange river until the close of the year. He had already been rewarded with a brevet lieutenant-colonelcy.

Monro's services were now required at the Hythe School of Musketry, and he returned home to assume the appointment of chief instructor there in February 1901. It was at Hythe that his abilities were first measured at their true worth. Fresh from South Africa and the Indian frontier where he had learnt to appreciate the value of rifle fire in war, he set to work to reform the methods of teaching musketry in the army. But his work did not end there and he became virtually responsible for the evolution of a new system of infantry fire-tactics. Monro remained at Hythe six years, the last four being spent as commandant of the school, and during that period was promoted substantive colonel in November 1903. He left Hythe in March 1907, having radically reformed army musketry; target-shooting was henceforth to become battle-shooting. The reputation which he had acquired at Hythe brought about his selection, two months later, to the command of the 13th Infantry Brigade, then stationed in Ireland. His tenure of that command was marked by the same practical outlook which had distinguished his work at Hythe. In October 1910 he was promoted major-general, but he remained with his brigade

until January 1912. Two months later he was appointed to command the 2nd London Division of the Territorial Force; in this capacity he proved a sympathetic and successful chief.

On the outbreak of the War with Germany in August 1914, Monro was transferred to the command of the regular 2nd division at Aldershot, and proceeded with the British Expeditionary Force to France on 12 August. He thus participated in all the early fighting of the War. He led his division, which formed part of the I Corps, under Sir Douglas Haig, back from Mons to the Marne; and he advanced from the Marne to the Aisne, where his troops played a distinguished part in the battle. The 2nd division was then transferred to Flanders and fought throughout the latter part of October and the beginning of November in the first battle of Ypres. On 31 October, when the combined staffs of the 1st and 2nd divisions were assembled at Hooge Château, the building was struck by an enemy shell, and nearly all the assembled officers were killed; but Monro escaped with a severe shock. At the end of the year he received the command of the I Corps in succession to Sir Douglas Haig, with the temporary rank of lieutenant-general, and in March 1915 was created K.C.B. for his war services. During the early summer he commanded the I Corps through the battles of Aubers Ridge, Festubert, and Givenchy, until in July 1915 he was given the command of the newly raised Third Army with the rank of general. But his tenure of that position, was not long, for in October 1915 he was ordered to take over the command of the Mediterranean Expeditionary Force at Gallipoli, in succession to Sir Ian Hamilton.

Monro arrived at Gallipoli on 27 October and proceeded to examine the situation. By the 31st he had communicated his views to the Cabinet, recommending instant evacuation. Lord Kitchener demurred, and left London on 4 November in order to investigate the situation for himself. Monro and other naval and military officers met Kitchener on 9 November and discussed the position, after which meeting Kitchener went round the British lines. On the 15th, before returning to London, Kitchener telegraphed to the Cabinet, supporting Monro's opinion as to evacuation. The view was then put forward in the Cabinet that the Peninsula should be evacuated except for the footing at Cape Helles; and this view gained ground. But Monro stood firm in his

advocacy of a complete withdrawal, and this decision was finally adopted on 23 December. The positions at Suvla Bay and Anzac Cove were evacuated between 8 and 10 December, the Cape Helles position in the first week of January 1916. By 9 January 1916 not a single British soldier remained in Gallipoli. The successful embarkation of so large a force at a cost of virtually no casualties and a relatively small sacrifice of material may be regarded as one of the most remarkable operations of the War.

Monro returned to France in January 1916 in order to assume the command of the First Army and held this post until 1 August of that year. His army did not play any notable part in the events of the summer, although the IV Corps, under Sir Henry Wilson [q.v.], sustained a somewhat nasty reverse at Vimy; Monro, however, would not sanction any attempt being made to recapture the lost ground.

On 1 October 1916 Monro was appointed commander-in-chief in India. By that time India had already placed in the field several divisions, which fought in France, Egypt, East Africa, and Mesopotamia, in addition to smaller contingents. But the Indian army was now required to undergo a further considerable expansion mainly for service in Palestine and Mesopotamia. In order to achieve this end it was found necessary to raise new classes of native soldiers and—an infinitely more difficult problem—efficient officers, British and native, to lead them. Proportionate expansion was required in the supply and medical services, while mechanical transport units had to be created. Lastly, supplies of war material and munitions adequate for the needs of these greatly augmented forces had to be found and organized. Throughout 1917 and 1918 Monro worked ceaselessly to overcome the difficulties of this colossal task. In addition, he was constantly engaged on inspection work, and even visited Mesopotamia. With the viceroy, Lord Chelmsford, Monro remained on the best of terms, so that the co-operation of these two able men made for success. At the time of the Armistice (11 November 1918) the Indian troops totalled nearly 600,000 men—nearly a fourfold expansion of the Indian establishment of August 1914.

The aftermath of the War, however, gave rise to events in India which caused Monro even greater anxiety than the development of Indian military power. Unrest in the Punjab culminating in the

Amritsar incident in April 1919, and events in Afghanistan leading to the so-called third Afghan War in the summer of that year, were followed by a difficult campaign in Waziristan during the winter of 1919 to 1920. The disturbances in the Punjab had for a time assumed serious dimensions. On 30 March there occurred an outbreak of mob violence at Delhi. At Lahore and at other towns similar incidents took place. At Amritsar on 11 April the officer in command, Brigadier-General R. E. H. Dyer [q.v.], ordered the troops to fire on a riotous crowd, with the result that 379 persons are known to have been killed and some 1,200 wounded; the incident aroused acute controversy. After the holding of an inquiry Dyer was eventually relieved of his command. From the first Monro had regarded Dyer's action as not showing the wisdom and sense of proportion which should be expected of officers of his position, and he never altered his opinion throughout the long agitation which ensued.

The Afghan and Waziristan campaigns were brought to a successful issue, the former in a few weeks; the latter after some laborious and protracted fighting. In spite of minor adverse criticism, both undertakings can be regarded as having been thoroughly well handled by Monro.

Eventually, however, the heavy cares of office began to tell on an over-worked man; Monro therefore resigned his appointment in August 1920 and went to live on half-pay in London. He was appointed governor of Gibraltar in September 1923, in which post he proved popular and efficient until his retirement in 1928. He died at his home in London 7 December 1929.

Monro may be regarded as a fine representative of the best type of British officer who fought in the European War. His cool common sense in battle was matched by true humanity; he was deliberate in council, determined in action. He possessed a great knowledge of warfare and remarkable insight into the reactions of men in battle. In addition to the K.C.B. he received the G.C.M.G. (1916), the G.C.S.I. (1919), and the G.C.B. (1919). He was created a baronet and appointed Bath King-of-Arms in 1921. He was an aide-de-camp general to King George V, 1918-1922, colonel of his old regiment, 'The Queen's', and a trustee of the Imperial War Museum.

Monro married in 1912 the Hon. Mary Caroline Towneley O'Hagan, daughter

of Thomas, first Baron O'Hagan [q.v.], lord chancellor of Ireland. There were no children of the marriage, and the baronetcy became extinct on his death.

H. DE WATTEVILLE.

MONTAGU OF BEAULIEU, second Baron (1866-1929), pioneer of motoring. [See DOUGLAS-SCOTT-MONTAGU, JOHN WALTER EDWARD.]

MONTAGU, EDWIN SAMUEL (1879-1924), statesman, the second son of Samuel Montagu, first Baron Swaythling [q.v.], by his wife, Ellen, daughter of Louis Cohen, was born in London 6 February 1879. His boyhood was undistinguished. He was educated for two years at Clifton College, until ill-health necessitated a sea-voyage, after which he spent two and a half years at the City of London School. But he made no mark until his undergraduate days at Trinity College, Cambridge, which he entered in 1898. As a young liberal politician he became president of the Union in 1902. He graduated B.A. in 1902 and M.A. in 1905.

Lord Swaythling was well known and respected as an unswerving upholder of Judaism, and his son, Edwin, remained a member of the Jewish community, but he did not inherit his father's rigid convictions. The Zionist movement appealed little to him, and national ties counted with him far more than the bond of race. But his racial antecedents may have quickened his Indian sympathies, and saved him from the sense of the colour bar in his personal relations with Indians. He notes in his Indian diary that 'there might be some truth in the allegation that I am an Oriental. Certainly that social relationship which English people find so difficult comes quite easily to me'.

Entering into politics when the liberal tide was running full flood, Montagu won, at the general election of 1906, the Chester division of Cambridgeshire, and remained member for that division until 1922. His foot was on the ladder as soon as he entered the House of Commons. He sought and obtained a private secretaryship to Mr. Asquith, then chancellor of the Exchequer, retaining the post

when his chief became prime minister. Promotion to the minor posts of government soon followed. He was for four years (1910-1914) parliamentary under-secretary of state for India, serving, during a period of considerable Indian change, under Viscount Morley and the Marquess of Crewe. In 1912 he paid a cold-weather visit to India, and his last Indian budget speech in 1918 showed the first-hand knowledge which enabled him to handle with easy and fluent mastery a wide range of Indian subjects.

In February 1914 Montagu became financial secretary to the Treasury, and during the first two years of the European War he held a succession of minor posts in the rapid ministerial changes which the War entailed. He won the coveted honour of a privy councillorship in February 1915, and entered the Cabinet at the unusually early age of thirty-six as chancellor of the duchy of Lancaster. He did good work in popularizing the first war loans, and in establishing voluntary war-saving associations (February 1916). In various offices he showed administrative ability and financial instinct which might have made him a good chancellor of the Exchequer, had he lived.

In June 1916 Montagu was made minister of munitions. An arrangement made by him with Messrs. J. P. Morgan & Co. saved the Allies many hundreds of millions on their American purchases. His loss of this office on the fall of Mr. Asquith's ministry in the following December was a heavy blow to his ambition. He had been in close personal touch with his chief; felt, as he says in his diary, 'hero-worship' for him, and owed to him his rapid promotion. He did in the end resign with most of Mr. Asquith's liberal colleagues, but he had no intention of being permanently entangled in the fallen fortunes of the prime minister. He felt it proper to give general support to the new government in the conduct of the War, and in June 1917 his chance came again when Mr. Lloyd George offered him the post of secretary of state for India on the resignation of (Sir) Austen Chamberlain.

Montagu accepted the office at a critical time. The need for constitutional change in India at the close of the War had been foreseen, and at the end of 1915 the viceroy, Lord Hardinge, had sent home a memorandum advocating a large programme of reform, so that the conclusion of peace might not find the home govern-

ment unprepared. The building of a new political structure in war time being impossible, an announcement of the goal of British policy in India might suffice for the moment, and it was the first task of Montagu to make this declaration on behalf of the Coalition government on 20 August 1917. The goal of British policy was declared to be the 'progressive realization of responsible government' in India as an integral part of the British Empire, to be attained in successive stages as might be determined by the Imperial parliament. Unexpectedly, the announcement was made, not in Montagu's language, but in terms drafted by Lord Curzon [q.v.], who was at that time a conservative member of the inner War Cabinet under Mr. Lloyd George [see Lord Ronaldshay's *Life of Lord Curzon*, iii, 127, for the two drafts]. Curiously enough, Lord Curzon's draft, by introducing the term 'responsible government', pointed more definitely than Montagu's to the familiar British model of an executive responsible to an elected legislature. No liberal, in Montagu's view, could question that parliamentary institutions had the same value for Indians as for Englishmen, and he was determined to introduce an adequate instalment forthwith into British India.

In order to determine on the spot the first step towards the announced goal, Montagu, with a small delegation, half of civil servants and half of politicians, toured round the provinces of India from November 1917 to May 1918. It was decided not merely to frame a scheme for submission to parliament, but to compile a report on the lines of the historic Durham report which led up to Canadian self-government. The task of drafting this report, *Report on Indian Constitutional Reforms* [Cmd. 9100 of 1918], under severe time limits, was carried through by (Sir) William Marris, joint secretary to the government of India.

Montagu's diary of this tour, published twelve years afterwards by his wife [*An Indian Diary*, edited by Venetia Montagu 1930], is an uncensored document which reveals the part played by him in the construction of the proposed scheme of reform. Written or dictated from day to day, and not meant for publication, the diary gives a vivid picture of the varying moods of a mind prone to ups and downs of feeling. Many of the statements in the diary, therefore, need not be treated as considered or deliberate judgements. Montagu is often unjust to

the viceroy, Lord Chelmsford, though in the end he does recognize the loyal and generous support which the viceroy gave him; and the picture drawn of the statesman playing a lone hand, dragging forward a reluctant viceroy and wrestling day by day unaided with the narrow obstinacy of all around him, can hardly be accepted. The scheme of the *Report* was not, in fact, the emanation of his own or, indeed, of any single brain. It was a composite structure, built up laboriously from the suggestions of many minds, and such strength as it possessed was due to this pooling of ideas. But if Montagu was not the sole author of the scheme, the diary makes two points clear. First, it reveals his own mental method, which he describes as 'framing conclusions and training himself to discard them, without prejudice, for better ones'. There were no precedents for a scheme of reform to serve a transitional period, such as he sought to find; and if there had been any, they would have required modifications to suit the wholly exceptional conditions of India. Montagu handled his problem with elasticity and resilience of mind, but the flexibility with which he entertained and discarded expedients was not without its embarrassments, even for himself. Secondly, the diary reveals the untiring pains which he took personally to persuade, convince, and even to cajole doubters or opponents, both British and Indian. He resented the Olympian airs of the government of India, and consulted Indian opinion as it had never been consulted before. If the scheme went through with goodwill, or at least acquiescence, it was largely due to the pertinacity, drive, and determination with which the secretary of state had previously rallied the bulk of opinion to his side.

Montagu had the satisfaction of seeing the scheme of constitutional reform accepted, with important amendments made by the joint select committee of both Houses of Parliament, but without opposition in parliament except from a determined group of retired Indian civilians. It passed into law in the Government of India Act (1919). Lord Curzon, then foreign secretary, in spite of his part in the declaration of 20 August 1917, suffered a violent revulsion of feeling. Speaking in the House of Lords, 12 December 1919, he said that 'the act was a great experiment—a daring experiment—he would not cavil at the word 'rash' being applied to it.' But he acquiesced in its passage. Space only suffices

to point out where the scheme broke new ground; its details must be sought in the *Report* itself. The central feature was a substantial but duly safeguarded extension of self-government in the nine major provinces, operating through the novel and much criticized expedient, incorrectly nicknamed 'dyarchy', whereby the governor of the province was to administer certain 'reserved' services through his executive council, and other 'transferred' services through Indian ministers responsible to the elected legislature of the province. Lord Morley in defending the Minto-Morley reforms had expressly disclaimed any intention of introducing parliamentary institutions into India. Up to 1919 a chain of responsibility reached from the district officer, personally administering his district in India, through the head of the province to the governor-general, who being subordinate to the secretary of state, was through him responsible to parliament. Montagu's plan broke this chain of responsibility to a definite but limited extent. Henceforth there would be a sphere of provincial government in which Indian ministers would be responsible, not to the British parliament, but through an Indian legislature to an Indian electorate.

Meanwhile, however, divergence widened between Montagu's views and those of the government of which he was a member. The treatment of conquered Turkey was bound to excite strong feeling among the ninety million Moslems of India. They resented the disintegration of the last great Mohammedan power and what seemed to them the desecration of the holy places of their religion. Mr. Lloyd George, following the Gladstonian tradition, wished to overthrow Turkish power in Europe, and cared nothing for pledges given in the opposite sense. The government of India was bound to represent the dangerous reaction of this policy on disturbed Indian opinion, and Montagu caused growing irritation among his colleagues by supporting the Indian view. The final breach came over a technicality; at a critical moment (March 1922) in the negotiations with Turkey and Greece, the government of India asked leave to publish its protest against the Treaty of Sèvres. Without obtaining permission from the Cabinet, Montagu sanctioned publication. The doctrine of Cabinet responsibility he worn thin under coalition government but the constitutional impropriety of his action could not be disputed. Lord Curzon

at the Foreign Office was indignant, and Mr. Lloyd George promptly required Montagu's resignation.

For Montagu, this proved to be the end of his political career. He took it hard, violently attacking Lord Curzon and the Coalition in a speech at Cambridge (11 March 1922). His speech in vindication of his action in the House of Commons closed with the words: 'this is the unhappiest moment of my life.' In the general election of 1922 his Cambridge-shire constituency turned against him, and in a three-cornered contest, in which he was opposed both by a conservative and a labour candidate, he was left at the bottom of the poll. He broke away from politics, took business posts in the City, went on a financial mission to Brazil (1923-1924) and died in London 15 November 1924, at the early age of forty-five. Montagu had married in 1915 the Hon. Beatrice Venetia, youngest daughter of Edward Lyulph Stanley, fourth Baron Sheffield [q.v.], and left an only child, a daughter.

A word may be added about Montagu's main recreation, the passion for shooting to which his Indian diary bears eloquent testimony. He cared for shooting for its own sake, but in India he did, in fact, get more out of it than the satisfaction of the deep-seated instinct of pride in efficient killing. It brought him into easy personal touch alike with British administrators and with maharajas, who glory in their tiger preserves. Nor did he wholly sink the naturalist of his early days in the sportsman; he delighted to shoot poached in Norfolk or sandprouse in Gujner, but he and Lord Grey of Fallodon established a bird sanctuary near his Norfolk home at Breckles Hall.

Speaking in the chamber of princes after Montagu's death, the Maharaja of Alwar applied to him a slightly altered quotation, 'He was our friend, faithful and just to us', and Indian nationalists have reason to echo that judgement.

For the measure of success attained by Montagu's scheme of Indian reform in the first years of its working, reference may be made to the report of Sir John Simon's commission [*Report of the Indian Statutory Commission of 1930*: Cmd. 3568]; but time alone can decide on the ultimate wisdom of the introduction of parliamentary institutions into India, towards which he gave the deciding impulse.

A portrait of Montagu is included in the painting by Sir William Orpen of the

signature of the Peace of Versailles at the Imperial War Museum, South Kensington. There is a statue of him by Lady (Hilton) Young (afterwards Lady Kennet) in Calcutta, and another by E. Riccardi at Jamnagar.

[*The Times*, 17 November 1924; *Edwin S. Montagu: a memoir*, privately printed; *An Indian Diary*, edited by Venetia Montagu, 1930.] C. ROBERTS.

MONTAGUE, CHARLES EDWARD (1807-1928), man of letters and journalist, was born at Ealing 1 January 1807, the third of the four sons of Francis Montague, by his wife, Rosa McCabe, daughter of a Drogheda merchant. The father was an Irish priest from county Tyrone who had renounced his orders owing to scruples of conscience and had settled in England. Montague was educated at the City of London School under Edwin Abbott Abbott, and at Balliol College, Oxford, where he matriculated as an exhibitor in 1825, and where he was deeply influenced by Richard Lewis Nettlehip [q.v.]. He obtained a first class in classical moderations in 1827 and a second in *literae humaniores* in 1829. Next year (1830) he joined the staff of the *Manchester Guardian*, on which he remained, except during the European War, until 1925. In 1828 he married Madeline, daughter of the editor, Charles Prestwich Scott. Trained by Scott, and also by William Thomas Arnold [q.v.], his chief lieutenant, Montague became a brilliant and many-sided journalist, writing for home rule, free trade, women's rights, and all the liberal causes, and taking, with his paper, the unpopular side in the Boer War. He also made his mark as a dramatic critic by articles which were reprinted in *The Manchester Stage* (reviews by Arnold, Montague, Allan Monkhouse, and Oliver Elton, 1900) and by his *Dramatic Values* (1911). In time, after Arnold's retirement in 1898 from the *Manchester Guardian*, Montague became second in command. He contributed the section 'Middle Life' to Mrs. Humphry Ward's memoir of his friend Arnold. This memoir was prefixed to Arnold's posthumously published *Studies of Roman Imperialism* (1906). In 1910 appeared Montague's witty skit on low journalism, *A Hind Let Loose*, and in 1913 *The Morning's War*, a tale full of the poetry of mountaineering, his favourite recreation.

On the outbreak of the European War in 1914, despite his age and family ties, Montague dyed his hair, which had been

grey from his youth, and enlisted. He was hurt by an explosion while training as a bomber, but in November 1915 crossed to France as a private in the 24th battalion of the Royal Fusiliers. After three weeks in the line he was invalided home, but in June 1916 was commissioned and entered the intelligence service on the Western front. For a year he was a 'conductor' of distinguished guests of the army; in June 1917 he became an assistant press censor. He saw most of the front in France and Flanders, and in 1918 went with the advance to Cologne.

Montague kept a war diary [see *Memoir*] which contains some of his best and simplest writing. He also wrote, while on service, vivid notes and introductions to the drawings by Muirhead Bone entitled *The Western Front (1916-1917)*, and to those by various other hands (*British Artists at the Front, 1918*.)

On being demobilized in 1919 Montague returned to the *Manchester Guardian*. Thereafter he published *Disenchantment* (1922), a series of fierce and notable essays on the War, which greatly widened his reputation; *Fiery Particles* (1923), short stories in which the War again figures; *The Right Place* (1924), gay holiday essays; *Rough Justice* (1926), a war novel with much personal reminiscence, and *Right off the Map* (1927), a fantasia full of anti-militarism. Posthumously published were *Action* (1928), more short stories, and *A Writer's Notes on his Trade* (1930), chiefly on the niceties of style and cadence. An unfinished paper, 'Inexpert Approaches to Religion' [see *Memoir*, appendix], reveals the movement of Montague's mind towards an undogmatic and partly mystical faith. In 1925 he retired from journalism and settled at Burford, Oxfordshire. In 1926 he received the honorary degree of Litt.D. from the university of Manchester. He died of pneumonia at Manchester 28 May 1928, leaving five sons and two daughters. His death was noticed with regret, and his career with pride, by journalists in most of the English-speaking countries.

In spite of a shy address, which covered great native courage, and of a certain film of reserve, Montague was at home in many companies, and not least with working people. His associates in the press and in the War, including the war correspondents, have paid him many tributes. As a journalist he had, when occasion demanded, an excellent fighting style. He also acquired a peculiar artistry in prose. His letters and diaries written without

study, show a great delicacy in the use of plain language. In his books the style, although never flat or commonplace and often most eloquent and beautiful, is not seldom over-conscious; it can also be unadorned and direct. All his gifts are seen in his longer novels, but on these his reputation will hardly rest; he found construction difficult, and the characters are not all equally real. Many of the shorter tales are admirably built and told, and are peopled by humorists, Irish or English, whose idiom is happily reproduced. As an essayist, whether polemical and satirical (*Disenchantment*), or buoyant and free of care (*The Right Place*), or aesthetic (*A Writer's Notes*), Montague excels and is likely to be remembered.

[Oliver Elton, *C. E. Montague, a Memoir* (including extracts from the Diary and 'Inexpert Approaches to Religion', &c.), 1929; personal knowledge.] OLIVER ELTON.

MONTGATH, SIR JAMES (1847-1929), Indian civil servant, was born at Guilburn, Lockerbie, Dumfriesshire, 7 September 1847, the fourth son of Thomas Montgath, of the Bank of Scotland, who came of an old Perthshire family, by his wife, Hannah Johnstone. After early education at Lockerbie, Montgath went to the Royal Academical Institution, Belfast, and thence to Queen's College, Belfast, where he graduated M.A. He passed the open examination for the Indian civil service in 1868, and was appointed to the Bombay Presidency in August 1870.

Montgath's early service was in the south of the Presidency, and his interest in this part of the province was shown by his contributions to the *Bombay Gazetteer* of the North Kanara district. His abilities, however, soon marked him for work at head-quarters, and he was transferred to Bombay in 1873. Here, after holding the posts of under-secretary and secretary to government and private secretary to the governor, Lord Reay, he became, in July 1896, chief secretary to the government of Bombay. In that capacity he had to deal with the great Bombay famine of 1896-1897. He handled the situation with such success that the Bombay government justly claimed that no previous failure of crops of equal magnitude had left so little mark on the agricultural community. Montgath received the C.S.I. in June 1897. The famine of 1896-1897 was followed, after two seasons of indifferent harvests, by the still more disastrous famine of 1899-1902, which affected fifteen districts and

ten million people. Monteath was placed in special charge of famine relief, and the famine commission of 1901 referred appreciatively to his work, in support of the recommendation for the regular appointment of a famine commissioner upon similar occasions in the future.

Monteath became revenue member of the Bombay executive council in August 1900, and was acting-governor of Bombay from 6 September to 13 December 1903. In January of that year he was promoted K.C.S.I. As member of the council he initiated, with lasting benefit to the agriculturists of Bombay, his important reforms of land-revenue law. The famine commission of 1901 had criticized the existing system of land tenure in Bombay, where, it alleged, at least one-quarter of the cultivators had lost their land and less than one-fifth were free from debt. The new and restricted tenure introduced by Monteath in the Land Revenue Code Amendment Bill of 1901 aimed at reducing agricultural indebtedness by restricting, on state lands, the tenants' power to alienate their land. The Bill met with heated opposition in the Bombay Legislative Council, but Monteath, with characteristic firmness, declined to yield.

Monteath left India in August 1905, taking with him the respect of every one, even of those who were most opposed to his policy, for his ability, determination, and unflinching devotion to duty. A man of reserved disposition, he was a great reader, especially of classical literature, the love of which he had acquired from 'dominie' Ferguson of Lockerbie, and retained to the end of his life. After retirement Monteath lived at Buckereil Lodge, near Honiton, where he died 18 April 1929. He married in 1872 Amelia (died 1927), daughter of Thomas Hunter, of Belfast, a member of a Scottish family long settled in Ireland. They had five sons and three daughters. Two of the sons followed their father in the Bombay civil service, a third was in the Indian forest service, while a fourth entered the India Office and became private secretary to the secretary of state—an unusual family record of service for India.

Monteath's reputation rests on his success as a famine administrator, and as an agrarian reformer whose policy has left an enduring mark on the land-revenue system in Bombay.

[*The Times*, 22 April 1929; *Reports of Indian Famine Commissions of 1898 and 1901*; official records; personal knowledge.]

A. C. McWATTERS.

MOOR, SIR FREDERICK ROBERT (1853-1927), South African statesman, was born at Pietermaritzburg, Natal, 12 May 1853, the eldest son of Frederick William Moor, a settler under the Byrne immigration scheme of 1850, by his wife, Sarah Annabella, daughter of Robert Ralfe. He was educated at Hermannsburg School, near Greytown, Natal. The discovery of the diamond fields attracted him, as a young man of nineteen, to the dry diggings at Kimberley. Here he met, and in 1878 married, Charlotte, daughter of William James Dunbar-Moodie and granddaughter of Donald Moodie [q.v.], first colonial secretary of Natal. Three sons and four daughters were born of the marriage. Moor remained at the diggings for seven years. With the arrival of Barnett Isaacs, better known as Barney Barnato [q.v.], and Alfred Beit [q.v.], Moor realized that it would be increasingly difficult for the individual digger to make a fortune. Like many others, he sold out his claims, and in 1879 returned to Natal, settling down as a farmer near the small town of Estcourt.

Moor's experiences in Kimberley, where he had twice been elected to the mining board, fostered an inclination towards public life; and in 1886 he began his political career in Natal as member, for Weenen county, of the legislative assembly. He attached himself to the party which advocated self-government for Natal; and in 1893, when responsible government was conceded, he was offered the portfolio of native affairs. This office he held for four years. His eloquence made him one of the most formidable members of the country party, and he possessed the full confidence of the native inhabitants of the colony. Two years in opposition (1897-1899) were followed by a further tenure of office as minister for native affairs. During this period (1899-1903) the two most important political issues were the maintenance of the Bantu tribal system, and the serious financial and administrative problems arising from the divergent policies of the four British South African colonies with regard to customs and railway rates. As minister for native affairs, Moor was disposed to modify the traditional policy of Sir Theophilus Shepstone [q.v.] of maintaining communal customs and upholding the authority of the Bantu chiefs. He favoured the grant of land titles to natives on individual tenure, but failed to carry a bill to that effect through the colonial legislature. He retired with his chief,

Sir Albert Hume, on the defeat of the ministry in August 1903.

As leader of the opposition to the ministry of C. J. Smythe (1905-1906), Moor trenchantly criticized the increase in the taxation of natives, and particularly the ill-advised poll tax which provoked the native rebellion of February 1906. On the larger question of the political future of South Africa, he consistently urged the necessity for some measure of political and economic unification. As delegate for Natal to the inaugural ceremonies of the Australian Commonwealth in 1901, he had been profoundly impressed by the enthusiasm of Australian statesmen, and by their confident anticipation that federation would lead to an immense expansion of the resources of their country.

In November 1906 Moor succeeded Smythe as prime minister, and the opportunity to throw the weight of Natal into the scales in favour of a movement for the unification of South Africa came in the critical years 1908-1910. In 1908 he went to Pretoria to attend the conference on customs and railway rates, and identified himself whole-heartedly with the proposal that immediate steps should be taken to assemble a national convention for the purpose of preparing a draft union constitution. Opinion in Natal was extremely sympathetic towards federation, but hostile to the suggestion of a unitary constitution. On this issue, Moor and his colleagues were outvoted in the National Convention which met at Durban in October 1908. Eventually Moor acquiesced in the grant of large discretionary powers to the Union government, believing that public opinion would safeguard the essential rights of the provinces. He informed the Natal legislature that a strong central government was essential for the immediate future in order to develop the resources of South Africa. He predicted, however, that the powers granted to provincial councils would ultimately be enlarged. His insistence that isolation would be suicidal brought round the bulk of his followers, and at a referendum in June 1909 Natal accepted the Union constitution by an unexpectedly large majority.

In General Botha's federal ministry of 1910, Moor took the portfolio of commerce and customs; but he was defeated at the first election following the Union. His previous experience as minister for native affairs in Natal qualified him to serve as a senator with special knowledge of native

requirements and he was nominated in this capacity, retaining his seat for ten years (1910-1920). He then retired to his farm, Greystone, at Estcourt, where he died 18 March 1927.

Moor was not a great parliamentary leader, but he was a fluent speaker and a man of genuine breadth of view. He was entirely devoid of racial prejudice, personally popular with Dutch-speaking colonists, and a sincere friend of the native population. Even political opponents acknowledged his deep attachment to the interests of Natal. In private life, he was a keen sportsman, and an excellent big-game shot. His political services were rewarded with a privy councillorship on the occasion of the Imperial Conference of 1907, which he attended as premier of a self-governing colony. He was knighted in 1911.

[*The Natal Witness*, 19 March 1927; *Debates of the Legislative Assembly of the Colony of Natal*, vols. xlv-xlviii, 1908-1909; *Sports and Sportsmen: South Africa*, n.d.; private information.]
A. F. HATTERSLEY.

MORESBY, JOHN (1830-1922), admiral and explorer, was born at Allerton, Somerset, 15 March 1830, the second son of Admiral of the Fleet Sir Fairfax Moresby [q.v.], by his wife, Eliza Louisa, youngest daughter of John Williams, of Bakewell, Derbyshire. He was educated at a private school until the age of twelve when he joined the royal navy in the *Caledonia*, then the flagship at Devonport. In 1845 he sailed as a midshipman in the frigate *America* for the Pacific via Cape Horn. The *America* returned to England the next year with a freight of specie which it was then the custom to send home in naval ships. Moresby next served with the Channel fleet, and in the paddle frigate *Odin* was at Palermo during the rising of 1848. The following year he joined the *Excellent* for gunnery instruction, and subsequently was appointed gunnery mate of the frigate *Amphitrite* and sailed for the west coast of South America in 1850. Shortly afterwards he was transferred to the frigate *Thetis* as gunnery lieutenant, and in 1853 was in command of a punitive expedition against the Indians of Vancouver Island. Returning home on promotion, Moresby joined the paddle sloop *Driver* as first lieutenant in 1854 on the eve of war with Russia. For two summers he was on reconnaissance work in the Baltic, and took part in the storming of the Bomar-

sund forts and the abortive attack on Riga.

On the conclusion of peace with Russia Moresby was appointed flag-lieutenant to the admiral in command of the Irish station and was given leave to accompany his father to Austria when Sir Fairfax Moresby represented the British navy at the centenary of the order of Maria Theresa. In 1858 he became commander, and after a period on half pay was appointed in 1861 to command the *Snake* on the China station, where he took part in the suppression of the Taiping rebellion and was in action at Shanghai. The *Snake* was subsequently engaged in the suppression of piracy on the coasts of southern China and in safeguarding the rights of English ships engaged in the opium trade. In the sloop *Argus*, of which he took command in 1863, Moresby went to Japan and took part in the international attack on the Shimonoseki forts in 1864 and in the subsequent naval demonstration in Japanese waters.

In 1865 Moresby was promoted captain and, sharing the fate of many officers of his rank at that time, went on half pay until 1871 when he was given command of the paddle sloop *Basilisk* for service on the Australian station. The *Basilisk* was not a survey vessel and carried no officers specially trained for such work, but the chances of exploration which her area of cruising afforded, led Moresby to apply successfully for a small outfit of surveying instruments. Between 1872 and 1874, except for two cruises to New Zealand and among the South Sea Islands respectively, the ship was in Torres Strait and along the coasts of New Guinea; and although primarily concerned with the suppression of the kidnapping of native labour, she carried out a long series of important explorations, adding to the charts some of the coast lines which were still unknown outside polar regions.

The Queensland government lent the services of a survey officer, but otherwise Moresby received scant encouragement until, at the end of its commission, the *Basilisk* was ordered to return home by the north coast of New Guinea in order that the survey work might be continued. In those days the south-east coast of New Guinea, though visited by a few missionaries, was scarcely known. The work of Luis Vaes de Torres in 1606 at the eastern end of the island was revealed only in 1878 by the discovery of his map in Madrid. Moresby surveyed, on

the south coast, Hall Sound and Redsear Bay, discovered Port Moresby, Fairfax Harbour (which he named after his father), and Discovery Bay, as well as their approaches, and various islets and reefs in Torres Strait. By Hilda and Ethel rivers he tried to penetrate the unknown interior. He next discovered at the east end Hayter, Basilisk, and Moresby Islands and China and Portescue Straits, and took possession of the islands in the name of Queen Victoria (1873). Of the eastern part of the north coast nothing was known at the time except a few vague landfalls of J. A. B. d'Entrecasteaux in 1793. Moresby mapped the whole coast westward to Astrolabe Bay as well as the islands of the d'Entrecasteaux group—Normanby, Ferguson, and Goodenough. In all, his surveys covered 1,200 miles of unknown coastline and about a hundred islands.

Moresby returned home at the end of 1874 to find that while geographers realized the value of his work, the Admiralty had become strangely indifferent and the government of the day had no anxiety to establish British claims in eastern New Guinea. It was not until 1884 that the hand of the government was forced by the action of Queensland, and a British protectorate, with its capital at Port Moresby, was proclaimed in the south-east of the island. The greater part of Moresby's discoveries eventually fell into German hands, but on 17 September 1914 Kaiser Wilhelm land, as the territory had been called, surrendered to an Australian force, and since 1920 has been administered by Australia under a mandate from the League of Nations.

After a short spell in charge of the coastguards between Cromer and St. Abb's Head, Moresby was senior naval officer in charge of the Bermuda dockyard from 1878 to 1881; there he effected many improvements. In 1881 he became a rear-admiral and was appointed assessor to the Board of Trade. He retired in 1888 with the rank of vice-admiral and became admiral on the retired list in 1893.

Moresby married in 1859 Jane Willis (died 1876), eldest daughter of Philip Scott, J.P., of Queenstown, Ireland, and had one son and four daughters. He enjoyed the unique distinction of having his name bestowed, during his lifetime, on a destroyer built in 1916, in recognition of his discoveries in New Guinea. He died at Fareham, Hampshire, 12 July 1922.

[*The Times*, 13 July 1922; J. Moresby, *Two Admirals* (an autobiography with some ac-

count of his father's career), 1909, and *Discoveries and Surveys in New Guinea*, 1876; private information.]

R. N. RUDMOSE BROWN.

MORLAND, Sir THOMAS LETHBRIDGE NAPIER (1865-1925), general, was born 9 August 1865 at Montreal, Canada, the eldest son of Thomas Morland, a manufacturing engineer, who, after emigrating to Canada as a young man, played an important part in the construction of the Canadian Pacific Railway, by his wife, Helen Elizabeth, daughter of General Henry Servante. On losing both parents when still a child, Morland was brought to England to be educated, and sent to Charterhouse and subsequently to the Royal Military College, Sandhurst. Thence he was gazetted into the King's Royal Rifle Corps in August 1884. Whilst still a subaltern he passed in 1890 into the Staff College, Camberley, where he spent two years, graduating in December 1892. After being promoted captain in April 1893, he was appointed aide-de-camp to General Sir A. J. Lyon Fremantle, commander-in-chief in Malta, in February 1895.

Being of an adventurous disposition, and a good horseman, Morland desired more active employment. This he found in Nigeria, being transferred in February 1898 to the West African Frontier Force, which he joined in time to take part in the operations which were then in progress in the river Niger valley and hinterland. This was the first of six minor campaigns in those regions in which he participated with credit. In recognition of his earliest service Morland was promoted brevet-major in July 1899 and given command of the 1st battalion West African Frontier Force with the temporary rank of lieutenant-colonel. Early in 1900 he commanded the little column engaged in the Kaduna expedition in Northern Nigeria; later in the same year he took part in the Ashanti operations, after which he obtained the brevet of lieutenant-colonel. In 1901 he conducted the operations against the emir of Yola, when he was slightly wounded, subsequently receiving the D.S.O. (1902). In the latter year he was given the command of the small Bornu expedition. Finally, in 1903, he was engaged in the campaign against the rulers of Kano and Sokoto. In the following March (1904) he was awarded the C.B. After a spell of leave Morland was promoted colonel in September 1905 and

returned to Africa as inspector-general of the West African Frontier Force with the temporary rank of brigadier-general. No more fighting fell to his lot, and he finally returned home in 1909. He did not obtain further employment until the following June (1910), when he was given command of the 2nd brigade at Aldershot, where he remained for three years. He then gave up his command (June 1913), having been promoted major-general three months earlier.

Morland now remained on half pay for over a year. On the outbreak of the European War, he was appointed (August 1914) to the command of the 2nd London division of the Territorial Force, but he was very soon transferred to the command of the newly created 14th division of the New Armies. Two months later he was again transferred, to the vacant command of the 5th division. Arriving in Flanders on 18 October, he led part of his new command at La Bassée during the first battle of Ypres. In July 1915 he was advanced to the command of the X Army Corps, with the temporary rank of lieutenant-general, and was created K.C.B. The X Corps was then in process of formation, and so did not participate in any important engagement until it was allotted to the Fourth Army before the opening of the battle of the Somme (1 July 1916). It then fought in the arduous actions at Bazentin and on Pozières Ridge (14-31 July). For some weeks during the following August and September Morland commanded the XIV Army Corps in the absence of Lord Cavan.

The X Corps was next moved into the Second Army, and thus came to take a full share in the battle of Messines (June 1917). It continued to fight in the operations that ensued to the east of Messines in the third battle of Ypres. For the closing stages of that battle Morland's Corps was transferred to the Fifth Army and took part in the sanguinary struggle of Passchendaele (September-October). Morland was then rewarded with the K.C.M.G. (1917). After this the X Corps was again brought south, and was virtually used up for reinforcements during the German offensive in March 1918. Morland himself, in April, was given the command of the XIII Army Corps, a position which he held until March 1919. During that period he commanded his troops with some success in the fighting round Cambrai in August 1918. His Corps was again heavily engaged on the river Selle, and

at the date of the Armistice (11 November) was standing on the river Sambre.

Morland was promoted substantive lieutenant-general in January 1919. But he was then struck down by an attack of the prevalent influenza, and never really recovered good health. In March 1919 he returned to the command of his former troops, the reconstituted X Corps, in the army of occupation at Cologne. A year later he succeeded Sir William Robertson as commander-in-chief of that army, and became temporary general. In March 1922 he returned home in order to assume the chief command at Aldershot in succession to Lord Cavan, and in November of that year he was promoted full general. Owing, however, to his impaired health he vacated his appointment at the end of February 1923. He never obtained further employment, and died rather suddenly at Montreux, Switzerland, 21 May 1925. He was appointed colonel of the Suffolk Regiment in 1919, and an aide-de-camp general to King George V in 1922.

Morland married in 1890 Mabel Elinor Rowena (died 1901), daughter of Admiral Henry Craven St. John, of Stokefield, Thornbury, Gloucester, and had two daughters.

[*The Times*, 25 May 1925; Army Lists; private information.] H. DE WATTEVILLE.

MORLEY, JOHN, VISCOUNT MORLEY OF BLACKBURN (1838-1923), statesman and man of letters, was born at Blackburn on 24 December 1838. His father, Jonathan Morley, a surgeon, who came from Mytholmroyd in the West Riding of Yorkshire, was the son of a small clothier. Morley's mother, Priscilla Mary Donkin, belonged to a shipowning family in North Shields. There were three sons, Edward, John, and William. Grace, the only daughter, was John's favourite companion and they were deeply attached to one another. The father, a man of strong character and quick temper, was a lover of books. Originally a Wesleyan, he joined the Church of England after settling as a surgeon in Blackburn. Blackburn, the chief centre of the cotton-weaving industry, was, in common with the whole North of England, suffering from trade depression during Morley's childhood. Distress often approached famine during the 'hungry forties'. The people were overcrowded and badly housed; there was much brutality, and rioting was frequent in the town.

John Morley's studious tastes were

encouraged by his father, and by the headmaster of an excellent local school, known as Hoole's Academy, which he attended. There he attained such proficiency that his father sent him to University College, Gower Street, and thence to Cheltenham College. There he took no part in sports but worked steadily, and in 1856 won an open scholarship at Lincoln College, Oxford. In an essay on Mark Pattison [q.v.], written long afterwards, Morley described the 'intellectual dilapidation' into which Lincoln College had fallen about this time. When, in 1851, the Fellows had elected as their rector not Pattison, but an obscure and unlearned person, Pattison, in consequence of this rebuff, had become a misanthrope who took no part in college life; Morley, therefore, only came to know the great scholar in after years. But he won the esteem of a young tutor, Thomas Fowler [q.v.], afterwards president of Corpus Christi College, and took a prominent part in the social life of the college as well as in the debates at the Union Society. His chief friend in college was James Augustus Cotter Morison [q.v.], then senior commoner, wealthy, brilliant, independent, who was already at work on his life of St. Bernard, and 'brought our young souls into vivid and edifying contact' with great contemporaries like Carlyle and wise teachers like Emerson. Morley had been destined for holy orders, but Oxford life gradually disinclined him for a religious vocation, and a quarrel with his father forced him, after obtaining a second class in honour moderations, to relinquish 'Greats' in his third year, and to leave Oxford with only a pass degree.

For the next three or four years (1860-1863) Morley had a hard struggle as a free-lance journalist in London. Of his experiences at this time he wrote to Frederic Harrison [q.v.] in 1873: 'I was a scrawler when I first came to town, and I have scribbled many a day before now with a hungry paunch, but 'twas all honest and honourable.' At last, after much ill-paid hack work, his contributions to the *Saturday Review* so impressed John Douglas Cook [q.v.], its almost illiterate but highly successful managing editor, that he sent for Morley (who was then lodging in King's Bench Walk) and commissioned him to write 'middle' articles and reviews, giving him at the same time a handsome retaining fee. Among others on the *Saturday's* staff at that time were Robert Cecil, afterwards

third Marquess of Salisbury and prime minister, and (Sir) Leslie Stephen, with whom Morley now formed a lifelong friendship.

In the same year (1863) Morley became acquainted with George Meredith, and later, through Meredith and Cotter Morison, with Frederick Augustus Maxse [q.v.], William Hardman, Frederic Chapman [q.v.], the publisher, and a set of bohemians at the Garrick Club. In those days, George Meredith lived in a cottage near Esher. Morley recalls [*Recollections*, i, p. 86] what Meredith's friendship and personality meant to a young journalist with an ambition for 'letters in their broadest sense—letters in terms of life, and in relation to life'. Besides being a poet and a novelist, Meredith was an ardent radical, though he did not always hold party views; and by this time, Morley, by nature an idealist, was open to the ideas and impulses of liberalism. He had no taste for the slashing Toryism of the *Saturday Review*, and never contributed to its political effusions. In 1865 he thought it worth while to republish some of his 'middles' in an anonymous volume entitled *Modern Characteristics*. The book made no mark, and in after life the author never claimed it as his own. Only here and there can be detected the originality of thought and style which appears two years later in his first book on Burke. But one of his *Saturday* essays—on 'New Ideas'—arrested the attention of John Stuart Mill, and brought Morley into personal contact and lasting friendship with the great teacher and philosopher of liberalism. After this, until Mill's death in 1873, Morley was a constant visitor at Blackheath; and never in after life forgot his debt to the 'saint of rationalism'. At Mill's house he met George Grote, Herbert Spencer, Leonard Courtney, Henry Fawcett, John Elliot Cairnes, and others of Mill's school. Another of Morley's articles, a review of *Toilers of the Sea*, written in 1866, brought him a much prized letter from Victor Hugo, then an exile in Guernsey.

By this time Morley's gifts were beginning to impress a widening circle of notable men and women, whose ideas were penetrated by progressive thought in science, religion, morals, and politics. In 1866, a criticism of her novels in *Macmillan's Magazine* gained him the friendship of George Eliot; and in January 1867, largely through the influence of Cotter Morison, he was appointed editor of the

Fortnightly Review, a venture which had been launched in the previous year by Frederic Chapman in conjunction with Cotter Morison, George Henry Lewes, and Anthony Trollope. In Morley's hands, the *Fortnightly* soon became an influential organ of liberal opinion, distinguished by the boldness and originality of its views, and by a happy variety of signed contributions from many brilliant writers and scientific men, such as Meredith, Trollope, Mill, Huxley, Herbert Spencer, Matthew Arnold, Swinburne, Mark Pattison, Walter Bagehot, and Leslie Stephen. At this time Morley was in close sympathy with Frederic Harrison and the leading positivists; but, like George Eliot, he never identified himself with the religion of Comte. In Frederic Harrison's chambers at Lincoln's Inn he read a little law. He was called to the bar in 1873, and, although he never practised, was elected in 1891 a bencher of Lincoln's Inn, where he often dined.

Morley held the editorship of the *Fortnightly Review* for fifteen years, and maintained throughout, with a few exceptions, the policy, then an innovation, of the signed article. Morley discussed and planned almost every number of the *Review* with Frederic Harrison, who virtually acted as assistant-editor. Up to a point, Harrison's positivism and Morley's agnosticism harmonized well enough, for both were enthusiastic opponents of established dogma, and eager champions of the new humanitarian rationalism which, it was thought, would take its place. Of Morley's published letters some of the liveliest are those which, in the early 'seventies, he wrote to Harrison.

Much of the best work published in the *Fortnightly Review* came from Morley's own pen. His first real contributions to English literature, a series of essays on Burke, began in the *Fortnightly* for February 1867. They were republished in the same year with some additions in book form by Messrs. Macmillan, who had just appointed him their reader and literary adviser. In this, his first study of Burke, are many faults; but there are passages to show that he had just begun to form a prose style of the first order. The book is also interesting for the light which it throws thus early on his political ideals, and for the characteristic blend of conservatism with liberal or radical doctrines, which he was ready to apply to problems of government and society. In these early days, his masters

were Adam Smith, the Physiocrats, Bentham, Austin, Maine, Comte, Mill, and Turgot. 'But', he says, 'I owed more to Burke for practical principles in the strategy and tactics of public life than to the others.' Comte's philosophy and his calendar of the great men who had contributed to human improvement made a lasting impression on Morley, but the influence of Mill and Huxley, as well as his own strong anti-sectarian instincts, prevented him from joining the English Positivist church, though he had much in common at this time with the three Wadham disciples of Comte—Frederic Harrison, E. S. Beesly, and J. H. Bridges.

For Huxley, ablest of the scientific agnostics and their most powerful controversialist, Morley entertained a lively admiration. Of all the articles published in the *Fortnightly* that of Huxley on the *Physical Basis of Life*, which appeared in February 1869, made, perhaps, the most stir. At a time when the Old Testament account of the origin of the world and even its chronology were still defended by orthodox theologians, Huxley was allowed and encouraged by the editor of the *Fortnightly* to substitute evolution for the Book of Genesis. A few months later, reviewing Lecky's *History of European Morals*, Morley combined in a constructive criticism utilitarian conceptions of ethics and politics with the new evolutionary interpretation of life, using Mill's refinement of Bentham's 'greatest happiness' formula to show how such virtues as mercy, humanity, and kindness to animals are useful and advantageous to society. From Mill, and from another of his favourite writers, Condorcet, Morley learned the desirability of raising the status of women, though it was long before he came to support, and even then without much enthusiasm, their political enfranchisement.

Towards the end of 1867 Morley had paid a brief visit to the United States, where he met Walt Whitman, Emerson, Charles Sumner, and E. L. Godkin. The antipathy of the American Irish to England made a painful impression on his mind; and soon after his return in May 1868, in an address at Blackburn on Ireland's rights and duties, he drew from his observations in America, as well as from the state of Ireland, a strong argument for the redress of Irish grievances, especially those connected with the position of the Established Church and with the land. A general election was not far

off, and Morley's political ambitions were stirred. After some unsuccessful negotiations with Preston, he turned to Blackburn, but there also was disappointed. It happened, however, that the two victorious conservative candidates were unseated on petition, and in March 1869, when new writs were issued, the Blackburn liberals chose Morley as their second candidate. The proceedings only lasted a few days. There was open voting, and the liberal candidates were heavily defeated, Morley being bottom of the poll. It was complained that many voters had been intimidated by conservative mill-owners, and the experience converted Morley into a strong supporter of the ballot. His radical opinions were now well known, and in June 1869 he was appointed editor of the *Morning Star*, a paper which had been started by Cobden and Bright to promote peace, retrenchment, and reform. But when Morley took over the paper it was already moribund, and was absorbed a few months later by its liberal rival, the *Daily News*.

After this double repulse from parliament and daily journalism Morley returned to the *Fortnightly Review*. In May 1870 he married Mary, daughter of Thomas Ayling, of Abbey Road, London, and took a short lease (in 1870) of Flexford House, near Guildford. He now devoted himself to a new task on which he had embarked after finishing his life of Burke. This was an attempt, in a series of biographical essays, to interpret the Frenchmen of the Revolution and to make their ideas known and serviceable to a new generation of English radicals. His *De Maistre*, *Condorcet*, and *Turgot* appeared first in the pages of the *Fortnightly*. These studies were interrupted, however, by the outbreak of the Franco-German War in 1870, which led to a sharp difference of opinion between certain of his friends. Harrison and several others favoured intervention on behalf of the French, especially after the fall of the Second Empire in 1871. Cotter Morison was equally ardent for Germany, while Morley and Meredith did their best, as Meredith wrote, 'to preserve an even balance'. In November 1870 Mill congratulated Morley on not having yielded to the 'utterly false and mistaken sympathy with France'; but Morley would not endorse Mill's advocacy of compulsory service, and printed in the *Fortnightly* an outspoken attack by Harrison on the Bismarckian policy of 'blood and iron'. In 1871 Morley gave up Flexford, and

bought the lease of a small farm-house on the Hog's Back, just above Puttenham. Here he lived happily for a couple of years. The view from Pitfield, as it was called, was declared by Mill to be the finest in the south of England. At Pitfield, Morley completed his *Voltaire* in 1871 and his *Rousseau* in 1873—two masterly studies. In the spring of 1873 Mill visited Mr. and Mrs. Morley at Pitfield. 'He is the one living person', wrote Morley to his sister at the time, 'for whom I have an absolutely unalloyed veneration and attachment, and of whose kindness I am most proud.' A few weeks later his friend and master passed away; and thereupon Morley wrote for the *Fortnightly* (June 1873) a very beautiful *éloge* on the 'Death of Mr. Mill'.

Morley's style, usually restrained, but often rich in colour, and sometimes vibrating with passion, gave distinction to his French studies. In the art of mingling meditative and critical reflections with narrative and description he had come to excel. In depicting the Frenchmen of the Revolution and their precursors, interpreting their minds, and expounding their doctrines, he found means to convey a message of rationalism and progress well adapted to catch the ear and move the hearts of a generation fired with new ideas and already advancing towards radicalism in politics and Darwinism in science. His writings often reflect the fierce indignation against moral and social wrongs which surged up within him. This was for him the attraction of Rousseau—a character in other ways rather repellent to one who held that great thoughts, though they spring from the heart, should go round by the head. Morley's own mind found expression sometimes in the critical and destructive rationalism of Voltaire, sometimes in the sentimental dreams of Rousseau. In Turgot he hailed his ideal philosopher-statesman.

About this time radical opinions verging on republicanism and a coincidence of view about national education—then a burning subject—brought Morley into political alliance and intimate friendship with a rising statesman, whose character, methods, and ways of approach to the problems of the day were strangely unlike his own. Joseph Chamberlain [q.v.] was a practical man of business, who had made his mark as a municipal reformer in Birmingham. A Unitarian and a radical, he was glad to lead nonconformists who resented denominational teaching at public

expense, and agnostics, like Morley, who demanded a national system of purely secular education, free to all. A National Education League was formed, with Morley's support, under the political guidance of Chamberlain. In 1878 Morley wrote four articles for the *Fortnightly*, and republished them in the same year with additions in a volume entitled *The Struggle for National Education*. This was a vigorous polemic against the Education Act of 1870, in the course of which the Church of England is denounced as 'the ally of tyranny, the organ of social oppression, the champion of intellectual bondage' at every great crisis except one in English history. Against this indictment is set the record of the nonconformists, who had always stood forth against privilege, and had even 'shed their blood for law and ordered freedom'. Morley was as fearless in attack as Chamberlain. In commenting on one of Gladstone's arguments for Anglican claims and voluntary schools, he wrote: 'A poorer sophism was never coined even in that busy mint of logical counterfeits.'

For the next twelve years Morley worked with Chamberlain; and they formed, together with Sir Charles Dilke [q.v.], a radical triumvirate whose programme of disestablishment, secular education, land reform, and progressive taxation gradually took strong hold on a large section of the liberal party. It was little liked by Mr. Gladstone, and still less by Lord Hartington. After 1875 the *Fortnightly* became the recognized organ of political radicalism. It was a severe critic of Disraeli's imperialist aims in India and South Africa. It supported Gladstone's policy during the Russo-Turkish War (1877) and denounced the second Afghan War (1879). Morley's attacks on Sir Bartle Frere, whom he dubbed 'a prancing Proconsul' for his action in South Africa, were especially bitter. His outlook on foreign and imperial policy was becoming definitely and notoriously pacific. He was again anxious to be in parliament; but at the general election of 1880, standing for Westminster, he received another rebuff. In the same year he accepted the editorship of the *Pall Mall Gazette*, a position which greatly augmented his influence in politics. He swung the paper round from conservatism to radicalism and from Imperialism to Cobdenism. At that time William Edward Forster [q.v.] was chief secretary for Ireland, and recollections of the Education Act of 1870 did not make

Forster's coercive policy any the more palatable to Morley, who maintained in a series of brilliant articles that Ireland had real grievances, for which force was no remedy. In May 1882 Morley's views prevailed. The Cabinet decided that the Irish Coercion Bill should not be renewed, and that Parnell, with John Dillon and Michael Davitt, should be released from Kilmainham jail. Forster resigned; but the murder of his successor, Lord Frederick Cavendish, in Phoenix Park (6 May), made it clear that coercion had to be resumed.

In the early 'eighties Morley had his hands very full. He had undertaken in 1879 to write the life of Cobden. His defeat at Westminster was fortunate; for it enabled him to finish the task in the autumn of 1881. *The Life of Cobden* (dedicated to John Bright) is one of the best of his writings and holds its place as a classic among English political biographies; it had, moreover, a very much larger sale than any of his previous books, and made Morley's name widely known, especially in the North, where Cobden and Bright were still the political idols of radical nonconformity. The study of Cobden's unselfish character and international statesmanship left impressions on Morley's mind which were never effaced. Most of the principles which guided him thenceforth as critic or director of public policy were essentially those of Cobden.

Just before the *Life of Cobden* appeared, Morley's connexion with the *Fortnightly Review* came to an end. A valedictory article in October 1882 (reprinted in his *Essays*) describes very happily the methods and aims of his editorship. He hinted that the radical programme had excited far more wrath than unorthodox theology. But he made no claim to have founded a new system of political thought. The liberals and radicals of the early 'eighties might have a party programme in common, but it could not be pretended that they surveyed society and institutions in a comprehensive and philosophic way, like the Benthamites or Philosophic Radicals. Morley was now entering party politics, and he would soon have to be content with compromises and second bests; but party politics never meant for him a relinquishment of doctrine; and it is significant that, in bidding good-bye to readers of the *Fortnightly*, he paused to tell them that in 1882 Englishmen were not less in need of systematic politics than their fathers: 'We shall need to see great

schools before we can make sure of powerful parties.' Indeed, by temperament, Morley was far better qualified to found a school than to lead a party.

After his two unsuccessful attempts, at Blackburn in 1867 and at Westminster in 1880, Morley's parliamentary ambitions were at last gratified early in 1883, when he was returned at a by-election for Newcastle-upon-Tyne, then a two-member constituency.

His fellow member was Joseph Cowen [q.v.], a jingo radical, editor and proprietor of the *Newcastle Chronicle*, who, although at first friendly enough, proved himself eventually a formidable if not an open foe. In the House of Commons Morley was only moderately successful. His set speeches were generally adequate to the occasion; but in the cut and thrust of debate he was inferior to many men of less talent. The charm of voice and gesture, the felicities of thought and expression, which made his conversation the delight of private society, found little play in parliament. But he had the gift of moral leadership, and his powerful protests against military intervention in Egypt, wars in South Africa, and coercion in Ireland soon gave him a position of independence and influence. In the summer of 1885 he was still an ally of Chamberlain and Dilke, and joint author with them of the radical programme. But when Chamberlain's negotiations with Parnell fell through, the Birmingham leader began to reconsider his Irish policy, and this change of view was confirmed when he saw the Irish vote in England and Scotland transferred to the conservatives. Morley refused to abandon Irish claims, and began to remonstrate with Chamberlain, reminding him, 'I have thought, read and written about Ireland all my life'.

When the general election of 1885 was over, the liberals and conservatives were equal, and the Irish Nationalists under Parnell held the balance. Though second to Cowen, Morley held his seat at Newcastle. Gladstone announced his conversion to Home Rule; but Lord Salisbury, whose short administration had been conciliatory towards the Irish Nationalists, drew back, and when a combination of liberals and Irish defeated him on a radical amendment to the address on 27 January 1886, he resigned, leaving Gladstone to form a government. To the chagrin of Chamberlain, Morley received what was obviously a post of honour and danger in becoming chief secretary for Ireland. The rupture

with Chamberlain was painful, but Morley had no doubts or qualms; for to him the conciliation of Ireland seemed a far grander policy than the material reforms on which Chamberlain's mind was set. Gladstone's choice was justified by the fidelity and loyalty of his new colleague, and their friendship continued unbroken until Gladstone's death more than twelve years later.

Gladstone formed his third administration at the beginning of February 1886. It was necessary to draft the first Home Rule bill very rapidly, and Morley shared with his new chief the difficult and (as it proved) hopeless task of framing a measure which would satisfy the Irish nationalists without completely alienating Chamberlain and the 'liberal-unionists'. Lord Hartington, (Lord) Goschen, and a small group of whigs were already in opposition, and the fate of the bill was practically sealed on 26 March, when Chamberlain and Sir George Otto Trevelyan [q.v.] left the government. Over ninety dissentient liberals or liberal-unionists headed by Hartington, Bright, and Chamberlain determined to vote against the second reading, which was thereby defeated by 341 votes to 311. The general election in July resulted in a large unionist majority; but at Newcastle Morley was returned at the head of the poll. In the following year (January-February 1887) he took a leading part in the Round Table Conference, at which it was hoped to bring about a concordat with Chamberlain and Trevelyan on the Irish question; but the breach between Chamberlain on the one hand, and Gladstone, Morley, and Parnell on the other could not be healed, although Trevelyan and several other liberal-unionists returned to the Gladstonian fold.

During these years of opposition Morley's energies were largely absorbed by politics. In parliament and on the platform he was constantly opposing and denouncing Lord Salisbury's policy of coercion which was pursued with persistence and defended with dexterity by Arthur Balfour, the chief secretary for Ireland. In February 1888 Morley visited Dublin and received the freedom of the city. By this time he was, next to Gladstone, with the possible exception of Sir William Harcourt, the most popular orator on liberal platforms. By-elections were going against the government, and Home Rule seemed to be coming into favour when in 1890 the Parnell divorce suit, and the nationalist

split which followed, made the cause desperate. In the autumn of 1891 a large programme of reform was adopted by the liberal party at Newcastle, and the general election of 1892 yielded a composite liberal and nationalist majority of 40. Meanwhile, Morley supported himself by his pen. He was editing the 'English Men of Letters' series, and found time to write *Walpole* (1889) for the 'Twelve English Statesmen' series, to which he persuaded Lord Rosebery to contribute *Pitt*.

Morley kept his seat for Newcastle in 1892, but this time he was only second. Although he had assented to the Newcastle programme of October 1891, he had steadily refused to support an 'Eight Hours' Bill which was being hotly demanded by some of the younger trade union leaders. Consequently the socialists worked against him, and his poll fell far below expectations. It looked as if he would be defeated at the by-election when he took office for the second time as chief secretary for Ireland; but although he was again opposed by the socialists, there was a great revulsion of local feeling in his favour, and he was returned with a handsome majority over his conservative opponent.

From the beginning of Gladstone's fourth administration it was obvious that Home Rule could not be carried without the consent of the House of Lords, and for two years the liberal government was mainly occupied in ploughing the sands. Morley's Irish administration, during his three years of office from 1892 to 1895, involved many real difficulties and more petty vexations. He had to deal not only with the Orangemen, but with the two factions of Irish nationalists, and with many personal jealousies. One of his admirers described him in the office of chief secretary as over-cautious, slow in taking decisions, and too much afraid of acting on the advice of the Irish leaders. He might perhaps have done more to decentralize Dublin Castle administration; but at any rate he avoided serious blunders, and achieved his main task of helping Gladstone to prepare and carry through the House of Commons the second Home Rule Bill. He also reduced the protestant ascendancy among the county justices of Ireland, and modified the Crimes Act by a partial suspension of its operations. In the Cabinet he had many difficulties with Harcourt, whose temper at this time exasperated nearly all his colleagues. Hence it was that, on Gladstone's retirement in March 1894, Morley

played a leading part in the choice of Lord Rosebery to succeed Gladstone as prime minister. The decision was unpopular with rank and file liberals, who resented the supersession of Harcourt in favour of a young and comparatively inexperienced peer. Morley quickly regretted on grounds of policy a course which he had taken for personal reasons, and soon found himself co-operating with Harcourt in the Cabinet on questions of foreign and colonial policy against the liberal imperialism of Rosebery. The government struggled on until the middle of 1895, when it was defeated on a snap division, and resigned rather ignominiously. At the general election the conservative and unionist party gained a sweeping majority, and Morley lost his seat. For a time he cultivated the pleasure and leisure of retirement; but Harcourt and other liberals of the Gladstonian school were anxious for his return to the House of Commons, and early in 1896 Morley was elected for the Montrose Burghs.

With Chamberlain at the Colonial Office, imperialism was now in the saddle, although Lord Salisbury did his best to preserve moderation in foreign policy. Morley and Harcourt resisted to the utmost the policy which found expression in Kitchener's conquest of the Sudan, and later on in the Boer War. At the end of 1898 a crisis occurred in the liberal party, owing to the sharp division between the friends of Harcourt and those of Rosebery. Harcourt resigned the leadership of the opposition in the House of Commons, and a correspondence between him and Morley was published, in which Morley complained of cross-currents and agreed that Harcourt's position had become intolerable. Fortunately for the party Sir Henry Campbell-Bannerman was chosen to fill the vacancy.

Meanwhile the death of Gladstone in May 1898 led Morley to undertake the most important and arduous literary task of his life—the official biography of his old chief. It was while he was engaged in August 1899 in examining and selecting the vast mass of letters and documents then assembled in the 'Temple of Peace' at Hawarden Castle that the negotiations between Sir Alfred (afterwards Viscount) Milner [q.v.] and President Kruger took an unfavourable turn. Morley was deeply concerned at the prospect of a war against the two South African republics, and made several speeches of protest in the hope of averting it. One of these, perhaps the

finest of all his orations, was delivered on 17 September 1899 to a crowded and excited audience in St. James's Hall, Manchester.

Once war had broken out there was no more to be done; Morley, therefore, withdrew and devoted himself to the *Life of Gladstone*. He had finished a biography of Oliver Cromwell in the autumn of 1899—a book of balanced criticism, abounding in aphorisms and reflections on government, which, as he often recalled with pleasure, was read and highly praised by the prime minister, Lord Salisbury. His *Gladstone* proved a Herculean task, but its progress was assisted by a doctor's mandate which for a long time debarred him, owing to an affection of the throat, from speaking either in the House of Commons or on public platforms. In spite of this disability he was re-elected for Montrose at the general election of October 1900. As the Boer War dragged on it became unpopular, and public opinion began to turn in favour of Campbell-Bannerman and Morley, who favoured a settlement by negotiation rather than the unconditional surrender which Milner wanted. Eventually Milner was overruled and the War was brought to an end by Lord Kitchener in 1902. In the same year King Edward VII conferred upon Morley the newly created Order of Merit, and Andrew Carnegie [q.v.] presented him with the library of Lord Acton [q.v.], which Morley, in his turn, presented to the university of Cambridge.

The *Life of Gladstone* was completed and published in three volumes in October 1903. Its reception by the public surpassed all expectations. Thirty thousand copies were sold in the first year, and a hundred thousand more in the ten years that followed. As literature it is perhaps less attractive than Morley's earlier biographies; but as the tribute of a colleague to the greatest English statesman of his age, a tribute of admiring but not uncritical friendship, it is unique; and Morley had a right to say, as he did, that the years of labour devoted to this commemoration of Gladstone were not ill employed.

Towards the end of 1904 Morley paid a visit to Canada and the United States, where he made many friends, and stayed for a few days at the White House with President Roosevelt. By this time the long reign of conservatism and liberal-unionism was coming to an end. In 1905 the fiscal question united the liberal party and broke up the conservative Cabinet.

On Balfour's resignation in the autumn of that year Campbell-Bannerman formed a government in which Morley took office as secretary of state for India. Thereafter Morley had the satisfaction of assisting in the restoration of self-government in South Africa, and also of laying the foundations of a series of reforms in the administration of India, on which he bestowed infinite pains. He listened to experience, read deeply, and formed his plans with an admirable mixture of caution and courage. The story of these reforms, which aimed at gradually associating the people of India with the civil administration and government, is told in his letters to the viceroy, the fourth Earl of Minto [q.v.], which Morley published in the second volume of his *Recollections*. Under the new system of government, experience would have tested the capacity of Indian public men, and in the course of a generation or two would have shown in what directions further advance might safely be made. This was the intention of Morley and his advisers. But during the European War a new secretary of state, Edwin Samuel Montagu [q.v.], with a rash precipitancy which Morley deplored, introduced 'the dyarchy' and gave further pledges, upon the theory (always rejected by Morley) that India is a nation, and as such is capable of a complete system of responsible government.

Sympathy was the keynote of Morley's policy. He repudiated the idea that India, with its diversities of races, religions, languages, and castes, was fitted for a democratic constitution; but by appointing Indian members to the viceroy's council and to the India council in London, as well as by enlarging the representative element on the viceroy's legislative council and on the provincial councils, he associated many more Indians with the work of government. The strain of office, combined with attendance in the House of Commons, told on Morley's health; and in 1908, when, on the death of Campbell-Bannerman, Mr. Asquith became premier, he was transferred at his own request to the House of Lords, being raised to the peerage as Viscount Morley of Blackburn. In November 1910, when his reforms were completed, he resigned his post at the India Office, but remained in the Cabinet as lord privy seal. Shortly afterwards Lord Crewe, who had succeeded him, fell ill; whereupon Morley returned to the India Office for a few months. He helped to conduct through the Upper House the

Parliament Bill limiting the Lords' veto. It fell to him to read the famous paper stating that in the event of rejection by the Lords King George V would assent to a creation of peers sufficient to prevent the Parliament Bill being exposed a second time to defeat. On the night of the division in the House of Lords Morley felt the strain even more intensely than on the occasion, twenty-five years before, when the House of Commons threw out the first Home Rule Bill. It was only by abstentions that the government gained a narrow majority of seventeen (August 1911).

Morley was in friendly intercourse with Sir Edward Grey during the years from 1906 to 1914, and shared responsibility for the *entente* with Russia, which, by relieving him from anxiety about the Indian frontier, made much easier the paths to economy and reform in India. At times, and especially during the Agadir crisis in 1911, he was persuaded that peace might be endangered by the *ententes* with France and Russia, and he asked for assurances that Great Britain was in no way committed to war in support of France and Russia against Germany and Austria. After Agadir these assurances were given to the Cabinet and repeated in the House of Commons. But the expansion of continental armies and navies went on apace, and in July 1914 the Asquith Cabinet had to decide between intervention and neutrality.

At first, under Morley's lead, a majority of the Cabinet (at least three-quarters, according to Mr. Winston Churchill) was determined not to be drawn into war unless Great Britain were attacked. How the peace group diminished until only four, and finally only two (Morley and John Burns), were left to resign, is told in the *Memorandum on Resignation* which Morley wrote to be published after his death. In a few dramatic pages he sketches the drift of the Cabinet towards intervention between 24 July and 4 August, when his resignation took effect. The *entente*, he felt, had proved even more dangerous than an alliance. When the question of Belgian neutrality arose, Belgium took 'the place that had been taken before, as pleas for war, by Morocco and Agadir'. Morley held that Grey should have taken advantage of his conversation (1 August) with the German ambassador about Belgian neutrality as an occasion for more talk and negotiation, instead of closing the door by refusing to consider conditions on which Britain might remain neutral. But

his resignation was based on wider grounds. He could not and would not share the responsibility for a war which he foresaw would be disastrous to Great Britain and to Europe. Nothing that happened afterwards made him regret his decision. He retained his interest in politics to the end, watching the course of the struggle with melancholy forebodings. The decline of the liberal party, whose doctrines and ideals, which he still cherished, had been thrown on the scrap-heap of war, occasioned him more grief than surprise. His loyalty indeed was to the faith rather than to the party.

Morley's last return to public life was during the brief parliamentary session of December 1921 after the treaty of peace with Ireland. On that occasion, in his eighty-fourth year, he expressed in the Lords his satisfaction that the British government, by consenting to the creation of the Irish Free State, had saved Great Britain and Ireland from an irreparable disaster. He remarked that Mr. Gladstone, 'who toiled so long to change our Irish policy, would have welcomed this settlement by a coalition Government, seeing that in 1885 he had proposed to Lord Salisbury a coalition for the purpose'.

For the rest of his life Lord Morley lived in retirement with his wife at Flowermead, Wimbledon Park, enjoying visits from congenial friends, reading books, new and old, and busying himself in the affairs of Manchester University, of which he had been elected chancellor in 1908. His interest in men and women, politics, history, and letters remained with him to the end, although his physical powers gradually yielded to the infirmities of age. The later writings of his old teacher Mill show how that 'saint of rationalism' and high priest of individual liberty was beginning to lean towards theism and socialism. On these subjects Morley's opinions also ripened and mellowed. They lost the asperities of his *Fortnightly* days, but he remained to the end of his life an agnostic, a liberal, and an individualist, as uncompromising on essentials as when he wrote *On Compromise* (1874), a book of which a witty critic remarked, 'I can find no sign of compromise except on the title page'. Agnostic though he remained to the end, Morley cared less and less about religious and metaphysical polemics, and his attitude towards religion revealed a sense of piety, holiness, and of the mystery of life and death not always found among orthodox church-goers. That he should

have combined consistency with success in public life, and with practical achievements in constructive statesmanship, is a tribute not only to his own character but to that of his countrymen. During a long public career he kept his course from first to last, remaining constant to the faith that he had reasoned out in early manhood. This consistency of thought and conduct gave moral weight to his opinions and helped to raise the standards of public life. He died, childless, at Wimbledon 23 September 1923, and his viscountcy became extinct.

The following is a list of Lord Morley's published works, excluding his Essays which have been published and republished in several volumes: *Modern Characteristics* (anonymous, 1865); *Edmund Burke* (1867); *Voltaire* (1872); *Rousseau* (1873); *On Compromise* (1874); *Diderot, and the Encyclopaedists* (1878); *Burke* ('English Men of Letters' series, 1879); *Life of Richard Cobden* (1881); *Walpole* (1889); *Oliver Cromwell* (1900); *Life of Gladstone* (1903); *Notes on Politics and History* (1913); *Recollections* (1917), and *Memorandum on Resignation* (posthumous, 1928). An edition of his works in fifteen volumes, with corrections by himself, was published in 1921.

A portrait of Morley by the Hon. John Collier hangs in the hall of Lincoln College, Oxford, and there is a replica of it at the National Liberal Club.

[Lord Morley, *Recollections*, 2 vols., 1917; F. W. Hirst, *Early Life and Letters of John Morley*, 1928; A. G. Gardiner, *Life of Sir William Harcourt*, 2 vols., 1923; Lord Morley's *Indian Speeches*, 1909.] F. W. Hirst.

MORRIS-JONES, SIR JOHN (1864-1929), Welsh poet and grammarian, was born at Trefor, Llandrygarn, Anglesey, 17 October 1864, the eldest son of Morris Jones, shopkeeper, by his wife, Elizabeth Roberts, both originally of Llanrug, Carnarvonshire. When he was three years old his parents moved to Llanfairpwll, Anglesey, and he was sent to the local school, the 'Duchess of Kent's', and the board school. From 1870 to January 1879 he attended the Friars' School, Bangor, under the headmastership of Daniel Lewis Lloyd (afterwards bishop of Bangor), and when Lloyd left for Christ College, Brecon, Jones, like many other Friars' boys, went with him. His father died at Christmas 1879, and his help was now required at home. He assisted his mother for a year in the shop, but somehow managed to find time to read a considerable amount of

Welsh literature, especially poetry, and the beauty of the old *cywyddau* and *englynion* captured his imagination so completely that he could barely tolerate any other kind of verse as long as he lived. Lloyd had a high opinion of his old pupil's gifts as a mathematician, and made it possible for Jones to return to Brecon early in 1881, in order to read for a mathematical scholarship at Oxford. But the old zest had gone. The year at home had roused in him such an interest in Welsh poetry that mathematics had to take second place. He won a scholarship, indeed, and went up to Jesus College, Oxford, in October 1883, but obtained only a third class in the final school of mathematics in 1887. A Meyricke scholarship from his college, tenable for a year, then enabled him to follow his real bent. He had already attended the lectures of (Sir) John Rhŷs [q.v.] on Celtic; he now devoted himself wholly to Welsh, and began to prepare an edition of *The Elucidarium* and other tracts in Welsh from *Llyfyr Aglŷr Llandewi Brefi*, which appeared under his name and that of Rhŷs in 1894.

Jones and six others had already (May 1886) founded the 'Dafydd ap Gwilym' Society in Oxford for the discussion of Welsh problems. Two of the first members, Jones himself and (Sir) Owen Morgan Edwards [q.v.], were to play the leading parts in the revival of Welsh literature. Edwards turned to history and Welsh prose; Morris-Jones to philology and Welsh verse. Both felt the need of a more regular and scientific orthography; both loved purity of idiom and diction, although the former found his models in the living dialect and the latter in the medieval poetry. Vigorous discussions at the 'Dafydd' paved the way for the work of the Orthographical Committee of the Society for Utilizing the Welsh language, whose *Report on Welsh Orthography* was published in 1893, Jones being the secretary. It is admitted that he did most of the work, and for years afterwards in controversy after controversy he defended this Oxford Welsh, as it was called, against all comers.

Jones's chance came when he was appointed lecturer in Welsh at Bangor University College in January 1889; he was elected professor of Welsh in 1895, and held the post until his death. The new university of Wales gave him students in plenty, and through them his lectures on Welsh grammar became known

throughout Wales. He studied the versification of the medieval poets, and dealt faithfully, if not tenderly, with Joseph Loth's *Métrique Galloise* in the *Zeitschrift für Celtische Philologie* (vol. iv, 1903). His own skill in the ancient technique of the bards was proved by the ode 'Cymru Fu, Cymru Fydd', published in *Cymru* (1892) and republished with other poems in his *Caniadau* (1907). Jones's exposure of the falsity of the claims made by Iolo Morganwg on behalf of the 'Gorsedd' appeared in *Cymru* for 1896, and in the same year, curiously enough, he gave his adjudication on the odes, the chief poetic competition, at the National Eisteddfod held at Llandudno. This was the first of a series of pronouncements, continuing until 1927, on correct Welsh and correct prosody given by him at this popular assembly, which made his name famous throughout Wales and helped to spread his doctrines. All slovenly work he castigated with ruthless severity; no man did more, no man did as much, to raise the standard of poetic diction in the Eisteddfod poetry. Although Jones's chief interest lay in the strict alliterative metres, he also helped to perfect the form of the free lyric by his translations from Heine, J. L. Uhland, and others; in particular his translation of Omar Khayyām ought to be mentioned. His chief contribution to the study of Welsh prosody and, in the opinion of many, his best work, is his *Cerdd Dafod* (1925), a full account of Welsh metric art. Modern critics assert that his poetry is too cold and formal: it may be so, but there is real satiric strength in his *Salm i Ffamon* and parts of *Cymru Fu*, *Cymru Fydd*, and his songs to Wales came from the heart.

Jones's chief contribution to Welsh prose is the masterly introduction to Ellis Wynne's *Bardd Cwse* (1898). He edited *Y Deirniad* from start to finish (1911-1920), but wrote little himself for that periodical, although he spent a great deal of time in correcting the work of others. Occasional articles from his pen appeared in various magazines; his 'Tudur Aled' in the *Transactions* of the Cymmrodorion, 1908-1909, should be noticed, and the review in English in *Cymmrodorion*, vol. xxviii, 1918, of the edition of the *Taliesin* by John Gwenogvryn Evans [q.v.], which, although too acrimonious in spirit, contains much valuable material for the student of early Welsh poetry.

Jones's *Welsh Grammar* (1913) has been both overrated and underrated; it deals

only with the phonology and accidence. An unfinished draft on *Welsh Syntax*, written in 1907, was printed posthumously (1931), and it is to be regretted that its author did not live to revise and finish it, for he had a remarkable gift of lucid exposition, and skill in the clear arrangement and presentation of grammatical facts. These qualities are evident in *A Welsh Grammar*. As a descriptive grammar it is unrivalled, and will remain a worthy memorial of years of devoted research into the history of the Welsh language.

Jones married in 1897 Mary, second daughter of William Hughes, of Siglan, Llanfairpwll, by whom he had four daughters. He was knighted in 1918, when he began to style himself Morris-Jones. In 1919 Glasgow University conferred on him the honorary degree of LL.D., and in 1927 the National University of Ireland that of D.Litt.Celt. He died after a brief illness at his home at Llanfairpwll 16 April 1929.

A bust of Morris-Jones, by R. L. Gapper, has been placed in the University Library of Bangor.

[*Transactions of the Cymmrodorion*, 1919-1920; *Y Cymmrodor*, vol. xl, 1929; *Wales*, 1896 and 1912; *Welsh Leader*, 28 January 1904; personal knowledge.] I. WILLIAMS.

MOTT, Sir FREDERICK WALKER (1853-1926), neuro-pathologist, was born at Brighton 23 October 1853. He was the only son of Henry Mott, of Brighton, who came of Huguenot stock, by his wife, Caroline, daughter of William Fuller, of Pulborough.

Both father and mother died whilst he was a child. He studied medicine at University College, London, where he graduated M.B., B.Sc. in 1881 and M.D. in 1886, and obtained many distinctions. In 1883 he was appointed assistant professor of physiology at Liverpool University, but in the following year returned to London in order to take up the post of lecturer on physiology at Charing Cross Hospital medical school, where he became in succession lecturer on pathology, assistant physician, physician, and lecturer on medicine. He was elected fellow of the Royal College of Physicians in 1892 and fellow of the Royal Society in 1896.

Mott laid the foundation for his subsequent study of the diseases of the nervous system by researches into its normal structure and functions. Most of his earlier work was carried on in Professor Schafer's laboratory at University College,

some of it in conjunction with other workers. These investigations included the paths of conduction in the spinal cord, localization in the cerebral cortex (especially relating to movements of the eyes), and the effect of acute anaemia on the brain. The influence of these studies upon his later work is manifest.

In 1895 the London County Council decided to appoint a pathologist in charge of the laboratory which it was proposing to establish at Claybury: all indications pointed to Mott as the most suitable occupant of the post. He stipulated, however, that he should retain his clinical appointment at Charing Cross Hospital, considering it essential that the study of diseased conditions should be combined with clinical observation. The Council consented, and was thus able to secure Mott's services, which were rendered whole-heartedly for a long period of years, during which time a vast amount of research work was carried out by him and his pupils and assistants. Most of this is published in a series of important volumes to which the title *Archives of Neurology and Psychiatry* was given.

Subsequently, when the Maudsley Hospital for mental diseases was established at Denmark Hill, Mott's pathological work for the Council was transferred to the newer and better-equipped laboratory attached to that institution, and was continued there until his final resignation from the post of pathologist to the London County Council asylums in 1923, the age limit having been stretched in order that his services might be continued as long as possible. But his activities were by no means at an end, for he continued to teach at the Maudsley Hospital, and also accepted the post of lecturer on morbid psychology at the university of Birmingham. This position he held up to the time of his death.

Besides the articles in the *Archives of Neurology*, Mott contributed numerous papers on the nervous system to the *Philosophical Transactions* and *Proceedings of the Royal Society*, to *Brain*, to the *Journal of Physiology*, to the *Proceedings of the Royal Society of Medicine*, and to other scientific and medical periodicals.

Largely owing to Mott's researches it became definitely established that the hitherto obscure disease of the nervous system, known under the designation 'general paralysis of the insane', is, in fact, a manifestation of syphilis, and is associated with the presence of the specific

spirochæte. The determination of the association between syphilitic infection and this and other mental disorders is the achievement by which Mott's name will probably be best known. But it was by no means his only important contribution to neuro-pathology, for he further demonstrated the close relation between the nervous system and the sexual organs manifested in dementia præcox, as well as the association of deficient mental condition with degeneration of the thyroid and other endocrine organs.

As the result of these researches Mott firmly and insistently supported the view, which had hitherto been strangely ignored, that mental disorders are, for the most part, correlated with bodily changes. Indeed, all his work tended to uphold this doctrine, which may be said to have dispelled the obscurity which had hitherto invested the causation of diseases of the mind. Even in the affection known as 'asylum dysentery' the cause used to be ascribed to a hypothetical nervous affection of the intestine, instead of to infection associated with micro-organisms, which was indicated by Mott to be its true causation. He wrote a report on his *Histological Observations on Sleeping Sickness and other Trypanosome Infections* which was published as No. VII of the *Reports of the Sleeping Sickness Commission* of the Royal Society in December 1906.

Mott received numerous honours and prizes, as well as appointment to lectureships, in recognition of his scientific work. He was awarded the Stewart prize of the Medical Association (1903), the Fothergill gold medal and prize of the Medical Society of London (1911), and the Moxon gold medal of the Royal College of Physicians (1910). He was Croonian lecturer (1900), Oliver-Sharpey lecturer (1910), Lettsomian lecturer (1916) and Harveian orator (1925) to the Royal College of Physicians, London, Morrison lecturer to the Royal College of Physicians, Edinburgh (1921), Huxley lecturer at Charing Cross Hospital (1910), Bowman lecturer to the Ophthalmological Society (1904), and Fullerian lecturer at the Royal Institution. He delivered the Chadwick lecture at the university of Liverpool in 1917 and 1926. At the time of his death he was president of the Royal Medico-Psychological Association.

Himself an accomplished singer, Mott was devoted to music, especially to vocal music, upon which he published two works. His interest in this was recognized by his

election as president of the Society of English Singers in 1923. In 1919 he was created K.B.E. in acknowledgement of his war services as lieutenant-colonel, Royal Army Medical Corps. His work on shell-shock was especially notable. In the same year he received the honorary degree of LL.D. from Edinburgh University. He was a good lecturer, always speaking to the point, and an honest investigator, his one desire being to arrive at truth.

Mott married in 1885 Georgina Alexandra, daughter of George Thomas Soley, shipowner, of Liverpool, and had four daughters. He died at Birmingham as a result of cerebral hæmorrhage 8 June 1926. His friends and colleagues dedicated to his memory a volume containing original articles on the subjects to which he had himself contributed. This book, published in 1929, contains an appreciation of the man and his work by his lifelong friend, Professor W. D. Halliburton, as well as a complete list of his published writings.

[*Proceedings of the Royal Society*, vol. c, B, 1920 (portrait); *Birmingham Medical Review*, vol. i, no. 6, 1926; *Lancet*, 1926, vol. i, p. 1228; *British Medical Journal*, 1920, vol. i, p. 1003; Memorial Volume, *ut supra*; personal knowledge.]

E. A. SHARPEY-SCHAFER.

MUDDIMAN, SIR ALEXANDER PHILLIPS (1875-1928), Indian civil servant, was born at Leighton Buzzard 14 February 1875, the second son of Alexander Phillips Muddiman, bookseller and publisher, of that place and afterwards of Dullfield House, near Derby, by his wife, Anne Griffiths. He was educated at Wimborne School and at University College, London, passed the open examination for the Indian civil service in 1897, and joined that service in 1899.

From the outset Muddiman's ability attracted attention, and his promotion was exceptionally rapid: but he lacked the normal training of an Indian civil servant. After barely three years of district work, he became under-secretary to the Bengal government in 1903: two years later he was selected to be registrar of the appellate side, Calcutta high court. In this post, in spite of his lack of judicial experience, Muddiman gave such satisfaction that, in 1910, he was promoted to be deputy secretary to the government of India in the legislative department. There he remained for the next ten years, becoming in 1915 secretary to government and a nominated official member of the central legislature. No enactment of outstanding importance

was passed by the Indian legislature during this period; nor did Muddiman play any considerable part in drawing up the policy of the Montagu-Chelmsford reforms. But he was one of the two additional members appointed by the government of India to serve on Lord Southborough's committee on the franchises (1918-1919); in this capacity he came to England on deputation, and his experience and skilful draftsmanship were of great value in framing the rules for the conduct of business in the legislatures.

Nevertheless, there was general surprise when in January 1921 Muddiman was appointed president of the council of state, the newly-created upper house of the Indian legislature. The appointment, however, was soon seen to be fully justified. Muddiman made an ideal chairman, courteous, imperturbable, and conciliatory. In March 1924 he was promoted to be ordinary member of the governor-general's council in charge of the home department, an appointment which made him the official leader of the assembly, or lower house. Here the same qualities stood him in good stead; and the affection with which he was personally regarded by the Indian members of all shades of opinion contributed not a little to the growth of a healthy parliamentary tradition in which political acrimony was mitigated by personal good feeling. The brilliant debating power and even the occasionally virulent invective of a strong opposition were effectively parried by Muddiman's unfailing serenity of temper. In the administrative work of his post he had the gift of being able to leave details to subordinates without losing his grasp of essentials.

Muddiman was knighted in 1922 and created K.C.S.I. in 1926. In 1928 he was appointed governor of the United Provinces. But, though his natural gaiety and zest for life never deserted him, he was already a very sick man; and on 17 July 1928 he died at Naini Tal of heart failure after barely six months of office. He was unmarried.

In the work of legislative draftsman Muddiman had an elegant and clear style: he never had the opportunity to become a profound or learned lawyer. His *bonhomie* and high spirits led him to take a larger part in the social life of Simla and Delhi than is usual with high officials in the government of India: in particular, though no gambler, he was (often till late hours) a brilliant bridge-player; and superficial

observers found it difficult to believe that the same man could be efficiently discharging onerous official duties. But in fact the double strain contributed not a little to his early death.

[*The Times*, 18 June 1928; official records; private information.] S. V. FITZGERALD.

MURRAY, SIR JOHN (1851-1928), publisher, was born in London 18 December 1851, the eldest son of John Murray (1808-1892, q.v.), of 50 Albemarle Street, London, and Newstead, Wimbledon, by his wife, Marion, daughter of Alexander Smith, banker, of Edinburgh. His father was the third of his name to be head in succession of the publishing house founded in 1768 by John Murray the first, who was followed by John Murray the second (1778-1843, q.v.), the friend of Byron and Scott. Publishing, therefore, was to him an hereditary profession, and in due course he became John Murray the fourth. He was educated at Eton and at Magdalen College, Oxford, and then entered the firm's house in Albemarle Street, passing through all its departments until, in 1892, he succeeded his father as its head.

Throughout his life Murray laboured with unceasing concentration at the work of his publishing house; but few publishers have so harmoniously combined such concentration with freshness of outlook, unfailing courtesy, and sympathy with the strivings and ambitions of young authors, added to wide interest in social and literary life. He was a staunch churchman and conservative, and was resolute to maintain the high standards of the past in the midst of a rapidly changing world. But this did not mean a stereotyped or reactionary outlook: his home was, as it had been in the days of his father and grandfather, the resort of many leaders both of literary and political thought, and he was the centre, the guide, philosopher, and friend.

In 1917 Murray's house acquired the publishing business of Smith, Elder & Co., and this enabled him, late in life, to take a personal interest in many of the younger school of novelists. From 1922 until his death in 1928 he edited the *Quarterly Review* and surveyed politics from an interested and yet detached point of view. His friendships were legion: from the earliest days, when he could recall Livingstone and Borrow, and was a friend of Darwin, down to his death he was able to make friends with authors, and to retain their friendship.

In Byron, Murray took an hereditary

interest, editing his *Correspondence* in 1922; and it was in honour of the Byron centenary in 1924 that he received the D.Ph. degree of the university of Athens and was created a commander of the order of the Redeemer (of Greece). In recognition of his publication of the first and second series of volumes of the *Letters of Queen Victoria* he was created C.V.O. in 1912 and K.C.V.O. in 1926. He found time not only to edit Gibbon's *Autobiography* (1897) and to write *John Murray III: a Memoir* (1919), but to be chairman of the Publishers' Association in 1898-1899, when his knowledge of copyright proved of great service, and for many years to be an active J.P. in London, of which he was also a D.L. and high sheriff in 1908. In addition, he was for forty-two years a member of the board of the Hospital for Sick Children, Great Ormond Street, and for thirty-seven years its vice-president.

Murray married in 1878 Evelyn, daughter of William Leslie, of Warthill, Aberdeenshire, sometime M.P. for Aberdeenshire, and had one son (John Murray the fifth), and three daughters, two of whom died young. He died at Hove 30 November 1928.

[*The Times*, 1 December 1928; personal knowledge.]

GORELL.

MURRY, KATHLEEN (1888-1923), writer under the pseudonym of KATHERINE MANSFIELD, was born at Wellington, New Zealand, 14 October 1888, the third daughter of (Sir) Harold Beauchamp, banker and company director, by his first wife, Annie Burnell, daughter of Joseph Dyer, secretary of a provident society. Her early childhood was passed for the most part at Karori, a village near Wellington. Her first story was published at the age of nine. In 1903 she was taken to England, and was a resident student for three years at Queen's College, Harley Street, London, where she edited the college magazine. In 1906 she returned unwillingly to New Zealand, but came back to England two years later on a modest allowance from her father. She married in London in 1909 George Bowden, from whom she parted soon after. In 1910 and 1911 she contributed regularly to a weekly paper, *The New Age*, and in 1911 published, under the pseudonym of 'Katherine Mansfield', her first collection of short stories, *In a German Pension*, based on experiences which she underwent in Wocrishofen in Bavaria.

In 1911 Katherine Mansfield met John

Middleton Murry, the critic, eldest son of John Murry, of the Inland Revenue Department. They lived together from April 1912 until their marriage in 1918. From 1911 to 1913 she published short stories and poems in *Rhythm* and *The Blue Review*, two periodicals of which Mr. Murry was associate editor. In 1915 she compiled and edited, with the help of Mr. Murry and D. H. Lawrence [q.v.], a magazine called *The Signature*.

Nervous strain due to the European War, a physical constitution weakened by operations and recurrent pleurisy, and the loss of her only brother, Leslie Heron Beauchamp, who was killed in France in 1915, led Katherine Mansfield to withdraw herself for a time into memories of her childhood, and she now sought to frame these memories in collections of short stories. *Prelude* was published in 1918 and *Je ne parle pas français* printed privately in 1919. Katherine Mansfield was divorced from George Bowden in 1918 and married John Middleton Murry in London in the May of that year. In April 1919 her husband was appointed editor of the *Athenaeum*, and she began to review current novels in its pages. These reviews were collected and published as *Novels and Novelists* in 1930.

Bliss, a volume of short stories, published in 1920, established Katherine Mansfield's reputation. Another volume, *The Garden Party* (1922), was the last of her books to be published in her lifetime. In December 1917 she had been found to be consumptive, and thereafter her life was marked by chronic illness. She travelled from place to place in Italy, Switzerland, and the south of France, returning infrequently to England. Her letters and journals describe her physical and spiritual conflict in poignant detail. She now came to feel that her attitude to life had been unduly rebellious, and she sought, during the days that remained to her, to renew and compose her spiritual life. With this object in view she entered on 17 October 1922 the Gurdjieff Institute, near Fontainebleau, which aimed at achieving physical, mental, and spiritual health by esoteric methods. She died there of pulmonary haemorrhage 9 January 1923, and was buried in the communal cemetery at Avon, near Fontainebleau.

The Doves' Nest (1923) and *Something Childish* (1924) are posthumous collections of Katherine Mansfield's stories. Her *Poems* were collected in 1923, her *Journal* edited in 1927, and her *Letters* published in

1928. *The Aloe*, an early draft of *Prelude*, appeared in 1930.

As a short story writer Katherine Mansfield is closely akin to Tolstoy. Their sensitiveness of perception is similar, their grasp of significant detail, their sense of quiet pattern, and their insistence on the poetic quality of simple homely familiarities. Katherine Mansfield broke completely with the older tradition of English tale-telling. Her influence on her own generation, which has been great, has served to render it conscious of the possibility of the short story as an art form presenting life at an arrested moment. Her *Journal* and her *Letters* belong to the permanent literature of self-revelation. They record with integrity the sensitive response of her generation to the War, and to the difficult years of transition after it, when youth, after a shattering experience, was endeavouring to formulate new values. Her *Poems* show promise rather than achievement.

E. O'BRIEN.

NEILSON, GEORGE (1858-1923), historian and antiquary, was born at Ruthwell, Dumfriesshire, 7 December 1858, the only child of Edward Neilson, captain in the mercantile marine, by his wife, Janet Paterson. He was educated at Cummertrees parish school and at King William's College, Isle of Man. After serving an apprenticeship at Dumfries, he attended law classes at Glasgow University, and qualified as a solicitor in 1881. After seven years of private practice in Glasgow, he was appointed procurator fiscal of police there in 1891, and in 1910 he became stipendiary police magistrate of Glasgow. He held this office until a few months before his death.

Neilson was endowed with an eager and alert mind and an insatiable ardour for investigation. He was eager to direct the attention of others to subjects which interested him and to place at their disposal the fruits of his studies. By his thirtieth year he had gained a first-hand knowledge of the sources of early Scottish history and of the antiquities of Scots law. As time passed he became a charter scholar and expert palaeographer. The

reading of *Bracton's Notebook*, edited by Frederic William Maitland [q.v.] in 1887, led him to send to Maitland in 1889 the manuscript of a study which he had made of the origin and early history of the duel. Maitland was enthusiastic, and Neilson's *Trial by Combat* was published at Glasgow in 1890. It was favourably received and, after forty years, is still the final word on the subject in English. Terse, pointed, and illuminating, it provides an admirable examination of an obscure field, and in particular makes clear the distinction between the judicial duel and the duel of chivalry. Its value was recognized by Maitland in the *History of English Law before the Time of Edward I.*

Up to the date of his death (1906) Maitland was in close correspondence with Neilson, and they met from time to time. Maitland constantly applied to him for guidance and information on questions of Scottish law and history. Neilson formed similar, though less intimate, relations with other scholars, especially Mary Bateson, J. H. Round, Andrew Lang, F. J. Haverfield, H. C. Lea, and F. Liebermann. It might be said that in the field of medieval studies he represented Scotland in the eyes of students south of the Border. He had real scholarship and most infectious enthusiasm, and much of his time was devoted to solving the problems of others. In 1894 he published *Peel, its meaning and derivation* and in 1899 *Annals of the Sokeay*, both admirable examples of the work of a learned antiquary, whose numerous papers are to be found in many volumes of transactions. He also edited *The Antonine Wall Report of the Glasgow Archaeological Society* (1899).

Neilson devoted many years to the study of middle Scots verse. His principal writings in this field are *John Barbour, Poet and Translator* (1900) and *Huchown of the Awle Ryale, the Alliterative Poet* (1902). He was not a philologist, and his interests were historical. He sought to claim for Barbour the authorship of a series of alliterative poems and to identify Huchown with Sir Hugh of Eglinton and to assign certain poems to him. He carried on a controversy about these matters in the pages of the *Athenaeum* and elsewhere for years, and in the course of it formed relations with Henry Bradley, F. J. Furnivall, W. P. Ker, W. W. Skeat, and others. These were of the friendliest character, for Neilson had the gift of inspiring liking even in opponents. His arguments for the thesis which he main-

tained were ingenious rather than convincing, and the debate is still open. It may be claimed, however, that his writings and the replies which they called forth revived an interest in a literature which had fallen into neglect and supported the view that Scotland was the place of origin of a considerable body of verse which had not been attributed to her previously.

In 1903, on the invitation of the university of Glasgow, he delivered a course of lectures on early Scottish literature, and in the same year the university conferred on him the honorary degree of LL.D. In 1913, at the invitation of the Society of Antiquaries of Scotland, he delivered the Rhind lectures in archaeology on 'Scottish Feudal Traits'.

In 1918, after delay due to the European War, the record commissioners issued the *Acta Dominorum Concilii, 1496-1501*, edited by Neilson and Mr. Henry Paton. The substantial introduction was Neilson's work. It contains many interesting suggestions and speculations, but it is somewhat lacking in cohesion and precision.

From 1903 to his death, much of Neilson's time was devoted to the *Scottish Historical Review*; no issue of the journal was without contributions, signed or anonymous, from his pen, and he had a large share in its direction.

After some months of illness Neilson died in Glasgow 15 November 1923, to the sorrow of a wide circle of friends and correspondents. He married in 1892 Jane, daughter of Thomas Richardson, of Hexham, by whom he had one son, who died in infancy, and one daughter. Neilson was slight and of medium height. He had a long thin face and large eager melancholy eyes. His portrait, etched by William Strang, R.A., is in the possession of Mrs. Neilson.

D. BAIRD-SMITH.

NESBIT, EDITH (1858-1924), writer of children's books, poet, and novelist. [See BLAND, EDITH.]

NEWBOLT, WILLIAM CHARLES EDMUND (1844-1930), divine and preacher, was born at Somerton, Somerset, 14 August 1844, the youngest son of the Rev. William Robert Newbolt, rector of Somerton, by his wife, Ann Frances Dorrien, daughter of Magens Dorrien Magens, of Hammerwood, East Grinstead. Newbolt was educated at Uppingham,

where the teaching and character of the headmaster, Edward Thring [q.v.], exercised a strong and permanent influence on him. He proceeded to Oxford as an Oades scholar of Pembroke College in 1863, obtained a second class in classical moderations (1865) and a third class in *literae humaniores* (1867). He was never a scholar in the academic sense of the word.

In 1868 Newbolt was ordained deacon for the parish of Wantage, of which the vicar was William John Butler [q.v.], the friend of John Keble, and afterwards dean of Lincoln. The parish was admirably administered on strong and original lines, and Newbolt was always loyal to the principles and methods which he learned from Butler. After two years at Wantage he became vicar of Dymock, Gloucestershire, on the nomination of Frederick, sixth Earl Beauchamp [q.v.]. There he did patient and persevering work, and on the whole was able to commend new ways of church life in a parish of slow and conservative country people. In 1877 Lord Beauchamp nominated Newbolt for the parish of Malvern Link, and there again he did excellent parochial work, besides rebuilding the church.

At Malvern Link Newbolt was in close touch with Worcester. In 1886 the dean of Worcester, Lord Alwyne Frederick Compton [q.v.], became bishop of Ely, and in 1887 invited Newbolt to succeed Dr. H. M. Luckock as principal of Ely Theological College. This was for Newbolt the beginning of the most important work of his life. The theological college at Ely had been founded by Bishop Woodford [q.v.] on the pattern of Bishop Wilberforce's college at Cuddesdon, with the aim of providing for ordinands a spiritual and professional training in accordance with Tractarian ideals of the priestly life. In 1856 and 1857 Dr. H. P. Liddon had published in the periodical *Ecclesiastic and Theologian* an essay, 'The Priest in his inner life', which suggested the lines along which the devotional life of the clergy should be developed, and it was on these lines that Newbolt worked at Ely. He brought to his task the knowledge of and sympathy with human nature gained by nineteen years of pastoral work, besides the example of his own strong and disciplined character.

On the death, in 1890, of Dr. Liddon, Lord Salisbury asked Liddon's brother whom he thought Liddon would have wished to succeed him as canon of St. Paul's. The answer was 'the principal of Ely'. The

same year Newbolt was installed at St. Paul's, and he held the canonry until his death forty years later. At that time St. Paul's held a great place in the religious life of London and England generally. Richard William Church [q.v.], with his unique distinction of intellect and character, was still dean; crowds had surrounded the pulpit when Liddon preached, and the eloquence of Henry Scott Holland [q.v.] was only less popular and persuasive; another canon was Robert Gregory [q.v.], a man of first-rate administrative ability, soon to be dean; the services were performed with great reverence and dignity; Sir John Stainer [q.v.] was the organist. Newbolt entered enthusiastically into the spirit and plans of the chapter; he wished to make the cathedral the central church of London, the spiritual home of the metropolis and of the British Empire, where the liturgy of the Church of England was perfectly rendered throughout the year.

Newbolt was a fluent and facile, but painstaking, preacher. His sermons were always carefully prepared; excellently phrased, and delivered with ease and grace; they were always interesting and fresh, and gave proof of wide reading and generous culture. For many years they reached a wide public through the medium of the *Church Times*. Newbolt made no attempt to grapple with the intellectual and social problems of the time; he was content to commend goodness and faithfulness and the Tractarian piety which he had known all his life. He was an unswerving champion of Tractarian orthodoxy, and of views about the inspiration of the Bible and the observance of Sunday which were becoming obsolete.

Large business houses stand round St. Paul's, and Newbolt was anxious to help the young men employed in them and living on the premises. With this object he founded in 1893 the St. Paul's Lecture Society, which provided courses of lectures and retreats, and later on the Amen Court Guild, which had about 400 members and associates.

Newbolt is chiefly to be remembered for the work which he did for the spiritual life of the clergy. During the whole time he was at St. Paul's he continued and developed the ministry which he had begun at Ely. Every year he conducted retreats for priests and heard their confessions; he published many books of counsel and admonition containing the meditations which he had given in retreat. *Speculum*

Sacerdotum (1893) was the most characteristic and successful of these books. He also edited, with Dr. Darwell Stone, the *Oxford Library of Practical Theology*. Newbolt's theological standpoint changed very little during his long life. He was true to the end to the ideals of Butler and Liddon. He was so thoroughly convinced of the excellence of the standard of religious life implied in the Prayer Book of 1662 that he felt some hesitation in following modern developments which went beyond what the Prayer Book enjoined. In his prime he was a leading speaker in Convocation, and for some years he was returned at the head of the poll as representative of the clergy of the London diocese in Convocation and the Church Assembly.

Newbolt's life was shadowed by a great sorrow. He married in 1870 Fanny Charlotte, fourth daughter of William Weld Wren, of 27 Gower Street, London; she was afflicted with mental illness for thirty years before her death in 1923. They had one son and two daughters. He died in London 12 September 1930.

[W. C. E. Newbolt, *Years that are passed*, 1921; personal knowledge.] J. F. BRISCOE.

NEWMAN, WILLIAM LAMBERT (1834-1923), scholar and philosopher, the second son of Edmund Lambert Newman, solicitor, of Cheltenham, was born at Cheltenham 21 August 1834. He was educated at Cheltenham College and at Balliol College, Oxford, which he entered as a scholar in 1851. Among his contemporaries at Balliol were the future scholars William Walter Merry, Robinson Ellis, and David Binning Monro, and the three future great lawyers, Charles Synge Christopher (afterwards Lord) Bowen, (Sir) Thomas Erskine Holland, and Albert Venn Dicey; his tutors were Benjamin Jowett, James Riddell, Edwin Palmer, and Henry Smith. He won the Hertford scholarship (1853) and the Ireland scholarship (1854), obtained first classes in classical moderations (1853) and in *literae humaniores* (1855), and while still an undergraduate was elected a fellow of his college (1854). As lecturer in history for the schools of *literae humaniores* and of law and modern history from 1858 to 1870, Newman exercised a unique influence on the teaching of history and political philosophy at Oxford; those who attended his lectures describe them with great unanimity as the best they ever heard. There was then no regular system of inter-

collegiate lectures, but Balliol was constantly asked by other colleges to permit their students to attend Newman. Among those who heard him were the philosophers T. H. Green (afterwards his close friend and colleague), Thomas Case, Edward Caird, and R. L. Nettleship; the historians, J. L. Strachan-Davidson and Evelyn Abbott; the lawyers, R. T. Reid (afterwards Lord Loreburn) and (Sir) W. R. Anson; and among others, Andrew Lang, John Addington Symonds, F. Y. Edgeworth, and the Earl of Kerry (afterwards fifth Marquess of Lansdowne). In spite of frequent absences owing to ill-health, and of a weak voice and rapid delivery, Newman's importance as a teacher was quite equal to that of Jowett and Green. His treatment of ancient history (the principal subject of his lectures) was then a new thing in its independence and imagination, in the wide range of modern history and law from which he drew his illustrations, and in the connexion between history and philosophy which he always maintained and which became characteristic of *literae humaniores*. In 1868 he was appointed university reader in ancient history, but in 1870 ill-health obliged him finally to leave Oxford. Thenceforward Newman lived in retirement at Cheltenham, preparing the edition of Aristotle's *Politics*, which is his principal monument, reading everything that bore upon the subjects of his interest, making endless notes on odd scraps of paper in his tiny handwriting, and corresponding with other scholars. Although partially lame, he took his country walk almost daily, and was a keen observer of birds.

While at Oxford Newman published only an essay on the land-laws in a volume entitled *Problems for a Reformed Parliament* (1867). Other contributors were (Sir) Godfrey Lushington, Frederic Harrison, and Thorold Rogers. Newman's essay deserves still to be read not only for the insight which in the retrospect seems almost prophetic, but as a masterpiece of noble English. While he has always in view the ethical principles which should govern the tenure of land, he never forgets historical and practical considerations; and in thus holding the balance between philosophy and practice this early work exhibits a notable quality of his edition of the *Politics*, of which the first two volumes were published in 1887. The first is occupied by an introductory essay which is virtually a treatise on political philosophy. The third and fourth volumes

appeared in 1902. The whole work belongs to the grand, leisurely type of scholarship, in which even notes have a literary quality, and the views of others (sometimes even when they do not deserve it) are discussed with courteous fullness. The hurried or perfunctory student finds little in Newman's work to encourage him; the minute pedant who has no sense of proportion may speak slightly of it; but for soundness of interpretation, copiousness of illustration, and mature wisdom its value is permanent.

Newman died at Cheltenham 23 May 1923. He was unmarried. He retained his fellowship of Balliol until his death, but for many years refused to accept the stipend, and left a considerable benefaction to the college in his will.

A. W. PICKARD-CAMBRIDGE.

NEWTON, ERNEST (1850-1922), architect, was born in London 12 September 1850, the fourth son of Henry Newton, then resident agent for the Sturt property in Hoxton, by his wife, Mary Lockyer. Educated at Uppingham, under Edward Thring [q.v.], he entered the office of Richard Norman Shaw [q.v.] in June 1873, and after three years as a pupil and three as an assistant, began to work independently in 1879. In Shaw's office he came into contact with E. S. Prior, Mervyn Macartney, G. C. Horsley, and, later, with W. R. Lethaby: the early meetings of this group for discussion of architectural matters ultimately developed into the Art Workers' Guild. To Shaw himself Newton owed a conception of architecture as an art, an adventure, a mode of personal expression, rather than an exercise in archaeology or a professional occupation. His own work is almost from the first marked by a serenity which is in marked contrast with his master's somewhat dramatic vigour.

Newton's earliest important work was the House of Retreat, Lloyd Square, Clerkenwell (1880), a building in the Shaw manner; but for the first ten years of his career he was working mainly on small suburban houses, hitherto the almost undisputed province of the speculating builder, and showing how orderliness of plan and unity of materials could give an effect of breadth even to minor works, a lesson which was not lost upon the next generation of architects. His small books, *A Book of Houses* (1890) and *A Book of Country Houses* (1903), illustrate a number

of his earlier buildings. Bullers Wood (Chislehurst, Kent, 1889) was his next large work (altered by another hand in 1932). Here a stucco house was eased and enlarged into what is in effect a new house, of substantial dignity, built in brick and tile. It is not only a departure from contemporary pseudo-Gothic, but a marked advance on the stylistic tendency of good work of the time. It is thought of in terms of wall and window, roof and chimney, while others were still thinking in terms of style and period. This is important, because it throws light on all Newton's subsequent work. Although a lover of old things, he was in advance of his times in that he was always profoundly conscious of the future use of a building: he was sensitive enough to put himself in the place of master and mistress and maid; and out of their various points of view the shape of the house would grow, as an embodiment of the home-life as it was to be lived.

Newton's work of the next fifteen years is peculiarly fresh and personal, notably the chapel for the House of Retreat, Lloyd Square, Clerkenwell (1891), Red Court, Haslemere (1894), Martin's Bank, Bromley (1898), Steep Hill, Jersey (1899), and many smaller works. The handling of the materials, lead, brick, rough-cast, granite, metal-work, plaster, and wood-work, reflects the contemporary interest in crafts.

In the spire of St. George's church, Bickley, Kent (1904), and in Ardenrun Place, Blindley Heath, Surrey (built in 1906 and burned down in 1932), appeared work more obviously referable to tradition. Perhaps most characteristic of Newton's maturity are seven houses, which are all based upon the same plan-idea—a long low house, with short projecting wings embracing a paved southern terrace. Of these Luckley, Wokingham (1907), Feathercombe, near Godalming (1908), and Logmore, Dorking (1913), are in brick, with wood cornice and tiled roof; Ludwick Corner, Hertfordshire (1907), Scotman's Field, Church Stretton (1908), and Brand Lodge, on the Malvern Hills (1911), are in rough-cast or stucco; and Flint House, above Goring (1913), is in flint, with stone dressings. All have peacefulness, a spacious handling of plan, and many small touches of charm in detail. Three large houses in a more traditional manner at Burgh Heath, Banstead, Kingswood, Surrey, and Abbotsbury, Dorset, were being built when the European War broke out in 1914; and a house near Versailles was abandoned unfinished.

Works of importance by Newton, in addition to those already mentioned, include the following houses: Glebelands, Wokingham (1897), Dawn House, Winchester (1907), Lukyns, Ewhurst (1910), and a house in Holland (1914); a number of cottages and small buildings at Overbury, Worcestershire (between 1899 and 1910), and a portion of the Whiteley Homes, Burhill, Surrey (1914); a dozen type houses for the development of the Bickley Park estate (1902-1905); major alterations at Shavington, Shropshire (1903), Field Place, Begbroke, Oxfordshire (1906), Upton Grey, Hampshire (1907), The Greenway, Shurdington, Gloucestershire (1910), and Oldcastle, Dallington, Sussex (1910); the church of St. Swithun, Hither Green (1892), office for the Alliance Assurance Company, St. James's Street, London (in collaboration with Norman Shaw, 1904), a Carmelite convent at Caen (1920), and the initial scheme, carried out by his son, W. G. Newton, for a memorial Hall at Uppingham School (1921).

Newton was elected president of the Royal Institute of British Architects in 1914. In 1916 he voluntarily undertook onerous public work in connexion with the issue of building licences. In 1918 he was awarded the royal gold medal on the recommendation of the council of the Royal Institute of British Architects. He was elected A.R.A. in 1911 and R.A. in 1919, and created C.B.E. in 1920. He married in 1881 Antoinette Johanna, the eldest daughter of William Hoynck, merchant, of Rotterdam, and had three sons. He died in London 25 January 1922.

As an architect Newton was thoroughly conversant with the building crafts, and more happy with intimate than with monumental problems. His work was at once too sane and too personal for the growth of a school of disciples, but the serenity of his touch evidently influenced English domestic architecture during the first quarter of the twentieth century.

As a man Newton had a peculiar faculty for making friends in every walk of life. He was from early years a freemason; and at various times keenly pursued the study of the Dutch language, the violin, acting, French conversation and literature, and the technique of water-colour. He had a notably candid mind and an unusually frank admiration for attainments which he lacked himself. He had a very great capacity for taking pains, and a cordial dislike of pedantry and fanaticism.

There is a portrait of Newton by Arthur

Hacker at the head-quarters of the Royal Institute of British Architects in Portland Place, London.

[W. G. Newton, *The Work of Ernest Newton*, R.A. (containing a complete list of his works), 1925; personal knowledge.]

W. G. NEWTON.

NICHOLSON, JOSEPH SHIELD (1850-1927), economist, the only son of the Rev. Thomas Nicholson, Independent minister at Banbury, by his wife, Mary Anne Grant, was born at Wrawby, Lincolnshire, 9 November 1850. His education began at a preparatory school at Lewisham. After attending classes at King's College, London, he matriculated there in 1867, and gained his B.A. with high honours in 1870. From 1872 to 1873 he studied at Edinburgh University. In 1873 he went to Trinity College, Cambridge, where he graduated with a first class in the moral science tripos in 1876. In 1877, the year of its institution, and again in 1880, Nicholson was awarded the Cobden (triennial) prize. The earlier of his prize essays, published in 1878 under the title of *The Effects of Machinery on Wages*, gained for him the Cambridge degree of Sc.D. In 1877 he was placed first in the London M.A. examination (philosophy branch), obtaining the Gerstenberg prize for special distinction in political economy. Subsequently, accompanied by his friend (Sir) James George Frazer, he went to Heidelberg, where he attended lectures, chiefly on law, at the university.

From 1876 to 1880 Nicholson was a private tutor at Cambridge; he lectured on English history at Trinity College, and took an active part in the extra-mural teaching of the university. For two years (1878-1880) he lectured on political economy for the Association for the Higher Education of Women in Cambridge. In the early days of the Cambridge Chess Club (founded 1871) Nicholson was an outstanding player, and a member of the team which, in 1874, defeated Oxford for the first time. In later years he became widely known through the chess column of *The Times* as a subtle composer and solver of chess problems. Nicholson was devoted to boating and fishing, and he was an accomplished swimmer. His vacations at this period were usually spent in the north of Scotland and his daring exploits in the seas around Cape Wrath and in the lochs of Sutherland became a tradition of the district.

In 1880, before he was thirty, Nicholson was elected to the chair of political economy and mercantile law at the university of Edinburgh. He came to Edinburgh from Cambridge with a reputation as a hard worker and as a teacher of great ability who could expound economic principles with lucidity and bring them into close and intelligible relation with the problems of the day. This reputation he fully justified throughout the whole period of forty-five years during which he held the chair. As professor he maintained the highest Scottish traditions. His teachings and his writings played a definite and important part in the formation of public opinion. On questions of imperial economic policy and of currency and banking he attained a position of exceptional authority. In the difficult period of war finance his counsel and consistent teaching did much to keep depreciation of currency within remediable limits. There were few teachers of his time in Scotland who did more to bring academic life into touch with that of the community. He was the pioneer of economic history in Scotland, and during his professorship his department grew until it included nearly half as many teachers as there had been students when it was opened.

As a writer Nicholson possessed a lucid and happy style. His main work, *Principles of Political Economy* (vol. i, 1893, vol. ii, 1897, vol. iii, 1901), may be said to complete the nineteenth-century tradition of a great system of economics. The general standpoint is that of the classical school, extended, humanized, and endowed with vitality. Especially is the attempt made to unite in one organic whole the tendencies of the historical and mathematical methods.

The numerous minor writings of Nicholson may be said to constitute an adequate guide to the economic controversies of the half-century ending in 1925. They begin with *Tenant's Gain not Landlord's Loss* (1883), which was followed by many articles and lectures relating to currency and bimetalism, the most important being included in *The Silver Question* (1886), *Money and Monetary Problems* (1888), and *Bankers' Money* (1902). To the *Economic Journal* Nicholson contributed articles on 'The Use and Abuse of Authority in Economics' (1893), 'Historical Progress and Ideal Socialism' (1894), and 'Strikes and Social Problems' (1896). Related to the tariff controversy are the following: *The Tariff Question* (1903),

History of the English Corn Laws (1904), *Rules and Taxes as Affecting Agriculture* (1905), *Rents, Wages, and Profits in Agriculture and Rural Depopulation* (1906), *A Project of Empire* (1909—translated into Japanese), and 'Economics of Imperialism' (*Economic Journal*, 1910). The War resulted in a new series of articles and essays, of which no less than forty-six were reprinted in *War Finance* (1917, enlarged edition 1918), and *Inflation* (1919), a volume of lectures given, on the invitation of Barclays Bank, to its London staff. His chief contribution to post-war problems is represented by *The Revival of Marxism* (1920—translated into Japanese). Of a less topical character were his editions of *The Wealth of Nations* (1884), a short treatise on economics entitled *The Elements of Political Economy* (1903), and *Lectures on Public Finance* (1906).

No estimate of Nicholson's personality would be complete without a reference to his literary activities of a lighter kind. His romance *A Dreamer of Dreams* (1880) is very revealing as a human document, while the other two—*Thoth* (1888) and *Toxar* (1890)—in their allegorical undertones give many of his views on life and its problems. The link between these and his books on Ariosto—*Tales from Ariosto* (1913), and *Life and Genius of Ariosto* (1914)—is to be found in the position assigned to Ariosto as 'the father of modern romance'.

Nicholson was an honorary LL.D. of the universities of St. Andrews (1911) and Edinburgh (1910), F.R.S.E. (1884), F.B.A. (1903), and medallist of the Statistical Society (1918). In 1885 he married Jeanie, daughter of William Ballantyne Hodgson [q.v.], his predecessor in the chair of political economy at Edinburgh. They had one son (who died of wounds in the European War) and two daughters. In *Quasi Cursors*, the tercentenary album of the university of Edinburgh (1884), there is an etching of Nicholson by William Hole, in which he is represented as seated in his class-room, lecturing, with volumes of the works of Adam Smith and John Stuart Mill on the table at his hand. In the presentation portrait painted by Henry Lintott in 1927, which is in the possession of Nicholson's family, the Tassie medallion of Adam Smith is reproduced to mark Nicholson's influence and success as an interpreter of Smith's genius and spirit. In 1925 he resigned his chair owing to an illness. In 1927 an operation became

necessary, and he died at Edinburgh 12 May of that year.

[*The Times*, 13 May 1927; *University of Edinburgh Journal*, autumn issue, 1927; W. R. Scott, *Joseph Shield Nicholson, 1850-1927*, in *Proceedings of the British Academy*, vol. xiv, 1928; private information; personal knowledge.] W. R. Scott.

NICOLL, SIR WILLIAM ROBERTSON (1851-1923), journalist and man of letters, was born at Lumsden, Aberdeenshire, 10 October 1851, the elder son of the Rev. Harry Nicoll, Free Church minister of Auchindoir, Aberdeenshire, by his wife, Jane Robertson. The manse at Auchindoir contained one of the largest private libraries in northern Scotland, for although the minister's stipend was less than £200 a year, Nicoll's father collected 17,000 volumes. His children had access to the shelves, and there young Nicoll formed and fostered a love for books which influenced his whole career. He attended the parish school of Auchindoir, and the Aberdeen grammar school. At fifteen he entered Aberdeen University, graduating M.A. in 1870. At the Free Church Divinity Hall he received the customary four years' theological training. During this period he contributed regularly to the *Aberdeen Journal*, writing reviews and literary notes. In 1874 he was ordained to his first charge at Dufftown, Banffshire. Three years later, in September 1877, he was inducted minister of the Free Church, Kelso, where he was second in succession to the hymn-writer, Horatius Bonar. In 1878 Nicoll married Isa, the only child of Peter Dunlop, a prosperous Berwickshire farmer. Two children, a daughter and a son, were born in the manse at Kelso.

During seven-and-a-half years' ministry at Kelso Nicoll established his reputation as a preacher, and a brilliant future seemed to be opening for him when, at the close of 1885, serious ill-health compelled him to resign his charge. His mother, a sister, and his only brother had died of consumption, and now he himself was 'ordered south'. Leaving Kelso, he went to live at Norwood in South-East London. Fortunately he had begun at Kelso a connexion with the publishing firm of Hodder & Stoughton which was to last, with ever-increasing confidence on both sides, to the end of his life. The firm appointed him editor of their monthly theological magazine, *The Expositor*, and he directed it from January 1885 until

his death thirty-eight years later. His list of contributors included many of the most distinguished names in Biblical scholarship at home and abroad.

A new opening came to Nicoll soon after his settlement in London. On 5 November 1886 appeared the first number of *The British Weekly: A Journal of Social and Christian Progress*, with Hodder & Stoughton as proprietors and publishers, and Nicoll as editor. Nicoll's aim was to establish a penny religious journal of the best sort, in which, to quote his own words, 'everything should be treated in a Christian spirit'. In view of the precarious state of his health, the enterprise was a venture of faith; but the publishers showed their confidence in Nicoll by supplying the whole capital and business organization, while leaving him an entirely free hand in the management and circulation of the paper. In the course of a few years Nicoll raised the *British Weekly* to a position of wide influence, and in due course to a circulation perhaps unrivalled among publications of its kind. (Sir) J. M. Barrie was a frequent contributor to the journal from the first year of its foundation, and Nicoll himself wrote for thirty years, with few interruptions, a well-known series of weekly letters, signed 'Claudius Clear', from which two volumes of selections were published: *The Daybook of Claudius Clear* (1905) and *A Bookman's Letters* (1913).

In 1891 Nicoll founded *The Bookman*, a literary monthly which proved very successful. Two years later he established *The Woman at Home*, an illustrated magazine, to which the Scottish novelist, Annie S. Swan (Mrs. Burnett Smith), was one of the chief contributors. In 1892 he removed with his family from Norwood to Bay Tree Lodge, Hampstead, an old Georgian house to which he added a library with room for 24,000 volumes. In 1894 his wife died after an operation, and he was left alone with his two children, and an ever-increasing load of work. In 1896 he paid a visit to the United States, accompanied by his friend J. M. Barrie. This was his only visit to America, but he kept in constant touch with American authors, politicians, and preachers. In the following year he married Catherine, daughter of Joseph Pollard, of Highdown, Hitchin, Hertfordshire. By his second marriage he had one daughter.

At the turn of the century Nicoll's health had greatly improved, and through the medium of his paper he threw himself vigorously into the political controversies

of the next twenty years. In addition to his editorial work, he was able from time to time to preach and address meetings. He was one of the champions of the movement of 'passive resistance' to Mr. Balfour's Education Bill of 1902; he became an ardent supporter of the social legislation identified with the name of Mr. Lloyd George; and he made the *British Weekly* a focus of Nonconformist support for the government during the European War. The political influence which he was in a position to exercise was thus considerable, and he was for long in touch with liberal members of the Cabinet. He was knighted for his political services in 1909, and in 1921 was made C.H. After 1920 Nicoll's health began to fail, but he continued to write until a few weeks before the end. He died 4 May 1923 at his Hampstead home, and was buried in Highgate cemetery.

In addition to many theological writings of a popular character, Nicoll edited (with T. J. Wise) *Literary Anecdotes of the Nineteenth Century* (2 vols., 1895, 1896), and wrote biographies of James Macdonell of *The Times* (1890) and of Ian MacLaren (Dr. John Watson, 1908); he also published an edition of the works of Charlotte Brontë (1902).

J. T. STODDART.

NICOLSON, SIR ARTHUR, eleventh baronet, and first BARON CARNOCK (1849-1928), diplomatist, was born in London 19 September 1849, the younger son of Admiral Sir Frederick Nicolson, tenth baronet, by his first wife, Mary Clementina Marian, daughter of James Loch, of Drylaw, member of parliament for St. Germans and the Northern Burghs. Intended for the navy, he passed through H.M.S. *Britannia*, but changed his mind and proceeded to Rugby and Brasenose College, Oxford. He entered the Foreign Office in 1870. In 1872 Lord Granville, the secretary of state for foreign affairs, made Nicolson his assistant private secretary. In 1874 he went as third secretary to Berlin under Lord Odo Russell, and shortly afterwards exchanged permanently into the diplomatic service. From Berlin he went to Peking in 1876, returning to his former post in 1878, just after the Berlin Conference. Thence he was transferred in 1879 as second secretary to Constantinople, where he served under Sir Austen Henry Layard, (Viscount) Goschen, and Lord Dufferin, and became superintendent

of student interpreters. Nicolson was also chosen to inspect the consulates in Asia Minor in 1881, and accompanied Lord Dufferin to Cairo in 1882. He served as chargé d'affaires at Athens from 1884 to 1885 and was then transferred as secretary of legation to Teheran, where he was in charge for three years, and succeeded in beginning the revival of British influence in Persia. For his services he was created C.M.G. in 1886 and K.C.I.E. in 1888.

From 1888 to 1893 Nicolson was consul-general at Budapest; in 1893 he became secretary of embassy at Constantinople, where he was in charge for most of the time during Sir Clare Ford's absence. In 1894 he went as agent to Sofia and in 1895 as minister to Tangier.

Nicolson's first years in Morocco were uneventful, but in 1901 serious unrest broke out. There had long been traditional rivalry between English and French, but the position of the latter in North Africa had become predominant. Germany also was beginning steadily to push her interests there. Nicolson saw that it was impossible successfully to continue rivalry with France, and he advocated a policy of agreement. In 1905 Germany promoted a conference on Morocco. This took place at Algeiras, and Nicolson, who had gone as ambassador to Madrid in 1904, was appointed British delegate. England and Russia steadily supported France against Germany. The conference nearly broke down, but, largely owing to Nicolson's patience, the French view prevailed, and the Treaty of Algeiras was signed on 7 April 1905. For his work in the conference Nicolson received the G.C.M.G. (1906). He was transferred to St. Petersburg the same year.

The Anglo-French *Entente* had been concluded in 1904, and now the peace between Russia and Japan encouraged the resumption of negotiations for an *entente* with Russia, which had been postponed on the outbreak of the Russo-Japanese War. These were carried to a successful conclusion by Nicolson, and an agreement was signed in 1907. For this service he received the G.C.B. (1907).

In 1910 Nicolson succeeded Lord Hardinge of Penshurst as under-secretary of state for foreign affairs. Nicolson's St. Petersburg experience made him aware of Russian limitations. He knew that Russia was the weak link in the *Entente*, but that without her England and France could not successfully resist German pretensions. For him the cardinal point of British

policy was to keep Russia in the *Entente*, but there were many, both in St. Petersburg and London, who did not agree with him. Nicolson and Sir Edward Grey wished to terminate the friction which had so long embittered Anglo-Russian relations, and to trust Russia to co-operate. Their policy was successful.

In 1914, when trouble first arose between Servia and Austria, Nicolson did not think that it would have serious results, but the moment it appeared that Germany was behind Austria, he realized the full gravity of the situation. He did everything possible to second Grey's efforts to avert war. Impressed by the effect produced on Germany by firmness during the Agadir crisis in 1911, he thought that a clear declaration by England of her intention to support her friends was the best chance of avoiding war. On 26 July he suggested that England should invite a conference between Germany, France, Italy, and herself, and Grey accordingly made the proposal. On 31 July and 1 August he officially recommended the mobilization of the fleet and the army.

Nicolson had been the intended successor of (Lord) Bertie [q.v.] as ambassador at Paris, but the outbreak of war made this impossible, and he remained at the Foreign Office as under-secretary until his retirement in 1916, when he was succeeded by Lord Hardinge. For a time he acted as liaison officer between the Foreign Office and Buckingham Palace, but important City interests offered him employment, and to these he devoted himself for the rest of his life.

Nicolson had been created a privy councillor and a G.C.V.O. in 1905. On his retirement he was raised to the peerage as Baron Carnock, of Carnock, Stirlingshire. Among the honours which he received were the grand cross of the legion of honour, the Russian order of Alexander Nevsky, and the Spanish order of Charles III. He succeeded his father as eleventh baronet in 1899, his elder brother having predeceased him. He married at Constantinople in 1882 Mary Katherine, daughter of Captain Archibald Rowan-Hamilton, of Killyleagh Castle, co. Down, and had three sons and one daughter. Nicolson died 5 November 1928 at his London house, and was succeeded as second baron by his eldest son, Frederick Archibald (born 1883). A portrait by P. A. de László is in possession of the family.

ONSLOW.

NORTHCLIFFE, Viscount (1865-1922), journalist and newspaper proprietor. [See **HAIRSWORTH, ALFRED CHARLES WILLIAM**.]

NORTHUMBERLAND, eighth Duke of (1880-1930). [See **PENNY, ALAN IAN**.]

NORTON-GRIFFITHS, Sir John, first baronet (1871-1930), engineer, was born 13 July 1871 in Somerset, the only surviving son of John Griffiths, of The Watton, Brecon, by his second wife, Juliet, daughter of Richard William Avery, of London. He had an unsettled youth and at the age of seventeen signed on as a seaman before the mast on a windjammer bound for Australia. On arrival in that country he was employed in engineering, excavating, and tunnelling in remote mining areas. Later he went to South Africa, where he practised as an engineer. In the Matabele War of 1896-1897 Griffiths commanded a body of scouts. On the outbreak of the South African War in 1899 he volunteered, and served as squadron leader in the second (colonial) division of the South African Field Force under (Sir) Edward Yewd Brabant, and later, from 1900 to 1902, as captain and adjutant of Lord Roberts's body-guard on the head-quarters staff. He took part in the Paardeberg, Modder River, and other engagements, was thrice mentioned in dispatches, and was awarded the queen's medal and clasp.

After the conclusion of peace in 1902, Griffiths built up a business as an engineering contractor, and in 1905 he constructed the first section of the Benguela railway in Portuguese West Africa, about one

hundred miles in length. He also carried out works in America, and in England he founded the firm of Griffiths & Co., public works contractors, of which he was managing director. He also became senior partner of the firm of Norton, Griffiths, Bruce, Marriott & Co. He represented Wednesbury in parliament in the conservative interest from 1910 to 1918, and Wandsworth Central from December 1918 to October 1921. He was an untiring advocate of 'Imperial' projects and ideas, contemplated founding a town in Canada for British emigrants, and was known in the House of Commons as 'Empire Jack'.

On the outbreak of the European War in August 1914, Griffiths, at his own expense, organized and equipped the second regiment of King Edward's Horse, which was entirely distinct from the first regiment [L. James, *History of King Edward's Horse*, 1921, 71-72]. In December 1914 he suggested to the War Office that coalminers and other underground workers should be specially enlisted for military mining purposes. In February 1915 he was authorized to enlist a party of these workers for service in France, and it was determined that they should form distinct units with their own establishment. Griffiths went to work with the most remarkable energy. The War Office approved the formation of eight companies on 19 February, and next day the first party of miners arrived in France to form the nucleus of the 170th company of Royal Engineers. Five days previously the men had been employed on sewer work at Liverpool. Within a fortnight four companies existed in embryo, and were engaged in active mining. By the end of June 1916 there were twenty-five Imperial companies and seven Overseas companies actively employed, the total force in existence being about 25,000 men in addition to the temporary employment of detachments from infantry battalions [*Work of the Royal Engineers in the European War. Military Mining*, 1922, 1-3]. Griffiths himself, with the rank of major, was attached to the staff of the engineer-in-chief at general head-quarters in France. He was mainly responsible for the planning and carrying out of the tunnelling operations under the Messines ridge, which successfully destroyed that German vantage-point on 7 June 1917. For his services he was three times mentioned in dispatches, and awarded the D.S.O. and the temporary rank of lieutenant-colonel in 1916.

The same year Griffiths was appointed general service officer, first grade, and sent on a special mission to Rumania. After the retirement of the Rumanian forces it became important for the Allies to prevent the supplies of oil and corn, left exposed, from falling into the hands of the Austro-German troops. Griffiths succeeded in wrecking the oil works and in destroying the standing corn with such completeness as to earn for himself a second nickname, that of 'Angel of Destruction'. It was a dangerous task, and for his daring and technical skill in carrying it out he was created K.C.B. in 1917 and officer of the legion of honour, and was awarded the star of Rumania and the order of St. Vladimir of Russia (third class). In 1917 he assumed by deed-poll the additional surname of Norton, and he was created a baronet in 1922.

In February 1920 the Egyptian government, in consequence of the report of an international commission, decided to raise the height of the Assuan dam [see BAKER, Sir Benjamin, and GARSTIN, Sir William], by twenty-three feet, and the firm of Norton-Griffiths & Co. obtained the contract for the work. The contractors, however, stopped work on 21 September 1930, notifying the Egyptian government that the resident Egyptian engineering inspectors were inexperienced and incompetent, and that by their persistent obstruction they had made it impossible to continue. The Egyptian government in reply complained that the work had not been carried on at the proper rate, and stated that the contractors were in need of financial assistance, implying that this was the real reason of the stoppage. Norton-Griffiths in a further statement said that the suspension was irrespective of the financial position, but that the obstruction complained of had made further expenditure by the company difficult [*The Engineer*, 26 September 1930]. On the morning of 27 September 1930 Norton-Griffiths shot himself while alone in a surf boat at a short distance from the Casino hotel at San Stefano, a sea-side resort near Alexandria. His body was embalmed and sent to England.

Norton-Griffiths married in 1901 Gwladys, daughter of Thomas Wood, head of the engineering firm of Browning, Wood, & Fox. By her he had two sons and two daughters. He was succeeded as second baronet by his elder son, Peter (born 1905).

Norton-Griffiths was a member of the

Institute of Mining and Metallurgy and a fellow of the Geological Society. He founded the Veterans of the Grand Army Association, afterwards called Comrades of the Great War.

[*The Times*, 29 September 1930; *The Engineer*, 3 October 1930.] E. I. CAMMIE.

O'BRIEN, IGNATIUS JOHN, BARON SHANDON (1857-1930), lord chancellor of Ireland, was born at Cork 31 July 1857, the ninth child and youngest son of Mark Joseph O'Brien, merchant, and freeman of Cork, by his wife, Jane, daughter of William Dunne, of Cork. He was educated at the Vincentian School, Cork, and then privately; and at the age of sixteen entered the Catholic University of Ireland, Dublin, a moribund institution which had no power to award recognized degrees. There he remained for only two years, for the circumstances of his family were straitened, and it became necessary for him to earn his own living immediately. He obtained a post first as junior reporter on *Saunders' Newsletter*, a Dublin conservative daily paper, and subsequently on the *Freeman's Journal*. Meantime he was studying for the bar, to which he was called in 1881.

Success came slowly, and O'Brien had to maintain himself by means of free-lance journalism. In his first year at the bar he made six guineas, in his second twenty-nine; in his third he began to acquire a small practice on the Munster circuit. Despairing of any real success, he was about to emigrate to New South Wales when a lucky opportunity brought his name before the public. In 1887 Canon Keller, the parish priest of Youghal, had been examined in the Court of Bankruptcy as to the means of certain of his parishioners, and, on his refusal to disclose knowledge which he had acquired in his capacity of priest, had been committed to prison for unsatisfactory answering. On the suggestion of Mr. T. M. Henly, and supported by the Land League, O'Brien brought a motion of habeas corpus to secure Canon Keller's release, and after being unsuccessful in the Court of Queen's Bench, secured an order of release from the Court of Appeal. Popular interest had been greatly stirred, O'Brien was the hero of the hour, and his solid attainments began to be realized. His practice now steadily increased. He gave up circuit business and devoted himself to cases in chancery and bankruptcy, becoming a leading authority in the latter branch of

law. In 1890 he took silk, and his income suffered no decrease by this step.

Thenceforward events combined to ensure O'Brien's success. The long liberal régime which began in 1906 found few liberals among the more eminent men at the Irish bar. O'Brien had always held liberal views and, although he never contested a seat, he had helped and continued to give help at elections. In 1907 he became a benchler of King's Inns, and in 1910 his services were recognized by promotion to the dignity of serjeant-at-law. In 1911 he was appointed solicitor-general for Ireland; in 1912 he became attorney-general and was admitted a privy councillor for Ireland. In 1913 the offices of lord chancellor and of lord chief justice of Ireland became vacant at the same time, and O'Brien as attorney-general sought for and obtained the chancellorship.

O'Brien's tenure of office was uneasy, for the political intrigues in England were reflected in attempts to oust him from his position. When the first Coalition government was formed in 1915, he was on the verge of being superseded in favour of the unionist (Sir) James Henry Mussen Campbell, a former solicitor-general and attorney-general for Ireland; but the weight of American and Irish nationalist opinion was too heavy for a government which feared a popular outcry. In 1916 O'Brien was created a baronet, and in 1917, when his rival, Sir James Campbell, was made lord chief justice, his position seemed safe. But in 1918 the conservative pressure was again felt; he received notice that his services were no longer required, and Campbell was appointed lord chancellor in his stead.

As some consolation for his summary dismissal, O'Brien was offered a peerage of the United Kingdom; this he accepted, choosing the title of Baron Shandon from childhood memories of the chimies which had inspired the poem 'The Shandon Bells' by 'Father Prout' (Francis Sylvester Mahony, q.v.). His work in Ireland was finished. Disgusted and disappointed with the violence and excesses of Sinn Féin, of which he had personal experience in a raid on his house, he sold his Irish property and went to live at St. Lawrence in the Isle of Wight. He was called to the English bar by the Middle Temple in 1923. In the House of Lords he found unexpected solace. The quiet, restrained atmosphere was strange to him, but he grew to appreciate it, and even became reconciled to the

hereditary system. While the abortive Government of Ireland Act (1920) was before parliament, Shandon took a prominent part in negotiation and debate, but thereafter spoke less and less frequently, confining himself to matters affecting Ireland, and to topics on which his legal experience might be of value. His last speech was delivered in 1927, on the Law of Libel Amendment Bill, which he opposed. He never returned to live in Ireland, and died in London 10 September 1930.

Shandon was not in the first rank whether as advocate, judge, or statesman, but he was always hardworking and pertinacious. During the troubled times when he was in office he exercised a moderating influence, aiming at securing a wide measure of Home Rule combined with preservation of the Imperial tie. Unfortunately he possessed neither the force of personality nor the skill in diplomacy necessary to make his advice effective, and he was overborne by abler and more subtle men.

Shandon married in 1886 Anne, daughter of John Talbot Scallan, a well-known Dublin solicitor. They had no children, and the peerage became extinct on his death.

[*The Times*, 12 September 1930; an unpublished autobiography and the private papers of Lord Shandon; Hansard, *Parliamentary Debates* (House of Lords); private information; personal knowledge.]

T. C. KINGSMILL MOORE.

O'BRIEN, WILLIAM (1852-1928), Irish nationalist leader, was born at Mallow, co. Cork, 2 October 1852, the second son of James O'Brien, of Mallow, a solicitor's clerk, by his wife, Kate, daughter of James Nagle, a local shopkeeper. Although his parents were Roman Catholics, O'Brien was educated at Cloyne Diocesan College, the Protestant high school of the district, and at Queen's College, Cork. In 1869 he became a reporter on the *Cork Daily Herald*; and in 1875 he joined the *Freeman's Journal*, Dublin, as a special correspondent. In 1881 Charles Stewart Parnell [q.v.] appointed him editor of *United Ireland*, the weekly organ of the Land League movement, the first number of which appeared on 13 August of that year. O'Brien made it the most militant political journal ever published in Ireland. In October it was suppressed by the chief secretary for Ireland, William Edward Forster [q.v.], and O'Brien was committed

to Kilmainham jail, in which Parnell and other land leaguers had already been lodged, without trial, being 'reasonably suspected' of treasonable designs.

On his first day in prison O'Brien (as he relates in his *Recollections*) wrote, at Parnell's request, the 'No Rent' manifesto appealing to the farmers to stop paying rent until the land question was settled; and it was the reading of this document at a meeting of the Land League in Dublin that led, on 20 October, to the proclamation of the League as an illegal and criminal organization. *United Ireland* continued to appear, however, being printed secretly in London and Liverpool, and ultimately in Paris, whence it was distributed in Great Britain and Ireland. Parnell and other suspects were released on 2 May 1882 under the Kilmainham treaty, *United Ireland* was issued again in Dublin, and O'Brien, still editor, was elected nationalist member of parliament for Mallow in 1883. His remarkable powers as a speaker and writer made O'Brien second only to Parnell as a nationalist leader.

The rejection of Gladstone's Home Rule bill in 1886, followed by the first unionist government under Lord Salisbury, with Mr. A. J. (afterwards first Earl of) Balfour as chief secretary for Ireland, led to renewed Irish land agitation in a form as intense as ever. O'Brien and his colleague John Dillon [q.v.] started the 'plan of campaign' (1886), under which the tenants of estates whose landlords refused abatements paid their rents into a common fund for the purposes of defence and support in case of eviction. This step was taken without consulting Parnell, and he made known that he did not approve of it. The plan was declared illegal in February 1887, and O'Brien, after a visit to Canada for the purpose of agitation against the governor-general, Lord Lansdowne (on whose Irish estates evictions had taken place), was convicted on a charge of conspiracy in order to intimidate tenants to refuse to pay their rents, and sent to Tullamore jail for six months. His claim to be treated as a political prisoner having been ignored, he declined to wear the prison uniform. He lay naked on his plank bed for several weeks, until one morning he was found clad in a suit of Blarney tweed which had been smuggled in by a warder. On his release, O'Brien reappeared in the House of Commons, as member for North-East Cork (in which Mallow had been absorbed in a redistribution of consti-

tuencies), and was the central figure of some stormy debates on the subject of his prison treatment, which Balfour dealt with in an exasperatingly cool and ironic manner.

In September 1890 O'Brien and Dillon were arrested on a charge of criminal conspiracy. Being admitted to bail during the trial, they escaped to France and thence to the United States. There they were engaged in conducting a political mission when the split in the Irish party occurred (November 1890) on the question of Parnell's leadership after the O'Shea divorce case. They immediately returned, and at Boulogne O'Brien conducted protracted negotiations intended to restore unity to the party by making Dillon temporarily leader until the feeling against Parnell had subsided. Nothing came of his efforts. Parnell consented to retire only if O'Brien would take his place as leader; and this O'Brien, in an excess of self-distrust, refused to do. In February 1891 Dillon and he returned to Ireland and served the imprisonment of six months in Galway jail to which they had been sentenced. Not until 1900 was the Irish party re-united, through the influence of O'Brien, under the leadership of John Redmond [q.v.].

O'Brien, in the general election of 1892, was returned as nationalist member both for Cork city and the North-East division of the county, and chose to sit for the city. He soon started on a new career. He who had been the most extreme exponent of the nationalist policy, and the founder (1898) of the United Irish League, the object of which was to break up the great grazing farms by methods akin to those of the former Land League, had now come to the conclusion that Ireland's regeneration must be sought for on different lines. Her social troubles could be remedied and her national demand satisfied only by the conciliation and union of all classes, creeds, and political parties in Ireland. His first move in this direction was the Land Conference of 1902, representative of landlords and tenants. This had remarkable success. It led to the Land Purchase Act of 1903 brought in by George Wyndham [q.v.], the chief secretary, by which agricultural Ireland was to be transformed from a land of tenant occupiers to a land of occupying owners. It meant the abolition of Irish landlordism. O'Brien's next aim was the settlement of the 'national' question by agreement between unionists and nationalists. In this he was opposed

by the majority of the Irish parliamentary party, who held that the concessions to Ulster which his policy involved would curtail the powers of a Home Rule parliament. O'Brien thereupon left the party. After some years of retirement from public life, he was again elected for Cork city in 1910 and founded the 'All for Ireland' League, which was supported by an independent parliamentary party under his own leadership, consisting of seven members (including T. M. Healy) returned by Cork constituencies in the general election of 1910. The motto of the League was 'Conference, Conciliation, Consent'. To this policy of combining all elements of the Irish population in a spirit of mutual tolerance and patriotic goodwill, O'Brien remained true to the end. He ascribed the rise of Sinn Féin to the blunders of the Irish party under John Redmond in their relations with the liberal government in the years before the European War. At the general election of 1918, O'Brien and his 'All for Ireland' followers retired, so as to leave the field clear for the contest between Sinn Féin and the Irish party. O'Brien saw the complete extinction of that great party, of which he had been a member at its rise under Parnell. He opposed the treaty which set up the Free State, because it divided Ireland.

O'Brien was the author of two novels, *When we were Boys* (1890), a story of the Fenian movement, and *A Queen of Men* (1898), dealing with the exploits of Grace O'Malley, a heroine of ancient Ireland. He also wrote *Recollections* (1906), *Evening Memories* (1920), *The Irish Revolution* (1923), *Edmund Burke as an Irishman* (1924), *The Parnell of Real Life* (1926), and other works. He married in 1890 Sophie, daughter of Hermann Raffalovich, of Paris, a French and Russian banker. They had no children. O'Brien died suddenly in London 25 February 1928, and was buried at Mallow.

There are portraits of O'Brien by Henry Holiday (1887) in the National Gallery, Dublin, by H. J. Thaddeus (1890) in Cork University, and by Sir William Orpen (1904) in the Municipal Gallery of Modern Art, Dublin.

[William O'Brien, *Recollections*, 1906, and *Evening Memories*, 1920; Michael Macdonagh, *Life of William O'Brien*, 1928; Mrs. William O'Brien, *Golden Memories*, 1929-1930.]

M. MACDONAGH.

O'CONNOR, THOMAS POWER (1848-1920), journalist and politician, was born

at Athlone 5 October 1848, the eldest son of Thomas O'Connor, shopkeeper, by his wife, Theresa Power, daughter of a non-commissioned officer of the Connaught Rangers. He was educated at the College of the Immaculate Conception, Athlone, and at the Queen's College, Galway, where he took his B.A. degree in 1866. In the following year he began his career in journalism as a reporter on the staff of *Saunders' Newsletter*, a Dublin conservative daily paper. In 1870 he went to London in search of work, and at the outbreak of the Franco-German War his mastery of French and German led to his appointment as sub-editor, dealing with war news, on the *Daily Telegraph*. He next became a free-lance journalist, and endured much hardship in the years during which he followed this precarious calling until he found settled employment in the London office of the *New York Herald*.

It was at this period that O'Connor wrote his first book, a *Life of Lord Beaconsfield*, which appeared anonymously in serial numbers during 1876. It was so unsparing an attack on the prime minister that it attracted considerable notice, and when it appeared in book form, with the author's name, in 1879, it brought O'Connor into public notice. In the general election of 1880 he won the borough of Galway as a supporter of Parnell, and was one of the most voluble and pertinacious talkers among the Parnellites who opposed the liberal government of Mr. Gladstone. At the general election of 1885 he wrote an address from the Irish party to the nationalist voters in Great Britain, urging them to defeat the liberal oppressors of Ireland by supporting the conservative candidates; and at the general election of 1886, when Gladstone had adopted Home Rule, he wrote another address to the same electors, exhorting them in even more moving terms to vote liberal.

Throughout his long life O'Connor combined journalism with politics and was better known, perhaps, as a journalist than as a politician. John (afterwards Viscount) Morley [q.v.], editor of the *Pall Mall Gazette* in the early 'eighties, engaged him to write a nightly sketch of the proceedings in parliament, and thought him unrivalled in depicting the personalities of the party fight of that day and its dramatic episodes. In 1887 O'Connor founded *The Star*, an evening journal noted both for its radicalism and for its inauguration of 'the new journalism', characterized by what was called the

'human touch'. After three years of O'Connor's editorship, differences arose between him and the proprietor, and O'Connor was bought out for £15,000, subject to the condition that he should not start another evening paper in London for three years. In 1891 he brought out the *Sunday Sun*, which was subsequently called the *Weekly Sun*. The *Sun*, which he founded in 1893 when he was free to start another evening paper, failed to outshine his earlier luminary. His next venture, *T.P.'s Weekly* (he was known familiarly as T.P.), a penny literary paper of more than ordinary merit, which he set going in 1902, flourished for many years. He started other weekly papers, such as *M.A.P.* ('Mainly about People') and *P.T.O.* ('Please Turn Over'), both devoted chiefly to personal gossip, and tried his hand also at a monthly called *T.P.'s Magazine*. Of his books the more important are *The Parnell Movement* (1886) and *Memoirs of an Old Parliamentarian* (1929). As a journalist he was not a publicist in the sense that he wrote leading articles of weight and influence on public affairs. He was content rather to be an observer of life and its chronicle in an easy and agreeable style, reminiscent and anecdotal. Nor as a parliamentarian did he ever aspire to leadership. To the end he was only a subordinate member of the Irish party, but very useful by reason of his ready pen, great popularity, and wide circle of influential acquaintance.

In 1917 O'Connor became the first president of the Board of Film Censors—a salaried appointment in the gift of the cinematograph trade, but independent of trade control or influence. O'Connor's signature on the Censors' certificate which preceded the presentation of every film thus became familiar to millions. His censorship was successful in that it excited no controversy. In 1924 he was made a member of the Privy Council by the first labour government. He was also for many years 'father' of the House of Commons by right of the longest unbroken period of service, having sat continuously for the Scotland division of Liverpool since 1885.

O'Connor loved the House of Commons for its history, its customs, and its sociabilities, and wrote innumerable articles about its more prominent members, their fortunes and fates. In his later years there was more than one demonstration of the regard in which he was held by his fellow members. On his seventy-fifth birthday they presented him with a Georgian gold snuff-

box, he being one of the few members who continued the practice of snuff-taking; and on his eightieth birthday he was entertained at a dinner, King George V sending to him his 'heartiest congratulations'. O'Connor died 18 November 1929, and was buried in the Roman Catholic cemetery, Kensal Green.

He married in 1885 Elizabeth Paschal (died 1931), daughter of a judge of the supreme court of Texas, U.S.A. They had no children.

There is a portrait of O'Connor by Sir John Lavery in the National Gallery, Dublin, and another by J. F. Bacon in the Walker Art Gallery, Liverpool.

[*The Times*, 10 November 1929; T. P. O'Connor, *Memoirs of an Old Parliamentarian*, 1929; Elizabeth O'Connor, *I Myself*, 1910.]
M. MACDONAGH.

O'DONNELL, PATRICK (1856-1927), cardinal, was born at Kilrairie, near Glenties, co. Donegal, 28 November 1856, the second son in the family of nine children of Daniel O'Donnell, of Kilrairie, who claimed direct descent from the famous O'Donnell clan, by his wife, Mary Breslin, of Gortlosk. His father was a very small tenant farmer, who still wore the old-fashioned cut-away coat and white stock. The family was Gaelic-speaking, and Patrick O'Donnell remained all his life a fluent speaker of Gaelic, and, as bishop and cardinal, strongly supported the Irish language revival and for years issued his pastorals in Gaelic as well as English. Educated at the local national school and at the high school at Letterkenny, he gained first place in 1873 at a concursus for nomination to the Propaganda College in Rome, but Dr. James MacDevitt, bishop of Raphoe, sent him to Maynooth, where, after completing his studies with a year in the Dunboyne Establishment, he was ordained priest in 1880. He was appointed professor of theology there in the same year, and prefect of the Dunboyne Establishment in 1884.

In 1888, at the age of thirty-two, O'Donnell was consecrated bishop of Raphoe, and for thirty-five years laboured to improve the condition of his extremely poor diocese. He built many churches and schools in county Donegal, including a large industrial school at Killybegs and a diocesan college at Letterkenny, and he opened the new cathedral of St. Eunan at Letterkenny in 1901. In 1922 he was appointed by Pope Pius XI coadjutor,

with the title of archbishop of Attalia, to Cardinal Michael Logue [q.v.], archbishop of Armagh, whom he succeeded as primate of all Ireland in 1924. He was created cardinal by Pope Pius XI, with the title of Santa Maria della Pace, in 1925. He attended the International Eucharistic Congress at Chicago in 1926. In the summer of 1927 he held a plenary synod of the Irish hierarchy at Maynooth, which introduced a large number of reforms concerning the clergy and ecclesiastical organization.

A man of great energy and courage and of charming personality, O'Donnell devoted his brilliant gifts to public life. An early supporter of the agitation for Irish land reform, he helped to promote reunion among the Irish nationalists after Parnell's death in 1891, and presided at the national convention (1900) which elected John Redmond [q.v.] leader of the Irish nationalist party. As the intimate friend of Redmond and John Dillon [q.v.] he became one of the three trustees of the Irish national fund. He supported Redmond's policy during the European War, and was an active member of the Irish convention of 1917-1918; but his final disagreement with Redmond on fiscal questions made the failure of the convention inevitable.

O'Donnell had been a champion of the Ulster catholics in opposing the partition of Ireland; but as archbishop of Armagh with his see in Northern Ireland, he accepted partition as an accomplished fact, and strove to promote better relations between catholics and protestants. In long service on many public bodies and commissions, especially on the Congested Districts Board, and by his work concerning education and in the founding of the National University of Ireland, O'Donnell gained wide experience; his courageous sincerity, shrewd judgement, and moderation commanded general respect and affection. He died at his summer residence at Carlingford, co. Louth, 22 October 1927.

D. GWYNN.

O'HIGGINS, KEVIN CHRISTOPHER (1892-1927), Irish statesman, born at Stradbally, Queen's County, 7 June 1892, was the fourth son of Thomas Francis Higgins, physician, by his wife, Anne, daughter of Timothy Daniel Sullivan,

M.P., the nationalist poet. His mother's sister was the wife of Timothy Michael Healy, K.C., first governor-general of the Irish Free State. He was educated at Clongowes Wood College, Knockley College, Carlow, St. Patrick's College, Maynooth, and at the National University of Ireland, Dublin. Having joined the Sinn Féin movement when a student in Dublin, he was imprisoned for six months in 1917 for a seditious speech. In December 1918 he was elected M.P. (Sinn Féin) for Queen's County, but was pledged not to attend parliament at Westminster and for the next three years led the fugitive existence of a revolutionary organizer and journalist. Meanwhile Arthur Griffith [q.v.] made him assistant minister for local government in the (revolutionary) ministry which the Sinn Féin party set up in January 1919; and with Mr. W. T. Cosgrave, minister for local government, O'Higgins secured control over local affairs. At the close of the year 1921, however, he came to the fore as the most effective advocate of the Treaty by which the Irish Free State was established (6 December), and in January 1922 he was appointed minister for economic affairs in the provisional government formed by Arthur Griffith, the president of Dáil Éireann, under the chairmanship of Michael Collins [q.v.].

Early in the civil war which broke out at the end of June 1922 between the Free State government and the republican party, after the death of Arthur Griffith (13 August) and Michael Collins (22 August), O'Higgins stepped into the breach as vice-president of the executive council and minister for justice. He saw in the civil war primarily a struggle for parliamentary democracy. His uncompromising policy, which resulted in the execution of 77 republicans in the year 1922-1923, mercifully shortened that struggle, but concentrated on him the resentment of the defeated party. The murder of his father, in the course of a raid by the insurgents on his house on 11 February 1923, foreshadowed his own fate. With the coming of peace in May 1923 more direct opportunities for statesmanship presented themselves. Already in the previous autumn O'Higgins had skilfully piloted the new Free State constitution through the Dáil. In 1924 he established the new judiciary, and his confidence in the sound instincts of the people was justified by the success of the new unarmed police force, the Civic Guard, which he established in 1922. His handling of a military mutiny

in March 1924 was a further effective demonstration of democratic rule. Nevertheless he scarcely gauged the depth of the revolutionary spirit in Ireland, and he made little progress towards allaying it.

As a negotiator, however, O'Higgins revealed the essentials of his political outlook. He aimed not at a republic, but at a free and undivided Ireland within the British Commonwealth of nations. He had been the chief factor in reconciling the Southern unionists to the establishment of the Free State, and it was his cherished ambition to reconcile Ulster. With the failure of the boundary commission in 1925, he refused to press the issue, securing, instead, remission of the Free State's share of the National Debt. At the Imperial Conference of 1926 he took a leading part in formulating the conception of equality within the British Commonwealth.

O'Higgins was assassinated near Dublin on 10 July 1927 while on his way to attend Mass at Booterstown church. During his short political career he had proved himself one of the outstanding personalities of modern Ireland. He possessed a rare grasp of essentials and breadth of vision, combined with a passion for first principles and justice. His ruthless integrity made him at once the most admired and hated man of his time. 'A figure out of antiquity cast in bronze' is Mr. Winston Churchill's pen picture of him. To his fellow countrymen he appeared the embodiment of Spartan virtue.

O'Higgins married in 1921 Bridget Mary, daughter of Andrew Cole, of Drumlisk, co. Longford, and had one son and two daughters.

[*Irish Times*, 11 July 1927; *Dail Eireann, Official Reports*, 1922-1927; Winston S. Churchill, *The World Crisis*, vol. v, 1929; private information.] J. HOGAN.

OWEN, JOHN (1854-1926), bishop of St. David's, was born in the parish of Llanengan, Carnarvonshire, 24 August 1854. He was the only son of Griffith Owen, by his wife, Ann Jones. His father, a working weaver and afterwards a wool-merchant, was a man of strong character and deep piety. Both his parents were staunch Calvinistic Methodists, and their son was brought up as a member of that denomination. Educated first at the local British school, and later at the old grammar school of Bottwnog, Owen developed quickly. At the age of fifteen the headmaster made him his assistant. In 1872

he proceeded with a mathematical scholarship to Jesus College, Oxford. He obtained second classes in both classical (1873) and mathematical (1874) moderations, and graduated in 1876 with a second class in the final school of mathematics. He began reading for *literae humaniores*, but abandoned the idea of taking the examination. At Oxford, Owen came under the influence of (Canon) A. M. W. Christopher, rector of St. Aldate's church, in whose Sunday school he was, for a time, a teacher, although he had not yet been confirmed. From 1877 to 1879 he was an assistant master at Appleby grammar school. There his inclinations towards the Church of England, fostered years before by his friend and patron, Canon James Rowlands, rector of Llanbedrog (incumbent of Bottwnog 1860-1877), led to his confirmation in 1879.

In 1879 Owen was appointed professor of Welsh and lecturer in classics at St. David's College, Lampeter. He was ordained deacon in 1879 and priest in 1880 by Bishop Basil Jones, of St. David's. At Lampeter, Owen began a remarkable career of service to Wales and to the Welsh Church. The principal of the college, Francis John Jayne [q.v.], afterwards bishop of Chester, immediately recognized his character and gifts, and helped to develop them. In 1881 Thomas Frederick Tont [q.v.] joined the staff as professor of modern history, and Lampeter thus came to possess a trio of really able men in its service. Owen remained at Lampeter for six years as a diligent and stimulating teacher. During these years the attack on the established and endowed position of the Welsh Church was renewed, and he soon became one of her most skilful defenders. Under the pseudonym of 'Einion' he wrote for the Welsh press a series of articles which established his reputation as a controversialist.

In 1885 Owen left Lampeter to become warden and headmaster of Llandovery College, in succession to the Rev. Alfred George Edwards, afterwards first archbishop of Wales. He found Llandovery a small school of about eighty boys. During the four years of his headmastership the number was more than doubled, and Llandovery reached a respectable place among public schools, with a good record at the universities.

In 1889 the Rev. A. G. Edwards, vicar of Carmarthen and Owen's predecessor at Llandovery, was consecrated bishop of St. Asaph, and one of his first bold acts

was to appoint Owen, at the age of thirty-four, to the deanery. The appointment seemed startling and aroused criticism, but events speedily justified it. The bishop and dean proved themselves to be a very able pair of organizers, and especially strong in controversy, in which both had been engaged for some years. The 'tithe war' in North Wales, and especially in Denbighshire, caused many unpleasant disturbances, and friendly relations between different political parties and religious denominations became increasingly difficult to maintain. The dean's letters to *The Times* in 1890, and a series of articles which he contributed to the weekly Welsh newspaper *Baner ac Amserau Cymru*, compelled attention. He successfully sought to prove that the agitation was not due to the injustice of tithe as a charge upon land, or even to the acute agricultural depression, but that it was being used as a lever (trosol) to bring about the disestablishment of the Welsh Church. The backbone of the agitation was soon broken, and the Tithe Rent-Charge Recovery Act was passed in 1891, making the owner and not the occupier of land responsible for the payment of tithe.

In the same year (1890) in which Owen was appointed dean of St. Asaph, the Welsh Intermediate Education Act, providing for the creation in every county in Wales (including Monmouthshire) of joint education committees, was passed, and although it was far from being satisfactory to churchmen, Owen, a keen and competent educationist, saw in it great possibilities for Welsh children. A member of the Flintshire committee, as well as of the joint committee for Wales and Monmouthshire, his experience in education, both secondary and higher, made his services invaluable in the work of establishing the Central Welsh Board and in the founding of schools in different parts of Wales.

In 1892, at the urgent request of the college board, and with the cordial approval of Bishop Basil Jones, Owen was induced to accept appointment as principal of St. David's College, Lampeter, with which he had kept in close touch since 1879. He relinquished the office of dean, but maintained his connexion with St. Asaph Cathedral through his preferment to a residentiary canonry, which he retained from 1892 to 1897. He was also sinecure rector of Llangeler, Carmarthenshire, for the same period. During his tenure of the principalship Owen took an active part in

establishing the university of Wales and in drafting its charter (1893). One difficulty arose. St. David's College, Lampeter, had hitherto been the only degree-conferring body in Wales, and Owen fought strenuously for its inclusion as a constituent college of the new university. When his efforts proved unavailing he accepted the situation and set himself to reform the constitution of his college, by drafting for it a new charter. This charter was granted in 1896, and resulted in the transfer of government to a council representative of the Welsh Church and of the Welsh university colleges. Hitherto the appointment of the principal had been the prerogative of certain officials of the universities of Oxford and Cambridge, while the other members of the college staff had been appointed by the college board. By the new charter the right of all appointments was vested in the new council. Owen was always mindful of the fact that, while it opened its doors freely and without test to all, the primary object of the college was to educate men for the ministry of the Church, and he was intensely anxious that this object should be attained.

The years 1892-1897 were not free from ecclesiastical controversy. In 1893 a Suspensory Bill was introduced into parliament, designed to prevent persons appointed to offices in the Church in Wales from acquiring any vested interest in their emoluments. The bill was not passed, but in 1895 another bill was introduced by Mr. Asquith, the object of which was to disestablish and disendow the Church in Wales and to sever her long organic union with the Church of England. The opposition to this bill was short and sharp, and as usual Owen was prominent in the struggle. But Lord Rosebery's ministry fell, and for a time Owen was set free to do the work that appealed most to his heart, namely, to raise the spiritual tone of his college.

In January 1897 Bishop Basil Jones died, and the hopes of Welsh churchmen were fulfilled when Owen became his successor. At that time St. David's was, in area, the largest diocese in the province of Canterbury, presenting many difficulties in administration—geographical, linguistic, and economic. Extending from Presteign, on the borders of Radnor and Herefordshire, westward to the city of St. David's, with parts of it populated by monoglot Welsh, parts by monoglot English, and parts of it bilingual, it was also poorly endowed. Owen set himself at

once to improve conditions all round and, by reviving the diocesan fund established by his predecessor, he achieved a large measure of success. His efforts were greatly helped by the recently established Queen Victoria Clergy Fund. Between 1898 and 1913 a total sum of more than £100,000 was raised, but even then the ideal of a minimum stipend of £200 for every incumbent had not been reached.

The year 1902 saw the passing of the new Education Act introduced by Mr. A. J. (afterwards first Earl of) Balfour [q.v.]. This Act transferred the maintenance of elementary education from local school boards to county councils, which were empowered to levy rates for the purpose of maintaining the schools. The Act also sought to improve the condition of church schools, which were now to be rate-aided on condition that they were kept in repair by those responsible for them. Definite religious instruction was secured. The liberals were strongly opposed to the measure, and a Welsh 'revolt' ensued, led by Mr. David Lloyd George. Some Welsh county councils refused to maintain church schools, and that of Carmarthen, in which the bishop's palace at Abergwili is situated, was stubborn in its refusal. An official inquiry was held in August 1904, and was followed by the passing of a parliamentary Default Bill, largely at the instigation of the bishop. The result was that the county council accepted the Act of 1902 and put it into operation.

In 1906 there began the sittings of the royal commission on the Welsh Church and on the general condition of religion in Wales. This commission, presided over by Sir Roland Bowdler Vaughan Williams [q.v.], continued in being for over four years, and issued a voluminous report in December 1910. The bishop's palace at Abergwili remained during all this time a centre of activity where evidence on behalf of the Church's case was collected and sifted. Owen himself gave evidence in 1908, occupying the witness chair for four days. His testimony fills about seventy pages of the report, and is elaborate and exhaustive. The findings of the commission were not unanimous, several minority reports being appended. Owen maintained that one result of the inquiry was finally to explode the statistical argument for disestablishment [*Report of the Welsh Church Commission, 1910*]. A new Disestablishment Bill was introduced in 1909, which formed the basis of a series

of measures brought forward until, by the operation of the Parliament Act of 1911, a bill was successfully passed on 18 September 1914, which disestablished the Church in Wales and Monmouthshire.

Throughout these years the labours of Owen in opposition to disestablishment were strenuous and incessant. He toured the greater part of England as well as of Wales, appealing everywhere to reason and judgement instead of to emotion and prejudice. But when the die was cast he counselled the acceptance of the position. In spite of considerable differences of opinion within the Welsh Church, Owen's view was finally accepted, and the Church set herself to meet the new situation and to prepare for the future. An Act of parliament passed in 1915 postponed the operation of the original Act until after the end of the European War, and the years 1915-1919 were used by churchmen in refashioning the Church's constitution. A meeting held at Shrewsbury in December 1914, followed by another held in London in January 1915, led to the formation of committees which sat in London for the purpose of drafting an appropriate constitution for the disestablished Church. In October 1917 the work of these committees was reviewed by a representative convention summoned at Cardiff, at which it was resolved to form a governing body and a representative body, the former to be the ruling power, and the latter to manage the finances of the Church. A general constitution, previously drafted in committee, was also amended and approved. The Church had set her house in order when, after the end of the War, fresh negotiations were opened with the government, which resulted, in August 1919, in the passing of the Welsh Church Temporalities Act, which greatly mitigated the severity of the Act of 1914. Owen was active in procuring the passing of this measure, and afterwards justified his acceptance of it in a pamphlet entitled *The Acceptance of the Welsh Church Temporalities Act*, issued to his diocese on 1 November 1919.

Owen, in conjunction with his leader, Bishop Edwards of St. Asaph, was both active and effective in all this work of reconstruction, his great ambition being to see the Church once more resuming her place as the national church in Wales. Throughout his life the religious divisions in his country were a source of great grief to him. He yearned for religious re-union without hoping to see it. Although some-

times called a 'fighting bishop', he disliked fighting and longed for peace, national and international. As early as 1888 he had formed one of a small band of distinguished Welshmen, which included Thomas Charles Edwards [q.v.], A. G. Edwards, and F. J. Jayne, who met together to discuss the religious situation. After the War he was an ardent supporter of world peace, and he became Welsh president of the League of Nations Union. A man of many activities in many parts of the country, Owen never at any time neglected his own diocese and work. He knew every corner of his vast diocese, and was personally acquainted with every one of his clergy.

When the day came for the disestablishment of the Welsh Church (31 March 1920) Owen acquiesced, after some doubt, in the formation of an ecclesiastical province of Wales, and himself conducted the proceedings in the parish church of Llandrindod, when the bishop of St. Asaph was elected the first archbishop and metropolitan of Wales.

From 1920 to 1926 Owen devoted his time and energy to the work of building up the Church in Wales and to facing the new conditions, especially in his own diocese, which on 1 July 1923 was divided into two by the creation of the new diocese of Swansea and Brecon. Although the old diocese was unwieldy, he was reluctant to part with any portion of it, especially Swansea, where his influence had always been great. For about half of this time Owen was obviously in failing health, but he never ceased his manifold activities. In 1924, when the governing body of the Welsh Church appointed a committee to confer with a number of representatives of nonconformist bodies in order to consider afresh the question of religious education, his hope of a settlement revived. Although there were no immediate results, the work then accomplished paved the way to an ultimate settlement of a vexed question. In 1925 Owen was appointed chairman of a departmental committee of the Board of Education in order to inquire into the use of the Welsh language in education. But his waning physical strength was over-taxed by his exertions, and he did not live to see the report of the committee completed and published [*Welsh in Education and Life*]. He died in London, after an illness which lasted several weeks, 4 November 1926, and was buried in the churchyard of Abergwili, hard by the house in which he had lived for over twenty-nine years.

Few churchmen of his time were better known throughout England and Wales than Bishop Owen. He frequently addressed meetings of the English Church Congress, notably those held at Manchester in 1908 and at Stoke-on-Trent in 1911. In 1909 he presided at Swansea over the fourth meeting of the Congress to be held in Wales; there he was as usual a central and impressive figure. After his death an old pupil wrote of Owen: 'Endowed with a power of work far surpassing that of ordinary men, burning with enthusiasm, he had an extraordinary faculty for organization and for selecting the right men to work out the details of a policy with which he was always able to keep in touch in spite of his multifarious activities' [*Welsh Outlook*, December 1928].

Owen married in 1882 Amelia Mary Elizabeth, daughter of Joseph Longstaff, of Appleby, and had four sons and six daughters. As a memorial to him in the diocese of St. David's a recumbent effigy was placed in the Lady chapel of the cathedral, and a sum of money was set aside to help widows and orphans of the clergy of the diocese. No portrait of him was ever painted.

[*The Times*, 5 November 1926; *Report of Welsh Church Commission*, 1910; Owen's published charges and addresses; reminiscences contributed by him to *Y Llan*; private information; personal knowledge.]

R. WILLIAMS.

OXFORD AND ASQUITH, first EARL OF (1852-1928), statesman. [See ASQUITH, HERBERT HENRY.]

PAGET, STEPHEN (1855-1926), biographer and essayist, was born in London 17 July 1855, the fourth and youngest son of the surgeon Sir James Paget, first baronet [q.v.], by his wife, Lydia, second daughter of the Rev. Henry North, domestic chaplain to Edward, Duke of Kent. He was nephew of Sir George Edward Paget [q.v.], physician, and younger brother of Francis Paget [q.v.], bishop of Oxford. He was educated at Marylebone grammar school, Shrewsbury School, and Christ Church, Oxford, where he obtained second classes in classical moderations (1875) and *literae humaniores* (1878). In October 1878 he entered the school of St. Bartholomew's Hospital, London, where his father had become a consulting surgeon in 1871. He qualified as F.R.C.S. in 1885 and proceeded to

practise surgery, serving on the staffs of three London hospitals, the Middlesex, the Metropolitan, and the West London. He found himself, however, in some ways unsuited for surgical work, and in 1897 he abandoned general surgery, although retaining some medical practice until 1910. He was thus earlier freed for literary work and for the propaganda which he had much at heart in the social struggle against disease.

This propagandist activity, which remained an aspect of his life until its very close, may be summarized before turning to Paget's more enduring work as a man of letters. An Act of parliament to regulate the performance, for scientific purposes, of experiments on animals had come into force in 1877. An association was formed by leading physicians and surgeons to watch and submit advice to the government on the working of this Act. Paget was appointed (1888) its secretary, a post demanding tact and courage. His success in it was complete. His fairness of view and unimpeachable integrity of statement won the confidence of all open-minded adherents of both the parties opposed in the controversy. In this post he could gauge the public needs of the question, and he determined to marshal in a book for the general public the facts bearing on the position of animal experimentation as an auxiliary in man's struggle against disease. He produced in 1900 *Experiments on Animals*, with an introduction by Lord Lister, a book with no pretence to literary appeal. In it Paget characteristically suppressed himself for his cause, often admitting descriptions of the crudest kind because they were written by actual experimenters, whereas he himself was not one. The book proved effective despite its drawbacks.

In 1908 Paget founded the Research Defence Society, its inaugural meeting being held on 27 January in his own house, 70 Harley Street. As its honorary secretary he conducted an unwearying campaign in justification of animal experimentation. Furthermore, in the early days of the European War protective inoculation of the troops against tetanus and the typhoid fevers was imperilled by prejudice and violent agitation. Paget volunteered to deliver lectures to the soldiers, and succeeded in removing the misconceptions which obstructed the measures for their safety. His career of devotion to public enlightenment in the cause of modern medicine is commemorated by the Re-

search Defence Society in an annual lecture bearing his name.

Yet Paget was essentially a man of letters, and above all an essayist. He contributed in some measure to biography, and in that field made his somewhat tardy literary debut (1897) with a sketch of *John Hunter* [q.v.], the anatomist. The same year appeared his *Ambroise Paré and his Times, 1510-1590*, an account of the famous surgeon of the French renaissance. Four years later (1901), following on his father's death in 1899, he produced the *Memoirs and Letters of Sir James Paget*. An autobiographical sketch left by his father, completed as to the concluding years of his life and amplified by letters, is made to portray with delightful intimacy the simple and cultured family life and upright professional leadership of the surgeon who more than any other personified to the Victorian community the beneficence of his calling. Paget also collaborated with the Rev. J. M. C. Cram in 1912 in a memoir of *Francis Paget, Bishop of Oxford*. Much later, when already well known as an essayist, Paget returned incidentally to biography. His *Henry Scott Holland, Memoir and Letters* (1921) presents admirably some memorable correspondence. Less successful is the *Study of the life and work* (1919) of the surgeon Sir Victor Horsley [q.v.], undertaken in response to a request.

Paget's career as an essayist began in 1906 with *The Young People*, a slim volume which obtained immediate success. There followed a series of essays, which appealed to an ever increasing public—*Confessio Medici* (1908), *Essays for the Young People* (an enlarged issue of *The Young People*, 1910), *I Wonder* (1911), *I Sometimes Think* (1916), and *I have Reason to Believe* (1921). These offer a forceful and graceful criticism of life, commenting on social ways and views. With a delicate, half-judicial humour they mingle enthusiasms and regrets. They follow the eager advances towards manhood and womanhood of young people whose lot is cast with youngish parents in a refined home in a great city, observing the poignant contrasts around them, poverty and wealth, religion and the lack of it, toil and leisure, well-being and disease. The style, individual and flexible, ranges securely over wit and pathos. Precepts are softened of didacticism by the fathering of them upon great masters, from Homer onwards, quoted as familiar friends. There is gentle tolerance of other men's tastes. The

reader feels in contact with a character actuated by strong convictions but rich in judgement and sympathy, and broad with sane knowledge of the world. One of the last of the series was *Essays for Boys and Girls* (1916). The European War had come and Paget had at once perceived the full measure of its issues. His book deals with it, and records the facts and impressions of those opening two years, with a fidelity and Bunyan-like simplicity which furnish an ineffaceable picture. His indictment to boys and girls of the German violation of Belgian neutrality and the atrocities of its violators reveals a power not before exerted; it marks the summit of his literary achievement.

Exhausting efforts among the troops at home and among the sick and wounded in Russia (1917), as surgeon to Lady Muriel Paget's hospital in Petrograd, gradually overtaxed a constitution never robust. Paget had to give up work; he retired to Limsfield, Surrey; there at his house, Furzedown, he died 8 May 1926. In stature somewhat short, and plain of feature, he had a pleasing resonant voice and unfailing charm of manner. He married in 1885 Eleanor Mary (died 1933), second daughter of Edward Burd, M.D., a physician in practice at Shrewsbury; by her he had two daughters.

[*The Times*, 20 May 1926; V. G. Plarr, *Lives of the Fellows of the Royal College of Surgeons of England*, revised by Sir D'A. Power and others, 2 vols., 1930; personal knowledge.] C. S. SHERRINGTON.

PAIN, BARRY ERIC ODELL (1864-1928), humorist, was born at Cambridge 28 September 1864, the son of John Odell Pain, linen-draper, of Cambridge, by his wife, Maria Pain. He was educated at Sedbergh School from 1879 to 1883, and in the latter year proceeded to Corpus Christi College, Cambridge, where he was awarded a scholarship in 1884, graduating in 1886 after obtaining a third class in the first part of the classical tripos.

From 1886 to 1890 Pain practised as an army coach at Guildford. He had contributed to the Sedbergh school magazine and with much success to the *Granta* while he was at Cambridge; he now decided to devote himself to writing. Settling in London in 1890, he obtained regular work from the *Daily Chronicle* and *Black and White*. His first book, *In a Canadian Canoe* (compiled from his contributions to the *Granta*), appeared in 1891. Shortly afterwards he was invited by James Payn

[q.v.], the editor of the *Cornhill Magazine*, to become a contributor to that journal. In a very few years he became well known as a novelist and writer of short stories, mainly of a humorous character. In 1897 he succeeded Jerome K. Jerome [q.v.] as editor of *To-day*. In 1900 he moved from Pinner, where he had lived for several years, to Hogarth House, Bushey, where he remained until about 1908; thereafter, until 1917, he lived at St. John's Wood.

In the autumn of 1914 Pain made a tour in the United States; but he felt the claims of war-work, and in April 1915 he joined the anti-aircraft section of the Royal Naval Volunteer Reserve; he was posted to the searchlight station on Parliament Hill, and quickly attained the rank of chief petty officer. Eye-strain caused by this work eventually compelled him to abandon it, and in 1917 he became a member of the London Appeal Tribunal, adjudicating on claims to exemption from military service. At this time, and until 1920, he lived at Farnham Royal, Buckinghamshire. His last home was at Watford, where he died 5 May 1928. Pain married in 1892 Amelia Nina Anna (died 1920), daughter of the portrait painter Rudolf Lehmann [q.v.], and sister of Liza Lehmann, the composer. They had two daughters.

Pain was a man of varied gifts. His interests included subjects so diverse as drawing, Georgian literature, occult lore, and precious stones, and his books range from a philosophic religious treatise to a detective novel. Some of his stories of the supernatural happily combine poetry with that *frisson* which is expected in tales of this kind. Early in his career he was advised by W. E. Henley to devote himself to 'serious' work, but his sense of fun being the most highly developed faculty in him, his humorous works predominate, and it is by these that he is best known. *Eliza* (1900) was the first of a successful series of books (continued until 1913) purporting to be written by a pretentious and ridiculous suburban clerk, describing incidents in his home life. The detail and descriptions are realistically exact, and the whole recital mordant in its irony, even if somewhat overdone. Other typical characters drawn by Pain are the charwoman, *Mrs. Murphy* (1913), and the jobbing gardener, *Edwards* (1915). These books are comedies of manners based on keen insight into the character of humble people, but their humour, if high-spirited

and satirical, is not without sympathy and restraint.

H. B. GRIMSDELL.

PALMER, GEORGE HERBERT (1846-1926), musician, was born at Grantchester 9 August 1846, the elder son of Jonathan Palmer, master-printer, of Cambridge, by his wife, Elizabeth, daughter of Thomas Stevenson, of Rainton, Yorkshire. He was cousin to the printer and bibliographer William Blades [q.v.] and to Sir George Grove [q.v.], the musical critic and historian.

Brought up at Cambridge, Palmer was greatly influenced by his father's friend the liturgiologist John Mason Neale [q.v.]; and after graduating B.A. at Trinity College, Cambridge, in 1869, was ordained deacon in 1869 and priest in 1871 at Chester. His first curacy was at St. Margaret's, Toxteth Park, Liverpool, where his organ-playing attracted the sympathetic admiration of the musician William Thomas Best [q.v.].

From 1876 to 1883 Palmer, as priest-organist at St. Barnabas's church, Pinlco, came to know the Rev. Thomas Helmore [q.v.], precentor of St. Mark's College, Chelsea, 1846-1877, and one of the pioneers of the Gregorian revival; and also the Rev. G. H. Woodward, curate of St. Barnabas, with whom he began his life-work in the rediscovery of the true plain chant tradition and the adaptation of the ancient melodies to English texts. To this task Palmer brought a fine musical perception and a natural gift for language; but it was from the manuscripts themselves that he learned the principles of the art of adaptation. The preservation of the Latin *cursus* necessitated at times a somewhat free translation, but he admitted no word alien to the authorized version of the Bible. He kept in touch with the researches of the Benedictine community at Solesmes near Le Mans, where his musical scholarship was held in great respect.

In 1888 Palmer co-operated in the foundation of the Plainsong and Medieval Music Society, to which he subsequently made several contributions. He also did a great work in the training of English religious communities in the liturgical music of the Church, issuing through St. Mary's Press, Wantage, *The Sarum Psalter* (1894, 5th ed. 1916), *The Order of Vespers*

from the Sarum Breviary (1899, latest ed. 1934), *The Offices or Introits* (1908, 3rd ed. 1927), and *Grails, Alleluys and Tracts from the Sarum Gradale* (1908), as well as many other adaptations of the music of the Mass and Divine Office.

In 1917 the archbishop of Canterbury, Dr. Randall Davidson, on a petition from a number of influential musicians, conferred upon Palmer a Lambeth degree of doctor of music. He was presented for the degree by (Sir) Richard Terry, organist of Westminster Cathedral, this being further evidence of the esteem in which Palmer's learning was held outside the Anglican communion. The same year he went to Oxford, taking over for a time the direction of the music at the church of the Society of St. John the Evangelist, Cowley, where he had founded the plain chant tradition many years before. He now had the opportunity of concentrating on his most important work, *The Diurnal Noted*, the text of which appeared in 1921 under the title *The Diurnal after the Use of the illustrious Church of Salisbury*. The manuscript of the music was completed just before his death: Part i was published in 1926 and Part ii in 1929; the remainder is in the press. He died at Oxford 20 June 1926, and was buried in the churchyard of St. Mary and St. John.

Palmer was a true son of the catholic revival, a scholar-saint of gracious courtesy, lavish in bestowing on others the fruits of his labours, who welcomed criticism and bore disappointment as they alone can who are completely single-minded.

J. M. CLOSE.

PANKHURST, EMMELINE (1858-1928), leader of the militant movement for women's suffrage, was born at Manchester 4 July 1858. She was the eldest daughter and third of the eleven children of Robert Goulden, owner of calico printing and bleach works, by his wife, Sophia Jane Craine. Her parents were actively interested in radicalism and reform movements, and Emmeline was only fourteen when, with her mother, she attended her first women's suffrage meeting. She was first sent to a 'ladylike' school in Manchester as a weekly boarder, and at fifteen to a much more efficient one in Paris. At eighteen she was considered 'finished'; she returned home, and shortly afterwards, in 1879, married Richard Marsden Pankhurst, LL.D., a barrister, many years

older than herself. A radical, passionately interested in social reform, Dr. Pankhurst had long been a prominent advocate of women's suffrage. With Sir John Duke Coleridge he had been counsel for the claimants in the case of *Chorlton v. Lings* in 1868, when 5,316 women householders of Manchester unsuccessfully claimed to vote under the existing law. His wife at once began suffrage work, and became a member of the Manchester women's suffrage committee; later, when differences of policy arose, she and Mrs. Jacob Bright formed a separate committee of their own. Dr. and Mrs. Pankhurst also supported the Married Women's Property Bill—Dr. Pankhurst drafted the Act of 1882—and their house was a centre for political reformers, Keir Hardie, Mrs. Besant, Sir Charles Dilke, and William Morris being among their friends. They both left the liberal party after Mr. Gladstone's refusal to put women's suffrage into the Reform Bill of 1884, and joined the Fabian Society. Five children were born to them, two sons and three daughters, of whom the eldest, Christabel, later became her mother's chief collaborator.

The death of Dr. Pankhurst in 1898 put an end to an exceptionally close and congenial companionship, and left Mrs. Pankhurst with four young children (the eldest boy having died) in straitened circumstances. She procured the post of registrar of births and deaths at Rusholme, which brought her a small income, and she held this office until 1907 when her increasing preoccupation with the suffrage movement caused her to resign and forfeit her claim to a pension. Having been for some years an active member of the independent labour party, she made efforts to press women's suffrage upon that body, but thinking that insufficient attention was given to it, she resigned in 1900. In 1903 she and her daughter, with a few friends, founded a new women's suffrage society, the Women's Social and Political Union, which began with propaganda among Lancashire working-women. In 1905 they decided on the adoption of more strident methods. At a liberal election meeting held in Manchester in October 1905, Christabel Pankhurst and Annie Kenney asked Sir Edward Grey what would be the new government's policy about votes for women; getting no answer they asked again, and were forcibly ejected from the hall amid great disturbance. A protest meeting in the street was followed by their arrest and imprisonment, and the

resulting commotion in the newspapers revealed to Mrs. Pankhurst the uses of publicity.

From that moment Mrs. Pankhurst adopted sensational methods of propaganda: interruptions at meetings were followed by importunate deputations, by processions to the House of Commons, and by original and unexpected devices to secure notoriety for the cause. The Suffragettes, as they were called, seemed to be ubiquitous. They appeared in all sorts of disguises, they chained themselves to railings, and from every point of vantage they waved their flags in the faces of Cabinet ministers and shouted 'Votes for Women'. They were repeatedly arrested and imprisoned; but each attempt at suppression brought more converts and more money to the Union, which grew rapidly. In 1908 Mrs. Pankhurst was herself arrested and charged with others at Bow Street with 'conduct likely to provoke a breach of the peace'. Mrs. Pankhurst spoke in her own defence. She was a true orator, quiet in manner and clear in substance, but with a quality of restrained emotion which moved even the police-court audience to tears. Oratory, however, was unavailing, and she was sentenced to three months' imprisonment in Holloway jail.

This militant campaign was intensified in 1909 by definitely illegal acts, such as window-breaking and destruction of property. More arrests followed, and the prisoners then adopted a policy of hunger-striking which, in spite of attempts at forcible feeding, obliged the authorities to release them after a short time. In this year Mrs. Pankhurst made a tour in the United States to arouse interest in the movement and to raise money for her work. In 1910, when an all-party committee of members of parliament brought forward a Women's Suffrage Bill which seemed to offer some chance of success, Mrs. Pankhurst consented to a truce to militancy; but, when the liberal government went to the country in November of that year promising nothing more than an adult male franchise bill, militancy broke out with renewed violence. Mrs. Pankhurst visited America again in 1911, but returned to carry on the campaign. In 1912 a police raid was made upon the headquarters of the Women's Social and Political Union, and Mrs. Pankhurst and others were again arrested. After a trial at the Central Criminal Courts they were convicted on the charge of conspiracy.

and satirical, is not without sympathy and restraint.

Mrs. Pankhurst visited America again in 1911, but returned to carry on the campaign. In 1912 a police raid was made upon the headquarters of the Women's Social and Political Union, and Mrs. Pankhurst and others were again arrested. After a trial at the Central Criminal Courts they were convicted on the charge of conspiracy.

and he advised Parratt to apply for the post of organist of Magdalen College, Oxford, which he himself was vacating. Parratt applied and was at once elected, and his name immediately became closely associated with Oxford and its music, remaining so until his death. He spent ten happy years at Oxford, and entered fully into the musical life of the university, conducting various college musical societies, and taking a prominent part in the activities of the University Musical Club. He was also president of the University Chess Club.

In 1882 Parratt received a command invitation from Queen Victoria to succeed Sir George Job Elvey [q.v.] as organist of St. George's chapel, Windsor. Windsor was thenceforth to be the centre from which radiated all the activities of Parratt's maturing powers. Elvey's legacy to his successor was a fully equipped choir, the services of an apprentice assistant organist—Hubert Walter Hunt, afterwards organist of Bristol Cathedral—and an extensive repertory from the works of Thomas Tallis to those of S. S. Wesley, on which to graft works by the younger British school of Church musicians, notably those of (Sir) Charles Villiers Stanford [q.v.]. Many of Stanford's works were first performed, before publication, in St. George's chapel. But by no means the least important item of Elvey's legacy was the Windsor and Eton Madrigal Society, an admirably equipped body wellnigh one hundred strong, founded by himself. This society, in conjunction with the choir of St. George's chapel, made the annual performance of the 'St. Matthew Passion' an important part of the musical life of the neighbourhood. The founding by Parratt of the Windsor Orchestral Society left his successors similarly indebted.

Almost immediately after his removal to Windsor, Sir George Grove [q.v.] invited Parratt to become chief professor of the organ at the recently founded Royal College of Music, of which Grove was the first director. This appointment made the opportunity of learning to play the organ under one of its foremost living exponents available to a greater number of pupils than had hitherto been possible, and in July 1902 several hundreds of these entertained their master at a banquet in London and presented him with a piece of old silver. Parratt's influence as a teacher of the organ is evidenced by the 'school of organ playing' which he founded. His

insistence on attention being paid to the minutiae of the text, cleanness of technique in its delivery, and crystal-clear phrasing are noted by all whom he taught. The services at St. George's chapel became the focus point of organists all over the country, as a very large number of important organistships came to be filled by Parratt's pupils.

In appreciation of Parratt's work as teacher and organist and of his responsibility for music connected with public services as well as with the more intimate ones of the royal family, Queen Victoria knighted him and made him her private organist in August 1892, and a year later appointed him master of the queen's music. Both of these offices were confirmed by King Edward VII, who awarded Parratt the M.V.O. (1901), and also by King George V, from whom he received the C.V.O. (1917) and the K.C.V.O. (1921). At Oxford his appointment in 1908 as successor to Sir Charles Hubert Hastings Parry [q.v.] in the professorship of music, a post which he held until his resignation in 1918, the award of the honorary degree of Mus. Doc. in 1894, as well as his election to an honorary fellowship at Magdalen College in 1906, testify to the university's appreciation of his distinction as a musician. The universities of Cambridge and Durham awarded him honorary degrees in 1910 and 1912 respectively.

For Parratt's organ playing no term seems more adequate than 'statuesque', to which 'poetical' must be added when considering his powers as an accompanist. He had no set rules, but taste always; no set interpretation, but dullness never. His work as a composer must not be left unrecorded. General acclamation greeted his 'Confortare', the anthem written for the coronation of King Edward in 1902, and again performed at that of King George in 1911. 'The Face of Death' (words by Tennyson), at its first public performance at the Windsor Festival in 1934, made a deep impression. His madrigal, 'Long Live Victoria' (words by Sir Herbert Warren), was written for and performed at the open air aubade on the occasion of the queen's eightieth birthday in 1899, by the combined musical societies of Windsor. As a composer of church music, considered solely as the author of the impressive and dramatic setting of the 'Obit' and its preceding hymn (words by A. C. Benson), and the music for the special service for the investiture of a knight of the Garter in St. George's chapel, revived for

the investiture of Edward, Prince of Wales, in 1911, Parratt is worthy of respect.

Parratt's only serious illness, which began a few months before he died, did not interfere very materially with his conduct of the services in St. George's chapel, and he was still carrying out the duties of his position when the end came at his house in the cloisters at Windsor 27 March 1924. His ashes are buried at the foot of the stair under the shadow of the loft and the organ console on which he played for forty-two years. Of his five children, one son and four daughters, all save his eldest daughter survive him.

There are portraits of Parratt by Gerald Moira (1892) in the practice-room of Magdalen College, Oxford, and by J. S. Sargent (1914), presented to Lady Parratt by her husband's friends, and now in the possession of his daughters.

[Private information; personal knowledge.]
R. F. M. AKERMAN.

PATON, DIARMID NOËL (1859-1928), physiologist, was born in Edinburgh 19 March 1859, the eldest son of Sir Joseph Noël Paton, artist [q.v.], by his wife, Margaret, daughter of Alexander Ferrier, of Bloomhill, Dumbartonshire. He was educated at Edinburgh Academy and at Edinburgh University. He graduated B.Sc. in 1881 and M.B., C.M., with first class honours, in 1882, and in the same year was elected Baxter scholar in natural science.

Originally attracted to botany, Paton carried out his first research in this field. In the study of medicine, however, he found his true vocation, and, after a brief period of study in Vienna and Paris, he was awarded in 1884 a biological fellowship in the Edinburgh physiological department under Professor William Rutherford [q.v.]. Then began a steady output of research which only ended with his retirement four months before his death. In 1886 Paton was elected lecturer in physiology at Surgeons' Hall (School of Medicine of Royal Colleges, Edinburgh), and three years later (1889), was appointed superintendent of the research laboratory of the Royal College of Physicians, Edinburgh. His whole time was then devoted to teaching and research, and the output from the laboratory under his control was remarkable for its excellence and diversity. This office he vacated in 1906 for the regius professorship of physiology in Glasgow University, a post which he held until his retirement in 1928. As professor he was a

stimulating teacher, a helpful colleague, and an enthusiastic researcher.

Attracted from the first by the chemical aspects of physiology, Paton was one of the earliest workers in Great Britain to take up the study of metabolism and nutrition. Some of his most original work was done in this field. Of his several dietary investigations the most outstanding was the valuable report, produced in conjunction with Dr. Leonard Findlay, on *Poverty, Nutrition and Growth*, published by the Medical Research Council (1926). He was also intensely interested in the endocrine glands, and published in 1918 a very stimulating book on the *Nervous and Chemical Regulators of Metabolism*. Interested also in heredity, he published (1926) *The Physiology of the Continuity of Life*, a book in which he vigorously attacked many of the orthodox views on the subject. In all he published some ninety papers, as well as text-books for medical and veterinary students.

Paton was appointed a member of the royal commission on salmon fisheries (1900) and of the Medical Research Council (1918-1923). Elected a fellow of the Royal Society in 1914, he was on its council from 1922 to 1924. He was also a fellow of the Royal Society of Edinburgh (1886), and a fellow of the Royal College of Physicians, Edinburgh (1886). He received an honorary LL.D. degree from Edinburgh University in 1910. He married in 1898 Agatha, daughter of Alexander Balfour, merchant, of Dawyck, Peeblesshire, and had one son and one daughter. He died at his home, Stobo, Peeblesshire, 30 September 1928.

[*Proceedings of the Royal Society*, vol. civ, B, 1929; personal knowledge.]

E. P. CATHCART.

PEAKE, ARTHUR SAMUEL (1865-1929), theologian and biblical scholar, was born at Leek, Staffordshire, 24 November 1865, the second son and third child in a family of seven of the Rev. Samuel Peake, a Primitive Methodist minister, by his wife, Rosabella Smith, the daughter of a Herefordshire farmer. In accordance with the custom of the Methodist ministry, his father moved frequently from one 'circuit' to another, and Peake was educated at various day schools, ultimately going up in 1883 with a classical scholarship from King Henry VIII grammar school, Coventry, to St. John's College, Oxford. After classical honour moderations he read for the honour school of theology, with a view to taking

orders in the Church of England. He obtained a first class in 1887, and continued to reside after graduation, winning the Denyer and Johnson scholarship in 1889 and the Ellerton essay in 1890. He was not, however, ordained, but remained to the end a Methodist layman.

In 1890 Peake was elected to a theological fellowship at Merton College, a position which he held for seven years. Earlier in the same year he had begun teaching at Mansfield College, which had been established at Oxford in 1886 for the training of candidates for the ministry of the Free Churches. His work here was mainly in the field of the Old Testament, though his interest in the New Testament was probably equally great, and his distinctive contribution to biblical studies was possible only to one who was a master in both fields.

Peake's career was soon given a decisive turn by a call from his own Church. Up to this time the Primitive Methodists had been backward in providing for the theological training of their ministry. A group of reformers, with the financial backing of (Sir) William Hartley, a wealthy manufacturer of Aintree, formed a plan to turn the existing Theological Institute at Manchester, with its one-year course and antiquated methods, into a college with a full theological curriculum on modern lines. On the foundation of Hartley Primitive Methodist College at Manchester, Peake was asked to take responsibility for the curriculum, with the position of tutor in the college. After some hesitation, and against the advice of some of his friends, he accepted the post. He went to Manchester in 1892, and for the remaining thirty-seven years of his life he was identified with Hartley College. At the beginning, his theological position was looked upon with suspicion by many as being dangerously 'advanced'; but his personal qualities won confidence even where his views were disliked, and at his death he held a position of almost unique authority in his Church. The higher intellectual standard of its ministry, and the broader outlook of its members in general, were largely the result of Peake's teaching and influence.

Peake's work at Manchester was not confined to a denominational college. In 1904 it was decided to form a faculty of theology in the university of Manchester. This was the first theological faculty to be established in any of the modern, 'secular' universities, and had from the outset

an interdenominational character. Peake took a leading part in working out the scheme, and when the faculty was set up, he became the first occupant of the Rylands chair of biblical criticism and exegesis, while retaining his appointment at Hartley College.

In addition to his strictly academic work, Peake rendered important service on the council of the John Rylands Library from its foundation in 1899 to his death as chairman of the council. He edited the *Holborn Review* from 1919 until his death. He took an active part in the ecclesiastical affairs of his own Church, and of the Free Churches in general, and was a leader in the movement for reunion, both among the Methodist bodies and beyond them. His numerous activities were carried out under the handicap of uncertain health, and the amount which he accomplished was astonishing to those who knew him.

Peake's knowledge of current literature, both native and foreign, in the field of biblical studies, was as nearly exhaustive as one man's knowledge can be. His original contributions to biblical learning were marked by accurate scholarship and a severe and balanced judgement, leaning to the side of caution in critical questions. But the works of scholarship on a large scale which he was known to have had in hand for many years remained as fragments on his premature death. His distinctive achievement lay in the diffusion of the methods and results of sound biblical learning. Such books as *The Bible: Its Origin, its Significance, and its Abiding Worth* (1913), and *The Problem of Suffering in the Old Testament* (1904), together with a *Commentary on the Bible* (1910) which he planned and edited, have had a wide circulation and very great influence. He helped a generation of Christian laity, brought up in the older tradition, to make the difficult transition to a modern outlook without loss of balance, and his work did much to save the Free Churches of Great Britain from the baneful effects of 'Fundamentalist' controversies.

Peake married in 1892 Harriet Mary, daughter of John Sillman, of Oxford, who survived him together with their three sons. He received the honorary degree of D.D. from the university of Aberdeen in 1907, and from the university of Oxford in 1920. He died at Manchester 19 August 1920.

[*The Times*, 20 August 1920; L. S. Peake, *Arthur Samuel Peake: A Memoir*, 1930; personal knowledge.] C. H. DOAN.

PEARCE, ERNEST HAROLD (1865-1930), bishop of Worcester, the eldest son of James Pearce, was born 23 July 1865 at 48 Great Marlborough Street, London, which then housed the West branch of the Young Men's Christian Association, of which his father was the secretary. His mother, Jane Courtenay, was the eldest daughter of Walter Edmonds, of Penzance, and sister of the Rev. Walter John Edmonds, chancellor of Exeter Cathedral. A severe attack of rheumatic fever at the age of seven seriously affected Pearce's heart and conditioned his habits throughout his life, so that he was always aware of the possibility of a sudden end, which ultimately came.

In 1874, on the presentation of the banker F. A. Bevan, Pearce was admitted to Christ's Hospital, and thus began his connexion with that foundation which was, in one form or another, to last all his life: he was exhibitioner, assistant master, governor, almoner, chairman of the education committee, and vice-chairman of the council of almoners. He also became its historian in *The Annals of Christ's Hospital* (1901, 2nd ed. 1908). In 1884 Pearce, who was a Grecian at Christ's Hospital, entered Peterhouse, Cambridge, as a classical scholar and choral exhibitioner, and obtained second classes in the first division of the classical tripos (1887) and in the second part of the theological tripos (1888), graduating B.A. in 1887 and M.A. in 1891. He was ordained deacon in 1889 and priest in 1890 by Archbishop Benson, his title to orders being an assistant-mastership at the South Eastern College (now St. Lawrence College), Ramsgate. In 1891 he returned to Christ's Hospital as an assistant master, but in 1892 accepted the post of metropolitan district secretary of the British and Foreign Bible Society, of which he ultimately became a life governor and vice-president (1914).

In 1895 there occurred a vacancy in the living of Christ Church, Newgate Street (held in conjunction with that of St. Leonard, Foster Lane), where the boys of Christ's Hospital attended the Sunday morning service; and the patrons for that turn, the governors of St. Bartholomew's Hospital, appointed Pearce to fill it. He soon re-seated the church and brought the boys down from uncomfortable galleries to the floor of the building. Pearce's appointment to the living led to his becoming chaplain in 1896-1897 to the lord mayor of London, Sir George Faudel-Phillips, the alderman of his ward, and to

a close connexion for many years with the Mansion House and the life of the City. His life while he held his City living (that is, until 1912) was full of activities of all kinds: he became a freeman on the roll of the Musicians' Company and served as its chaplain; he was professor of biblical history at Queen's College, Harley Street (1899-1905); for four years he was secretary of the London Diocesan Church Reading Union; he was elected on to the court of Sion College, became treasurer and president, and in 1913 published its history, *Sion College and Library*; he was a member of the court of assistants of the Corporation of the Sons of the Clergy, was twenty-nine times a steward of its festival, and for ten years a treasurer, and wrote an account of the charity, *The Sons of the Clergy* (1904, 2nd ed. 1928).

In 1899 Pearce joined the staff of *The Times* as its ecclesiastical correspondent and was in Printing House Square every night, except Saturday, in order to write up the news and to provide obituaries. Newspapers usually keep a 'graveyard' in stock, but from time to time a gap has suddenly to be filled; on one occasion the obituary notice of a very eminent scientist had to be compiled on a Sunday night by the joint efforts of the ecclesiastical and military correspondents. Pearce's facility of composition and sound common sense soon led to leader-writing as well. About this time he came into close contact with the prime minister's office and became an unofficial adviser in the allocation of ecclesiastical patronage. Since he possessed the gift of knowing men and of holding his tongue, he was passed on from one prime minister to another, and was still 'looking in at Downing Street' to the day of his death.

In 1911 Pearce was appointed by Mr. Asquith to a canonry at Westminster Abbey, for, in addition to his work for the prime minister's office, he was becoming known as a thoughtful and acceptable preacher, and Bishop Ryle, as dean of Westminster, had suggested his name for the post. At Westminster Pearce became in due course treasurer (1912-1916), archdeacon (1916-1918), and sub-dean (1918-1919). Whatever position he held, he at once wanted to research into its history: Christ's Hospital, Sion College, the Sons of the Clergy, had given him the opportunity. At Westminster much investigation had been carried out by Dean Armistage Robinson and his predecessors; but Pearce spent a large amount of time in the

muniment room and produced a work of great importance for ecclesiastical and monastic history in *The Monks of Westminster: being a Register of the Brethren of the Convent from the time of the Confessor to the Dissolution* (1916). He also produced *William de Colchester, Abbot of Westminster* (1915), and *Walter de Wenlok, Abbot of Westminster* (1920). By this original research he qualified for the Cambridge degrees of Litt.D. (1917), B.D. (1920), and D.D. (1924).

In the course of the European War Pearce's activities were strangely diverted into quite a different channel. During his time at Cambridge he had served in the Volunteers, and in the City he had been chaplain to the 8th battalion, London Regiment (Post Office Rifles), and had gained the Territorial decoration. The chaplains' department of the War Office, sufficient for peace time, was in need of assistance to deal with the new situation created by the War. Pearce was appointed assistant chaplain-general (1915-1919), with the substantive rank of brigadier, and greatly helped to secure the smoother and more orderly working of the department. He was a chaplain to King George V in 1918 and 1919, and in 1919, at the close of the War, received the C.B.E.

In 1919 Pearce was nominated by Mr. Lloyd George to the bishopric of Worcester, and was consecrated in Westminster Abbey 24 February. It was something of an experiment to send a Londoner born and bred to a rural diocese, with Hartlebury Castle as his residence; but Pearce's country clergy soon got to know and to respect him. London was still the scene of part of his labours; for, as a director of the London Life Association, which had incorporated the Clergy Mutual Office, he was there every week and was thus able to keep up his regular attendances at the board meetings of Christ's Hospital, the Ecclesiastical Commission, Queen Anne's Bounty, and other bodies where his capacity for business was valued. But Hartlebury Castle was his home; and, *more so*, he wrote a book about it, *Hartlebury Castle* (1920). His antiquarian interests (he was elected F.S.A. in 1918) led him to work upon the Worcester Cathedral muniments and to edit for the Worcestershire Historical Society *The Register of Thomas de Cobham, 1317-1327* (1930); on his knowledge of the Register he had already published a life of *Thomas de Cobham, Bishop of Worcester* (1923).

In the controversies over the Prayer

Book (1927-1928) Pearce always took the conservative side, and he spoke and voted in the House of Lords against the approval of the 'Deposited Book'. But this attitude did not in any way affect the regard of the Worcestershire people for him; they had found him to be a just and generous ruler of his diocese.

Pearce's own college, Peterhouse, elected him an honorary fellow in 1919 and, on his incorporating at Oxford and proceeding to the degree of D.Litt. in 1929, Worcester College, Oxford, paid him the like honour. Among his writings not previously mentioned are *The Book of God's Kingdom* (1902), *English Christianity in its Beginnings* (1908), *The Laws of the Earliest Gospel* (1913), and a posthumous work, *The Correspondence of Richard Hurd and William Mason*, completed and edited by Leonard Whibley (1930).

Pearce died suddenly, within the precincts of Westminster, while on his way to attend the opening of parliament 28 October 1930; his ashes are buried in Worcester Cathedral at the foot of the monument of Bishop Hurd. He was unmarried.

There is a portrait of Pearce by Solomon J. Solomon at Hartlebury Castle, and another by A. Hyndman hangs in the hall of Christ's Hospital, Horsham; there is also a memorial tablet to him in the cloisters of the Hospital.

[Personal knowledge.] E. C. PEARCE.

PEARSON, WEETMAN DICKINSON, first Viscount COWDRAY (1856-1927), contractor, was born at Shelley Woodhouse, Yorkshire, 15 July 1856, the eldest son of George Pearson, of Brickenonbury, near Hertford, by his wife, Sarah, daughter of Weetman Dickinson, of High Hoyland, Yorkshire. He was educated privately at Harrogate. His grandfather, Samuel Pearson, had founded a firm of contractors, and of this firm Weetman Pearson, after serving a short apprenticeship, became a partner in 1875, at the early age of nineteen. When he joined, the head-quarters of the business were at Bradford, and its operations were carried out chiefly in the North of England. The firm was suffering at the time from the high price of coal, and the moment was favourable for new developments. Young Pearson decided to extend its sphere of activity by finding openings abroad, and he visited both Spain and the United States, where contracts of all kinds were undertaken. These brought pros-

perity to the company, and in 1884 the head offices were moved from Bradford to London.

In 1880 Pearson went to Mexico, and there established for his firm a valuable business connexion. The first contract which he secured was for a big drainage scheme; this was followed by contracts for railways, electric lines, harbours, and waterworks. In the course of these operations he acquired extensive tracts of land rich in oil. Pearson's position in Mexico was for some time one of predominant authority, although he had not the field to himself. Subsidiary branches of the American Standard Oil Company were already at work there, and the struggle between contending interests was carried on vigorously and not without exciting episodes. In July 1908 the Dos Bocas well, the largest oil gush on record, was opened by Pearson, and burst forth in overwhelming volume. Unfortunately for the contractors, the column of oil caught fire, and the crater, flaming up to an immense height, burned for weeks, an accident which caused heavy loss. Another well, the Polvero, yielded a hundred thousand barrels of oil a day. Pearson was the first to fill oil-tankers at sea through pipes. After the European War he relinquished his controlling interests in the Mexican oil-fields to the Royal Dutch Shell group.

Apart from their special connexion with Mexico, Pearson and his firm carried out, as contractors, works of great importance in many parts of the world. In 1894 they completed the Blackwall tunnel under the Thames, and at the opening ceremony Pearson was created a baronet. They extended Dover harbour, a difficult task which occupied many years, as the requirements of the Admiralty were eventually included in the original scheme. In America they constructed four tunnels under the East River for the Pennsylvania railway. One of the greatest of their contracts was for the building of the dam across the Blue Nile above Khartoum: this dam was inaugurated in 1926.

Pearson made his first attempt to enter political life in 1892, when he stood for Colchester in the liberal interest and was defeated. But he won that seat at the general election of 1895, and held it for fifteen years. He was raised to the peerage in 1910 as Baron Cowdray, of Midhurst, Sussex. During the War he supervised the construction of an important munition factory at Gretna Green, and early in 1917 he was invited to become president

of the Air Board. His duty was to consider how the air forces could be brought harmoniously under a single ministry, and how the supply of aircraft could be increased. When his work came to an end in the following November, he was able to point to a considerable increase in the effective air forces of the country.

After the War Lord Cowdray made occasional appearances upon political platforms, and took some part in the discussion of current questions. But in public life generally he was little known, although his business ability was recognized by those who came in contact with him. A point of some interest in his career is the fact that his earliest business triumphs were gained when he was a boy, with hardly any education or technical training. In later life he used to emphasize the necessity of a contractor having an expert's knowledge of every detail of the work which he undertook, a praiseworthy maxim to which he himself had proved a striking exception.

Lord Cowdray's gifts to public objects were numerous and often substantial. He maintained his interest in the Air Force, contributing in 1918 the sum of £100,000 for the endowment of the Royal Air Force Club, and at a later date another large sum to the Force's memorial fund. Aberdeen in particular was indebted to him and Lady Cowdray for many benefactions. The Cowdray memorial hall bears his name, while the university, of which he was rector from 1918 to 1921, the hospitals, and other institutions of the city owed much to his support. He owned extensive estates in Aberdeenshire and Kincardineshire, and took trouble to improve the conditions of those living on his property.

Lord Cowdray was promoted to a viscounty in 1917, and was created G.C.V.O. in 1925. He died at Dunecht House, Aberdeenshire (formerly the property of the Earls of Crawford), 1 May 1927. He married in 1881 Annie, daughter of Sir John Cass, of Bradford, Yorkshire, and had three sons, the youngest of whom was killed in action, and one daughter. He was succeeded as second viscount by his eldest son, Weetman Harold Miller (born 1882).

[*The Times*, 2 May 1927.] A. COCHRANE.

PEASE, SIR ARTHUR FRANCIS, first baronet, of Hummersknott (1866-1927), coalowner and industrialist, was born at Hummersknott, Darlington, 11

March 1866, the eldest son of Arthur Pease, M.P. for Whitby 1880-1885 and for Darlington 1895-1898, by his wife, Mary Lecky, daughter of Ebenezer Pike, of Bessborough, co. Cork. He came of a quaker family which had long been associated with industrial development in Durham and Yorkshire. He was great-grandson of Edward Pease [q.v.], railway projector, grandson of Joseph Pease [q.v.], also a railway projector, and the first quaker to sit in parliament, and nephew of Sir Joseph Whitwell Pease [q.v.], first baronet of Hutton Loweross and Pinchinthorpe, who for nearly forty years represented a Durham constituency in the House of Commons. Pease was educated at Brighton College and Trinity College, Cambridge, and received a business training in the offices at Darlington of Pease and Partners. In 1900 he became chairman and managing director of that company. In course of time Pease became associated as chairman or director with numerous coal-mining and other industrial undertakings in the north of England: he was also a director of Lloyds Bank and of the London and North-Eastern Railway Company.

Pease became known to the public as a prominent negotiator when an organized demand arose among miners for a minimum wage. He was one of three representatives of the Durham owners who served on the committee of coalowners which was appointed in 1912 to meet the government and the Miners' Federation. Subsequently, when the Joint District Board for Durham was set up under the Minimum Wage Act of 1912, he was called upon to state the case for the owners. On the outbreak of the European War in 1914, Pease's great experience of industrial affairs was at once available for the government, and during the years 1914-1921 he was an active member of many government committees. He held office as second civil lord of the Admiralty in 1918-1919, and was created a baronet in 1920.

Although Pease did not originate any definite policy in relation to the coal-mining industry of Great Britain, yet his intimate knowledge of that industry, his powers of conciliatory exposition, and his personal popularity even among those to whom his views were unacceptable, combined to make him an acknowledged leader and the chosen spokesman of a large section of the coal-mining community. He was one of the leaders of British

industry from whom successive administrations sought and received expert advice and service during the many and great emergencies in the European War.

Pease devoted much time to the affairs of his native county. He was elected chairman of the Durham county council in 1922 and took an especial interest in education. He was a J.P. and deputy-lieutenant for the county of Durham, and in 1920 he served as high sheriff. During the European War he assisted in the raising of the 18th battalion of the Durham Light Infantry. Preoccupation with business affairs prevented Pease from seeking election to the House of Commons, but his strong political sympathies induced him to act as president of the Durham Unionist Association from the time of its formation in 1910. He was devoted to all forms of sport and was a regular follower of the Zetland hounds. On 28 November 1927 Pease, whose health had become precarious as a result of overwork, was seized with sudden illness at a meeting of directors, and on the same day he died at his home, Middleton Lodge, near Darlington.

Pease married in 1889 Laura Matilda Ethelwyn, daughter of Charles Peter Allix, of Swaffham Prior House, Cambridgeshire. She survived him with one son, Richard Arthur (born 1890), who succeeded his father as second baronet, and three daughters.

[*The Times*, 24 November 1927; *Darlington and Stockton Times*, 26 November 1927; private information.] A. E. WATKIN.

PENTLAND, first BARON (1860-1925), politician. [See SINCLAIR, JOHN.]

PERCY, ALAN IAN, eighth DUKE OF NORTHUMBERLAND (1880-1930), was born in London 17 April 1880, the fourth of the seven sons of Henry George Percy, Earl Percy, afterwards seventh Duke of Northumberland, by his wife, Lady Edith, eldest daughter of George Douglas Campbell, eighth Duke of Argyll, and sister of John Douglas Sutherland Campbell [q.v.], ninth Duke of Argyll. The second and third sons died young, and on the death of the eldest son, Henry Algernon George Percy, Earl Percy [q.v.], in 1909, Lord Alan Percy became heir to the dukedom as Earl Percy, and held the courtesy title for nine years. He was educated at Eton and at Christ Church, Oxford (1897-1899), and joined the Grenadier Guards in January 1900. He served in the South African

War from 1901 to 1902, and with the Egyptian army from 1907 to 1910, retiring from the army with the rank of major in 1912. On the outbreak of the European War he rejoined his regiment, and served in France as one of the official 'eye-witnesses' from 1914 to 1916. Subsequently he was appointed to the general staff (Intelligence department) at the War Office, being promoted temporary lieutenant-colonel in 1916, and brevet lieutenant-colonel two years later.

After his succession to the title in 1918 the duke played a prominent part in public life. He was lord-lieutenant of the county of Northumberland, president of the Territorial Army Association, and an alderman of the Northumberland county council. He became president of the Royal Institution in 1919 and chancellor of Durham University in 1929, and was still holding those offices at the time of his death.

Politically the duke was a conservative, belonging to the extreme right wing of the party and often at variance with the policy of its leaders after the War. But the sincerity and fearlessness with which he expressed his views gained him universal respect, even his political opponents recognizing his integrity of purpose and intense faith in the ideals which he had at heart. He was a gifted speaker and writer, and a skilful debater, who always showed complete mastery of his subject. His political and military essays and articles, notably *The Writing on the Wall*, published under the pseudonym of 'Daniel' in 1911, conveyed a warning from the events of that year; and articles on the military weakness of Great Britain and the inadequacy of the proposed British Expeditionary Force, written in 1913, expressed his point of view in a clear and concise manner and are remarkable for their accurate knowledge and logical deduction. His two short stories, *The Shadow on the Moor* and *La Salamandre, the Story of a Vivandière*, published after his death in 1931 and 1934 respectively, show that he also possessed a real power of dramatic description.

In his younger days the Duke of Northumberland was conspicuous for his love of adventure and light-heartedness, but as he grew older he became far more serious-minded, and his deep-rooted religious and political convictions sometimes seemed to weigh unduly on his spirits. His patriotism and faith in the historic traditions of his country were such that

he could never reconcile himself to any course of policy which appeared to him to lower its prestige or to be out of keeping with its imperial status. To him the settlement effected in Ireland by Mr. Lloyd George's coalition government in 1922 and the opening of relations between Great Britain and the Russian Soviet government in 1924 were utterly repugnant, because he considered the former to be a surrender to lawlessness, and the latter a recognition of an intolerable and anti-Christian system of government. The word expediency did not exist in his vocabulary, and any form of compromise or surrender of principle was abhorrent to him. In a sense it was unfortunate that he was so rigid in his adherence to his particular political beliefs; for, had he been more ready to appreciate that new social and economic conditions must inevitably necessitate new policies, he might, had he lived, have played a leading part in English politics, for he had high courage, conspicuous ability, and, above all, the power of leadership.

The duke's death, which took place at his London house 23 August 1930 at the comparatively early age of fifty, was an especial loss to the north of England where, at his seat of Alnwick Castle, his kindness of heart, his keen sense of the duties of his position, and his love of sport made him popular with all sorts and conditions of men.

The Duke of Northumberland married in 1911 Lady Helen Magdalen, youngest daughter of Charles Henry Gordon-Lennox, seventh Duke of Richmond and second Duke of Gordon, and had four sons and two daughters. He was succeeded as ninth duke by his eldest son, Henry George Alan (born 1912).

[*The Times*, 25 August 1930; privately printed biography of the Duke of Northumberland by his wife.] C. M. HEADLAM.

PEREIRA, GEORGE EDWARD (1865-1923), soldier and traveller, was born in London 20 January 1865, the eldest son of Edward Pereira, of 23 Grosvenor Square, by his wife, the Hon. Margaret Anne Stonor, eighth daughter of Thomas Stonor, third Baron Camoys. Educated at the Oratory School, Edgbaston, under Cardinal Newman, where he showed a characteristic determination to succeed, Pereira joined the Grenadier Guards in 1884. A hunting accident that winter left him with a permanent limp, and threatened to impede the fulfilment

of the two great ambitions of his life—to see active service and to win fame as an explorer; but in the event he achieved both.

From 1884 to 1899 Pereira served at home. In the latter year he was seconded for service with the Chinese regiment recently formed at Wei-hai-wei. He took part in 1900 in the fighting at Tientsin and in the relief of the legations at Peking, and was slightly wounded. He was awarded the D.S.O. After a year spent in touring the provinces of North-East China, he rejoined his battalion in South Africa in 1902 towards the close of the Boer War.

In January 1904 Pereira was appointed a temporary military attaché to the British minister at Seoul in Korea, and on 11 February, from aboard H.M.S. *Talbot*, he saw the Japanese fleet attack and sink two Russian ships, the *Varyak* and the *Koreetz*, which were sheltering at Chemulpo. In 1905, as military attaché with the Japanese army, he witnessed the Manchurian campaign, and at its close became military attaché at Peking. He spent the following years mainly in making a series of long journeys in every part of China. He remained attaché at Peking until 1910. Being at home on the outbreak of the European War in 1914, Pereira immediately rejoined the service, first serving on the staff of the 47th London division, and in June 1915 taking over command of the 4th Royal Welch Fusiliers, the pioneer battalion of the 1st division. From January 1916 until November 1917 he commanded the 47th brigade of the 16th division. He always won the absolute confidence of the troops under his command by his complete disregard of danger. He retired at the end of the War with the rank of brigadier-general.

Since the two French Lazarist missionaries, Évariste Huc and Joseph Gabet, had visited Lhasa in 1846, seventy-six years previously, all attempts by European travellers to reach that city from the east had been frustrated by the Tibetan authorities. Pereira had long desired to accomplish this journey, and after the end of the War, although over fifty-four years of age, lame, and in indifferent health, he set out. Leaving Peking in January 1921 he crossed the famine-stricken provinces of Chihli, Western Shensi, and Honan. He went to Honan Fu (Loyang) at the invitation of General Wu-pei-fu in order to visit his model army and establishments. From the end of July to October Pereira undertook three most

arduous shooting-trips in the wild mountainous district of Muping in Szechwan in the hope of shooting a giant pandar, a rare animal that no European had ever shot. He failed to get one, but secured a pandar cat, equally rare in China, which is now in the Natural History Museum at South Kensington. After this he was laid up, suffering from frost-bitten feet. Leaving Tangar in Kansu in May 1922, Pereira reached Jyekundo on 23 June, after crossing an area devoid of food, with very little grazing, and waterless in places. During this journey he lost most of his transport animals, but was fortunate in procuring assistance from passing caravans. Chamdo was reached on 28 July after eighteen days of difficult travelling. On 3 September he received the anxiously awaited permission to proceed to Lhasa. The next six weeks were spent in a succession of journeys following valleys and crossing numerous passes, varying in height from 14,500 to 16,800 feet, scrambling over tracks covered with large boulders where the height above sea-level made every step an exertion. Pereira arrived at Lhasa on 17 October, completely exhausted by hardships and suffering from thrombosis. There he was comfortably housed by the Tibetan commander-in-chief, and he had an interview with the Dalai Lama. He reached Calcutta early in December, and went to hospital to be treated for thrombosis. Since leaving Peking he had travelled nearly 7,000 miles, more than half of them on foot.

In January 1923 Pereira left Calcutta on his last journey, in order to explore the wild Tibetan-Szechwan border; but after covering 4,000 miles he died at Kanze, in Szechwan, about thirty miles from the Tibetan border, 20 October 1923. It is known that, had he lived, he would have been recommended for the award of the gold medal of the Royal Geographical Society.

Pereira's journeys on foot in China covered almost 45,000 miles. He could never have ventured upon such travels had he not possessed a knowledge of Chinese which made him independent of interpreters, a familiarity with Chinese etiquette which saved him from imposition, and a personal liking for the Chinese, among whom he numbered many friends; but without his iron will and indifference to danger, discomfort, and fatigue he could assuredly never have accomplished them. He carried out much important survey work, and his reports and new maps

were of great value to the British government.

Pereira was made C.M.G. in 1905 and C.B. in 1917. He was unmarried.

[Personal knowledge.] C. E. PEREIRA.

PERKIN, WILLIAM HENRY (1860-1929), organic chemist, born at Sudbury, Middlesex, 17 June 1860, was the elder son of the chemist (Sir) William Henry Perkin [q.v.], by his first wife, Jemima Harriet (died 1862), youngest daughter of John Lissett, who was of Huguenot descent. From 1870 to 1877 he attended the City of London School where, according to Sir Walter A. Raleigh (in the *School magazine*), 'two boys fought with an abandon and a fury that I have never seen surpassed at the business of taking and rescuing prisoners. They were a West Indian . . . and W. H. Perkin, now my colleague at Oxford.' At school Perkin concentrated so fully on mathematics to the detriment of the classics that he failed to pass the matriculation examination of London University.

Perkin's early years were passed in the most favourable environment possible, for his father maintained a private laboratory and allowed his sons, William and Arthur, to assist him in experimental work while refraining from any attempt to give them systematic instruction. The whole atmosphere of the home was one of devotion to the cause of the advance of chemical science. The most important recreation was music; all the members of the family had executive ability, in several cases far above the average, and an effective orchestra of eight or ten players practised weekly and occasionally gave concerts. This interest remained lifelong with Perkin; at first a pianist, he then took to the violin, and used a fine Joseph Guarnerius, the property of his uncle, Thomas D. Perkin. Later, on going to Germany, he found that ordinary violins were unsatisfying, and he returned to the pianoforte. Perkin was ever hospitable, and later in his life the chamber music concerts held at his house, in which distinguished musicians frequently participated, were memorable occasions.

In 1877 Perkin entered the Royal College of Chemistry at South Kensington, and studied under Professor (afterwards Sir) Edward Frankland [q.v.] and Dr. W. R. E. Hodgkinson. Mr. A. J. Greenaway, who was one of the demonstrators, has testified that Perkin's special aptitude for practical chemistry was the astonish-

ment of his teachers and that his organic preparations were marvels of purity and yield. After some hesitations on the part of his father, who as an evangelical churchman regarded Germany as a dangerous centre of free thought, Perkin proceeded in 1880 to Würzburg, where he studied under Professor Johannes Wislicenus, a great chemist and a great leader. Two years later Perkin migrated to Munich, where he found his real scientific hero in the person of Adolf von Baeyer. It was not entirely a question of the influence of a senior on a junior, although Perkin regarded himself as the pupil, almost the disciple, of Baeyer. Much that Perkin has written of Baeyer is equally true of himself, as for instance in the Baeyer memorial lecture delivered before the Chemical Society in 1923: 'It was only necessary for the commanding figure of Baeyer to stroll through the research laboratories every day, and for him to chat with the various workers, criticize their results, and admire their preparations, to make it out of the question for any one to forget for a moment that research was the only thing that really mattered.' And so, in the company of a famous galaxy of organic chemists—Philip Otto Fischer, Wilhelm Koenigs, Theodor Curtius, Hans von Pechmann, Eugen Bamberger, Paul Friedländer, and others—Perkin untiringly gathered material for his systematic building. As a *Privatdozent* in the department of chemistry at Munich University from 1883 and later as a private assistant of Baeyer, he took part in many of the latter's original studies, including the classical work on the polyacetylenes, and outside the laboratory entered into all the normal activities of German students in a large university city.

In 1887 Perkin was appointed professor of chemistry at the Heriot-Watt College, Edinburgh, and on the last day of that year married Mina, eldest daughter of William Thomas Holland, of Bridgwater, who survived him and whose charm and graciousness made as strong an impression as Perkin's power and geniality. They had no children. Elected a fellow of the Royal Society in 1890, he succeeded Carl Schorlemmer [q.v.] as professor of organic chemistry at Owens College, Manchester, in 1892. His colleague on the side of inorganic chemistry was H. B. Dixon, whom he first met on the occasion of the visit of the British Association to Canada in 1884.

This step was destined to have important consequences, not only for Perkin, but also for the future of chemistry in Great Britain. The opportunity was presented of organizing a school of organic chemical research and Perkin took full advantage of it, first, in prosecuting analytic and synthetic investigations with unflagging zeal; secondly, in directing and encouraging the work of others; and thirdly, in providing the necessary facilities. A man of considerable administrative ability, he understood exactly how to advance the case for expansion, with the result that he was able to supervise the construction of fine laboratories first in Manchester and later in Oxford. It is credibly stated that Perkin was once invited by the curators of the university chest at Oxford to offer an explanation of the overspending of his grant, and that the result of the interview was that the curators were induced to part with a considerable further sum.

Perkin's first pupil was Frederic Stanley Kipping, who studied under him at Munich and was his assistant at Edinburgh. Kipping collaborated with Perkin in writing three books: *A Course of Practical Chemistry* (1890), *Organic Chemistry* (1894-1895), and *Inorganic Chemistry* (1909, 1911). He married Perkin's sister-in-law and later became a notable investigator and professor of chemistry at University College, Nottingham. At Manchester Perkin trained a succession of distinguished organic chemists, who have occupied more than twenty chairs in the universities of Great Britain and of the British Empire.

In 1912 Perkin accepted the offer of the Waynflete professorship of chemistry at Oxford University. A new laboratory was erected in the museum area with a frontage to South Parks Road in 1915. A substantial part of the cost was borne by the university, but the completion of the building and the endowment were rendered possible by the munificence of Mr. Charles William Dyson Perrins, whose father, Mr. J. D. Perrins, had carried out early work on the derivatives of berberine. Perkin's studies of berberine were initiated in Edinburgh and completed in the Dyson Perrins laboratory. The work which Perkin did in Oxford is second in importance only to that of his Manchester period; he established a strong school of original research, trained pupils who have done the same elsewhere, and brought about a minor revolution in the attitude of Oxford to chemistry. As Waynflete

professor he was a fellow of Magdalen and greatly appreciated his connexion with the college, to which he left, as a reversionary bequest and to found research scholarships, the larger part of his fortune.

As a teacher Perkin was the personification of lucidity; his success was partly due to clear thinking and direct expression, and partly to the atmosphere which he created. The audiences which listened to his lectures felt that the subject was being developed then and there. 'Pa Perkin' was indeed beloved of his students, who respected his achievements, admired his great experimental skill, and had confidence in his fairness and in his judgement. He had many personal friends and was regarded for a generation as the first organic chemist of his country and one of the outstanding scientific figures of his age. After music, his chief recreation was gardening; he was very successful at Oxford in the culture of roses, delphiniums, and carnations. He enjoyed travel, particularly in the Alps and Dolomites, a visit to which was often combined with a call on Baejer in Munich.

When Perkin died at Oxford 17 September 1929 after a visit to Switzerland, it was generally recognized that something more than the usual obituary was called for, and a memorial notice of 138 pages was published by the Chemical Society as a separate issue. Only a very brief summary of his work can be attempted here. Perkin was not regarded as a great theoretician, but his practical skill at the bench amounted to genius. In Munich he began a long series of researches on the formation of rings of carbon atoms; this was pioneering work of the first order, and it would be hard to overstate its importance. He made rings of three, four, five, six, and seven carbon atoms and emerged triumphant from a controversy in regard to the three and four rings; even the acute and brilliant Victor Meyer did not at first credit the possibility of their existence. At Edinburgh Perkin attacked an entirely different problem, that of the molecular structure of the yellow plant-base, berberine. This interest in complex alkaloids continued to the end; he synthesized many of them and threw light on the intricate transformations of strychnine. In this field he was not alone, but practically the whole of our knowledge of cryptopine and protopine is due to Perkin's single-handed efforts. At Manchester he made his renowned syntheses of camphoric acid, limonene, sylvestrene, terpineol, and other

members of the terpene group of constituents of essential oils. He also placed the chemistry of brazilin and haematoxylin on a firm basis, discovering in these substances a protean character rivalling that of camphor. The periods of research overlapped, and there are very many significant discoveries which cannot be placed in the above-mentioned categories. Unquestionably Perkin's scientific interests were narrow, but this constitutes no valid criticism of his pre-eminence as an organic chemist. Hardly anything he did was superfluous; his results have stood the tests of time and repetition.

In addition to his purely scientific work Perkin had many contacts with industry. As befitted the son of the discoverer of 'mauve', he made valuable contributions to the establishment of the manufacture of dyes in Great Britain both in his laboratory work and in an administrative capacity.

Perkin received many academic honours. He was awarded the Longstaff medal of the Chemical Society (1900), and the Davy and Royal medals of the Royal Society (1904 and 1925). Honorary degrees of the universities of Cambridge (1910), Edinburgh (1910), St. Andrews (1911), and others were conferred upon him, and he received corresponding or foreign membership of scientific academies of Bavaria, Göttingen, Edinburgh, Washington, Belgium, and Sweden, and of the Institute of France. He was the president of Section B of the British Association in 1900 and of the Chemical Society in 1913-1915.

Many interesting photographs of Perkin are accessible, and some of these formed the basis of the bronze plaques which were presented by his colleagues and pupils to the Chemical Society and to the universities of Oxford and Manchester. Two of these mementoes (by E. G. Gillick) adorn the walls of laboratories which owe their existence largely to him and in which he laboured to such good purpose.

[*The Times*, 18 September 1929; A. J. Greenaway, J. F. Thorpe, and R. Robinson, *Life and Work of W. H. Perkin*, Chemical Society, 1932 (containing an account of Perkin's scientific work embodied in over 275 original memoirs); personal knowledge.]

R. ROBINSON.

PETTY-FITZMAURICE, HENRY CHARLES KEITH, fifth MARQUESS OF LANSDOWNE (1845-1927), was born at Lansdowne House, Berkeley Square, 14 January 1845, the elder son of Henry

Thomas, fourth Marquess of Lansdowne [q.v.], by his second wife, Emily Jane Mercer Elphinstone de Flahault, Baroness Nairne, daughter of the Comte de Flahault and the Baroness Keith and Nairne. During the lifetime of his grandfather, the third marquess, he was known as Viscount Clanmaurice and his father as Earl of Shelburne—the latter title having been called into use when Henry Fitzmaurice, by the death of his elder brother, William, Earl of Kerry, became heir to the Lansdowne estates. The Kerry title has, however, since been resumed by the eldest son, and was borne by the fifth marquess during the three years (1868-1869) in which his father held the marquessate.

From 1855 to 1858 Clanmaurice was educated at a private school at Woodcote, near Reading, kept by the Rev. P. H. Nind, vicar of South Stoke with Woodcote. From there, at the age of thirteen, he went to Eton, where, with several boys who remained his friends in after years, he 'boarded' at the house of the Rev. Augustus Birch. Towards the end of his Eton career he was 'fag master' to Arthur James Balfour, who was some three years his junior. As a 'wet bob' Clanmaurice rowed for two years in the 'boats'; in the field of scholarship he showed no marked pre-eminence, although his masters appear to have had a high opinion of his abilities. It was at his tutor's suggestion that, in order to be suitably prepared for Oxford, he was removed from Eton and its distractions in his final year. The Rev. Lewis Campbell [q.v.], the collaborator of Jowett in his edition of Plato's *Republic*, and at that time vicar of Milford in Hampshire, was the coach chosen. It was through Campbell's influence that Lord Kerry, as he now was, proceeded to Balliol College, Oxford, instead of to Christ Church, and that Jowett eventually became his tutor. Though not yet master, Jowett was already a leading figure at Balliol, and Kerry was one of those pupils on whom, foreseeing future possibilities, he delighted to use his influence. His debt to Jowett was freely acknowledged by Lansdowne in after years. At the moment, however, Kerry somewhat neglected his work in favour of the lighter side of Oxford life: the river, the drag, and the society of friends all claimed their share of his time. He obtained a second class in classical moderations in 1865, and, in spite of a serious effort in his last year to retrieve

the situation, disappointed expectations by leaving Oxford in 1867 with only a second class in *literae humaniores*. His father had died suddenly in 1866, and he thus found himself at the age of twenty-one a member of the House of Lords and one of the largest landowners in the country.

It would seem that at this period Lansdowne had displayed no marked political ambitions. Interested in agriculture and forestry, a keen rider to hounds, a good shot, and an expert angler, he found plenty of occupation, and had it not been for Jowett he might have rested content with the life of a country gentleman. As the representative of a family with Whig traditions of long standing he was, however, soon called upon to take his part in public affairs, and his response was such that for the remainder of his active life he was seldom free from political or administrative responsibility.

Lansdowne's public career may be conveniently divided into four periods. First (1868-1883), when as a liberal he held minor posts in two Gladstonian administrations and acted with his party in opposition to Lord Beaconsfield's government of 1874 to 1880; secondly (1883-1894), as governor-general of Canada and viceroy of India; thirdly (1895-1906), as secretary of state for war and foreign secretary in two consecutive unionist administrations; and fourthly (1906-1916), as leader of the conservative opposition in the House of Lords.

Owing to the liberal traditions of his family Lansdowne was not without friends in the inner councils of that party. Lord Granville had long been intimate with his family, and Lansdowne's earlier appointments were probably in part due to the influence which that statesman exerted with Mr. Gladstone. In 1869, within two years of leaving Oxford, he was appointed a junior lord of the Treasury, a post in which he acquitted himself so creditably that he was transferred in 1872, in succession to Lord Northbrook, to that of under-secretary for war. Two years later, however, Gladstone resigned, and Lansdowne, with the rest of his party, found himself in opposition.

Lansdowne married in 1869 Lady Maud Evelyn Hamilton, the youngest of the seven beautiful daughters of James, first Duke of Abercorn [q.v.], and the next six years were spent with his wife and children at his various homes—Lansdowne House in Berkeley Square, Bowood near Calne in Wiltshire, and Derreen near Kenmare in

county Kerry. The last of these homes was largely Lansdowne's own creation. Although his Irish ancestry reached back to the Norman Conquest, his family had for upwards of a century been non-resident in Ireland. Derreen, commemorated by J.A. Froude in his *Forlornight in Kerry* (1869), was little more than a cottage when Lansdowne decided to make it his Irish home in 1870. In the years which followed it was enlarged, the surrounding country, then destitute of trees, was planted, and under Lansdowne's personal supervision gardens were laid out and filled with the sub-tropical vegetation which now constitutes their great attraction. The love of this Irish home was one of the dominant features of Lansdowne's life, and its destruction in 1922 was to him a devastating blow.

On the return of the liberals to power in 1880, Lansdowne was appointed under-secretary of state for India. Gladstone was now developing his new Irish policy, and although Home Rule was still distant, Lansdowne, as an Irish landlord, at once found himself out of sympathy with the legislation of his chief. Matters came to a head over the Compensation for Disturbance Bill, which Lansdowne, having first resigned his office, effectively opposed in the House of Lords (8 August 1880). Although he continued thereafter to give general support to his party, he now found himself a target for radical and nationalist attacks. He was assailed in the newspapers by Mr. Charles Russell (afterwards Lord Russell of Killowen, q.v.) in respect of the management of his Kerry estates, but he successfully replied to the charges brought against him. Later on he became the object of one of the most determined manifestations of the Land League in a 'plan of campaign' for the wholesale withholding of Irish rents at another of his estates, Luggacurran, in Queen's County. He continued none the less to spend a portion of each year at Derreen.

In the summer of 1883 Lansdowne was offered by Mr. Gladstone the governor-generalship of Canada in succession to the Marquess of Lorne. His numerous home interests made him unwilling to absent himself for five years, but he was feeling the strain of administering a large estate on an income depleted by the non-payment of Irish rents as well as by some heavy charges to which it was then subject. Financial considerations, therefore, largely determined his acceptance of this post.

Lansdowne's tenure of office in Canada

(1883-1888), broken only by a visit of a few months to England in the autumn of 1886, passed smoothly and successfully. He worked throughout in complete and friendly accord with the prime minister, Sir John Alexander Macdonald [q.v.]. The principal Canadian achievement during the period, and one which owed not a little to the backing of the governor-general, was the completion of the Canadian Pacific Railway in June 1886. Lansdowne himself had travelled over the new line to British Columbia, riding along the unfinished portion, in the previous autumn, and was greatly impressed by all he saw. Another matter of moment was the long-drawn-out dispute with the United States over the delimitation of the Newfoundland fisheries, a quarrel which more than once threatened to become acute, and was not finally settled until after his return to England. It was in this connexion that Lansdowne first met Mr. Joseph Chamberlain [q.v.], who was sent out to Canada as British commissioner in the autumn of 1887. In the summer of 1885 there took place in the North-West Provinces the second rebellion of Louis Riel [q.v.], a half-breed who had already given trouble in 1870. The rising caused much anxiety at the time, but it was successfully put down by Canadian troops with scarcely any bloodshed, Riel being sentenced to death.

A more personal incident took the form of an attack by the Irish nationalist, William O'Brien [q.v.], who came over in 1887 for the express purpose of stirring up feeling against Lansdowne in Canada. His ill success was a tribute to the popularity which the governor-general had already established, and showed that Canadians were not prepared for the importation of the Irish land-war into their country.

In January 1887 Lansdowne had been offered, and had refused, a post in Lord Salisbury's government. A year later Salisbury suggested that he should succeed Lord Dufferin as viceroy of India. This Lansdowne agreed to do, stipulating, however, that he should be allowed a few months in England between the two appointments. His Canadian governorship had thus to be cut short. He embarked for England in June 1888 and spent a short time in London, at Bowood, and at his beloved Derreen, where, in spite of all that had passed, he received an address of welcome from his tenants. He left for India in November and was sworn in at Calcutta on 10 December.

In India, Lansdowne's term of office as viceroy passed without any sensational incidents. Although the national congress was becoming increasingly active, the demand for self-government had scarcely been formulated, and the prosperity of the country, which had been steadily enhanced by the policy of railway extension and irrigation work, made its administration, in comparison with more recent times, a matter of no great difficulty or anxiety.

Lansdowne found in his council a body of singularly able men with whom he worked in complete harmony, and in the commander-in-chief, Sir Frederick (afterwards Earl) Roberts, one who became and remained through life a close personal friend. With few exceptions also he was well supported by the home government. Problems, however, arose of sufficient magnitude to become dangerous if injudiciously handled, and it must be reckoned to Lansdowne's credit that none of them were allowed to reach the acute stage. A long dispute, as to frontiers and trade, with Abdur Rahman, the ameer of Afghanistan, was after several years adjusted through the agency of Sir Henry Mortimer Durand [q.v.], who was dispatched for the purpose to Kabul in 1893. A sudden rising in 1890 in Manipur, a small native state on the borders of Burma, resulted in the murder of the British resident there and of the chief commissioner of Assam. It was quickly put down, and its instigator, a native official known as the senapati, executed; but in securing the extreme penalty for the offender the viceroy had to meet considerable opposition at home. On another matter, the Juries Bill (1893), a measure designed to remove criminal cases in some parts of Bengal from the purview of juries who were notoriously afraid to convict, Lansdowne was definitely overruled by the home government. His Indian Councils Bill, which sought to introduce for the first time the elective principle into Indian affairs, failed also in the first instance (1890) to obtain the necessary backing at home, although it was eventually placed upon the statute-book two years later in a somewhat altered form.

A very troublesome position arose during Lansdowne's term of office in connexion with the Indian currency. Owing to the depreciation of silver the exchange value of the rupee, which had been nominally two shillings, had shrunk to half that amount and remained very unstable from

day to day. Remittances from the government as well as the hard-earned savings of civil servants and army officers, when sent home in terms of gold currency, were thus greatly diminished in value. After protracted and anxious consultation Lansdowne in 1898 took the drastic step—by many considered foredoomed to failure—of restricting the supply of the currency by the closing of the Indian mints to free coinage. The rupee at once gained in price and in stability, and a few years afterwards (1899) it became possible to fix its value at 1s. 4d. by legal enactment.

Some anxiety was also caused to the government of India by the anti-opium agitation which arose in England in 1892. A considerable portion of the Indian revenue had for long been derived from the growth and sale of this drug, and it was officially urged that, since it would be impossible to prevent its use, it was better that the traffic should remain in government hands rather than fall into those of private individuals by whom it would be exploited. There were some excited debates in the House of Commons, but the question was finally referred (1893) to an opium commission under the chairmanship of Lord Brassey. The commission's report went far to maintain the position of the Indian government.

As regards the social side of the viceregal office, it is enough to say that both Lord and Lady Lansdowne earned in India an exceptional measure of popularity, and left behind them many friends, Indian as well as British. Amongst numerous distinguished persons whom it fell to their lot to entertain were the Duke of Clarence, the Archduke Franz Ferdinand of Austria (who was murdered at Serajevo in 1914), and the Tsarevitch, afterwards Tsar Nicholas II.

An additional four months were added to Lansdowne's viceroyalty owing to the failure of his successor designate, Sir Henry Wylie Norman [q.v.], to take up the office. A substitute was eventually found in the person of Lord Elgin [q.v.], and Lansdowne returned to England in January 1894. In the interval which elapsed before his next appointment he was offered, but declined, the embassy at St. Petersburg. At this time he was created K.G., received an honorary D.C.L. from the university of Oxford, and was appointed lord-lieutenant of Wiltshire. By the death of his mother in 1895 he added two Scottish properties to those which he already possessed in England and in Ireland.

On the formation of Lord Salisbury's government in 1895, Lansdowne was appointed secretary of state for war, a more than usually difficult post at the moment, since it involved, not only the selection of a commander-in-chief, but the initiation of an entirely new system in the place of that which had so long centred in the person of the Duke of Cambridge. The claims of Viscount Wolseley [q.v.] to the reversion, which were backed by the new secretary of state, proved successful, and the reorganization of the office, long overdue, was then proceeded with on the lines which had been recommended by the Hartington commission of 1890. The effect of the reforms introduced in 1896 was to transfer to the secretary of state much of the administrative power previously exercised, without parliamentary control, by the commander-in-chief, though the conduct of operations in time of war remained as before in the hands of the military staff of the office. All went well at the outset, Wolseley being from the first conspicuously supported by the secretary of state, who on one occasion went so far as to threaten resignation if the commander-in-chief's demands were not complied with.

After the Jameson Raid (December 1895), war in South Africa was generally regarded as inevitable sooner or later; it was, indeed, within measurable distance about eighteen months afterwards. Not, however, until October 1899 was war finally precipitated as the result of President Kruger's famous ultimatum. An efficient and well-equipped expeditionary force was at once dispatched to the scene of action, under Sir Redvers Buller [q.v.] as commander-in-chief, but met with no success. The failures of the British army created consternation at home, and it was generally believed that the system under which they had occurred must be at fault. Lansdowne thus found himself the target for public criticism. Essentially loyal to his office, he made no attempt to clear himself, as he might have done, at the expense of his military colleagues, but in the light of subsequent knowledge it is clear that the responsibility for the mistakes which had been made lay with the military rather than with the civilian side of the War Office. The difficulties of the military situation in South Africa had been, indeed, gravely underestimated by Lansdowne's advisers, the prevalent military opinion being that the war would be over in a few months. But the numbers, the

fighting powers, and the mobility of the enemy had been underrated; the assistance of troops from India had been refused; while the Colonies were encouraged to send infantry instead of mounted men. The fighting, moreover, was of a sort new to British generals in the field, whose lesson had to be learned at a heavy cost. In the earlier operations the commander-in-chief himself had not only been notably unsuccessful in effecting the relief of Ladysmith, but had succeeded in entangling the major portion of the British forces among the fastnesses of Natal. These were matters over which Lansdowne, since military operations could not be directed from Whitehall, had no control. It is, however, on record that throughout the War every demand for men, money, and material was met with the minimum of delay by the office which he controlled. With the supersession of Sir Redvers Buller and the advent of Lord Roberts as commander-in-chief in January 1900, matters immediately began to improve, although it was not until nearly two years after Lansdowne had relinquished his office that the War was brought, under Lord Kitchener, to a successful conclusion.

Foreseeing that a further reorganization of the War Office would be called for, Lansdowne had, in August 1900, intimated his readiness to make room for a new secretary of state. After the general election in November he was offered the post of secretary of state for foreign affairs by Lord Salisbury, who no longer felt able to combine control of the Foreign Office with his duties as prime minister. Lansdowne accepted the position, for which it soon became evident that he possessed exceptional qualifications.

To a courteous manner Lansdowne joined an intimate knowledge of the French language. Diplomatic conversations were to him a pleasure rather than an effort. He was correct and discreet almost to a fault, and although naturally diffident, had the gift of making friends with those with whom he came into personal contact. He never betrayed a confidence nor promised more than he intended or was able to perform. His position gave him every opportunity for entertaining, which he did at this time lavishly, both in town and country. He was soon on the best of terms with the whole diplomatic corps in London.

Lansdowne's term of office will be chiefly remembered for the two great alliances—with Japan and with France—

for the negotiation of which he was responsible. Japan had long been seeking to strengthen her position in Europe, and, with the full consent of her government, the ground had been prepared between Lansdowne and the Japanese ambassador, Baron Hayashi, in 1901. The negotiations were, however, gravely endangered at the last moment by the arrival in Russia of the Marquess Ito, a Japanese statesman whose preferences inclined towards an alliance with that country. It was not until Ito had been persuaded to come to England and to pay a visit to Bowood that all was satisfactorily settled and the treaty signed (30 January 1902). England was at the time in a position of complete isolation, and the community of interests which this treaty established between her and the most virile power of the East did much to strengthen her position, as well as that of Japan, in the eyes of the world. This was to become apparent in the Russo-Japanese War of 1905.

The Anglo-French *Entente* of 1904, which paved the way for the alliance of 1914, had its origin in the difficulties which were constantly recurring between England and France in various parts of the world. These had been most acute in Egypt, and Lord Cromer [q.v.], whose administration had been gravely hampered, lent the full weight of his influence towards a general settlement. Lansdowne found a friendly and able coadjutor in the person of M. Cambon, the French ambassador in London, and together they worked out the numerous details of a difficult and lengthy agreement. In the event all was settled—in Egypt, in Morocco, in Newfoundland, and in Siam—at one stroke, and by this securing of the friendship, instead of the potential enmity of Great Britain's nearest neighbour, the whole orientation of European diplomacy was changed. King Edward VII by his tact and his well-known love of France did much to create the necessary atmosphere for the *Entente*, although his share in its actual formation seems to have been somewhat overrated in popular estimation.

With other countries the relations of Great Britain during Lansdowne's term of office sensibly improved, but in view of after events the diplomatic exchanges with Germany have since attracted the most attention. Germany's policy of naval expansion, joined to the Kaiser Wilhelm II's unconcealed jealousy of his royal uncle and of all things English, had

for some time been a source of anxiety. Nevertheless, private *pourparlers* for an alliance between England and Germany took place in 1901, and made considerable progress, although they were eventually allowed to drop. Later (in 1903) Lansdowne was amongst those who were desirous that Great Britain should, in view of her interests in the Persian Gulf, co-operate with Germany in the project of the Bagdad Railway. Strong public feeling was, however, manifested against any association with that country, and the foreign secretary was obliged to yield to it.

With the United States there were two incidents which required careful handling during Lansdowne's period as foreign secretary. The blockade of Venezuela which, after persistent flouting of diplomatic representations, Great Britain, in co-operation with Germany and Italy, had deemed it necessary to establish (at the beginning of 1903) was considered by President Theodore Roosevelt to be an interference with the American sphere of action, and provoked representations to which the British government was eventually forced to yield. The principal objects had, however, been obtained before the blockade was lifted in deference to American opinion. The government of the United States also showed itself obdurate over the question of the Alaskan boundary. This had long been a subject of dispute, and when President Roosevelt demanded that it should be decided by arbitration, the British Foreign Office had perforce to agree (January 1903). There was considerable feeling, both in Canada and in England, over the appointment of the American members of the tribunal, who hardly satisfied the agreed condition of being 'impartial jurists', as well as over the eventual award (October 1903), which did scant justice to the strength of the Canadian claims. Lansdowne's position was rendered the more difficult by the fact that the American president had privately informed the British government that he would accept no result which did not satisfy the American claims.

When Lord Salisbury died in 1903 and Mr. Balfour succeeded him as prime minister, the leadership of the conservative party in the House of Lords devolved upon Lansdowne as of right. A general election took place in December 1905 and resulted in an overwhelming victory for the liberal party, which had long been out of office and was pledged to legislation

of a drastic nature. In the House of Lords there was, as always, a large conservative majority, and collisions of opinion between the two Houses upon almost every subject were inevitable. It fell in the main to Lansdowne to decide the delicate question how far the revisionary powers of the Upper House should in these circumstances be exercised, though he acted throughout in close consultation with his colleagues in the House of Commons.

The first clash came over the Education Bill of 1906. The Commons refused to accept the Lords' amendments to this measure which, after the failure of an attempt at compromise, was dropped by the government. In the same year the Plural Voting Bill was summarily rejected by the Lords on second reading; though the Trades Disputes Bill, a much more far-reaching measure, was allowed to go through. In recommending this course Lansdowne was much criticized for openly stating that he considered that the latter bill afforded 'unfavourable' ground on which to fight. The Old Age Pensions Bill (1908) was passed under protest, since the Lords' amendments thereto were ruled to be privileged. The Licensing Bill, after a strenuous fight in the Commons, was thrown out on second reading, and the same fate befell the Scottish Land Bill and another Education Bill. Thus the process of 'filling up the cup' against the House of Lords had already gone far when the climax was reached in the famous 'People's Budget' of 1909. This measure sought to introduce *inter alia* a variety of land taxes (all to be afterwards repealed by common consent); after strenuous opposition in the Commons it was, on Lansdowne's advice, summarily dismissed in the Lords (1 December 1909). The prime minister (Mr. Asquith) immediately appealed to the country (January 1910). The action of the Lords was so far endorsed by the electorate as to transfer some hundred seats from the liberal to the conservative side, but the liberals with the help of the Irish vote were still in a position to get their way. They lost no time in preparing a measure to curtail the powers of the second chamber, while in the Lords Lansdowne gave notice of a measure for the internal reform of that body. The death of King Edward then occurred, and an attempt to settle the question by consent was made in the Constitutional Conference which assembled in the summer. This having proved abortive, the Parlia-

ment Bill, limiting the Lords' veto to a period of two years, was introduced and a fresh election held (December 1910). The strength of parties emerged much as it was before, and it became clear that if the government could make sure of the Irish vote it would be able to dictate its terms. This object it achieved by giving a definite promise of Home Rule, and the Parliament Bill was soon passed in the House of Commons, the government making no secret of the fact that, in the event of the Lords proving obdurate, the consent of the new king had been obtained in advance to the creation of a sufficient number of new peers to ensure the passage of the Bill into law. Meanwhile Lansdowne's Bill for the reform of the House of Lords had been introduced and framed in that chamber. It was in these circumstances that the Parliament Bill, after heated controversy amongst conservative peers, was finally passed in the upper house. Lansdowne, although he abstained from voting himself, and advised others to do the same, failed for the first time to carry with him the whole of his followers. Some thought that they could not be expected to subscribe to so drastic a curtailment of the legislative powers of their own house; others believed that the threat of a wholesale creation of peers could not and would not be carried out, or that at all events it should be put to the test of execution. In the result 114 'die hards' recorded their votes against the measure, which was only carried by the narrow margin of seventeen votes, a number of conservative peers having given way at the last moment (9 August 1911).

In the following year Mr. Balfour, with whom Lansdowne had now worked in the closest harmony and friendship for eight years, resigned his position as leader of the conservative party and was succeeded by Mr. Bonar Law. The new leader was expected to be more acceptable to the extremist advocates of tariff reform than his predecessor, who had always been a lukewarm supporter of that policy. Lansdowne himself had throughout occupied a central position between the 'food taxers' and 'free fooders' within the party. It was now attempted to bring these two sections into line on the basis of a policy for the taxation of foreign wheat only; but this proved so far from satisfactory that both Bonar Law and Lansdowne for a time contemplated resignation, nor was it until all food taxes had been definitely dropped that harmony was restored. The imminence

of Home Rule with the threatened resistance of Ulster now dominated the political situation. It culminated in the abortive conference which met, with Lansdowne among its members, in July 1914 at Buckingham Palace in an endeavour to avoid civil strife in Ireland. But the European War was now imminent.

It was on Sunday 2 August 1914 that the historic meeting took place at Lansdowne House between Bonar Law, Lansdowne, and a few hurriedly summoned colleagues, at which it was agreed to pledge the unionist party to the support of France, already at war with Germany. This decision was immediately communicated to Mr. Asquith, whose Cabinet was known to be at variance on the subject of Great Britain's entry into the War; and it turned the scale. Two days later England declared war on Germany.

In May 1915, with other conservative colleagues, Lansdowne joined the first Coalition administration, in which, though himself without portfolio, he was a member of the inner committee responsible for the conduct of the War. He soon became profoundly disquieted by the trend of events, and like many others at the time feared that the War, if fought 'to a finish', would result in such mutual exhaustion that the fruits of victory would not be worth having. In response to an invitation from the prime minister in November 1916 he set out at length in a private memorandum his views as to the possibility of a peace 'of accommodation'. With this document Mr. Asquith, in a short note, expressed his 'complete concurrence'; it was circulated to the Cabinet, and no one who saw it seems to have shown any signs of disapproval. At a later date, however, Lord Crewe, one of Lansdowne's colleagues, put it on record that this memorandum was the prime cause of the break-up of the first Coalition government [Earl of Oxford and Asquith, *Memories and Reflections*, vol. i, c. 14, 1928]. Asquith's dilatory methods had for some time been the subject of violent newspaper attacks, and it would seem that it was the fear of his colleagues supporting Lansdowne's plea for peace that led Mr. Lloyd George to take the steps which brought Asquith's ministry to a speedy end and placed Lloyd George in control of the situation as prime minister in the second Coalition government (December 1916).

In the new ministry Lansdowne did not find a place; it is doubtful whether in the circumstances he would have accepted

one had it been offered him. Although he continued to attend and not infrequently spoke in the House of Lords, he was thenceforth without personal responsibility in affairs of state. Living now in partial retirement, he grew increasingly uneasy as to the results of a continued war of attrition. He had long been anxious that, in the hopes of shortening hostilities, the war aims of the Allies should be more definitely stated, and he had thought of initiating a debate in parliament to that end. Ultimately he propounded his views in his famous letter to the *Daily Telegraph* (29 November 1917). It was for long generally supposed, even by those who were in his closest confidence, that Lansdowne took this step without consulting any of his friends or former colleagues. It did not transpire until some years after his death that the matter had been fully discussed between him and the foreign secretary (Mr. Balfour) who, although he did not himself see the letter before publication, made no attempt to dissuade Lansdowne from publishing it, and was content to refer the whole matter to the permanent under-secretary, Lord Hardinge [Lord Riddell's *War Diary, 1914-1918* (1933) and correspondence in *The Times*, 1 August 1933]. The argument of the letter was practically identical with that of the memorandum of 1916 and in its essence was unassailable. That argument Lansdowne summed up at the conclusion of the letter as follows: 'An immense stimulus', he wrote, 'would probably be given to the peace party in Germany if it were understood: (1) that we do not desire the annihilation of Germany as a Great Power; (2) that we do not seek to impose upon her people any form of government other than that of their own choice; (3) that, except as a legitimate war measure, we have no desire to deny to Germany her place among the great commercial communities of the world; (4) that we are prepared, when the war is over, to examine in concert with other powers the group of international problems, some of them of recent origin, which are connected with the question of "the freedom of the seas"; (5) that we are prepared to enter into an international pact under which ample opportunities would be afforded for the settlement of international disputes by peaceful means.'

It seems, however, that Lansdowne and those who had knowledge of his intention did not realize that a communication of this kind broadcast throughout the world

was calculated to raise in Great Britain's friends fears, and in her enemies hopes, of a weakening purpose on the part of the principal partner amongst the Allies. The moment also was inopportune. A negotiated peace might conceivably have been possible in 1916, but, as subsequent knowledge of Germany's inner counsels has proved, would have been impossible in 1917, except on terms which could not have been contemplated by the Allies. Lansdowne's letter was at once violently repudiated by the government and in the press. His previous record as a tried servant of the state was forgotten in a moment, his argument was misrepresented, and he was bitterly reproached with disloyalty to the Allied cause. At a conservative meeting addressed by Mr. Bonar Law on 30 November he was, to use his own expression, 'excommunicated' from the party. True to his character he vouchsafed no answer to these attacks, and his respect for official secrecy was so ingrained that he never made the slightest allusion in public or in private to his memorandum of 1916 or to the communications with the Foreign Office which had preceded the publication of his letter. But he felt most keenly the absence of any support or countenance from those who were aware of his intentions. He did not, however, give up his efforts to work for peace. Two more letters from him were published in the same strain on 5 March and 31 July 1918; but the armies in France and elsewhere were by that time at death-grips, and, with the German collapse, the peace which had seemed so unattainable soon came in sight.

Lansdowne was now in his seventy-fourth year. Although scarcely to be described as a strong man, he had hitherto on the whole enjoyed good health, but in May 1919 he was struck down by a severe attack of rheumatic fever from which he did not recover for nearly two years. During this time he ceased to attend parliament, and his bodily activity, which had been very striking for one of his age, was thenceforth markedly impaired.

Lansdowne spent most of these later years at Bowood. Already in 1921 the condition of affairs in Ireland had become such as to make residence in a remote corner of that country undesirable. In 1922 it became for Lansdowne impossible; all communication with Derreen was cut off, and after being looted by the 'Irregulars' the house was destroyed by fire in September. This was to him a bitter blow,

for there seemed little prospect of reconstruction during his lifetime. The work, however, was pushed forward as soon as circumstances permitted, and in 1925 he was able to return to Derreen once more. At the end of 1926 his health again gave cause for anxiety, but he had sufficiently recovered in May to start on his annual visit to Ireland. On his way to Derreen he stopped at Newtown Anner, Clonmel, the home of his youngest daughter; an aneurism of the heart supervened, and he died there rather suddenly 3 June 1927.

Of a modest and even retiring disposition, Lansdowne was no seeker after high office. His personal predilections inclined him towards a domestic life, and he was at his best when he found himself in the midst of his friends and family. But his strong sense of duty impelled him to accept the great responsibilities which fell to his lot. His habit of reticence was always marked, and it no doubt increased owing to the fact that at a comparatively early age he occupied positions in which its exercise was essential. Politics, which formed so large a part of his life, were scarcely mentioned, and never discussed, in his home circle, nor did he often open his heart except to a few intimate friends. Although he was an excellent speaker and ready debater, he took little pleasure in speech-making. He was quick at getting at the heart of a question and in expressing his conclusions clearly and concisely. His minutes on official as well as on private papers were models of lucidity and terseness. His ability, his probity, and his straightforwardness were never called in question by friend or foe, but he abhorred publicity in any form and was thus little known or understood by the public. To the world he seemed to be the typical aristocrat—aloof, severe, and unbending—a conception of the conservative leader in the House of Lords which it suited political opponents to foster. To those who really knew him, on the other hand, he was a kind friend, a lover of nature and of poetry, a good classical scholar with a remarkable store of knowledge on all kinds of subjects, and not without a saving sense of humour—in short, a man full of human sympathies.

Lansdowne had two sons and two daughters. He was succeeded as sixth marquess by his elder son, Henry William Edmond (1872-1935). His younger son, Charles, who had assumed the name of Mercer Nairne when Lansdowne made

over to him his Scottish estates in 1918, was killed in action in 1914.

There are portraits of Lansdowne by P. A. de László in the National Portrait Gallery and at Bowood; by Fiddes Watt at Balliol College, Oxford; and by Frank Holl in the possession of Lady Emily Digby. There is an equestrian statue by Harry Bates at Calcutta (Maidan).

LANSDOWNE.

PHILLIMORE, JOHN SWINNER-TON (1873-1926), classical scholar and poet, was born at Boconnoc, Cornwall, 26 February 1873, the fourth son of Vice-Admiral Sir Augustus Phillimore, of Shedfield, Hampshire, by his wife, Harriet Eleanor, second daughter of the Hon. George Matthew Fortescue, of Boconnoc, M.P. for Hindon, Wiltshire, 1820-1881. He was a first cousin of Sir Walter George Frank Phillimore, first Baron Phillimore [q.v.]. He was educated at Westminster, and proceeded with a scholarship to Christ Church, Oxford. At Westminster his talent was recognized and fostered by William Gunion Rutherford, and at Oxford he proved himself the best classical scholar of his time. He obtained first classes in classical moderations (1893) and in *literae humaniores* (1895), and won the Hertford and Craven scholarships (1892), the Ireland scholarship (1893), and the chancellor's prize for Latin verse (1894). He was already writing distinguished verse, and, like his friend Hilaire Belloc, he was a leading figure at the Union, of which he became president in 1895. Christ Church appointed him a lecturer in that year, student in 1896, and tutor in 1898. With one of his colleagues, S. G. Owen, he published in 1898, under the title *Musa Clauda*, a collection of versions from English into Latin elegiac verse. He took up the study of Russian, and wrote a translation of Mikhail Lermontov's novel *A Hero of Nowadays* (not published until 1921). In politics also he took a serious interest at this period, and he was one of the contributors to a volume of *Essays in Liberalism by Six Oxford Men* (1897). In the vacation much of his time was spent in mountaineering in the Dolomites. In recognition of his skill and during the guides and president of the Club Alpino decided that 'one of the fine ascents he had made should bear his name'.

In 1899, at the age of twenty-six, Philli-

more was appointed to succeed Professor Gilbert Murray in the chair of Greek in the university of Glasgow. For some years he took a prominent part in the political life of the West of Scotland as a liberal imperialist, but his interests were steadily concentrating on his work as a scholar and teacher. In 1902 he published a translation in rhymed verse of three plays of Sophocles, but the texts of Propertius (1901) and of Statius's *Silvae* (1905), which he revised for the Clarendon Press at this period, showed where his real bent lay. It was a great satisfaction to him when in 1906 he was transferred from the chair of Greek to that of Humanity, rendered vacant by the retirement of Professor George Gilbert Ramsay. Thenceforward he contributed to the *Classical Quarterly*, the *Classical Review*, *Mnemosyne*, and other periodicals a steady stream of notes, linguistic and textual, on Latin authors. He published a translation and an *Index Verborum* of Propertius (1906), and he set to work upon a large-scale edition of that poet. His facility in Greek now exercised itself in studies of the intellectual and religious life of the Roman Imperial period; and a translation of Philostratus's *Apollonius of Tyana*, introduced by a characteristic essay, appeared in two volumes in 1912. From time to time he published papers and addresses on classical subjects, notably 'The Greek Romances' (in *English Literature and the Classics*, 1912), *Some Remarks on Translation and Translators* (1919), *The Revival of Criticism* (1919), 'Ille Ego' (1920), and *Pastoral and Allegory* (1925). His growing reputation at home and abroad was shown by the conferment upon him of the honorary degree of LL.D. by the university of St. Andrews (1917) and of that of Litt.D. by Trinity College, Dublin (1921); by the dedication to him, as 'philologue, humaniste, poète', of Frédéric Plessis's edition of the *Odes* of Horace (1924); and by his appointment for the year 1914-1915 to the Sather professorship in classics in the university of California. This appointment he was prevented from taking up by the outbreak of the European War.

In 1902 Phillimore published a volume of *Poems* containing a selection of the verse which he had written up to that year. In 1918 he issued a second volume under the title *Things New and Old*. A change of mind visible in his poems is explained by the fact that in 1906 he was received into the Roman Catholic Church. He wrote occasionally for the *Dublin*

Review, his contributions including a notable essay on 'Blessed Thomas More and the Arrest of Humanism in England' (1913). A substantial work on Christian Latin poetry he left unfinished. In the year of his death he published in a popular series a selection of *The Hundred Best Latin Hymns* (1920). It was characteristic of his versatility that in the same year he wrote an introduction to a reprint of Francis Hiekes's translation of the *Vera Historia* of Lucian.

Phillimore was an occasional contributor to the *Eye Witness*, to its successor the *New Witness*, and to *G. K.'s Weekly*. As his sympathetic association with those reviews indicated, Phillimore no longer concerned himself with party politics, but he maintained from a new angle his interest in national affairs and international relations, and he welcomed the opportunity to go to France towards the close of the War as a representative of the Franco-Scottish Society. At the universities of Bordeaux and Toulouse and at the Sorbonne he delivered addresses on the cultural relations of Great Britain with France and with Germany. In the public life of the West of Scotland he held a position of his own as a witty speaker and an admired lecturer on a wide variety of topics, among which he once ventured to include the national poet (speech printed by the Govan Burns Club, 1905). But Phillimore's main concern was with his duties at the university. He was scrupulously diligent in attendance at academic committees, and he took his full share in the routine of his chair. Most of the work he published was a by-product of his careful preparation of his lectures. The regard in which he was held by his students found expression in January 1925, when, in their name, a portrait of him painted by Maurice Greiffenhagen was presented to the university. Yet Phillimore's influence was not confined to the Latin class-room. When the students of Glasgow first decided to issue a volume of *University Verses* (1910), and when all four Scottish universities later combined to publish a volume of *Scottish University Verses* (1923), he was invited on each occasion to supply the preface introducing the volume to the public. As professor of humanity he exercised a profound influence upon the student body as a whole, and through it upon the cultural life of Scotland.

Phillimore married in 1900 Cecily, only daughter of the Rev. Spencer Compton Spencer-Smith, vicar of Kingston, Dorset,

and had one son and one daughter. He died at Shedfield 16 November 1926.

[Phillimore's published writings and private papers; personal knowledge.]

S. N. MILLER.

PHILLIMORE, Sir WALTER GEORGE FRANK, second baronet, and first **BARON PHILLIMORE**, of Shiplake (1845-1929), judge, ecclesiastical lawyer, and international jurist, was born in London 21 November 1845, the only son of Sir Robert Joseph Phillimore, first baronet [q.v.], the last of the judges of the ancient High Court of Admiralty. He was grandson of Joseph Phillimore [q.v.], regius professor of civil law at Oxford University, and first cousin of John Swinnerton Phillimore [q.v.]. His mother was Charlotte, third daughter of John Denison, of Ossington Hall, Nottinghamshire, and sister of John Evelyn Denison, Viscount Ossington [q.v.], Speaker of the House of Commons, and Edward Denison [q.v.], bishop of Salisbury. Phillimore was sent to Westminster, where he found his family name carved amongst those of many distinguished old boys on the porch leading to the famous schoolroom. He became captain of the school, and won a studentship at Christ Church, Oxford, in 1863. He obtained first classes in classical moderations in 1865, in *literae humaniores* in 1866, and in law and modern history in 1867. He was secretary and treasurer of the Union. In the interval between the two final schools he was elected to a fellowship at All Souls College, and he subsequently (1868) won the Vinerian (law) scholarship. He entered the Middle Temple, was called to the bar in 1868, and joined the western circuit.

Phillimore was counsel in many famous ecclesiastical cases, amongst them being *Boyd v. Philpotts* (the Exeter reredos case, 1874) and *Reed v. the Bishop of Lincoln* (1891) in the court of the archbishop of Canterbury. He was also counsel in other cases in which questions of ritual were under discussion, such as the use of lighted candles on the Communion Table, the wearing of certain ecclesiastical vestments, the eastward position during the prayer of Consecration, the singing of the 'Agnus Dei', and the legality of a reredos with sculptural representations of the Transfiguration and Ascension. In 1872 he became chancellor of the diocese of Lincoln. In that office he held that a nonconformist minister was not entitled to describe himself by the title of 'Reverend' on the tomb-

stone erected to his daughter (*Keel v. Smith*, 1876). The decision was upheld by his father, Sir Robert Phillimore, but reversed by the Privy Council. Phillimore never took silk, but in December 1883 a patent of precedence was conferred upon him which enabled him to be ranked with Her Majesty's counsel. In 1885 he succeeded to his father's baronetcy. Apart from ecclesiastical cases he was almost entirely engaged in the Admiralty Court, of which for many years he was the leader.

As a politician Phillimore was not successful. An admirer of Mr. Gladstone, he was unable to persuade the electors of St. George's, Hanover Square, to return him as a liberal in 1885, and a similar fate befell him when he contested the Henley division of Oxfordshire in 1886 and again in 1902.

Phillimore was seldom seen in common law courts, and some surprise was felt when, in December 1897, he was appointed a judge of the Queen's Bench division. He remained a judge of first instance for sixteen years. His lack of experience of criminal law exposed him to considerable criticism when presiding as the red judge at assizes. It was thought that his sentences were too severe, especially in sexual cases. As the years passed he modified the severity of his outlook. Again, on the civil side of his work, he was not always happy in trial of an ordinary *nisi prius* case before a jury, and was wont to interrupt cross-examination of counsel. In cases tried before himself alone, he was more at home and excelled in the difficult task of interpreting confusing and apparently conflicting Acts of parliament, although here also he was apt to be somewhat precise and pedantic in his ways and methods. His decision on facts was not as sound as his determination of the law, where his classical education enabled him to express his judgments in language of exceptional brevity and lucidity. An example of his versatility was shown when he was appointed to administer the bankruptcy jurisdiction of the King's Bench. He was a rapid judge in whose court no time was wasted, and it was the admiration of spectators to watch him taking notes of the evidence sometimes with his right and sometimes with his left hand, with equal facility. His courtesy to everybody and his kindness to the junior bar were recognized on all sides. In summing up his career as a judge of first instance, a place cannot be found for him among the inner circle of great common law judges, but he became a better judge every year he

sat. Always a man of great public spirit, even during his occupancy of the bench he devoted his spare time to public work. He was an alderman of the borough of Kensington, where he lived, and mayor from 1909 to 1911.

In 1918 Phillimore was made a lord justice of appeal and admitted to the Privy Council. Again the appointment was not altogether expected, but it was at once justified by results, and it was from this time onward that his legal capacities bore their best and most abundant fruit. It was fortunate that the Court of Appeal should, during the European War, have had as one of its members so distinguished an international lawyer as he was. He was party to the judgment in the *Continental Tyre Co. v. Daimler Co.* (1915), where the issue was the status of an English company controlled by Germans resident in Germany. He was one of those who decided the case of *The King v. Speyer* (1916) as to whether naturalized British subjects were eligible for membership of the Privy Council; and his judgment in *Beal v. Horlock* (1915) on the effect under the Merchant Shipping Act of the detention of a British ship in a German port at the outbreak of war was subsequently affirmed in the House of Lords.

Phillimore retired from the bench in 1916, and two years later (1918) was raised to the peerage under the title of Baron Phillimore, of Shiplake, co. Oxford. He gave regular assistance to the judicial proceedings of the House of Lords and the Privy Council for the next ten years, bringing to the help of his colleagues a ripe experience, a memory which seemed never to forget any case in which he had been engaged at the bar or which had been cited to him as a judge, and, in addition, a great knowledge of Roman and canon law. The manner in which his native ability, enriched by all this learning and experience, enabled him to deal with other codes and new problems was seen in his masterly treatment of Burmese, Hindu, and Mohammedan law in the Judicial Committee. Here the facts had been found and his duty was to apply the law to them. By the Naval Prize Act (1918) he was appointed chairman of the Naval Prize Tribunal. Summing up his career as a lord justice and in the highest tribunals of the land, his work justified his claim to be considered as one of the great lawyers of his generation.

As an international jurist, Phillimore acquired a European reputation. He was

a constant attendant at the meetings of the International Law Association at Grenoble, Stockholm, Vienna, and Warsaw. He was president of the Association in 1919-1920. At the request of the secretary of state for foreign affairs, he had, in the years 1917 and 1918, been appointed chairman of a committee to consider early schemes for the League of Nations. His report was sent to the Cabinet, taken up by General Smuts, and communicated to President Woodrow Wilson. The president deputed Colonel E. M. House to work upon Phillimore's draft, and his name thus links up the British Empire with the institution of the League. In 1917 he published *Three Centuries of Treaties of Peace and Their Teaching*, and in 1920 was a member of the committee which drew up the statute constituting the Permanent Court of International Justice at The Hague.

Like other busy men, Phillimore found time for many activities outside his profession. He was seldom absent from the meetings of the governing body of his old school, of which he was a member from 1885 until his death, and he took a prominent part in the affairs of the Middle Temple, of which he was reader (1898) and treasurer (1907). He joined the English Church Union in 1865 and was president in 1919. For many years he was treasurer of the Pusey House at Oxford, and after his retirement from the Court of Appeal, he took part in the sessions of the Church Assembly, especially in the controversies which arose in connexion with the revision of the Prayer Book (1927-1928). He was one of the chief authors of the scheme for clergy pensions.

In the House of Lords Phillimore's speeches were not persuasive, but he took a large share in the debates upon the Legitimacy Bill (1885) and the Guardianship of Infants Bill (1886). Those who heard him will always remember him as a man who had decided though rather narrow views, which were always advanced with the greatest courtesy and the greatest consideration for the opinions of others.

Phillimore was responsible for the second edition of his father's *Ecclesiastical Law of the Church of England* (2 vols., 1895), for the third edition of vol. iv of his father's *Commentaries on International Law* (1889), and for many editions (1872-1905) of J. H. Blunt's *Book of Church Law*.

In his private life Phillimore was a charming host who frequently engaged in argument with his visitors and was ac-

customed to verify his views by immediate reference to one of the many books in his well-stocked library. It remains to record what was perhaps his greatest good fortune. In 1870 he married Agnes, eldest daughter of Charles Manners Lushington, M.P. for Canterbury, and had four sons and three daughters. She died in January 1920, but for nearly sixty years Phillimore spent with her a life of unalloyed happiness. He himself seemed to be in league with time, for to the end he preserved his youthful appearance and quick and incisive manner of speech and walk. He died at his house in Kensington 13 March 1929, and was succeeded as second baron by his third (the elder surviving) son, Godfrey Walter (born 1879).

There is a portrait of Phillimore by George Henry in the Kensington Town Hall, but it is not a very satisfactory likeness. A cartoon of him by 'Spy' appeared in *Vanity Fair* 24 November 1898.

SANKEY.

PHILLIPS, Sir CLAUDE (1846-1924), art critic, was born in London 29 January 1846, the second son of Robert Abraham Phillips, court-jeweller, by his wife, Helen, daughter of Moses Lionel Levy, and sister of Joseph Moses Levy [q.v.], founder of the *Daily Telegraph*. He was educated chiefly in France and Germany, and graduated B.A. at London University. He was admitted a solicitor, but subsequently entered the Inner Temple and was called to the bar in 1883. Phillips's practice involved visits to Italy, of which he took full advantage for artistic study. This was extended by travel in other European countries, and systematic visits to their galleries, churches, and private collections. His knowledge and love of music came only second to this leading interest, and his first contributions to the *Daily Telegraph* in the later 'eighties dealt with that subject. Articles on painting followed, growing in number, and in 1897 Phillips was given ample scope for his abilities when he was appointed regular art-critic to that paper—a post which he filled until the end of his working life, devoting to it his main energies, and a high sense of the responsibilities of his task.

In the same year (1897) Phillips's authority as a scholar was recognized by

his appointment to the keepership of the Wallace Collection, which was then being prepared for its opening at Hertford House in 1900. In the arrangement of the collection a committee of the trustees played a controlling part, but the cataloguing fell to Phillips, and in the course of it he identified as an original Titian the 'Perseus and Andromeda', which had been neglected as a school piece.

In addition to journalistic work, Phillips was the author of *Sir Joshua Reynolds* (1894) and of five valuable numbers of the *Portfolio* monographs inaugurated by Philip Gilbert Hamerton [q.v.]—*Frederick Walker* (1894), *Antoine Watteau* (1895), *The Picture Gallery of Charles I* (1896), *The Early Work of Titian* (1897), and *The Later Work of Titian* (1898). His unsurpassed knowledge of pictures, old and new, and his retentive memory furnished him with a copious and even embarrassing wealth of illustration for any given topic. Phillips's approach to painting reflected a fervently emotional nature. If his sense of painter's quality was not so strong, he was anxiously wide-minded, honourably and fiercely independent of personal influence or any taint of commerce. He was unmarried, but found satisfaction in social life and activities, and had deep family affection. He was knighted on retirement from the keepership of the Wallace Collection in 1911, and died at his home in Kensington 9 August 1924. He left a bequest of money and pictures to the National Gallery.

[Preface by Maurice Brockwell to Claude Phillips's posthumous collection of essays, *Emotion in Art*, 1925; personal knowledge.]

D. S. MacCOLL.

PICKFORD, WILLIAM, BARON STERNDALE (1848-1923), judge, was born at Manchester 1 October 1848, the second son of Thomas Edward Pickford, merchant, of that city, by his wife, Georgina, daughter of Jeremiah Todd-Naylor, of Liverpool. The Pickfords came from Prestbury in Cheshire. James Pickford, who died in 1768, was a waggoner between Manchester and London. His son Matthew, and his grandson Thomas (who was Lord Sterndale's grandfather) developed a big carrier's business, and the latter took Joseph Baxendale into partnership. The Baxendales eventually took over the concern, but the name of Pickford is still connected with it. When William Pickford was made a peer he said in conversation that he had been told

that he ought to provide himself with supporters for his arms. 'You had better choose Hadley and Baxendale both proper', said one of his colleagues on the bench: lawyers will appreciate the point.

Soon after the death of Pickford's father, which took place in 1859, his mother moved to Liverpool, and he was educated at Liverpool College. In 1867 he entered Exeter College, Oxford, where he obtained second classes in classical moderations (1870) and in *literae humaniores* (1872). The college elected him an honorary fellow in 1916. In 1871 he entered as a student of the Inner Temple, was a pupil of Thomas Henry Baylis [q.v.], and was called to the bar in 1874. In 1875 he joined the northern circuit, and began as a 'local' at Liverpool, having his chambers for a few years at 22 North John Street, and from 1879 at Commerce Chambers, Harrington Street. He had to wait some years before he got much work; he then acquired a sound and increasing practice, largely in commercial affairs, but with the diversity that a provincial practice usually involves. The most sensational case he had was in 1889 as counsel for Mrs. Maybrick at the police court, and as her junior counsel at the assizes.

Pickford married in 1880 Alice Mary, daughter of John William Brooke, of Sibton Park, Yoxford, Suffolk: she died in 1884, leaving him with two daughters. Her death was the one great misfortune of his successful and otherwise happy life.

In 1892 Pickford moved to London. He had been for some time increasingly engaged there. In particular, he was sent up to conduct in the Admiralty Court almost all the collision and salvage cases in which Liverpool shipowners or solicitors were concerned. He accordingly made London his head-quarters, with his chambers at 2 Mitre Court Buildings, Temple. Of this Admiralty work he continued to enjoy a large share while he remained at the bar. In 1893 he took silk: another Queen's Counsel created at the same time was Charles Swinfen Eady (afterwards first Baron Swinfen) whom Pickford was to succeed as master of the Rolls twenty-six years later.

At first, after these changes, Pickford still went the northern circuit, of which he soon became the *de facto* leader. But the growth of his business in London made his visits to the north more and more infrequent to the great loss of the circuit bar mess, where he was very popular.

'His gaiety and vivacity as a young man', one of his oldest circuit companions has said, 'are not easy to realize for those who only knew the temperate dignity and reserve of the master of the Rolls.' Another friend, who first knew Pickford shortly after he lost his wife, says, 'I can hardly believe that description, except that I know how deeply her loss changed him.' As an advocate he had never the brilliance of Charles Russell, or the learning of Lord Herschell or Sir Joseph Walton—great names on that circuit; but he could get what he wanted from a jury as well as, or better than, any of them. One who knew him well says that in the tradition of the circuit he was the lineal successor of James Scarlett (Lord Abinger) and Sir John Holker. But he was not merely a jury advocate: references to the earlier volumes of the *Commercial Cases* will show that he had a large share of the work of the Commercial Court from its foundation in 1895 until he became a judge, which was the period of its busiest days.

In 1901 Pickford was made recorder of Oldham, and in 1904 recorder of Liverpool. In 1902 he became a bencher of the Inner Temple. In 1905 he was leading counsel for Great Britain at the inquiry held in Paris into the affair of the attack by the Russian fleet upon the Hull trawlers at the Dogger Bank. In 1906 he was sent as commissioner of assize on the north-eastern circuit, an appointment which, for a man with so leading a practice, is usually the prelude to promotion to the King's Bench.

In 1907, parliament having sanctioned the appointment of an additional judge of the High Court, King's Bench division, Pickford was selected for the post by Lord Loreburn, and received the usual knight-hood. It was that lord chancellor's first judicial appointment, and none could have met with more universal approval. Nor was expectation disappointed, for Pickford proved an ideal judge. He was not a very learned lawyer, and he had no brilliancy of style or expression; but in the substance of his decisions he was almost invariably right. Moreover, he possessed that quality which in a judge is of the first importance for efficiency—not to mention his own happiness—the power of making up his mind without being worried, and of forgetting all about a case immediately it is finished. Whether he was trying criminals, or civil cases with a jury, or sitting alone, as he often did, in the Commercial Court, he was equally successful. Nor has any judge more

deservedly earned the respect of the bar for his kindly but dignified courtesy.

When at the bar Pickford had been active in the proceedings of the International Maritime Committee and other movements for the unification of maritime law, and he continued so to be interested after he became a judge. In 1905 he had been the senior British representative at the Brussels Conference which formulated the conventions as to collision and salvage: these were given legal force in England by the Maritime Conventions Act of 1911. He took a prominent part in the later conferences which formulated conventions about limitation of liability and mortgages and maritime liens. He also presided in 1923 over a select committee of both houses of parliament to which was referred the bill which became the Sea Carriage of Goods Act of 1924.

In 1914, upon the resignation of Sir Roland Bowdler Vaughan Williams [q.v.], Pickford was promoted to the Court of Appeal as lord justice, and sworn of the Privy Council. It would be hard to find two men more unlike in every respect than Vaughan Williams and his successor. Pickford had little of the erudition of his predecessor, but he was a much more efficient judge, and proved as successful in the Court of Appeal as he had been in the inferior court.

In July 1916 the bill to set up a commission 'to inquire into the origin, inception, and conduct of operations in the Dardanelles' was introduced. In the House of Lords Lord Cromer [q.v.], the designated chairman, proposed that some one of judicial experience should be added to the commissioners named in the bill as it came from the Commons, and, as a result, Pickford's name appears in the Act (6 and 7 Geo. V cap. 34) which received the royal assent on 17 August. He attended diligently at the laborious meetings of the commission. An interim report was issued before the death of Lord Cromer on 29 January 1917. Lord Justice Pickford was then selected by his colleagues to succeed Lord Cromer as chairman. The final report signed by him as chairman was published 8 March 1917. Another additional task which Pickford undertook during the European War was to preside over a 'conscientious objectors' tribunal in Chelsea. He did the work, as some in a similar position did not, judicially.

In 1918, upon the death in September of Sir Samuel Thomas Evans [q.v.], there was still much work to be done in the

prize court, and it was important to find a man to carry on the task which Evans had done so well. Pickford was obviously the man for this, and, with some reluctance, but with a characteristically high sense of duty, he accepted the post of president of the probate, divorce, and admiralty division of the High Court, and was raised to the peerage as a baron. A few years earlier he had inherited a small estate at King Sterndale, near Buxton, in Derbyshire (which had been first purchased by his great-grandfather), and he therefore took the title of Lord Sterndale. In London he lived first at 92 Elm Park Gardens, and from 1910 onwards at the fine Queen Anne house in Cheyne Walk called 'Queen's House'.

The War ended about two months after Pickford's appointment to the Admiralty Court, and in a year most of the important prize cases had been disposed of. In October 1919, upon the resignation of Swinfen Eady very shortly before his death, Lord Sterndale was appointed master of the Rolls. The prospect, now that the prize work was ending, of trying divorce suits, and, by the strange variety of that court, collision and salvage cases, was not attractive, and he gladly returned to the Court of Appeal as its president. For four years he presided there, and did his work as admirably, and with as much apparent ease, as he had done everything before. On 16 August 1923 he spent an active day in a hayfield at King Sterndale, and went to bed seemingly in the excellent health which he had always enjoyed: next morning it was found that he had died in his sleep. The front page of *The Times* announced his death as on 17 August, i.e. after midnight. He was buried at King Sterndale on 22 August. As he had no son, the barony became extinct.

Pickford was a very tall, handsome man. When he presided in the Court of Appeal, and his colleagues were Lord Justice Bankes and Lord Justice Scrutton, he overtopped them, but there must have been nearly nineteen feet of them altogether. In his younger days he was an ardent bicyclist, a cricketer, and a follower of a Cheshire pack of beagles. He was also a keen climber, and, despite his great weight, an accomplished one. He was elected a member of the Alpine Club in 1894, and was its president from 1914 to 1916. He was also a member of the Athenaeum Club and of the United University Club, and served on the committee of the latter. His service was in one respect

especially valuable to his fellow members: for he was as good a judge of port as he was of men and things. He was also a prominent freemason. He took no part in politics, and never contested a constituency.

There is a portrait of Lord Sterndale, in his robes as master of the Rolls, by Fred Stratton, in the possession of his daughter, the Hon. Dorothy Pickford. An engraving of this was made as a private plate. There is also a copy of this portrait in the Parliament Chamber at the Inner Temple. To those benchers who, in that friendliest of fraternities, remember him as they knew him, it does not do justice to his great and kindly personality.

F. D. MACKINNON.

PIRRIE, WILLIAM JAMES, Viscount Pirrie (1847-1924), shipbuilder, was born at Quebec 31 May 1847. He was of Irish parentage, being the only son of James Alexander Pirrie, of Little Clondeboye, county Down, by his wife, Eliza, daughter of Alexander Montgomery, of Duodesart, county Antrim. He was brought up at Conlig, county Down, near Belfast, and educated at the Royal Belfast Academical Institution. In 1862, at the age of fifteen, he entered as a pupil the shipbuilding firm of Messrs. Harland & Wolff, and made such rapid progress in his profession that he became a partner in 1874, when he was only twenty-seven. He remained for the rest of his life with Harland & Wolff, and after the firm was converted into a limited company he was chairman of the board for many years.

Pirrie's career was contemporaneous with the introduction of modern steel-shipbuilding, and for half a century he was identified with all the important developments which took place in naval architecture and marine engineering. A practical constructor himself, he was also a shrewd man of business, and under his administration Harland & Wolff became one of the leading shipbuilding companies in Great Britain. In a sense he may be said to have been the creator of the big ship. The tendency of his firm was to increase the size of vessels built by them, the 10,000-ton ship of the 'eighties being succeeded by larger vessels, and culmin-

ating in the *Olympic* of 46,000 tons (1911), and the *Britannic* of 48,000 tons (1914). The latter was used as a hospital-ship during the European War, and was torpedoed and lost in the Mediterranean. Harland & Wolff were the sole builders for the White Star line and the Bibby line, and they also supplied important ships for the Peninsular & Oriental Company, the Royal Mail Steam Packet Company, and other leading lines.

Many of the improvements, both in the design of ships and in their machinery, during this period of progress were due to the suggestions of his company or of Pirrie himself. With the increase in the size of ships he was alive to the importance of securing additional strength and rigidity by improved methods of construction. His firm was also the first to arrange passenger accommodation amidships, and to provide many of the amenities of modern ocean travel. Great as were the changes which Pirrie witnessed in the building of ships, the concurrent advance in the science of marine engineering was even greater. Balanced engines reduced vibration to a minimum; quadruple expansion engines, coupled with a low-pressure turbine, gave the greatest economy of steam; the adoption of oil fuel owed much to his foresight; and he did valuable pioneer work in connexion with the introduction of Diesel internal-combustion engines.

Pirrie built up the firm of Harland & Wolff into a very large organization. The works at Belfast alone covered 230 acres, and he established other yards on the Clyde, as well as ship-repairing works at Liverpool and other ports. In busy times the enterprises under his direct control must have employed about 50,000 men.

During the European War, like other leaders of industry, Pirrie placed the resources of his establishments at the service of the Admiralty. Warships were constructed in his yards with rapidity, and liners were converted into cruisers. An extensive aeroplane department was also inaugurated. In March 1918 Pirrie was appointed comptroller-general of merchant shipbuilding, and his energy in this capacity was of value in making up as quickly as possible the shortage caused by submarine warfare. His influence was continually used in favour of harbour and dock development, and he was one of the moving spirits in the promotion of the Atlantic shipping combine, which was

formed at the beginning of the twentieth century. As a result of these negotiations various British and American shipping interests were brought into one organization in 1902 under the title of the International Mercantile Marine Company.

Pirrie's whole career was bound up with Belfast, and most of his interests were centred in that city. His philanthropic activities were considerable, and he devoted special attention to education. He supported the practice, which is now followed by most engineering and ship-building firms, of encouraging apprentices in his employment to continue their education by attending classes at technical schools.

Pirrie's prominent place in the life of the city was recognized by his election in 1898 as the first honorary freeman of Belfast. He served as lord mayor in 1896-1897, and was appointed His Majesty's lieutenant for the city in 1911. Honorary degrees were conferred upon him by the Royal University of Ireland (1899), and by Trinity College, Dublin (1903). He was raised to the peerage as Baron Pirrie, of Belfast, in 1906, and when King George V visited Belfast in 1921, to open the first parliament of Northern Ireland, he received a viscounty. He was admitted privy councillor in 1897, and created K.P. in 1909.

Pirrie died at sea 6 June 1924 while on a business tour, one of the objects of which was to inspect the ports of South America and to impress on their authorities the necessity of increasing and extending facilities in order to meet the growing commerce of the world.

Pirrie married in 1879 Margaret Montgomery, daughter of John Carlisle, of Belfast, but left no issue, and the peerage became extinct at his death.

[*The Times*, 9 June 1924; *Transactions of the Institute of Naval Architects*, vol. lxvi, 1924.] A. COCHRANE.

POLAND, Sir HARRY BODKIN (1829-1928), criminal lawyer, was born in London 9 July 1829. He was the sixth son of Peter Poland, furrier, of Bread Street and Winchester Hall, Highgate, by his wife, Sarah Selina, daughter of Edward Matless Jackson, of London. He was educated at St. Paul's School from 1841 to 1846 and was called to the bar by the Inner Temple in 1851. He became a bencher in 1879. He took chambers first at 7 King's Bench Walk and afterwards at 5 Paper Buildings with his friend

Hardinge Giffard (afterwards Lord Halsbury, q.v.). The two friends shared these chambers until Giffard became lord chancellor in 1895. At the time of Poland's call his uncle by marriage, (Sir) William Henry Bodkin [q.v.], was in large practice as a criminal lawyer, and this fact doubtless contributed to Poland's decision to try his fortunes at the criminal bar and assisted him to make a start at the Old Bailey and at the Middlesex sessions at Clerkenwell. But it was his own qualities of untiring industry, lucidity, and accuracy which enabled him to build up a good practice.

In 1855 Poland appeared for the Crown in the successful prosecution of the bankers Sir John Dean Paul [q.v.], William Strahan, and Robert Makin Bates for misappropriation of securities. This case, according to Poland's own account, 'made his fortune'. In 1865 he was appointed counsel to the Treasury at the Central Criminal Court (the 'Old Bailey') and adviser to the Home Office in criminal matters; he held these offices for the unequalled period of twenty-three years. Poland proved an ideal prosecutor, eschewing all appeals to passion or prejudice but presenting the case for the Crown with a completeness, lucidity, and force which were all the more effective because they were combined with scrupulous fairness. The phrase 'Poland at whose name Freedom shrieks' (an adaptation of Campbell's 'And Freedom shriek'd when Kosciusko fell') was applied to him in jesting appreciation of the terror which he inspired in malefactors.

During his term of office Poland was necessarily engaged for the Crown in most of the important criminal trials of the day. In 1876 he appeared for the Crown against the *Lennie* mutineers who were tried for the murder of the captain and two mates of their ship. In this case he came to the conclusion that one of the prisoners, an Austrian named Giuseppe Lettis, was not a party to the murder. He therefore withdrew the case against him and accepted his evidence for the Crown. After the conclusion of the case the Austrian consul inquired whether Poland would accept a decoration from the Austrian government as an expression of its appreciation of his fairness to this prisoner. Poland declined the honour. Other noteworthy murder trials in which he appeared for the Crown were those of the Wainwrights (1876) and the Stauntons (1877).

Poland was also engaged for the Crown

in the *Franconia* case (*R. v. Keyn*, 1876) which raised the question of the jurisdiction of the English courts as regards crimes committed at sea. He also appeared on occasion for the defence—thus in 1868 he appeared for Edward John Eyre [q.v.], governor of Jamaica, in both the criminal and the civil proceedings. The case of *R. v. Willoughby* illustrates Poland's fairness. The prisoner (who had been previously convicted several times) was indicted for stealing chickens and also for a serious assault on their owner committed (as was alleged) immediately after the theft. The indictment for assault (as being the more serious of the two) was tried first. The defence was an alibi, and the prisoner asserted that two persons who were not called as witnesses might have established this defence. The judge summed up against the prisoner and the jury convicted. In view of this conviction the Crown did not proceed with the minor charge of stealing. Poland, however, was not satisfied of the man's guilt, and he caused inquiries to be made as a result of which the two witnesses were found. Poland then arranged that the prisoner should be tried on the indictment for stealing the chickens. The prisoner again set up his alibi and, as he was not represented by counsel, Poland, at the suggestion of the judge and with the consent of the prisoner, examined the two new witnesses as well as all the other witnesses for the defence. The result was an acquittal and a free pardon for the assault of which the prisoner had been previously convicted.

Besides his criminal work, Poland had acquired a considerable practice in other common law work, especially rating and licensing. He became a bencher of the Inner Temple in 1879. In 1888 he took silk and relinquished his appointment as Treasury counsel. He now appeared as leading counsel for the defence in criminal cases. His methods in this novel capacity remained unchanged, but his quiet and unimpassioned style was by no means unsuccessful with juries, and he was probably assisted by the reputation for fairness which he had acquired as a prosecutor. He is said to have been one of the earliest exponents of the defence of kleptomania. In 1895 he retired from practice and was knighted. It is said that he had intimated his unwillingness to accept a High Court judgeship when approached by Lord Halsbury. In 1874 he had succeeded Sir W. H. Bodkin in the recordership of Dover, an

office which he retained until 1901 when he was succeeded by his cousin, Sir Archibald Henry Bodkin, afterwards director of public prosecutions.

Poland's retirement from his absorbing work at the bar had no adverse effect on his health, for he survived until his ninety-ninth year and his faculties remained almost unimpaired until he had long passed his ninetieth year. During his retirement he was a frequent correspondent of *The Times* on matters of legal and antiquarian interest, and he was a familiar and picturesque figure, in his black skull cap and slightly old-fashioned garb, in the library of the Inner Temple, where he spent much time verifying his references. There he was wont to converse in sonorous tones which aroused the affectionate interest of the other readers and which his deafness doubtless caused him to suppose were no louder than the customary discreet whisper.

Poland never married. His main interest in life until his retirement had always been his practice, although in his earlier years he had been fond of the theatre and of swimming. He was, however, an alderman of the London County Council from 1893 to 1901, and he gave useful evidence at governmental inquiries into the law of licensing and rating and the defence of poor prisoners. He was also an influential advocate of the reform which was ultimately achieved by the Criminal Evidence Act of 1898 under which accused persons and their wives or husbands are permitted to give evidence for the defence. He was, however, an opponent of the creation of a Court of Criminal Appeal. In 1862 he published a handbook on the Merchandise Marks Act 1862 entitled *Trade Marks. The Merchandise Marks Act 1862*. In 1900 he contributed a lecture on changes in criminal law to a series of lectures entitled 'Changes in the law of England during the Nineteenth Century' organized by the Council of Legal Education and published in 1901 under the title *A Century of Law Reform*.

Poland died in his sleep at his house in Sloane Gardens, London, 2 March 1928. An excellent photograph of him in his old age and a reproduction of a cartoon by 'Spy' will be found in Mr. E. Bowen-Rowlands's *Seventy-two Years at the Bar* (1924).

[*The Times*, 5 March 1928; *Law Journal*, 10 March 1928; *Law Times*, 10 March 1928; E. B. Bowen-Rowlands, *Seventy-two Years at the Bar*, 1924.] D. DAVIES.

POSTGATE, JOHN PERCIVAL (1853-1926), classical scholar, was born at Birmingham 24 October 1853, the eldest son of John Postgate, F.R.C.S., of Scarborough, by his wife, Mary Ann, daughter of Joshua Horwood, of Driffield, a surgeon in the royal navy; he was thus of purely Yorkshire stock. His father had had his own way to make, but had succeeded in qualifying as a medical practitioner before his thirtieth year, and subsequently won an honourable position in Birmingham, where he showed keen interest in the public side of his profession. Postgate was sent to King Edward's School, Birmingham, of which A. R. Vardy, a distinguished classic, was then headmaster; and in 1872 he was elected a scholar of Trinity College, Cambridge. He was placed eighth in the first class of the classical tripos of 1876, having won one of the chancellor's medals in the same year. In 1878 he was elected to a fellowship at his college, and in 1884 he was appointed a classical lecturer, an office which continued the fellowship; and, since he held the lectureship for the requisite twenty-five years, he remained a fellow until his death.

Postgate's first book, an edition of all the best-known elegies of Propertius (*Select Elegies of Propertius*, 1881), was hardly surpassed in scholarship and literary power by any of his later work; the discriminating enthusiasm and poetic feeling which appear in this volume, and no less in his editions of Books VII and VIII of Lucan (1896 and 1917) and in his text and translation of Tibullus (Loeb Library, 1913), show Postgate at his best; and it is mainly these qualities which constitute his peculiar contribution to English scholarship.

In 1880 Postgate was appointed to the professorship of comparative philology in University College, London, a post which he held till 1910. Although he wrote little on this subject apart from Latin, it gave a special degree of breadth and precision to his grammatical writing. Hence came his *New Latin Primer* in 1888, a short but admirable Latin grammar which had lasting success; hence, too, his enthusiasm for the correct pronunciation of Latin, the establishment of which perhaps owed more to him than to any other single scholar; and hence the delicate sense of Latin diction which inspired his own writing and teaching of Latin prose (see especially his *Sermo Latinus*, 1889 and 1913). It is not possible here to enumerate

the thirty or forty books and booklets which Postgate devoted to one or other aspect of classical study; still less, the scores of articles which he contributed to the *Classical Review* and the *Classical Quarterly* before, during, and after his own editorship of those journals. His greatest undertaking was one which demanded twenty years of labour—his edition, with a critical commentary, of the *Corpus Poetarum Latinorum* in two quarto volumes (1893-1894 and 1904-1905). No such enterprise had been previously undertaken by any British scholar, and few other scholars, perhaps, could have carried it through with such distinction.

The *Corpus* has been seriously criticized in two points only. First, for its exclusion of the *Appendix Vergiliana* and several later poets, e.g. Ausonius and Claudian, as well as those commonly known as the *poetae minores*: omissions which, although it is perhaps ungrateful to resent them, do leave something substantial to be added by a succeeding generation. The other admitted failure is the result of Postgate's too sanguine attempt to rearrange the couplets and poems of Propertius merely by internal evidence, a task which he might have known was hopeless.

Postgate's editorial services were not confined to the *Corpus Poetarum*. He was in charge of the *Classical Review* from 1899 to 1907, and of the *Classical Quarterly* from 1907 to 1911. It may be doubted whether the contributions to any other learned journal ever received more careful editing. Even a second-rate article might be transformed into a first-class piece of work by his painstaking comments and suggestions. In questions of procedure, no doubt, he sometimes made mistakes which he afterwards regretted; but as a rule he was open to argument, although he clung to points on which he felt sure that he had reached the facts.

In the collation and criticism of manuscript evidence Postgate's work was hard to surpass; so rarely was his selective judgement of readings at fault. On the other hand, his own emendations, though often very clever, were rarely convincing. Those who did not know him imagined wrongly that it was only the smaller points of a case which he recognized. He was, in fact, deeply interested in questions of literature, politics, and philosophy. But his acute perception was always alive to the dangers of premature generalization, and he instinctively looked first to any points of fact, however small, that were in debate;

and if the evidence on these seemed to him adverse to some theory he was apt to reject that theory outright.

Thus it was that those who knew Postgate only at a distance were not a little surprised to find that his enthusiasm, embodied in an eloquent article in the *Portnightly Review* in 1902 entitled 'Are the Classics to go?', followed up by a large and prolonged correspondence, brought to birth, in 1908, one of the most interesting and typical of English institutions, the Classical Association. He and Professor Edward Adolf Sonnenschein [q.v.] were its first honorary secretaries, and it still continues active work with twenty-four branches in Great Britain alone. Postgate was president of the Association in 1924-1925. Meanwhile his merits as a scholar had been recognized by honorary Litt.D. degrees from the universities of Manchester (1906) and Dublin (1907). He was elected a fellow of the British Academy in 1907.

In 1909 Postgate accepted the chair of Latin in the university of Liverpool. He held it for eleven years, and carried out its varied duties with resourcefulness, good humour, and enthusiasm. In addition to his translation of Tibullus and his edition of Lucan VIII, already mentioned, he published an edition of the *Fables* of Phaedrus (1920), during this period.

One of Postgate's last adventures in scholarship was his effort to reform both the teaching and the practice of Greek accentuation ('Ancient Greek Accentuation', *Proceedings of the British Academy*, vol. xi, 1924-1925). He contended with justice that the new evidence of the papyri showed that the traditional system, though correct in the main, is incorrect in some important details; secondly, that teachers of Greek had no right to force upon their pupils the labour of acquiring any rules which were ill founded; and thirdly, that it was to be seriously considered whether English teachers ought not to follow the example of other nations and give to the accents a proper spoken value. This fearless attempt at the age of seventy-one to reform what seemed to him fundamentally wrong was most characteristic and is probably destined to bear fruit.

Postgate's last essay was on a famous passage of Lucretius alleging and describing the use of wild animals in battle by primitive tribes—a passage which scholars have long defended, and some still defend, as being a pardonable poetic exaggeration. Postgate's frank declaration that it was the work of a brilliant

mind which for the time had been unable to distinguish between dream and reality, and that it must be attributed to one of the fits of dementia to which we know the poet was liable, has won cordial assent from many Latin scholars. ('New Light on Lucretius', *John Rylands Library Bulletin*, January 1926).

A few months after this article had appeared Postgate met with a serious bicycle accident a few yards from his own home in Cambridge. He died from grave injuries the next day, 15 July 1926, leaving behind him memories of keen disputation, lively friendship, and whole-hearted devotion to knowledge.

Postgate married in 1891 a former pupil of his at Girton College, Edith, daughter of T. B. Allen, tea-merchant, and had four sons and two daughters.

R. S. CONWAY.

POWELL, SIR RICHARD DOUGLAS, first baronet (1842-1925), physician, born at Walthamstow 25 September 1842, was the second son of Captain Scott Powell, of the 28th Royal Welch Fusiliers, by his wife, Eliza, daughter of Richard Meeke. Much of his boyhood was spent at Toff, near Cambridge, and there he laid the foundations of the interest in natural history and sport (fishing and shooting) which were the chief relaxations of his later life. Educated privately at Streatham, he gave up his wish to follow his father's profession and entered University College, London, with the object of studying medicine. He continued his course at University College Hospital, becoming physician's assistant (now termed house physician) to Sir William Jenner [q.v.], to whom he owed much in his early professional career.

A brilliant student with first class honours in the M.B. (1865) and qualifying for the gold medal at the M.D. (1866) examinations of the university of London, Powell was appointed in 1867 to take temporary charge of out-patients, and in 1869 he applied unsuccessfully for a vacancy as assistant physician at University College Hospital. Two years later (1871) he was elected assistant physician to Charing Cross Hospital where, five years afterwards (1876), he was joined by two other colleagues from his old medical school, (Sir) Thomas Barlow, who followed him as president of the Royal College of Physicians of London, and (Sir) Rickman John Godlee

[q.v.], subsequently president of the Royal College of Surgeons of England. In 1878 Powell was elected assistant physician to the Middlesex Hospital, becoming physician in 1880 and consulting physician in 1900. Thus for nearly thirty years he taught medical students, being a stimulus to the thoughtful rather than a source of dogmatic answers for those interested only in satisfying examiners. As resident clinical assistant, assistant physician (1868), physician (1875), and consulting physician (1889) he was attached to the Brompton Hospital for Consumption and Diseases of the Chest, and was much in demand as a consultant in thoracic disease. For thirty-eight years he was connected with the court, being appointed physician-extraordinary (1887) in the place of Wilson Fox [q.v.], whom in some respects he much resembled, and physician-in-ordinary (1899) to Queen Victoria, whom he attended in her last illness (1901); he continued to serve in the latter capacity King Edward VII and King George V.

A hard worker, Powell's published writings extended over a period of fifty-six years and included articles on diseases of the chest contributed to Russell Reynolds's *System of Medicine* (1879), and to the two editions (1898-1899 and 1909) of its successor, Sir T. C. Allbutt's *System*. He also wrote a text-book on *Pulmonary Tuberculosis* in 1872 which, with altered titles, went through six editions, the last two appearing in 1911 and 1921 respectively in collaboration with Sir Percival Horton-Smith Hartley. He also published his Lumsden lectures, delivered in 1898 at the Royal College of Physicians of London, in an expanded form as *The Principles which govern Treatment in Diseases and Disorders of the Heart* (1899).

In the medical life of London Powell was continuously at work from the time when he was a junior at the Pathological Society, of which he was secretary (1877-1879). Later he was successively president of the Medical Society of London (1891), the Clinical Society of London (1899-1901), and the Royal Medical and Chirurgical Society (1904-1906), being in the chair at the centenary banquet (22 May 1905) of the last-named society, and taking a full share in the arrangements, occupying two years, necessary for its amalgamation with seventeen other medical societies into the Royal Society of Medicine (1907). Powell also lent his help to the formation, initiated by Sir William Osler [q.v.], of the Association of Physicians of Great Britain

and Ireland, and was its first president (1907). At the Royal College of Physicians of London he became a member (1867), a fellow (1873), held several offices, was president (1905-1910), and delivered the Harveian oration in 1914. He was deputy-chairman (1899-1925) of the Clerical, Medical, and General Life Assurance Society, and in 1896 was president of the Life Assurance Medical Officers' Association. With the Conservative and Unionist Association of the university of London he was closely connected for more than thirty years, and was its president 1909-1919. He was created a baronet in 1897 and K.C.V.O. in 1901, and received several honorary degrees from English, Scottish, and Irish universities.

Powell was a striking personality. Tall, slight, with an ascetic, clean-shaven, pale face, charming in manner and voice, reticent, correct, cautious, dignified, and kindly, he was widely recognized as an impressive leader. He married twice: first, in 1873 Juliet (died 1909), second daughter of Sir John Bennett [q.v.], sheriff of London and Middlesex, and niece of William Cox Bennett [q.v.], miscellaneous writer; secondly, in 1917 Edith Mary Burke (died 1935), younger daughter of Henry Wood, of Cleveland Square, Hyde Park, London. By his first wife he had three sons and two daughters. He died in London after a short illness 15 December 1925, contributions from his pen to the medical press appearing three days before and two weeks after his death. He was succeeded as second baronet by his eldest son Douglas (1874-1932), brevet lieutenant-colonel, Royal Welch Fusiliers. The second son was killed in the South African War; the third in the European War.

A portrait of Powell by Spencer Watson belongs to his grandson, Sir Richard Powell, third baronet; a replica is in the possession of the Royal College of Physicians of London. A cartoon of him by 'Spy' appeared in *Vanity Fair* 28 April 1904.

[*British Medical Journal*, 1925, vol. ii, p. 1201; personal knowledge.]

H. D. ROLLESTON.

PRIMROSE, ARCHIBALD PHILIP, fifth EARL OF ROSEBERY (1847-1929), statesman and author, was born at 20 Charles Street, Berkeley Square, London, 7 May 1847, the elder son and third child of Archibald Primrose, Lord Dalmeny, and grandson of Archibald John Primrose, fourth Earl of Rosebery [q.v.]. His mother was Catherine Lucy Wilhelmina, the only

daughter of Philip Henry Stanhope, fourth Earl Stanhope, the sister of Philip Henry Stanhope, fifth Earl Stanhope, the historian [q.v.], and a great-niece of William Pitt. Lord Dalmeny died in 1850. Four years later his widow married Harry George Vane, fourth Duke of Cleveland.

Archibald Philip Primrose was educated first at Bayford, near Hertford, and then at Mr. Lee's school at Brighton. In 1860 he went to Eton. His tutor, William Johnson, better known as William Johnson Cory [q.v.], formed a high opinion of his ability, writing of him as 'surely the wisest boy that ever lived'. In 1862 a privately printed volume of verse indicated Lord Dalmeny's literary bent, and when in 1864 he was elected to 'Pop' he showed exceptional gifts as a speaker. He made no mark as a scholar, but reading where his inclination led him and to no specified end, he acquired a wide general culture. In later years he declared that he owed 'whatever ambitions or aspirations I ever indulged in to Macaulay's *Essays*'. In spite of a 'shade of constraint' in his bearing and a precocious maturity which made him difficult of approach, he was popular at school. Among his contemporaries at Eton were Arthur James Balfour, Lord Randolph Churchill, and the fifth Marquess of Lansdowne.

In January 1866 Dalmeny matriculated at Christ Church, Oxford. In the following year, in reply to a suggestion that he should enter parliament, he declared that he had no politics, adding that 'in any case it is not the time for a young man to commit himself in any way on either side'. A year later (March 1868) on the death of his grandfather he succeeded to the earldom and estates which included Dalmeny Park, near Edinburgh, and other properties in Scotland.

Before the opening of parliament in 1869 Rosebery was invited by Lord Granville to second the address in the House of Lords. In declining the offer he announced his adhesion to the liberal cause. In the same year he began his career as an owner of racehorses, buying and entering for the Derby a colt called Ladas. The university authorities took exception to an undergraduate figuring on the turf and, on his refusal to give up his stud, his name was removed from the books. Rosebery, therefore, left Oxford without a degree. In 1870 he was elected to the Jockey Club, and in February 1871, in seconding the address, made his first speech in the House of Lords. The encomiums which the

speech evoked were more than customary. Rosebery himself noted in his diary: 'Great congratulations, very ill deserved'. In November of the same year he read to the Edinburgh Philosophical Institution a striking paper on the Union of England and Scotland, which confirmed the opinions already formed of his talents. His speeches, which showed increasing study and reflection, his territorial possessions, his association with the most popular British sport, an established reputation for wit, and the charm of his personality, combined to make him at the age of twenty-four an outstanding figure among his contemporaries, with a future of great expectation.

In the House of Lords in the session of 1872 in committee on the Scottish Education Bill, Rosebery moved an amendment against denominationalism. At Queensferry in September, when presented with the freedom of the burgh, he spoke at length on the same topic. At this time Scottish interests were prominent in his speeches, and he was continually urging that they should receive fuller consideration by parliament. In the same year Mr. Gladstone offered him a household appointment with the duty of answering for the Poor Law Board in the House of Lords. The offer was declined, but refusal to accept the lord-lieutenancy of Linlithgow was withdrawn in deference to pressure from Lord Granville.

On 4 June 1872 Rosebery intervened for the first time in foreign affairs in a debate on the terms of the arbitration between the United States and Great Britain for damage done in the American Civil War. It was proposed as a condition precedent to arbitration that the United States should be invited to withdraw certain heads of claim. Rosebery urged that nothing should be done which could have the appearance of dictation to America or disturb the relations between the two countries. There was no division, and before the arbitration America withdrew the claims in question.

In the autumn of 1873 Rosebery paid his first visit to North America, including a flying visit to Canada. His notes written at the time record his close observation of the American outlook on home and foreign affairs. He returned to the United States in 1874 and 1876 and again in 1882 with Lady Rosebery on their way to Australia.

In parliament during these years Rosebery spoke seldom, but always with effect. A speech in the House of Lords against

creating the title of Empress of India (1876), and speeches in Scotland in defence of liberal principles marked him out as a force in political life. But the Eastern question was now growing acute, and he became an active critic of Lord Beaconsfield's policy, attacking the government for failing to satisfy the claims of Greece and for undertaking to defend the Asiatic dominions of Turkey, as to which he declared 'that one may pay too great a price even for the preservation of India'. He was opposed then, as he was opposed thirty years later in the case of France, to incurring obligations which might involve Great Britain in war, and in October 1878, at Aberdeen, he charged the government with having, by the Treaty of Berlin, 'incurred responsibilities of a vast and unknown kind' without consulting the British parliament and the British people.

In the autumn of 1878 Rosebery was elected lord rector of Aberdeen University, delivering his inaugural address, a characteristic and powerful plea for the study of Scottish history, on 5 November 1880. On the day following his Aberdeen address he was elected lord rector of Edinburgh University, but it was not until 4 November 1882 that he delivered his rectorial address on patriotism.

In 1878 Rosebery married Hannah, only daughter and heiress of Baron Meyer Amschel de Rothschild [q.v.], of Mentmore, Buckinghamshire. Baron Meyer having died in 1874 and his wife in 1877, Hannah de Rothschild had succeeded to the family fortune, which comprised Mentmore and its famous works of art. In 1879 Rosebery, who had risen to a position of eminence and authority in Scotland second only to that of the Duke of Argyll, and was now regarded as the future leader of the Scottish liberals, invited Mr. Gladstone to make Dalmeny the head-quarters for his Midlothian campaign. The course of the contest, which resulted in the return of Gladstone as member for Midlothian, brought Rosebery into spectacular prominence and bound him to Gladstonian liberalism. On the formation of his second ministry in 1880 Gladstone offered Rosebery the under-secretaryship of the India Office. In a letter of 25 April, acting on a characteristic scruple, Rosebery declined the offer, saying that in accepting he would 'lose the certainty that what I have done in the matter of the elections, however slight, has been disinterested'. The offer was renewed in July, but again declined on account of the state of his health. In

the new parliament he was active in pressing Scottish claims, and the desirability of appointing a minister for Scottish affairs.

In August 1881 Rosebery was offered and accepted the under-secretaryship of the Home Office with special charge of Scottish business in the House of Lords, thus coming into official relations with Sir William Harcourt [q.v.], then home secretary. In Scotland, especially, the office was regarded as far from commensurate with the position which Rosebery had acquired in the country and in parliament. While generally supporting Gladstone's Irish measures Rosebery was by no means satisfied, and he wrote in his diary (6 May 1882): 'I am clear that I disagree with the policy of government, but am almost clear that I ought not to resign', adding an intention to ask Gladstone 'what is the exact position of a subordinate like myself with reference to Cabinet policy?' The next day his doubts were resolved by the news of the assassinations of Lord Frederick Cavendish and T. H. Burke. The government must be supported. But the close of 1882 found him dissatisfied with the delay in dealing with Scottish affairs, and in the spring of 1883—nothing having been done in the meantime, notwithstanding his protests to Gladstone—he resigned. In July he was offered the Scottish Office, should the bill creating it be passed, but he declined, stating that his advocacy of the office debarred him from accepting.

In September 1883 Lord and Lady Rosebery visited New Zealand and Australia, where, in the course of a series of public speeches, Rosebery developed his view of Imperial relations. On 18 January 1884, speaking at Adelaide, he asked the question whether the fact of Australia being a nation implied separation from the Empire. 'God forbid', he continued, 'there is no need for any nation, however great, leaving the Empire, because the Empire is a *Commonwealth of Nations*.' He returned to England (by way of Ceylon, March 1884) with the Imperial idea deeply rooted in his mind, and convinced of the need for a new outlook on the development of empire, broadly comprehended in the phrase 'commonwealth of nations', with 'mutual self-respect and mutual independence' as basic conditions. In Scotland he was given the freedom of Dundee, his reception showing the commanding position which he now held in Scottish opinion.

On 20 June 1884 Rosebery took his first step towards reform of the House of Lords, moving 'that a select committee be appointed to consider the best means of promoting the efficiency of this House'. In a speech praised for its eloquence and wit, he urged the necessity for increasing the representative character of the House, and enlarged on the danger of delay. The defeat of the motion was made decisive by Lord Granville and his colleagues walking out. Rosebery's speech in support of the second reading of the Representation Bill in July established his reputation as one of the best speakers of the day. The Prince of Wales (afterwards King Edward VII) wrote to express his admiration, and T. H. S. Escott described it as 'incomparably the best speech in the whole debate'. In November Gladstone offered him the post of first commissioner of works with a seat in the Cabinet. The offer was less perhaps than that to which Rosebery's position entitled him, but it was declined on other grounds. In February 1885, however, the political situation was rendered critical by the fall of Khartoum. Rosebery at once informed Gladstone of his willingness to take office. 'The question', he wrote, 'now is one less of policy than of patriotism', and he was thereupon appointed to the Board of Works with a seat in the Cabinet as lord privy seal. The government early in April decided to abandon the Sudan. In reply to a letter from Sir Henry Ponsonby inviting his opinion, Rosebery wrote justifying government action: 'It is a choice of great evils, I admit, but I am sure we chose the least.' The situation had been altered in March by the Penjdeh incident, which brought Great Britain to the verge of war with Russia, and rendered imperative the suspension of military operations in the Sudan.

In May Rosebery visited Count Herbert Bismarck, a lifelong friend, in Berlin, and was introduced to his father, the chancellor, with whom he discussed informally the attitude of Germany with regard to the Egyptian loan, the Afghan frontier question, Turkey, and the African colonies, all which matters were causing friction between Great Britain and Germany. Meanwhile, the Irish question had reached an acute stage in the Cabinet. Joseph Chamberlain [q.v.], supported by Sir Charles Dilke [q.v.], was opposed to 'coercion' and in favour of a large measure of local government; Rosebery, while favouring local government, held that the

lord-lieutenant, Lord Spencer, should be granted such powers as he claimed were essential for the maintenance of law and order. On 8 June the government was defeated on an amendment to the budget. Upon the resignation of Mr. Gladstone, Queen Victoria sent for Lord Salisbury, who consented to form a government pending the dissolution of parliament in November.

In the autumn, at Paisley, Rosebery, after an effective attack on the conservative policy of general conciliation towards Ireland and on the negotiations between the lord-lieutenant, Lord Carnarvon [q.v.], and Parnell, dealt with the Irish leader's recent demands. 'What is proposed', he continued, 'is that Ireland should be treated as a colony. . . . If I had the power and if I were convinced that Ireland were loyal to the connexion with this country, there would be no limits to the concessions that I would offer to Ireland.' At Sheffield he dealt with social subjects, favouring shorter hours and state-aided emigration. At Slaithwaite (near Huddersfield) he outlined a land policy advocating the abolition of primogeniture, more equitable distribution of interests, simplification of transfer, and extension of allotments. In November, at a banquet given to him by the Scottish liberals, he returned to the Irish question and said: 'If you can obtain from the representatives of Ireland a clear and constitutional demand which will represent the wishes of the people of Ireland, and which will not conflict with the unity or the supremacy of this country, then by satisfying that demand Ireland might see in this country her best ally.'

At the general election of November 1885 the conservatives and the followers of Parnell exactly balanced the liberals, but on 26 January 1886 the government was defeated on an amendment to the address, and Lord Salisbury resigned the next day. Mr. Gladstone was sent for by the queen, and in the new administration Rosebery accepted the foreign secretaryship. To the queen he said of his new office: 'It was too much.' But the queen herself described it as 'the only good appointment'. At his official visit to Lord Salisbury, Rosebery expressed his intention of maintaining the continuity of policy in foreign affairs. The outlook had recently improved: danger of war with Russia had been removed by the protocol of 10 September 1885 which secured the Zulfikar pass to the ameer of Afghanistan; a better understanding with Germany

had caused the situation in Egypt; and Lord Salisbury had given a warning that a threatened war between Greece and Turkey would not be tolerated by Great Britain. In April Rosebery, in continuation of his predecessor's policy, joined in an ultimatum addressed by the Powers to Greece. In May notice of blockade by the combined squadrons was presented, and Greece capitulated. Anticipations freely entertained that a liberal government would mean a new policy in South-Eastern Europe were thus falsified.

In his foreign policy Rosebery showed that he could be decided and firm. The attempt of the French to occupy the New Hebrides formed the subject of a strongly worded dispatch to Lord Lyons [q.v.], ambassador at Paris; a failure on the part of Sir Robert Morier [q.v.], ambassador at St. Petersburg, to adhere to his instructions called forth a severe reprimand; while later, a declaration by Russia that Batum was no longer to be a free port, was met by a dispatch from Rosebery in which he said: 'H.M. government are compelled to place on record their view that this proceeding of the Russian government constitutes a violation of the Treaty of Berlin. . . . In no case can H.M. government have any share in it. It must rest on the responsibility of its authors.' The Tsar was painfully affected by the terms of the document, while the Russian chancellor, M. de Giers, described it as 'the most wounding communication that has ever been addressed to one Power by another'. In Egypt Rosebery recognized that a respite was needed from 'projects, reports, and conventions', and gave whole-hearted support to Sir Evelyn Baring (afterwards first Earl of Cromer, q.v.).

The defeat of Mr. Gladstone's Home Rule Bill in June 1886 resulted in another general election and the return of the conservatives and liberal-unionists to power with a majority of 113. Rosebery left the Foreign Office with his reputation as a statesman greatly strengthened. He had kept foreign affairs free of the fluctuations of domestic politics, and in distrusting Russia, in maintaining an attitude of firmness towards France, and in laying stress on the common interests of Germany and Great Britain, he had secured continuity with the policy of Lord Salisbury. Speaking at Manchester in August, Gladstone told the liberal party that in Rosebery they saw 'the man of the future'.

In October 1886 Rosebery left England for a visit to India, returning in the spring

of 1887. During his absence the Round Table Conference had shown that no agreement between Home Rulers and liberal-unionists was possible. Rosebery in speeches up and down the country declared his adherence to Gladstonian liberalism and to the general principle that 'Ireland should be allowed to manage her own affairs in the way of domestic legislation'. To Lord Randolph Churchill he expressed his satisfaction with the state of the liberal party, 'no longer a flabby disconnected majority but a compact minority united by a principle'. As chairman at this time of the Imperial Federation League, Rosebery was constantly bringing before the country the question of Imperial Federation, 'the closest possible union of the various self-governing states ruled by the British Crown, consistently with the free national development which is the birthright of British subjects all over the world—the closest union in sympathy, in external action, and in defence'. Describing it as 'the dominant passion of his public life', he probably did more than any statesman of his time to advance the cause of cohesion as against disintegration, to dissociate the idea of empire from aggrandizement, and to reconcile liberal opinion to a new conception of Imperial relations. While refraining from specifying the form of the relationship which should exist, he advocated recurrent colonial conferences and the admission to the Privy Council of colonial ministers and colonial judges.

In 1888 Rosebery again brought forward his motion for a select committee to inquire into the constitution of the House of Lords. His definite proposals included curtailment of the hereditary right to a seat in the House, election of peers by county councils and municipalities, representation of the colonies, and, in the event of disagreement, a joint meeting of both Houses with decisions dependent upon certain fixed majorities. The motion was defeated by 97 votes to 50. In 1889 Rosebery was returned for the City in the election for the new London County Council and was chosen as chairman by 104 votes to 17. He held the office for a year and threw himself into the work with devoted public spirit. His authority and experience gave distinction to the new body, and his aptitude for detail, by many unsuspected, proved invaluable in guiding the proceedings. Time, however, has not endorsed two items of his municipal programme, namely, the control of the police

by the Council and the merging of the Corporation of the City and the London County Council. For a short period in 1892 he again accepted the chairmanship of the Council.

In November 1890 Rosebery's life was darkened by the death of his wife. This was a blow from which it is doubtful if he ever wholly recovered. Her wisdom and rare serenity of character had been invaluable elements both in his domestic and in his public life. For the next eighteen months he withdrew from politics and, with his health affected, spent much of his time on the continent.

In June 1892 parliament was dissolved. The election which followed showed a majority of forty for Home Rule, and Mr. Gladstone became prime minister for the fourth time. Rosebery was reluctant to take office: he had the gravest doubt if 'his long loneliness and sleeplessness' had not unfitted him for public life, and expressed to Gladstone his 'loathing of politics' [Lord Crewe, *Life*, ii, p. 402]. 'This attitude excited impatience among some of his colleagues. Harcourt regarded it as 'pretty Fanny's way'; Morley wrote: 'How tiresome all this sort of thing is.' But it was only after a moving appeal from Mr. Gladstone and a strongly worded letter from the Prince of Wales indicating the wishes of the queen, that Rosebery's distaste for office was overcome. On 15 August he again became secretary for foreign affairs, and in October he was created K.G.

The question of British withdrawal from Uganda at once revealed differences in the Cabinet. Harcourt was in favour of immediate evacuation. To this Rosebery was opposed. A crisis was only averted by a compromise suspending withdrawal for three months, the question to be investigated by a commissioner on the spot. Some eighteen months later (June 1894), as the result of the mission of Sir Gerald Portal [q.v.], a British protectorate was declared, and Uganda, in accordance with Rosebery's policy, became part of the British Empire. In January 1893 there was again disagreement over Egypt. The dismissal by the young khedive Abbas of ministers friendly to England was objected to by Lord Cromer. Rosebery supported the action of Cromer, but Harcourt, who was in favour of withdrawal from Egypt, was strongly opposed to the interference involved. A protest by France against British action was met by instructions from Rosebery to the British ambassador

in Paris to the effect that so long as the British flag was flying in Egypt such action on the part of the khedive would not be tolerated. Appointments were thereupon made in conformity with the wishes of Cromer, and in February, the British garrison having been reinforced, fear of a Mohammedan outbreak ended. In July a French ultimatum to Siam and a rumour that the French had ordered British gunboats to leave Bangkok, created a grave crisis. The rumour proved to be false, and the handling of the crisis by the foreign secretary resulted in a settlement of the differences between the two countries. In answer to a communication from the queen, Rosebery in a memorandum of 9 June dealt with his attitude towards Home Rule. He viewed it with guarded approval 'as the most practicable or the least impracticable method of governing the country'. In the House of Lords he spoke at length on the second reading of the second Home Rule Bill, which was defeated on 8 September by 419 votes to 41.

On 17 November Rosebery intervened in the great coal strike of 1893 and, presiding at the Foreign Office over a meeting of owners and men's leaders, succeeded in bringing about a settlement. Towards the end of the year there was disagreement in the Cabinet over the naval estimates. The controversy dragged on; Rosebery supporting Lord Spencer, then first lord of the Admiralty, Gladstone and Harcourt protesting against the increase asked for. Harcourt finally accepted some minor amendments; but Gladstone was inflexible, and burdened with his weight of years and threatened with loss of sight, he resigned on 3 March 1894. On the same day, acting on her own initiative, the queen offered the premiership to Rosebery. Anticipating that the policy which he had inherited and intended to pursue might disturb his relations of confidence with the queen, he accepted with hesitation.

The Cabinet as a whole approved the appointment, but differences soon became apparent. Harcourt, whose claims to the succession had received strong support in the liberal party and in the radical press, was at variance with his chief on a number of questions. The foreign secretaryship, which a section of the Cabinet held should be in the House of Commons, was given to Lord Kimberley. On 11 March a pronouncement by Rosebery in his speech on the address 'that before Irish Home Rule is concluded by the Imperial parliament, England as the predominant member of

the partnership of the three kingdoms will have to be convinced of its justice and equity', which was interpreted as meaning that Home Rule could only be passed by purely English votes, created consternation in the party and exasperated the Irish. Two days later an amendment to the address, abolishing the veto of the Lords, was carried by two votes. A new address had to be substituted. Friction in the Cabinet increased as the session advanced. Harcourt's famous death-duties budget evoked criticism from the premier and gave rise to an exchange of embittered memoranda between the two ministers. Further, an Anglo-Belgian agreement for the lease to the king of the Belgians of territory on the Upper Nile, negotiated by Rosebery and Kimberley, was bitterly opposed by Harcourt without whose knowledge the preliminaries had been adjusted. Protests to Belgium from Germany and France led to the abandonment of the lease by the king.

On 27 October 1894 Rosebery at Bradford opened his campaign for reform of the House of Lords, but beyond the audience of 4,500 whom he addressed, the proposals aroused little enthusiasm. The rejection of the Home Rule Bill had strengthened the position of the upper chamber in the country. The queen wrote (30 October) to protest against the policy which Rosebery had announced. In a letter in reply, Rosebery on 1 November justified his policy, claiming that it was conservative in its ultimate tendency and deprecating the suggestion put forward by the queen that she should have been consulted before the policy was announced [*Letters of Queen Victoria*, third series, vol. ii, pp. 432-444]. Before a large audience at Glasgow on 14 November, Rosebery again spoke on House of Lords reform, and declared himself in favour both of Welsh and of Scottish disestablishment. In the same month, by summoning a conference at Downing Street on the co-ordination of the fighting services, he may be said to have taken the first step towards the formation of the Committee of Imperial Defence. In January 1895 at a meeting of the National Liberal Federation he paid a generous tribute to the work done by Harcourt as leader of the House of Commons, and renewed his plea for reform of the House of Lords and disestablishment of the Welsh Church.

Early in 1895 Rosebery suffered from a severe attack of influenza which left him seriously weakened and a victim of in-

somnia. The strain of office, the difficulties which beset him within the Cabinet, and the attacks to which he was subjected in a portion of the radical press were undoubtedly at this time affecting his health. The session opened on 5 February. The party programme included plural voting, Welsh disestablishment, and a liquor control bill. But the Parnellite group under the leadership of John Redmond [q.v.] was hostile, and the government could only count on a majority of fifteen. Against the advice of Rosebery, the question of the House of Lords was relegated to the background. On 21 June the government was defeated by 182 votes against 125 in the House of Commons on the question of the supply of cordite, and Rosebery at once resigned, receiving from the queen as a mark of special favour the order of the Thistle. Cabinet differences were reflected in the election which followed, Rosebery, Harcourt, and Morley putting in the forefront respectively reform of the House of Lords, local option, and Home Rule. The unionists were returned with a majority of 152. On 12 August Rosebery wrote to Harcourt a formal intimation that their official connexion must be regarded as at an end.

In 1895-1896 the Armenian massacres drew Mr. Gladstone from his retirement. In a speech at Liverpool in August 1896 he suggested that the British ambassador should be recalled from Constantinople and the Turkish ambassador in London be given his passports. This policy was supported by a section of the liberals. To Rosebery, who saw in isolated action the likelihood of war, this proved the 'last straw on his back', and on 8 October he resigned the leadership of the liberal party. The following day at the Empire Theatre, Edinburgh, to a tense and crowded audience he made his farewell speech as leader. 'Home to supper. What a relief', is the entry in his diary for that evening. Inability to act in partnership with Harcourt, the fact that his lead had been disregarded at the general election, and lastly, the intervention of Mr. Gladstone with a policy to which he could not subscribe, combined to make a further continuance of his harassed term of leadership impossible. In 1897 by the purchase of the Villa Delahante at Posilipo, near Naples, a locality to which he was devoted, he secured a retreat remote from the arena of politics.

The death of Gladstone in 1898 brought Rosebery back to the House of Lords to

deliver a fine panegyric on his chief. His retirement had failed to effect any semblance of unity in the liberal ranks, and in 1899, Sir Henry Campbell-Bannerman having succeeded Harcourt in the leadership of the party, Rosebery emerged from his seclusion, and in May, at the City Liberal Club, urged the party to return to liberalism as it had been before 1886, and to seek a combination of the old liberal spirit with the new Imperial spirit. In November he delivered an eloquent and memorable rectorial address on Imperial questions at Glasgow University.

The outbreak of the South African War in 1899 accentuated the cleavage in the liberal party. In 1901 a new organization, the Liberal Imperial Council, was formed of the followers of Rosebery with the object of supporting his leadership and promoting his Imperial policy. But on 17 July in a letter to *The Times*, while pointing out that there were now two schools of liberal statesmanship, the insular and the Imperial, pulling in opposite directions, Rosebery stated that he could never voluntarily return to the arena of party politics. Two days later (19 July) at the City Liberal Club, he referred to 'ploughing his lonely furrow'. A speech at Chesterfield in December in which he called for 'a clean slate' and advocated discussion of peace terms with the Boers led to a visit from Campbell-Bannerman in search of agreement. But co-operation was not to be attained, and in February 1902 the formation of the Liberal League with Rosebery as president and H. H. Asquith, Sir Edward Grey, and Sir Henry Fowler as vice-presidents, denoted a definite split between the two wings of the party. But in May 1903 the opening of Chamberlain's tariff reform campaign brought about a change in the situation, and supplied the liberal party with a common ground in defence of free trade. Rosebery in the course of the year spoke at a number of meetings in opposition to Chamberlain's proposals, but mindful of the way in which his own policy had been received, he held aloof from formal co-operation with the official leader of the party.

In 1905 Rosebery spoke at the City Liberal Club and in the country in criticism of the Anglo-French agreement, anticipating that it was more likely to lead to complications than to peace, and in a speech at Bodmin he emphatically dissociated himself from Home Rule, which had once more been brought to the front by Campbell-Bannerman. But his inde-

pendence brought with it an inevitable decline in influence, and when Campbell-Bannerman became prime minister in December and was joined by the vice-presidents of the Liberal League, Rosebery finally severed himself from official liberalism. In the years immediately following he was much at his house at Posilipo. At home he took little part in politics beyond presiding at the annual meetings of the Liberal League. In the House of Lords he thenceforward occupied a seat on the cross benches. In Scotland he spoke on a number of ceremonial occasions, and among his most notable utterances must be included his speech when unveiling a memorial to the Scots Greys at Edinburgh on 16 November 1908 and his address as chancellor of the university of Glasgow on 12 June 1908 on the influence of national universities on Scottish character.

In 1909 the budget introduced by Mr. Lloyd George recalled him once more into the political field, and in a letter to the press (21 June 1909) and at a meeting in Glasgow (10 September 1909) he denounced the financial provisions dealing with land as revolutionary and leading directly to socialism. In November the Finance Bill reached the House of Lords, and he again spoke in condemnation of its proposals, but warned the House against rejecting the measure. This attitude was much criticized, yet his Glasgow speech had indicated that he was not prepared to stake the existence of the House of Lords on such an issue. The rejection of the budget by the peers was followed by the general election of January 1910. In the parliament which succeeded on 14 March Rosebery brought forward in the House of Lords resolutions in favour of reform and reconstitution. The resolutions were passed, but the death of King Edward VII on 6 May prevented their being further dealt with at the moment. On 15 November the conference dealing with the constitutional crisis between Lords and Commons having meanwhile broken down, Rosebery again brought forward his resolutions, which were again passed without a division. Before the general election of December 1910 he spoke at Manchester and Edinburgh, condemning the Parliament Bill as 'ill-judged, revolutionary, and partisan'. On 9 August 1911 the Bill, which had been drastically amended by the Lords, was again returned from the House of Commons, and Rosebery, who had not supported the amendments, denounced the measure but declared that great as were

its evils he considered them less disastrous than the creation of sufficient peers to ensure the passing of the Bill. He therefore voted with the government, afterwards drawing up a protest, signed by fourteen other peers, to be recorded in the journals of the House. It was the end of his work in the House of Lords. At the coronation of King George V in June he had been created Earl of Midlothian in the peerage of the United Kingdom. In September he delivered his rectorial address at St. Andrews University—one of the happiest of all his notable non-political utterances.

The outbreak of the European War in 1914 led to Rosebery's appearance on many platforms, and in a series of stirring speeches he spoke on empire, the calls of patriotism, the need for recruits, and confidence in final victory. In December 1916 he was offered high office in the second Coalition government, but refused. The following year his younger son, Neil Primrose, was killed in action. Rosebery continued his war speeches from time to time, but he was a stricken man. In November 1918 he was prostrated by the circulation of an embolism, and thenceforward remained partially crippled, but maintaining his interest in current affairs, in books, and in the society of his friends. He died 21 May 1929 at his home, The Durdans, Epsom, and was buried in the church at Dalmeny. Since 1887 his town house had been 38 Berkeley Square.

In 1891 Rosebery published a small volume on William Pitt for the 'Twelve English Statesmen' series edited by John Morley. The work is a judicial exposition of the known facts of Pitt's career, written with consummate felicity and charm. It met with an instant success. It was followed in 1900 by *Napoleon: the Last Phase*, and in 1910 by *Chatham: his Early Life and Connections*. The reputation of the three books is based less on research or even revelation than on Rosebery's power to give life and colour to historical portraits. The volumes abound with evidence of this special gift, and although limited in scope, they reveal the loss suffered by literature and historical writing when their author gave himself to a political career. In 1906 Rosebery published a monograph on *Lord Randolph Churchill*, the most completely successful of his writings. The combination was unusual. Contemporaries at Eton and close friends at Oxford, and later occupying positions of eminence in the state, the

two men, although differing in politics, retained to the end the sympathy and affection of their early days. The appreciation is written with lightness and charm and an intimate comprehension of Churchill's character and genius. In the same vein of portraiture Rosebery's sketches of *Sir Robert Peel* (1899), *Oliver Cromwell* (1899), and *William Windham* (1913) stand out among his numerous occasional essays and addresses.

Few men have had a more successful career as an owner of racehorses than Lord Rosebery. He won the principal classic events of the turf, including the Derby three times, with *Ladas* the second in 1894, with *Sir Visto* in 1895, and with *Cicero* in 1905. He was no amateur owner, but a highly versed student of breeding and form. The Durdans (which he purchased in 1874) is celebrated for its collection of pictures of famous horses of the past, and in the extensive library is included a section dealing with the horse in all its aspects. He was the last to use in London a cabriolet, driving a high-stepping horse with a 'tiger' standing on a platform at the back. In later years he made a habit of driving in the country at night after dinner in an open victoria with a pair of horses and a postillion.

Rosebery was of middle height, strongly built, and of active habits. His head was massive, with a fine intellectual forehead and regular features. His eyes were light blue, and normally enigmatic in the quiescence of their expression, but readily breaking into animation and a smile of singular radiance which illuminated his whole countenance. His general appearance altered little with age. He found pleasure in long walks in the country, and in shooting, at which he was proficient. But yachting, regardless of weather, and racing were his principal pastimes. He disliked games, saying, 'Balfour prefers any game to no game, I prefer no game to any game'. He was a born talker, varied, witty, and informed, master of ironic banter and humour, passing easily from light to shade, from gaiety to earnestness, and appearing always to give his best. In society he was liable to disconcerting moments of silence and was at little pains to disguise when he was bored. He was at his happiest when in company of his own choosing, at Dalmeny, or The Durdans, on his yacht, or at his villa at Posillipo.

Although Rosebery inherited works of art of the highest quality, his interest lay

in the associations rather than in the beauty of his possessions. He was a noted collector of portraits and relics of historical characters. Every year his outlay on books for the libraries at Barnbougle, the castle adjoining Dalmeny, and The Durdans was considerable, and his gift (1927) to the National Library in Edinburgh of Scottish books and pamphlets is remarkable for the range and rarity of its contents. He was an omnivorous reader in the field of biography, history, and memoirs, and of these, with the aid of a strong and accurate memory, his knowledge was profound. But he eschewed science and philosophy, and, indeed, speculative writing of all kinds, and concerned himself little with modern literature save in so far as it threw light on aspects of the past.

As an orator Rosebery enjoyed a period of unequalled prestige. His speeches were studiously prepared, and the contrivance of his effects, if sometimes too elaborate, was often masterly. His voice was strong, flexible, and harmonious; his vocabulary authentic and direct rather than subtle or rare. In speaking he would emphasize a passage with an up and down movement of both arms bent, or sink his voice to a note so deep as to appear at times almost painfully mannered. He delighted in the exercise of his gift of oratory, and passages in his speech to the press of the Empire (5 June 1909), in his rectorial addresses at Glasgow (16 November 1900) and St. Andrews (14 September 1911), and in his address on Robert Burns (21 July 1896) have been ranked with the greatest masterpieces of British eloquence.

Rosebery held that he had been drawn into politics largely by force of circumstances and was wont to declare that they were hateful to him. But he was far from insensible to the gratifications of celebrity and high position. He wanted office on his own terms with freedom to carry out his own policy. As foreign minister he approached most nearly to the conditions which he required. As such he acted with judgement and distinction, showing firmness and restraint, brooking little interference from his colleagues, and winning a position of authority among the statesmen of Europe. As prime minister he was faced with the conditions which he was least qualified to control, by a powerful leader of the House of Commons definitely hostile to him, and a party of which a large section regarded Imperialism, and reform of the House of Lords as a means to the creation of a strong second chamber, with

open disfavour. At the same time in Home Rule he was inheritor of a policy as to the expediency of which his doubts steadily increased. 'I never did have power', he said of himself as premier. He wrote of William Windham: 'His self-conscious, self-tormenting nature was indeed wholly unsuited for public life.' For similar reasons Rosebery was unsuited, not indeed for public life as such, but for public life as he had the misfortune to find it. Thus situated, his sensitiveness to criticism, his dislike of contradiction, his hatred of political intrigue, and, above all, a dread of failure tended to aggravate the difficulties of his position as leader. His name is not associated with any notable parliamentary measure, and he proved unequal to the desperate task of re-uniting a party shattered by Home Rule; but as a missionary of Imperial ideals he left a deep and lasting influence on the political thought of his time. His earliest and his latest parliamentary activities were directed to reform of the House of Lords, a cause which he did more to bring before the country than any other statesman of his time. Later years may be said to have completed his alienation from the party which he had led, while a growing fear of socialism drove him more and more to sympathize with other political views.

Lord Rosebery had two sons and two daughters. Of the sons the elder, Albert Edward Harry Mayer Archibald (born 1882), was M.P. for Midlothian in the liberal interest 1906-1910, and succeeded his father as sixth earl. The younger, Neil James Archibald, was under-secretary of state for foreign affairs in 1915 and joint parliamentary secretary to the Treasury 1916-1917.

A portrait of Rosebery by Sir John Millais and a bust by Sir Edgar Boehm are both in the possession of the sixth earl. A cartoon of him by 'Spy' appeared in *Vanity Fair* 14 March 1901.

[*The Times*, 22 May 1929; Marquess of Crewe, *Lord Rosebery*, 2 vols., 1931; E. T. Raymond, *The Man of Promise, Lord Rosebery; a critical study*, 1923; T. F. G. Coates, *Lord Rosebery, his Life and Speeches*, 2 vols., 1900; John Buchan, *Lord Rosebery, 1847-1930* in *Proceedings of the British Academy*, vol. xvi, 1930; Lord Rosebery, *Miscellaneous Literary and Historical*, 2 vols., 1921; personal knowledge.] E. CHARTERIS.

PRIMROSE, SIR HENRY WILLIAM (1846-1923), civil servant, was born in Edinburgh 22 August 1846, the second of the six sons of the Hon. Bouverie Francis

Primrose, by his wife, Frederica Sophia, daughter of Thomas Anson, first Viscount Anson, and sister of Thomas William Anson, first Earl of Lichfield. His father was the second son of Archibald John Primrose, fourth Earl of Rosebery [q.v.], and uncle of Archibald Philip Primrose, fifth Earl of Rosebery [q.v.], the statesman. Henry Primrose was educated at Trinity College, Glenalmond, and Balliol College, Oxford. He obtained second classes in classical moderations (1867) and in the final honour school of law and modern history (1869). From Oxford he passed into the home civil service, entering the Treasury in 1869.

Primrose was in India from 1880 to 1884 as private secretary to the viceroy, Lord Ripon; in 1886 he became private secretary to Mr. Gladstone. It is said that he drafted the financial proposals for the Irish Home Rule Bill which the prime minister introduced that year in the House of Commons. In 1887 Primrose was appointed secretary to H.M. Office of Works, and held that post until 1895, when he was appointed chairman of the Board of Customs. In 1899 he became chairman of the Board of Inland Revenue, a position which he occupied until his retirement from the civil service in 1907.

Useful as his official career had been, the duties which Primrose undertook after he retired were no less valuable. In the same year that he left the civil service he was appointed chairman of the Pacific Cable Board. This body contains Dominion representatives whose interests are at times divergent, and control of it is not easy. Primrose presided over its deliberations with tact and courtesy, so that the seven years of his chairmanship resulted in the accomplishment of much good work. In 1912 he was nominated a member of the royal commission on the civil service, a commission of which Lord MacDonnell [q.v.] was chairman, and in the same year was appointed chairman of the committee to consider the financial position of Ireland before the introduction of the new Home Rule Bill. The government did not, however, act upon the report of his committee. In 1918 he served under the chairmanship of Lord Loreburn on a royal commission upon railways, a body whose labours were interrupted by the European War. In 1914 Primrose accepted the chairmanship of the Welsh Church Commission. During the War he was chairman of the Sugar Commission, and in 1918 was a member of Sir John (afterwards Baron) Bradbury's

committee on the reduction of staffs in government offices.

Primrose's record of public service was distinguished, and his sound judgement and extremely business-like methods well qualified him for the various important positions which he held. He also had considerable gifts of writing, and his reports and minutes are models of clear statement. He was created K.C.B. in 1899, and was sworn a member of the Privy Council in 1912.

The end of Primrose's useful life came tragically by his own hand. He suffered much from insomnia, and the depression consequent upon loss of sleep unhinged his mind. Early in the morning of 17 June 1928 he was missed from his house. He was found to have shot himself in Kensington Gardens, and was taken to St. George's Hospital, where he died almost immediately upon arrival.

Primrose married in 1888 Helen Mary (died 1910), eldest daughter of Gilbert McMicking, of Miltonise, Wigtownshire, and formerly the wife of James Montgomery Walker. They had one son.

A. COCHRANE.

PRINGLE, WILLIAM MATHER RUTHERFORD (1874-1928), politician, was born at Gordon, Berwickshire, 22 January 1874, the third and youngest son of George Pringle, of Gordon, by his wife, Elizabeth Mather. He was educated at Garnethill School, Glasgow, and at Glasgow University, where he graduated with first-class honours in classics and history.

He was called to the bar by the Middle Temple in 1904. His opinions matured early, and he never changed them. Alert, intelligent, hardworking, vigorous in private and eloquent in public, he seemed to be marked out for promotion when, after unsuccessfully contesting the Camlachie division of Glasgow in 1906 in the liberal interest, he entered parliament as member for North-West Lanarkshire at the general election of January 1910: he retained the seat until 1918. He had time to make his mark but not to attain office before the break-up of the liberal party. He swiftly won a reputation for exhaustive knowledge of parliamentary procedure, and in collaboration with James Myles Hogge, liberal member for East Edinburgh 1912-1924, was not slow to take advantage of the opportunities which this knowledge afforded of promoting the interests of his party. Pringle was certainly the abler and

more popular member of the partnership, but 'Pringle and Hogge' achieved a fame which neither alone was able to sustain. Pringle was passionately loyal to Mr. Asquith, and this loyalty led him into the wilderness, in which he gained a new but not less deserved reputation for tenacity and for optimism. He contested the Springburn division of Glasgow at the general election of December 1918 but, in common with all except a handful of 'Wee Free' liberals, failed to be elected. He returned to parliament, in company with another small liberal band, in 1922, when he stood successfully for the Penistone division of Yorkshire. He held this seat in the election of 1923, but only to lose it at the end of the succeeding short-lived parliament in 1924.

Mr. Asquith said of Pringle in 1922 that he was the 'first man' in parliament, and that there was no position in the state which he was not fitted to fill. Pringle never had the chance to justify this opinion. Events brought him disappointment after disappointment. But he never lost hope of being one of the architects of a real liberal revival. His ability was recognized when he was invited, in 1924, to join the liberal 'shadow Cabinet' under Mr. Asquith, and he was one of the chief movers of its open rebuff to Mr. Lloyd George after the General Strike in May 1926. Pringle was certainly expressing his characteristic feelings when he signed the letter describing Mr. Lloyd George as 'one whose instability destroys confidence'. Mr. Lloyd George's well-known readiness to co-operate with other parties and the existence of the 'Lloyd George Fund' were alike repugnant to one so wholly devoted to the conception of independent and locally financed liberalism.

Although it seemed almost impossible for the breach in an already diminished party to be healed, Pringle relaxed neither hope nor energy. The loss of his seat was a great handicap to one who delighted in the House of Commons, and it cut short the most effective display of his special gifts, which he had given as a critic in parliament of the first labour government. But he founded and was first chairman of the Liberal and Radical Candidates Association in 1924, and at the time of his death was prospective liberal candidate for Paisley, whither he had gone in the hope of winning back a seat once held by his leader, Mr. Asquith. He was also a keen supporter of the formation of the Liberal Council in 1927. Pringle takes a

place in political history as a member of the invaluable band of those who have never held office but who have, nevertheless, exercised a considerable influence upon any House of Commons of which they were members.

Pringle died suddenly at his home in Southfields 1 April 1928. He married in 1906 Lillias Patrick, daughter of Joseph Somerville, of Glasgow. They had four sons and one daughter.

[*The Times*, 2 April 1928; private information.]
W. E. ELLIOT.

PROTHERO, Sir GEORGE WALTER (1848-1922), historian, was born at Charlton, Wiltshire, 14 October 1848. He was the eldest of the four sons of the Rev. George Prothero, vicar of Clifton-upon-Teme, Worcestershire, afterwards rector of Whippingham, Isle of Wight, and canon of Westminster, by his wife, Emma, daughter of the Rev. William Money Kyrle, of Homme House, Herefordshire, and Whetham House, Wiltshire. The third son, Rowland Edmund, was president of the Board of Agriculture from 1916 to 1919 and was raised to the peerage as Baron Erle in the latter year.

George Prothero was educated on the foundation at Eton and became head of the school. In 1868 he went with a scholarship to King's College, Cambridge, where he had an equally distinguished career. He was awarded the Bell scholarship in 1869, was sixth classic in the tripos of 1872, and was elected a fellow of King's in the same year. He also captained his college boat (1870-1871). After acting for a short time as assistant-master at Eton, Prothero studied at Bonn University, where he became familiar with the work of the great German historians of the time, contracting a special admiration for Ranke, the first volume of whose *Weltgeschichte* he translated in 1883.

Returning to Cambridge in 1875, Prothero was appointed history tutor at King's in 1876, and in 1884 university lecturer in history. With these appointments, his publications indicated the trend of his aims and interests. In 1877 appeared his *Life and Times of Simon de Montfort* and in 1894 his valuable collection of *Select Statutes and other Documents Illustrative of the Reigns of Elizabeth and James I.* His own wise, generous, and sympathetic outlook on life is, however, perhaps most clearly shown in his *Memoir* (1889) of his friend Henry Bradshaw [q.v.].

In 1894 Prothero was appointed to the

newly created chair of modern history at Edinburgh University. Whilst resident at Edinburgh he lived at 2 Eton Terrace, a house with a charming view over the Water of Leith. He found his new work entirely congenial. He liked the raw Scottish students with their passion for knowledge and their sacrifices to get it; and they returned his affection.

In 1899, however, there came to Prothero the offer of the editorship of the *Quarterly Review* resigned by his brother Rowland. He accepted the offer, moved to London, and held the editorship until his death. Changes such as the European War produced elsewhere have modified the administration of the *Quarterly*, and Prothero might, perhaps, be reckoned the last in the old editorial tradition. His position as editor of the famous periodical was sustained by many academic distinctions. He was president of the Royal Historical Society (1901-1905), fellow of the British Academy (1903), Rede lecturer at Cambridge (1903), Lowell lecturer at Boston and Schouler lecturer at Johns Hopkins University, U.S.A. (1910), and Chichele lecturer at Oxford (1915, lectures delivered 1920). Thus he had a definite place in the social and intellectual life of the London of his time. He entertained generously, and those who were privileged to be his guests at 24 Bedford Square were sensible of the quiet charm of their host not less than of the vivacious charm of their hostess. In touch with representative men in political and diplomatic as well as in historical and literary circles, Prothero had good company at his command; and the talk at his table was enriched by his own balanced and sympathetic contributions.

Whether Prothero would have been well-advised to exchange, as he might have done, his work and interests in London for the perhaps more dignified but also less public post of provost of King's College is open to debate. Howbeit, he decided to refuse the offer of the provostship, and it is primarily as an editor that he left his mark upon the intellectual life of his time. Those who worked with him on the *Quarterly Review* were conscious of his scrupulous regard for careful English and considered opinion. Prothero had further opportunity of showing his patience and thoroughness as co-editor of the *Cambridge Modern History* (1901-1912) and as general editor of the Cambridge Historical Series and of the handbooks designed to supply the British delegates at the Peace Conference at Versailles in 1919 with the

requisite historical, geographical, and economic information. These last were prepared between 1917 and 1919 jointly in the Intelligence division of the Admiralty, in the War Trade Intelligence Department, and in a specially created historical section of the Foreign Office. In his capacity as historical adviser to the Foreign Office Prothero attended the Peace Conference in 1919, and in 1920 was created K.B.E. as a reward for his services. The work, however, had overtaken his strength, and he died in London 10 July 1922.

Prothero married in 1882 Mary Frances, daughter of Samuel Butcher [q.v.], bishop of Meath, and sister of Samuel Henry Butcher [q.v.] and of John George Butcher, afterwards Lord Danesfort. They had no children.

[*The Times*, 12 July 1922; *Quarterly Review*, October 1922; personal knowledge.]

A. CECIL.

QUIN, WINDHAM THOMAS WYNDHAM-, fourth EARL OF DUNRAVEN AND MOUNT-EARL in the peerage of Ireland and second BARON KENRY of the United Kingdom (1841-1920), Irish politician, was born at Adare, co. Limerick, 12 February 1841. He was the only son of Edwin Richard Windham Wyndham-Quin, third Earl [q.v.], by his first wife, Augusta, daughter of Thomas Gould [q.v.], master in chancery in Ireland. During his boyhood his father, who had been under the influence of the Tractarian movement, joined the Roman Church. Lady Dunraven, however, remained strongly Protestant, and the boy was accordingly sent to Rome for education, and forbidden to communicate with his mother. This produced an obstinate resistance. Lord Adare, as he then was, after some tuition in Paris, went to Christ Church, Oxford, in 1858 without having had any public-school education.

After three idle years at Oxford Adare entered the army in 1862, as cornet in the first Life Guards, and with his troop saw the 'battle of Hyde Park' on 23 July 1866, when the mob threw down the railings as a protest against the Cabinet's prohibition of a meeting of the Reform League. He rode steeplechases, being a very light weight, and raced a little; but already the passion of his life was sailing, and his leaves were mostly spent on a yacht. In 1867, when the military expedition to Abyssinia was announced, no volunteers from England were accepted for Sir Robert Napier's force, but Adare contrived to get the post of war-correspondent for

the *Daily Telegraph*, and was present at the capture of Magdala. He again acted for the *Daily Telegraph* in the war of 1870 between France and Prussia, and witnessed the earlier battles from the Crown Prince's head-quarters. He spent the winter of 1870 to 1871 at Versailles, and was present when the king of Prussia was proclaimed German emperor in the Galerie des Glaces. There, half a century later, he saw the signing of the peace between the Allies and defeated Germany, being the only person who was present on both occasions.

In 1871 Adare succeeded to the earldom and to the seat in the House of Lords; but his wandering instinct was not sated, and he went immediately to America (which he had visited with his wife in 1869) for big game shooting. He was introduced by General Sheridan to 'Buffalo Bill' (William Cody) and 'Texas Jack', and with these famous scouts he shot buffalo and wapiti about the Platte River in the days of Indian war. In 1874 he again went to the United States, accompanied Dr. George Henry Kingsley [q.v.], and explored the Yellowstone region, in special pursuit of mountain sheep. His observations were written in *The Great Divide*, published in 1876. From this time on for sixteen years he yearly crossed to America for sport, especially in Canada and Newfoundland.

Unlike his predecessors, who had lived chiefly at Dunraven Castle in Glamorgan-shire, Dunraven made his home at Adare, county Limerick, and in 1880 published the first of his many pamphlets on Irish public affairs, *The Irish Question*. In 1885-1886 and again in 1886-1887 he was under-secretary for the Colonies in Lord Salisbury's administration, but resigned because he thought the government unfair to Newfoundland in the controversy with France over the fishery question, and also in general too ultra-tory. He had, as he says himself, 'a cross-bench mind', interested in politics but not in party politics. Turning his attention to social subjects, Dunraven moved in the House of Lords for the appointment of a committee on sweated labour, carried his motion, and was appointed chairman (1888-1890). He considered that much later legislation sprang from its recommendations. A different task was the chairmanship in 1890 of the commission on Irish horse-breeding. His stud at Adare was famous and successful. He raced a good deal, but his interest lay chiefly in breeding,

'Desmond' being the most famous of his sires.

In the years before 1900, however, Dunraven was chiefly known to the public as a yachtsman. He competed for the America's Cup in 1893 and 1895 with two specially built yachts, *Valkyrie II* and *III*—both times unsuccessfully. In the second contest against the American *Defender*, after two races out of three had been sailed, he withdrew from the third race, being dissatisfied with the keeping of the course. His subsequent protest in a pamphlet created much acrimonious international controversy, and he was struck off the membership of the New York Yacht Club. Dunraven took out his certificate as master and extra master, and in 1900 published *Self-Instruction in the Practice and Theory of Navigation* primarily for the use of yachtsmen. This training enabled him in the European War to take command of the steam yacht *Grianaig* (bought and run at his own expense) for service as a hospital ship, navigating both Channel and Mediterranean among mines and submarines. Thus he continued the life of active adventure until close upon his eightieth year.

But the service by which Dunraven will be best remembered was connected with Ireland. In 1902 George Wyndham [q.v.], as chief secretary, was contending with a renewed outburst of land agitation, when the idea of a conference between representatives of landlords and tenants was suggested in a public letter by Captain John Shawe Taylor, a young Galway squire. An official communication from the chief secretary supported the suggestion, which was accepted by the Nationalist leaders, but repudiated by the Irish Landlords' Convention. Lord Dudley, the viceroy, however, joined in advocating the plan, and a group of powerful landlords, of whom Dunraven was chief, set up an organization which polled the lieutenants and deputy-lieutenants of Ireland on the question and secured 103 votes for conference against 33 opposing. After further proceedings, the Landlords' Convention having renewed its refusal, a poll of individual landlords nominated four representatives, Lord Mayo, Colonel Sir Hutcheson Poë, Colonel (afterwards Sir) Nugent Everard, and Lord Dunraven. When the conference of eight assembled, Dunraven was named chairman on the motion of Mr. Redmond. After long and difficult negotiation a unanimous report recommended a general policy of land

purchase, and specified terms. This became the basis of the Wyndham Land Act (1903) which settled the policy that Irish landlords should, without exception, be bought out and the occupier become the owner. 'For the first time', William O'Brien [q.v.] wrote in his book *An Olive Branch in Ireland* (1910), 'both parties in the state were brought to vie with one another in acclaiming an Irish compact which brought honour to both of them.'

This achievement was the great success of Dunraven's life, and naturally led him to attempt more. The Land Conference was revived as the Irish Reform Committee, which advocated the policy that came to be known as 'devolution', a partial transfer of Irish administration and legislation to an Irish assembly. Sir Antony (afterwards Lord) MacDonnell [q.v.], under-secretary to the lord-lieutenant, helped to draft the proposals which, when published in 1905, were denounced by extreme Nationalists and Unionists alike, with the result that the scheme broke down and Wyndham was forced into resigning the chief secretaryship. On the other hand, a split among the Nationalists occasioned the temporary withdrawal of William O'Brien, Dunraven's most ardent admirer. Later, in 1910, when O'Brien returned to active political life and launched a new organization, the All for Ireland League, Dunraven gave it public support.

In the struggle over the Home Rule Bill and the Parliament Act Dunraven played a cross-bench part. His last opportunity to forward what he always believed in, a settlement of the Irish difficulty by conciliation between different sections of Irishmen, came when the Irish Convention was set up in 1917; and in that assembly he advocated, what he had preached in many pamphlets and public letters, a solution on federal lines. But there, as elsewhere, he lacked one of the main qualifications of a political leader; he had neither the equipment nor the temperament of an orator. He lived to see, after the European War, a period of savage turmoil in Ireland, which profoundly saddened him. Yet the postscript to his book of memoirs, *Past Times and Pastimes*, published in 1922, ends on a note of hope, declaring that 'by acceptance of the Treaty the foundations of a great and desirable peace had been laid', and paying a tribute to the 'governing qualities displayed by the leaders of the provisional government' in Ireland. He was among the members nominated by President Cosgrave to serve

on the first senate of the Irish Free State in June 1921.

Dunraven married in 1869 Florence Elizabeth (died 1916), daughter of Lord Charles Lennox Kerr, and had three daughters, two of whom predeceased him. He was succeeded in all his Irish titles by his cousin, Windham Henry Wyndham-Quin (born 1857). He died at his London residence 14 June 1920.

Few of his contemporaries touched life at more points than Dunraven, and although he experimented in many directions, he dropped nothing that interested him, while his physical endurance permitted. A large experiment in tobacco growing at Adare was checked by the accidental burning of his factory in 1916; but even so he continued to grow as much Turkish leaf as would supply the cigarette factory which he had established. Fishing in all its forms was one of his main interests; and he constantly advocated the serious development of fish supply by hatcheries, both fresh water and marine, for the British Isles. Adare under his ægis continued to be what perhaps his forerunners had first made it—one of the few villages in Ireland having beauty as well as historic interest, a place not of ruins but of ancient churches and buildings nobly preserved for use. He was never officially in a position to have enthusiastic followers, and circumstances never called on him to make important sacrifices: but few men in his day brought more intelligent goodwill to the service of Ireland, and few Irish politicians have done so little mischief to offset their work for good.

[*The Times*, 15 June 1926; Lord Dunraven, *Past Times and Pastimes*, 1922; *Report of New York Yacht Club's Special Committee on certain charges made by the Earl of Dunraven, 1896. Portrait, Royal Academy Pictures, 1921.*]
S. GWYNN.

RALEIGH, SIR WALTER ALEXANDER (1861-1922), critic and essayist, was born at 4 Highbury Quadrant, London, 5 September 1861, the fifth child and only son of Alexander Raleigh [q.v.], then Congregationalist minister of Hare Court chapel, Canonbury, by his wife, Mary Darling, only daughter of James Gifford, of Edinburgh. After a short time at the City of London School, he was sent in 1876 to Edinburgh, where he lived with his uncle, Adam Gifford, Lord Gifford [q.v.], and he became a pupil at the Edinburgh Academy. On his return to London in 1877 he attended University College

School, whence he proceeded to University College, London, graduating B.A. in 1881. In October 1881 he entered King's College, Cambridge, and obtained a second class in the historical tripos of 1885. His residence had been interrupted in the Lent Term of 1883 by a sea voyage to Italy. Since childhood he had been subject to a nervous tremor in both arms, which he never wholly overcame, and he had shot up to the height of six feet six inches. For some time he edited the *Cambridge Review*, and in Michaelmas Term 1884 he was president of the Union.

In the autumn of 1885 Raleigh went out to India on being appointed the first professor of English literature in the Mohammedan Anglo-Oriental College, Aligarh, but he was invalided home in April 1887. His letters give a vivid picture of his Indian experience [*Letters*, i, 28-107], and he always spoke of it with enthusiasm. Forbidden by his doctors to return to India, he had thoughts of becoming a journalist. During the winter of 1888-1889 he lectured for the Oxford University Extension Delegacy, and in March 1889 became personal assistant to Professor (Sir) Adolphus William Ward [q.v.] at the Victoria University, Manchester. In November of the same year he was appointed professor of modern literature at University College, Liverpool, in succession to A. C. Bradley, beginning his work there in January 1890.

At Liverpool Raleigh played a spirited part in college affairs, at a time when the college was developing into the university; and he began to write, his chief publication hitherto having been a paper read to the Browning Society while he was still at Cambridge (Browning Society's *Papers*, No. 25, 1884). His first book was *The English Novel* (1894), which he soon came to regard as 'prentice' work, but it exhibits his gift of lucid and lively narrative. It was followed by *Robert Louis Stevenson: an Essay* (1895), a brief appreciation based on a lecture delivered at the Royal Institution, and by *Style* (1897), the gayest of his longer publications, which he wrote with enthusiasm but afterwards disparaged as 'stuck up'. He was Clark lecturer in English literature at Trinity College, Cambridge, in 1899, and embodied his lectures in his *Milton* (1900), his first substantial study of a poet. The same year he edited, with a long introduction which breaks new ground, Sir Thomas Hoby's *Book of the Courtier, from the Italian of Count Baldassare Castiglione*, for 'The

Tudor 'Translations', a series of reprints projected by W. E. Henley [q.v.]. These five books belong to the ten years of Raleigh's professorship at Liverpool, and in addition he had contributed to *English Prose Selections*, edited by (Sir) Henry Craik [q.v.], and to periodicals such as the *New Review* and the *Yellow Book*. His appointment in 1890 had been a risk taken on his promise; in 1900 he was winning recognition as the most original and stimulating of the younger critics.

In June 1900 Raleigh was appointed by the Crown to the chair of English language and literature at Glasgow University, again in succession to A. C. Bradley, and for the next four years was one of the outstanding personalities there. As a member of the university court he was involved in academic affairs to an extent which those who knew his apparent indifference to them in later years would not have credited. Daily lectures to hundreds of students and continual meetings left him less time for writing than he had enjoyed at Liverpool. But in the summer vacation of 1902, while staying at Stanford-in-the-Vale, Berkshire, he wrote his *Wordsworth* (published 1903), a companion to his *Milton*, and a surprise to admirers of Wordsworth, who had not expected the author of *Style* to state their faith for them so loyally. He intended that his next book should be on Chaucer, whom, in contrast to Milton and Wordsworth, he called 'my man', but only disjointed lecture-notes remain. Having been consulted by the publishing firm of MacLehose, of Glasgow, about their projected series of English voyages, Raleigh promised an essay for their edition of Richard Hakluyt's *Voyages*. This he wrote at Uffington, Berkshire, in the summer of 1904, and it was published under the title of *The English Voyages of the Sixteenth Century (Hakluyt's Voyages, vol. xii, 1905, published separately, 1906)*; and more than once he said that it was his 'best book'. In 1903 he had also undertaken to write the long desired volume on *Shakespeare* for the 'English Men of Letters' series.

In June 1904 Raleigh became the first holder of the new chair of English literature at Oxford, with a fellowship at Magdalen College. The school of English language and literature had been established in 1894, but its steady development began with Raleigh's appointment. His usual method as a lecturer was informal—a few facts, the reading of passages (admirably interpreted), and a

running commentary. Much depended on his mood at the time, but when he was at his best no student forgot the impression he had made. Believing that system and dogma are not trusty servants in the study of literature, he invited his listeners to read and think for themselves. His audience contained men of all ages—during one term Robert Bridges attended regularly—and to one and all he seemed to speak as an equal. To this rare attitude in a professorial teacher was largely attributable his remarkable power of arousing enthusiasm. In directing enthusiasm he was not so successful; here his indifference to system sometimes told unfavourably.

Raleigh's first essay written at Oxford was on Blake (*Lyrical Poems of William Blake*, 1905). He wrote his *Shakespeare* during the latter half of 1906 (published in 1907); and none of his books was he more pleased to have finished. 'I think Falstaff is good,' he said, 'so are Shakespeare's women.' He realized the book's inequalities; but it would not be easy to find more vivid criticism of Shakespeare than the chapter on 'Story and Character'. He welcomed the relaxation offered by a voyage to South Africa in 1907, although during his two months there he lectured at Pretoria, Johannesburg, Durban, Grahamstown, Cape Town, and Stellenbosch. On his return he made a collection of Samuel Johnson's essays and notes on Shakespeare (*Johnson on Shakespeare*, 1908). Two years later (1910) he brought out his *Six Essays on Johnson*. This was his last book on a single author, and there are many critics who consider it his best. He was knighted in 1911 on the occasion of the coronation of King George V.

Raleigh had never overrated the importance of the academic study of literature, and from his first years at Oxford, and even earlier, he had an increasing desire to write on men and things directly. It was significant of this changing interest that his next book should have been an edition of the *Complete Works of George Savile, first Marquess of Halifax* (1912). His Henry Sidgwick memorial lecture on Dryden, delivered at Newnham College, Cambridge, in 1913, was largely on politics and the application of Dryden's satire to the present day. His essay on Burns (contributed to W. S. Douglas's edition of J. G. Lockhart's *Life of Burns*, 1914) he thought as good as anything he had written 'on a man'. But he had no heart for further literary criticism after the out-

break of the European War in 1914. He wrote only one more critical essay on a new subject, 'Don Quixote' (*The Times Literary Supplement*, 27 April 1910), and it was on the moods of Quixote and Sancho, which 'seem to divide between them most of the splendours and most of the comforts of human life'. In October 1914, when his Oxford professorship was reconstituted as the Merton chair of English literature, he became a fellow of Merton College.

The War occupied Raleigh's thoughts for the rest of his life. *Might is Right*, written for the series of Oxford Pamphlets (October 1914), was followed by addresses on *The War of Ideas* (December 1916), *The Faith of England* (March 1917), *Some Gains of the War* (February 1918), and *The War and the Press* (March 1918), and by his British Academy lecture on *Shakespeare and England* (July 1918). Together these form a volume entitled *England and the War* (1918), the main subject of which is the English character. In 1915 Raleigh was responsible for 'The Times Broadsheets for Soldiers and Sailors'. In that year he went to the United States of America in order to deliver at Princeton the two lectures published under the title of *Romance* (1915); they were based on old material and delivered in the intervals of speaking about England and the War. His introduction to *Shakespeare's England* (1916), a book which he had planned many years earlier, is a glorification of the Elizabethan spirit and ends on a patriotic note. He found a new interest in his lectures at Oxford after 1918, when men who had fought in the War crowded to hear him, and at no time was he more sought after by the younger members of the university. These post-War years were busy, for in July 1918 he had accepted the invitation of the Air Ministry to write the official history of the Royal Air Force.

Raleigh was able to complete only the first volume of *The War in the Air* (*History of the Great War based on official documents*, 1922), but it remains his longest work. It was his first experience of writing history on a large scale. The assistance of a skilled staff in sifting details and explaining technicalities enabled him to work with sustained zest. 'The writer of this history', he said in his preface, 'has endeavoured to make his narrative intelligible to those who, like himself, are outsiders.' It is the most readable of official histories, and it contains some of his best writing. His style is here at its

simplest, but the fervour of his admiration for the heroism of the air is everywhere apparent, and finds memorable expression in the introduction. The volume was published a few weeks after his death. On 16 March 1922 Raleigh set out for the East in preparation for his second volume. When he returned to London on 25 April he was in the grip of typhoid fever, contracted when his aeroplane was marooned for four or five days in the desert between Jerusalem and Bagdad. He died at the Acland Home, Oxford, 13 May. He was buried at Ferry Hinksey, the village near Oxford where he had lived since 1909 at 'The Hangings, the house designed for him by his friend A. H. Clough, the son of the poet. He married in 1890 Lucie Gertrude, only daughter of Mason Jackson, art editor of the *Illustrated London News*, and had four sons and one daughter.

Raleigh could be equally at his ease in very different kinds of company, and many thought of his talk as the best that they could ever hope to hear. Something of its quality is preserved in his letters, which show a wide range of mood and often disguise their purpose in their gaiety. As a critic he came to write most freely when dealing with an author's character and outlook. His aim, he once said briefly, was 'to explain people'. General questions he preferred to treat incidentally when dealing with 'live men'. He was more interested in men than in movements or theories. Yet he taught the continuity of literature and maintained that the English school at Oxford must be a school of the history of English literature and language. An important part of his work at Oxford was done as adviser to the Clarendon Press.

At Cambridge Raleigh was Clark lecturer at Trinity College again in 1911 and Leslie Stephen lecturer in 1907, and he was elected an honorary fellow of King's College in 1912. He received honorary degrees from the universities of Glasgow and Durham. He was elected an honorary fellow of Magdalen College in 1910.

A selection from Raleigh's lighter pieces in verse and prose, among them three 'little plays', was edited by his second son, Hilary Raleigh, in 1923 under the title *Laughter from a Cloud*, and in the same year fourteen of his occasional essays and addresses, written between 1896 and 1916, were collected in *Some Authors*, a volume which he had roughly planned. The longer passages in his notes for his lectures were edited in 1926 by George

Gordon under the title *On Writing and Writers*. His *Letters* (2 vols.), edited by Lady Raleigh, also appeared in 1926.

A portrait in oils of Raleigh by Francis Dodd, which belongs to Lady Raleigh, is reproduced in *Laughter from a Cloud*, and a drawing by William Rothenstein, also in the possession of Lady Raleigh, is reproduced in the *Letters*. A memorial window by Anning Bell is in the library of Merton College. The larger portion of the fund which was raised in memory of Raleigh provides an income for the purchase of rare books for the library of the English school at Oxford.

[*The Letters of Sir W. Raleigh, 1879-1922*, edited by Lady Raleigh with a biographical preface by D. Nichol Smith, 2 vols. 1926; O. Elton in *Liverpool Post*, 15 May 1922; H. W. Garrod in *Oxford Chronicle*, 19 May 1922; G. S. Gordon in *The Times Literary Supplement*, 8 June 1922; R. W. Chapman, *Walter Raleigh*, privately printed 1922; H. A. Jones, *Sir Walter Raleigh and the Air History, a personal recollection*, 1922; Violet Crum, *Sir Walter Alexander Raleigh*, 1923. A full bibliography of Raleigh's writings is printed in the *Periodical* for September 1922, and is reprinted in abstract in the *Letters*, vol. ii.]

D. NICHOL SMITH.

RAMSAY, SIR JAMES HENRY, tenth baronet, of Bamff (1832-1925), historian, was the eldest son of Sir George Ramsay, ninth baronet [q.v.], a voluminous writer on philosophy, by his wife, Emily Eugenia, daughter of Captain Henry Lennon, of West Meath. William Ramsay [q.v.], professor of humanity in the university of Glasgow, was his uncle. James Ramsay was born at Versailles 21 May 1832. He was educated at Rugby and at Christ Church, Oxford. He obtained a second class in classical moderations in 1853 and a first class in *literae humaniores* in 1854. He also obtained a first class in the school of law and modern history in 1855. He was elected a student of Christ Church in 1854, but lost that position in 1861 on his marriage to Mary, daughter of William Scott Kerr, of Chatto and Sunlaws, Roxburgh. Although he abandoned an academic career, Ramsay remained all his life a loyal and devoted member of his college. He was called to the bar by Lincoln's Inn in 1863, but, although he continued to reside in London until 1871, he does not appear to have practised. During these years he lost his first wife, who died in 1868 leaving three daughters.

The first important event of Ramsay's life as a scholar was his appointment as

an examiner (1867-1869) in the Oxford school of law and modern history. This experience convinced him that the current books on English political history were unsatisfactory. He records in his diary that in December 1869 he consulted Dean Liddell, of Christ Church, on the advisability of his writing a new history of England. The leisure and the means necessary were supplied in 1871 when he succeeded to the baronetcy and estates of Bamff, near Alyth in Perthshire. For a moment he was tempted to enter the political arena, and in 1872 he stood for Forfarshire in the liberal interest. Fortunately, he was unsuccessful, and, although he continued to take a keen interest in politics (after 1886 as a liberal unionist), his activity was limited to membership of local associations and to the writing of occasional letters to the *Scotsman*. He had by this time settled down to his life's work, the writing of the history of England down to the end of the Middle Ages—the period covered, from a different angle, by another eminent scholar, William Stubbs [q.v.]. The difference between the two men was that Stubbs lived an active academic and ecclesiastical life, in constant touch with other scholars and with practical problems, whereas Ramsay was, as a scholar, comparatively solitary. The distractions from his work were the ordinary occupations of a landowner, visits to London for the purposes of research in the Public Record Office, and occasional trips abroad. French he knew well from boyhood, and spoke fluently; but he never mastered German, and this was a serious handicap to his researches, especially in dealing with the early history of England.

Ramsay's second marriage in 1873 to Charlotte Fanning (died 1904), daughter of Major William Stewart, of Ardvorlich, gave him a renewal of a happy home life. A young family of two sons and three more daughters grew up around him at Bamff. As time went on, his elder daughters were able to give him valuable assistance in his *magnum opus*, which was at all times his primary occupation.

Although as a student Ramsay was essentially solitary, and very few outside his family, except the officials at the Record Office, knew about his literary occupations, he was no pullid indoor scholar. Like his younger brother, George, who had succeeded his uncle William as professor of humanity at Glasgow, and whose successive country homes were within easy reach of Bamff, he excelled

and excelled in out-door recreations. With a short sturdy figure, he was an admirable walker, skater, and mountaineer. Both brothers were keen members of the Alpine Club, and Sir James was a pioneer in ascending Mont Blanc from the Italian side. The physical vigour which enabled him to continue his long spell of work was largely due to his habit of regular bodily exercise.

Twenty years of solid and almost unsuspected labour had elapsed when the first instalment of Ramsay's work was issued in two volumes by the Clarendon Press in 1892. Rather curiously this instalment was the concluding part, dealing with the fifteenth century, and was entitled *Lancaster and York: A Century of English History: 1399-1485*. No such elaborate and carefully documented work on this period had yet appeared, and it at once attracted the attention of scholars, although it failed to find many readers among the general public. Six years later, in 1898, two more volumes were issued by a different publisher, Swan Sonnenschein & Co., under the title *The Foundations of England*. These volumes, which had been partially rewritten during the interval, covered the years from 55 B.C. to A.D. 1154. The same publisher issued the succeeding volumes, *The Angevin Empire, 1154-1216*, in 1903, and *The Dawn of the Constitution, 1216-1307*, in 1908. The last two volumes, however, *The Genesis of Lancaster, 1307-1399*, were published, like the first two, by the Clarendon Press in 1913. The Clarendon Press made amends for its temporary defection by taking the whole work under its ægis, and re-issuing it in eight volumes under the general title *The Scholar's History of England*.

After the completion of his great book, Ramsay found occupation for his unfamiliar leisure in editing *The Bamff Charters and Papers*, which was published by the Clarendon Press in 1915. He lived for ten more years, and died at Bamff 17 February 1925. In these later years he put together his researches into medieval finance, which had attracted considerable attention in his previous volumes, and they were issued in collected form under the title of *A History of the Revenues of the Kings of England, 1066-1399*, by the Clarendon Press in 1925, a few months after the author's death.

There can be no doubt that Ramsay's reputation as a historian will rest upon the eight solid volumes of his consecutive

narrative. His financial conclusions, although they represent his most original research in manuscript records, are not likely to be accepted as conclusive. Ramsay had insufficient training in accountancy to grasp fully all the problems that he set himself to solve, and he had not explored all the available material. This was one of the results of his comparative isolation. If he had been in more intimate and constant touch with other workers in the same field, he would have been more critical than he was, both of his method and of the value of his results. On the other hand, it is difficult to overpraise the narrative part of his work. Nowhere else is it possible to find so orderly an account in chronological order of the facts of English history, or such a careful series of references to the available sources. It is not only a quarry in itself, but it is a guide to the bigger quarry from which historians have to extract their materials. It may be said that his mind was that of a chronicler rather than historian, that he was more concerned to show when and how a thing happened than why it happened. But a trustworthy narrative history, covering fifteen centuries and compiled with no aim but the desire to ascertain the truth, is a possession which few other countries enjoy.

Apart from his historical work, Ramsay's chief interest was in his family. He was a resolute advocate of the education of women, and an eager supporter of St. Leonard's girls' school at St. Andrews, to which he sent four of his daughters. He was immensely gratified by the success of his third daughter by his first marriage, Agnata Frances, who was placed by the examiners above the senior classic at Cambridge in 1887, and who subsequently married, as his second wife, Henry Montagu Butler [q.v.], master of Trinity College, and became the mother of very able sons. His eldest daughter by his second marriage, Katharine, Duchess of Atholl, not only entered the House of Commons in 1923 as member for Kinross and West Perthshire, but was also promoted to hold political office under the conservative government in 1924. Ramsay's last appearance at a political meeting took place when his daughter was nominated as candidate for the division. He was succeeded as eleventh baronet by his only surviving son, James Douglas (born 1878). His elder son, Nigel Neis, was killed at Magersfontein in 1899 while serving with the Black Watch.

Ramsay's work received a measure, but only a measure, of public recognition. The first came from his brother's university of Glasgow, which conferred upon him the honorary degree of LL.D. in 1900. Cambridge gave him an honorary D.Litt. two years later, and he was elected a fellow of the British Academy in 1915. But he missed what he would have valued most. He was never a D.C.L. of Oxford nor an honorary student of Christ Church.

[T. F. Tout, *Sir James Henry Ramsay, 1832-1925*, in *Proceedings of the British Academy*, vol. xi, 1924-1925; private information; personal knowledge. Portrait, *Royal Academy Pictures*, 1922.] R. LONDON.

RASHDALL, HASTINGS (1858-1924), moral philosopher, theologian, and historian of universities, was born in London 24 June 1858. He was the elder son of the Rev. John Rashdall, incumbent of Eaton Chapel, Eaton Square, London, previously vicar of the Priory Church, Malvern, and afterwards (1864) of Dawlish, a friend of the Tennyson family, by his wife, Emily, daughter of Thomas Hankey, banker, and sister of Kate Hankey, author of the mission hymn 'Tell me the old, old story'. His father died in 1860, but his mother only six months before himself, at the age of ninety-two in 1923. In September 1871 he went to Harrow, to the house of the headmaster, Montagu Butler, whom he always greatly admired, and who in his turn is said to have replied, when asked in later years whom he considered his most distinguished pupil: 'It is not easy to say, but, if you press me, I think—Rashdall.' In 1877 Rashdall passed with a scholarship to New College, Oxford, where he read for classical honours, and obtained a second class both in moderations (1878) and in *literae humaniores* (1881). In 1879 he won the Stanhope essay prize with an essay on John Huss. He twice failed to obtain a fellowship by examination, but won the chancellor's prize for an English essay in 1883 with an essay on the universities of the middle ages. This was eventually expanded into the work entitled *The Universities of Europe in the Middle Ages*, published in three volumes by the Clarendon Press in 1895, which established his reputation as an historical scholar. It will long be the standard work on the subject in English, and this contribution to learning would by itself entitle Rashdall to a place in this DICTIONARY. A new edition, prepared by F. M. Powicke and A. B.

Emden, was issued by the Clarendon Press in 1936.

Between the winning of the prize and the publication of the book, Rashdall had passed through a varied experience of teaching, first at St. David's College, Lampeter, in 1883, next at University College, Durham (1884-1888), and lastly at Hertford College, Oxford, of which he was elected a fellow at the end of 1888, thus returning to Oxford, to fulfil for the next twenty-seven years what he had already decided was his real vocation—teaching philosophy for the school of *literae humaniores*. At Hertford College he remained for six years; during the last of these (1894-1895), however, he resided in Balliol College as divinity tutor and chaplain—he had been ordained deacon in 1884, and priest in 1886—while retaining his fellowship and philosophical teaching at Hertford. In 1895 he accepted a fellowship as tutor in philosophy at his first college, New College, which he retained during the remaining years of his residence in Oxford. Two volumes on *The Theory of Good and Evil*, which appeared in 1907, embody the teaching on moral philosophy imparted during the preceding years to those who attended his lectures. The 'ideal utilitarianism' expounded in this work 'combines the utilitarian principle that ethics must be teleological with a non-hedonistic view of the ethical end.' In this view 'actions are right or wrong according as they tend to produce for all mankind an ideal end or good which includes, but is not limited to pleasure' [i. 184]. Whatever criticisms may be urged against this theory, the exposition 'bears the impress of a philosopher who makes a valiant attempt to grapple with ethical problems, and who illuminates his ideas by vivid and arresting practical illustrations' [*Life*, 117]. There is perhaps no English book to be preferred to Rashdall's as an introduction to ethics, covering the ground and giving to the student a sense of being engaged with real issues.

Among Rashdall's other writings of this period, during which he produced a volume of university sermons (*Doctrine and Development*, 1898), are a number of articles and reviews, as well as contributions to two notable volumes, one of philosophical, the other of theological essays, *Personal Idealism* and *Contentio Veritatis*, both published in 1902. Specially noteworthy is his article on 'The Ethics of Religious Conformity' in the *International*

Journal of Ethics for January 1897, written in answer to Henry Sidgwick (a philosopher for whom Rashdall had a special admiration), and in defence of Anglican clergymen who did not personally assent to every article of the creeds taken in its literal sense. Rashdall's interest in the same cause found expression also in his active participation in the work of the Churchmen's Union, of which he was a vice-president from its foundation in 1898. He also joined the Synthetic Society for philosophical and theological discussion, established by Arthur Balfour, Wilfrid Ward, and Bishop E. S. Talbot 'to consider existing Agnostic tendencies and to contribute towards a working philosophy of religious belief', which in 1896 arose from the ashes of the older Metaphysical Society [see KNOWLES, Sir J. T.]. He was a member of the Christian Social Union from its inception in 1890, and from 1892 to 1910 one of the editors of the organ of the Oxford University branch, *The Economic Review*. He was preacher at Lincoln's Inn for two years from 1898, and was elected a fellow of the British Academy in 1909. In 1905 he married Constance, daughter of Henry Francis Makins. The union was a very happy one; his wife (who survived him) was 'one who shared his interests and helped him in every way' [*Life*, 114]. They had no children.

In 1909 Rashdall was appointed by Bishop Percival to a canonry at Hereford, with a share in the teaching of candidates for holy orders. He was installed in 1910 and for seven years divided his time between Hereford and Oxford, where he retained his New College fellowship with a reduced amount of teaching and lecturing. He was elected Bampton lecturer in 1914 and delivered in 1915 eight sermons, published in 1919 as *The Idea of Atonement in Christian Theology*. This is an important contribution to the history of one of the central doctrines of Christianity, and a powerful defence of the theory, associated with the name of Abelard, that the passion and death of Christ 'justifies' man by enkindling in him the love of God, which expresses itself in regeneration of life. Rashdall was now recognized as being no less distinguished in the field of theology than in history and moral philosophy.

When the European War broke out Rashdall was wholeheartedly in sympathy with the national cause, and while in Oxford, although in his fifty-seventh year, joined the volunteer training corps commanded by his old schoolfellow Alfred

Denis Godley. In 1917 he was appointed dean of Carlisle, and resigned his canonry and fellowship. He was, however, elected three years later, to his great satisfaction, an honorary fellow of New College. Rashdall's six years at Carlisle were remarkable for his encouragement of friendly relations between the Anglican clergy and nonconformist ministers, and for the generous hospitality to city and diocese of which he and his wife made the deanery the centre. The cathedral owed much to his zealous care for the dignity and beauty of its fabric and services.

In the spring of 1921 Rashdall visited Spain in search of information to be used in a second edition of his *Universities*. The report of a paper read by him in August to a conference of modern churchmen at Cambridge gave rise to attacks upon him for denying the divinity of Christ. These attacks he felt deeply, since this doctrine, his interpretation of which he believed to satisfy the most exacting standards of orthodoxy, lay at the heart of both his personal religion and his theology. His sensitiveness to these criticisms was probably increased by the inroads of the disease which was within two years to bring his life to an end. An operation in 1922 revealed the presence of cancer; and the fortitude with which he bore the period of weakness and suffering which followed was the admiration of all who witnessed it. He went abroad for the last time in August 1923, preached regularly in his cathedral until within two months of his death, and kept up to the last his keen interest in the matters which had been the chief pre-occupation of his life. He died 9 February 1924 at Worthing, whither he had been taken to recruit his strength after an operation, and was buried in Holywell cemetery at Oxford. A memorial tablet was placed in New College cloister by the warden and fellows; and another, with a medallion portrait, in the south aisle of Carlisle Cathedral by his widow, who also gave two bells to complete a peal to be rung annually on his birthday. He is also commemorated at Carlisle by an exhibition founded by his friends for boys and girls from the diocese of Carlisle who have been awarded scholarships or exhibitions at Oxford. A portrait painted in 1923 by Oswald Birley, and now in the possession of Mrs. Rashdall, gives a good likeness of him, although showing evident traces of the pain which he was then suffering.

Rashdall was a figure of real importance in the recent history of English

religious thought. His candour and courage, profound earnestness, unquestioned learning, and attachment to historical tradition fitted him to be a leader of the liberal school of Anglicanism; while his gift of clear and interesting exposition extended his influence to a much wider circle. He had little sympathy with 'the mystical element in religion'. His historical studies had led him to suspect it of being morally dangerous; and he was before all things a moralist. He had no love for the phrase 'religious experience' and disclaimed an immediate knowledge of God, whose existence, he held, was postulated by morality and could be inferred from the impossibility of supposing the material world to exist except as the object of some consciousness. This conviction, however, no more interfered with the fervour of his devotional life than his parallel conviction that we only infer by analogy the existence of other minds than our own was inconsistent with a great capacity for warm and intimate friendship. His general *Weltanschauung* was that of 'personal idealism'. Individual and mutually exclusive consciousnesses or spirits were ultimately real, and indeed the only ultimate reality, although they were not all alike eternal, one personal God being the cause of the existence of the rest. Belief in individual immortality was bound up with this view; for denial of it was incompatible with a wholehearted acknowledgement of the standards implied in that acceptance of Christ's life and teaching as the supreme revelation of God to man which was to Rashdall essential Christianity.

As often happens with remarkable personalities in universities, Rashdall became the hero of a cycle of legends, many of them turning upon a notable absentmindedness which did but endear him the more to those who knew him. His strongly held political views were in general of a liberal cast; he was a unionist, but always a liberal unionist, and rejoiced when the free trade controversy of 1902 ranged him again with the majority of the liberal party. In ecclesiastical matters he was, although not Anglo-catholic in his theory of sacraments or ministry, a thorough churchman, caring greatly for the historical institutions of religion, and for continuity and tradition even in the smallest details; in his own practice he set great store by frequent communion and regular attendance at public worship. Since the publication of Rashdall's *Life*,

which contains a bibliography up to date, two further collections of pieces from his pen have appeared, *Ideas and Ideals* (1928) and *God and Man* (1930).

RAWLINSON, SIR HENRY SEYMOUR, second baronet and **BARON RAWLINSON**, of Trent (1804-1925), general, the elder son of Sir Henry Creswicke Rawlinson [q.v.], first baronet, by his wife, Louisa, daughter of Henry Seymour, of Knoyle House, Wiltshire, and of Trent Manor, Dorset, was born at Trent Manor 20 February 1804. He was educated at Eton and Sandhurst, and on his twentieth birthday (1824) was gazetted to the King's Royal Rifles, joining the fourth battalion of that regiment in India. In 1838, thanks to the friendship between his father and Sir Frederick (afterwards Lord) Roberts [q.v.], then commander-in-chief in India, the latter appointed him to be one of his aides-de-camp. Rawlinson accompanied Roberts to Burma, and there, in the guerrilla warfare which followed the capture of Mandalay by (Sir) Harry N. D. Prendergast [q.v.], saw his first active service, being attached to the mounted infantry of the Rifle Brigade, and earning the Burma medal and a mention in dispatches.

In 1839 Rawlinson was called home by the serious illness of his mother, who died in October, her death making him heir-presumptive to the Seymour property of Trent Manor. In the following year (1840) he married Meredith, daughter of Coleridge John Kennard, of Fernhill, Hampshire. In order to be near his father he resigned his appointment on Lord Roberts's staff, and on his promotion to captain in 1861 obtained a transfer to the Coldstream Guards, being gazetted captain in that regiment in July 1862. In the following year he passed into the Staff College, Camberley, amongst his fellow students there being J. H. G. (afterwards Viscount) Byng and (Sir) Henry Wilson; the latter he had already met in Burma. After passing through the Staff College Rawlinson was appointed brigade-major at Aldershot in November 1865. In the previous spring his father, to whom he had been devoted, died, and he succeeded to the baronetcy.

In the winter of 1867 Rawlinson took

his wife to Egypt for her health, and he was in Cairo when (Lord) Kitchener [q.v.] was preparing for his advance to Omdurman. Kitchener offered him an appointment on his staff, which was eagerly accepted, and in that capacity Rawlinson served at the battles of Atbara and Omdurman. He was mentioned in dispatches and promised the brevet of lieutenant-colonel on promotion to major. He received his majority in the Coldstream Guards in January 1899, and the next day was gazetted brevet lieutenant-colonel, at the age of thirty-five.

In the autumn of that year, when the crisis in South Africa came to a head and Sir George White [q.v.] was sent out to Natal with reinforcements, Rawlinson was given an appointment on his staff and was with him throughout the siege of Ladysmith. It was at Rawlinson's suggestion that the naval guns which played such an important part in the defence were brought up from Durban just before the Boers completed the investment. On the relief of Ladysmith Rawlinson was appointed assistant adjutant-general on Lord Roberts's staff, and joined him in March 1900 at Bloemfontein. In November of that year, when all the chief Boer towns had been occupied and the War seemed to be drawing to a close, he accompanied Lord Roberts to England. But it was soon discovered that the British had been too optimistic, and within three weeks of coming to England he had sailed again for South Africa, to join Lord Kitchener in Pretoria. Within a month Kitchener appointed him to the command of a mobile column, and in that capacity he served until the end of the War in May 1902, proving himself one of the most energetic and successful of the younger commanders. For his services in the South African War, during which he had been five times mentioned in dispatches, he was made C.B., and in June 1902 a brevet-colonel.

After eight months' service at the War Office, Rawlinson was in December 1903 promoted brigadier-general and made commandant of the Staff College, and there for three years his experience of staff work in peace and in war enabled him to make the course of instruction more practical than it had been. On leaving the Staff College he was given the command of a brigade at Aldershot, which he gave up on promotion to major-general in May 1909. In June of the following year he was made commander of the 3rd division and spent

four happy and strenuous years in its training. His time of command came to an end in May 1914, and to his distress there was no place for him in the Expeditionary Force which went to France in the following August. But he had not long to wait, for in the third week of September he was given command of the 4th division, then on the Aisne, and thence early in October he was sent to Belgium to take command of the 7th division and the 3rd cavalry division, which were landing at Ostend and Zeebrugge in order to attempt the relief of Antwerp.

Antwerp fell before Rawlinson's force was ready for action, and he then had the difficult task of covering the right flank of the retreating Belgian army and of retiring on Ypres to join the British army, which was moving into Flanders from the Aisne. He reached Ypres on 14 October. There his command soon became involved in the struggle for the defence of the Channel ports. His 7th division was absorbed in the I Corps, under Sir Douglas Haig [q.v.], and the 3rd cavalry division joined the Cavalry Corps. On this break up of his command Rawlinson returned to England in order to bring out the 8th division, destined with the 7th division to form the IV Corps, under his command. Towards the end of the year the IV Corps went into the line on the Neuve Chapelle front, and on 10 March took a leading part in the battle of Neuve Chapelle. Throughout 1915 Rawlinson commanded the IV Corps, leading it in the battles of Aubers Ridge, Festubert, and Loos. His experiences of those battles made him a strong advocate of the method of attack with limited objectives; but that method was not then generally accepted, and fate decided that he should be the protagonist in the first of the prolonged battles which were the outstanding feature of trench warfare on the Western front.

In December 1915 when Sir Charles Carmichael Monro [q.v.] left France to recommend and organize the evacuation of the Gallipoli Peninsula, Rawlinson was given temporary command of the First Army, and early in the next year he was promoted lieutenant-general and chosen to command the newly created Fourth Army. This army was given the task of preparing for the counter-offensive on the Somme, which was to disengage Verdun. Rawlinson strongly advocated that the battle of the Somme should be begun with limited attacks, but he was overruled and set himself loyally to carry out

Haig's plan, which aimed at breaking through the German first and second systems of defence at one blow. The attempt to do this on 1 July failed, only the attacks of the French on the British right and of the right of Rawlinson's army succeeding. Haig's plan then became one of exploiting the success of the right and of gradually forcing the Germans back from the Somme ridges.

By the end of the first week of July Rawlinson had driven the Germans from their first defensive system. He then proposed to attack the second system by night with four divisions. A night attack on this scale had never before been attempted in war, and Haig at first hesitated to accept the risk of such a novel experiment; but, won over by Rawlinson's insistence and by the perfection of his arrangements, Haig in the end consented, and the attack was successfully made on 14 July. Unfortunately in the interval the Germans had been reinforced, and it is at least probable that if the attack had been made 48 hours earlier, as Rawlinson had wished, the results would have been far greater. The battle dragged on until the middle of November, when bad weather and mutual exhaustion brought it to a close. In the following January Rawlinson was promoted general.

During the early months of 1917 the British First Army was occupied in extending its front in order to set free the French troops required for the operations planned by the new French commander-in-chief, General Nivelle. The First Army was thus too much extended to take full advantage of the German retreat to the Hindenburg line, which began in March 1917; it thus took no part in the battles of Arras and Messines. In July, when Haig was preparing to attack the Germans at Ypres, he chose Rawlinson to take charge of the secret preparations for a combined naval and military attack on the Belgian coast; but this, owing to the failure of the Ypres attack to make sufficient progress, came to nothing. In November 1917, towards the close of the battle of Passchendaele, Rawlinson took over the command of the British left, and he was in that position when in February 1918 he was appointed British military representative on the Supreme War Council in succession to his old friend Sir Henry Wilson, who had been recalled to the War Office. From that position he was removed at the end of March 1918 to take command of the remnants of the British

Fifth Army, which had been shattered in the great German attack launched on 21 March. These he reconstituted as the Fourth Army, while fully occupied with the defence of Amiens. The last German effort to drive the British from that vital railway junction ended with the recapture by the Fourth Army of Villers-Brettonneux on 25 April, and Rawlinson was then left a period of comparative leisure in which to fill the gaps in his army and perfect its training.

A part of this training consisted of practice in co-operation between infantry and the latest pattern of 'tank'. A test of this carried out on 4 July in an attack on a small scale on Hamel was completely successful, and Rawlinson then prepared to apply his methods on a larger scale. His plans being approved by Haig and Foch, he attacked astride the Somme on the Amiens front on 8 August and at once gained the most important success which up till then had been won by the British army. General Ludendorff has, indeed, described that day, 8 August, as 'the black day in the history of the German army'. Following on this victory Haig extended the front of battle northwards from the Somme, and while the Third and First Armies on his left were pressing back the Germans, Rawlinson's Fourth Army crossed the Somme, captured Peronne (31 August), and by the middle of September had driven the Germans into the shelter of the Hindenburg line. The attack of the Fourth Army, reinforced by an American Corps of two divisions, on those formidable defences began on 29 September, when the St. Quentin canal was crossed, and by 8 October the army had forced its way through the Hindenburg system. Nine days later it attacked in the battle of the Selle the Germans who had made a stand behind that river. On 4 November the army again attacked, forced its way across the Sambre canal, and drove the enemy through the Mormal forest. When the Armistice became effective on 11 November, the Fourth Army had reached a point south-east of Mauberge, a few miles west of Beaumont, having, since 8 August, fought and won four great battles and eighteen actions, as the result of which the enemy had been driven back 60 miles with the loss of 79,743 prisoners and 1,108 guns. It had engaged 24 British, Australian, Canadian, and American divisions against 67 German divisions; but it had suffered 122,427 casualties.

After the Armistice the Fourth Army remained in occupation in Belgium, and on its dissolution Rawlinson came home in March 1919, to be appointed, at the end of July, to carry out the evacuation of Northern Russia by the Allied forces. On his way to Archangel he received the news that he had been accorded the thanks of both Houses of parliament, with a grant of £30,000, and had been created a baron. He was back in England in October 1919, having successfully accomplished his mission, and after a short period of command at Aldershot he was, in November 1920, appointed commander-in-chief in India.

The major problems which Rawlinson set himself to solve in India were: (1) the reorganization of army head-quarters and of its relation with the military member of the viceroy's council, a question which had been the subject of long and bitter dispute between Lord Curzon and Lord Kitchener; (2) the reorganization of the Indian army and the improvement of its equipment, consistently with the urgent demand for economy; (3) the introduction of the process of Indianization; and (4), most important of all, the application of a new policy on the North-West Frontier. Rawlinson's father had been one of the earliest advocates of the policy of opening up Baluchistan, as successfully initiated by Sir Robert Groves Sandeman [q.v.]; and despite considerable, and at times somewhat acrimonious, opposition Rawlinson applied the same policy to Waziristan, opening up the country by constructing roads and establishing an important military station at Razmak in the midst of the Waziris. That policy has since stood the test of disturbed conditions on the Frontier. The other items of his programme he carried through with equal success, and he could claim in 1925 that while the military budget had been reduced from 82 crores of rupees in 1921 to 56 crores in 1925, the British garrison from 75,300 to 57,000 men and the Indian army from 159,000 to 140,000, the general standard of efficiency had been raised. He achieved the difficult task of gaining the admiration and affection of the army while making these reductions, and the even more difficult task of winning the respect of the legislative assembly. A fine horseman and brilliant polo player, Rawlinson exercised a healthy influence upon the development of the game both at home and in India. It was after taking part in a hard game of polo on his

sixty-first birthday and soon after making 21 runs at cricket against the boys of the new Dehra Dun military school, that he was taken ill at Delhi, and died of the after effects of an operation 28 March 1925. His body was brought home and buried at Trent. He had no children, and on his death the barony became extinct. He was succeeded as third baronet by his brother Alfred (born 1867).

There are portraits of Lord Rawlinson by Oswald Birley in the possession of Lady Rawlinson and at the Staff College, Camberley. He figures in J. S. Sargent's group 'Some General Officers of the Great War' (painted in 1922), in the National Portrait Gallery, and there is a portrait of him by Sir William Orpen in the Imperial War Museum.

[Sir J. F. Maurice and M. H. Grant, (Official) *History of the War in South Africa, 1899-1902*, 1906-1910; Sir J. E. Edmonds, (Official) *History of the Great War. Military Operations. France and Belgium, 1914-1918*, 1922-1933; Sir F. Maurice, *Life of Lord Rawlinson of Trent*, 1928.] F. MAURICE.

RAWLINSON, WILLIAM GEORGE (1840-1928), art collector and writer on Turner, was born 23 December 1840 at Taunton, the only son of William Rawlinson, who owned a silk mill there. His mother's name was Harriet Jehoult. About 1865 young Rawlinson joined a London silk firm which handled the produce of the mill at Taunton. Later, as a partner in that business (James Pearsall & Co.) he helped to create the English embroidery-silk trade, until then a German monopoly. In conjunction with Sir Thomas Wardle [q.v.], of Leek, he re-introduced old methods of dyeing silk with the natural dyes of the East. He retired from this business in 1908.

Rawlinson's chief claim to remembrance is the zeal and precision with which he collected and studied the drawings and engraved work of Turner. In 1878 he produced a catalogue of the *Liber Studiorum*, describing for the first time the states of the engravings comprised in that work. Its revised edition (1900) remained the standard catalogue of the *Liber* until the publication, in 1924, of Mr. A. J. Finberg's more exhaustive description.

Rawlinson then studied closely the miscellaneous engravings after Turner, produced during the painter's lifetime and under his supervision, or shortly after his death. He based on this research another detailed catalogue, *The Engraved Work of*

J. M. W. Turner, R.A., of which vol. I (1908) described the engravings on copper, vol. II (1913) the engravings on steel and prints by other processes. In 1909 he wrote on Turner's water-colours for a special number of *The Studio*. He contributed technical notes in 1902 for the catalogue of an exhibition of English mezzotint portraits held at the Burlington Fine Arts Club, of which he was a keen and active member from 1872 to 1921.

These researches grew out of Rawlinson's activity as a collector. His choice cabinet of Turner water-colours was sold in 1917 to R. A. Tatton, after whose death it was dispersed at Christie's on 14 December 1928. His collection of *Liber* proofs, of which he issued a privately printed catalogue in 1887 (a revised edition, November 1912, cites additions bought at the J. E. Taylor sale at Christie's, 15-16 July 1912) was sold late in 1912 to Francis Bullard, of Boston, Massachusetts, whose entire *Liber* collection, in which Rawlinson's proofs were incorporated, was bequeathed at his death in 1918 to the Boston Museum of Fine Arts. Rawlinson's fine collection of other engravings after Turner was bought, as a whole, in September 1910 by Mr. S. L. Courtauld. Rawlinson also became interested, late in his career as a collector, in coloured aquatints of the early nineteenth century, which were then beginning to enjoy a revival of popularity. Another of his hobbies was the collection of blue and white Chinese porcelain.

For many years until he left it in 1910, subsequently taking a flat in Chelsea, Hill Lodge, Rawlinson's residence on Campden Hill, was the centre of a large circle of friends, especially writers and artists. By his marriage in 1867 to Mary Margherita, daughter of the Rev. Alexander Cridland, incumbent of Hensall-cum-Heck, Snaith, Yorkshire, he had one son and three daughters. Rawlinson died in London 13 May 1928.

[*The Times*, 15 May 1928; private information; personal knowledge.] C. DONALDSON.

READ, SIR CHARLES HERCULES (1857-1920), antiquary and art connoisseur, was born at Gillingham, Kent, 6 July 1857, the third son of John Finsbury Read, by his wife, Catherine, daughter of Hercules Angus, of Shetland. He was educated privately. His first official appointment was as ethnographical assistant in the collection of prehistory and ethnography

formed by Henry Christy [q.v.], then housed in Victoria Street, Westminster, but transferred in 1888 to the British Museum. There Read was appointed assistant in the Department of British and Medieval Antiquities and Ethnography in 1880. In 1896, at the early age of thirty-nine, he succeeded Sir Augustus Wollaston Franks [q.v.] as keeper of the department, and he held the post until his retirement in 1921. Read owed much to the training and friendship of Franks, a notice of whom he contributed to this *Dictionary*. Of the many valuable gifts acquired for the department during his keepership, the most important were reproduced in a volume which was presented to him as a parting gift. These benefactions included the Waddesdon bequest (the collection of Baron Ferdinand de Rothschild, q.v., 1898); the Greenwell collection of prehistoric bronzes, presented by Mr. J. Pierpont Morgan in 1909; the collection of painted enamels bequeathed by the Rev. A. H. S. Barwell in 1913; and that of plaquettes given by Mr. T. Whitcombe Greene in 1915.

Read's connexion with the Society of Antiquaries was also exceptionally long and useful, as he became successively secretary (1892-1908) and president (1908-1914 and 1919-1924); and he claimed that his knighthood in 1912 was meant as a compliment to the Society with which he was identified. An ideal chairman, he held various offices, such as president of the Royal Anthropological Institute (1899-1901 and 1917-1919) and of Section II of the British Association (1890). The university of St. Andrews conferred on him the honorary degree of LL.D. in 1908, and he was elected F.B.A. in 1913. He also received many distinctions from foreign academies and learned societies.

Read's main official publications were catalogues of the *Waddesdon Bequest* (1899 and 1902) and of the *Antiquities from Benin* (with O. M. Dalton, 1899). He also contributed the introduction to the *Catalogue of the Faience of Persia and the Nearer East* (1907), and prefaces to those of *Early Chinese Pottery and Porcelain* (1910) and *Chinese Art* (1915). His contributions to the publications of learned societies were numerous, the Society of Antiquaries receiving no less than 115. He was a member of the Society of Dilettanti and of the Gentlemen of Spalding; and his social gifts enabled him to form a group of 'Friends of the British Museum', to supplement with gifts the

inadequate purchase grant of his department. These benefactors formed the nucleus of the National Art Collections Fund, which, with its thousands of subscribers, can conduct operations on a grander scale.

A fluent speaker and an imposing figure, Read also possessed a most retentive memory of things he had seen, together with artistic feeling and capacity of no mean order, which made him a useful member of the Burlington Fine Arts Club, and justified his appointment in 1920 as vice-chairman of the National Art Collections Fund. As keeper of a miscellaneous department of national antiquities he acquired a most extensive knowledge of ancient material. On his retirement from the Museum, his department was divided into two, ceramics and ethnography being separated from prehistoric and medieval antiquities.

Read died after a lingering illness 11 February 1929 at Rapallo, where he was buried. He married in 1880 Helen Mary, elder daughter of Frederick George Smith, of Chelsea, and had two daughters. His striking features are preserved in Seymour Lucas's drawing of 1912 (reproduced as frontispiece to the presentation volume of 1921). Augustus John's painting of 1921 shows him in declining years.

[*The Times*, 13 February 1929; O. M. Dalton, *Sir Charles Hercules Read, 1857-1929*, in *Proceedings of the British Academy*, vol. xv, 1929; *Antiquaries Journal*, vol. ix, 1929.]

R. A. SMITH.

REID, JAMES SMITH (1840-1926), classical scholar and ancient historian, was born at Sorn, Ayrshire, 3 May 1840, the eldest son of John Reid, schoolmaster, by his wife, Mary Smith. Among collateral relatives on his mother's side he reckoned Adam Smith, the author of *The Wealth of Nations*. He was educated at the City of London School, and entered Christ's College, Cambridge, as a scholar in 1865. Three years later (1868) he was bracketed senior classic, and was awarded the Browne medal for a Latin epigram. He was senior chancellor's medallist in 1869, and the same year was elected a fellow of his college. Concurrently with his classical work Reid had been studying law, and was Whewell scholar in 1870 and graduated LL.M. in 1872.

From 1873 to 1878 and again from 1880 to 1885 Reid was classical lecturer at Pembroke College, and in 1878, having ceased to be a fellow of Christ's on his

marriage in 1872, he was elected to a fellowship at Gonville and Caius College, of which society he remained a member for forty-four years. Here, together with the Rev. E. S. Roberts (master of the college, 1903-1912), he built up a brilliant classical school. In 1899 he was elected first professor of ancient history in the university, and held this chair until 1925. He received the honorary degrees of Litt.D. of Dublin University and LL.D. of St. Andrews University, and in 1917 he was elected a fellow of the British Academy. He was also an honorary fellow of Christ's College.

Reid's main interests were in Latin studies, and he early took a foremost place among Ciceronian scholars, bringing to the establishment and elucidation of the texts a mastery of idiom which has had few rivals. His forerunner and model was the Danish philologist, Johan Nicolai Madvig, for whose lightest word Cambridge men of that day manifested a respect little short of idolatry. He produced a smaller and a larger edition of the *Academica* (in 1874 and 1885), and editions of the *Pro Archia* (1877), the *Pro Balbo* (1878), *De Amicitia* (1879), *De Senectute* (1879), *Pro Sulla* (1882), and *Pro Milone* (1894). The first volume of his edition of the *De Finibus*, containing Books I and II, appeared in 1925, forty-two years after the publication of his translation of the whole work. The text was constructed too early to do full justice to the manuscript tradition available at the time of publication. In this and in the *Academica* Reid showed himself a master of later Greek philosophy. This list does not, however, exhaust his contribution to Ciceronian studies, for his knowledge was at the disposal of his friends, and it was freely utilized and acknowledged by them. Reid's erudition in Latin literature of the republic and early empire was wide as well as deep. As professor of ancient history he was most concerned with questions of Roman constitutional history, in which his training in law stood him in good stead. Even when his suggestions on much-debated topics did not wholly win assent, his command of the evidence and a natural instinct for Roman ways of thinking were recognized. It may indeed be said that he viewed Roman history as a Roman would have viewed it. To his command of literary evidence he added a great knowledge of inscriptions, so that the absence of documentation in his *Municipalities of the Roman Empire* (1913) is to be deplored.

Reid played a large part in the foundation in 1910 of the Society for the Promotion of Roman Studies, of which he succeeded F. J. Haverfield as president in 1916, and in his own university he was both accessible and indefatigable in giving encouragement and help. For fifteen years he was a tutor of Caius, but his forte was in scholarship and teaching rather than in administration. For university affairs he had little taste. In politics he was a liberal of the old school, and was for some years chairman of the party in the town of Cambridge. His personality, in which the desire to shine found no place, was gentle and kindly. He retired from his chair on the ground of failing health in 1925, and died at Cambridge 1 April 1926.

Reid married in 1872 Ruth, daughter of Thomas Gardner, of the Stock Exchange, and sister of Professor Percy Gardner, Professor Ernest Gardner, and Miss Alice Gardner. He had three sons, two of whom survived him, and one daughter.

[A. Souler, A. C. Clark, and F. E. Adcock, *James Smith Reid, 1846-1926*, in *Proceedings of the British Academy*, vol. xiii, 1927; memoir by Peter Giles in *The Caius*, 1926-1927; private information; personal knowledge.] F. E. ADCOCK.

REID, ROBERT THRESHIE, EARL LOREBURN (1846-1923), lord chancellor, was born 3 April 1846 at Corfu, the second son of Sir James John Reid, of Mouswald Place, Dumfries, sometime chief justice of the Ionian Islands protectorate, by his wife, Mary, daughter of Robert Threshie, of Barnbarroch, Kirkcudbrightshire. He was educated at Cheltenham College, where he distinguished himself both as a scholar and as an athlete. He rose to be head of the school, he was for three years (1862-1864) in the cricket eleven, and he was the best racket-player. From Cheltenham he won a demyship at Magdalen College, Oxford, but threw it up, and entered for a scholarship at Balliol College, to which he was elected in 1864. His Oxford career was very successful, and few better all-round men have passed through the university. He obtained first classes in classical moderations (1866) and in *literae humaniores* (1868), winning the Ireland scholarship in the latter year. He played for Oxford for three seasons at cricket, and, although he did little as a batsman, he was in the front rank as a wicket-keeper. He played rackets, both doubles and singles, against Cambridge in 1865 and 1867, and he was a fair short-dis-

tance runner. His busy life allowed him little leisure in later years for athletics, but his reputation as an expert at games remained with him throughout his career, and gained him many friends. He always kept up his interest in cricket, and served as president of the Marylebone Cricket Club in 1907.

Reid's ancestry and associations were legal, and immediately upon leaving the university he prepared for the English bar. He was called by the Inner Temple in 1871, and went the Oxford circuit. It is related of him that with characteristic honesty he broke through the established convention that barristers on circuit should travel first-class, admitting that he could not afford the luxury, and that he was indifferent to what the bar mess might say. His rise at the bar was rapid. For a time he 'devilled' for Sir Henry James (afterwards Lord James of Hereford, q.v.). James was himself an old Cheltonian, having been one of the first boys at the college, and he was glad to help a prominent younger member of his old school by every means in his power. Reid's practice, however, soon increased so much that he had enough work of his own. His advance was chiefly due to his quick mastery of the salient points of a case. He was particularly effective in commercial suits, and as a junior contributed to several legal questions of importance. An interesting appeal in which he was led by Sir Charles Russell, afterwards Lord Russell of Killowen, was that of the *Capital and Counties Bank v. Henty* (1882) on the doctrine of innuendo in a libel action. The issue of a circular among the respondents' (the bank's) customers to the effect that the respondents would not accept the appellant's cheques in payment of accounts, was held not necessarily to imply a doubt of the appellant's solvency.

Before many years Reid turned his attention to politics. At the general election held in the spring of 1880, when Mr. Gladstone was returned to power, Reid entered the House of Commons as the second liberal member for the borough of Hereford. He was again fortunate in receiving help from Sir Henry James, who had influence in the constituency. After he became a member of parliament, Reid's interest in politics to some extent diverted his thoughts from legal work. He took silk in 1882, but his practice as a leader scarcely fulfilled his early promise. He found constant employment before the House of Lords and the Judicial Committee

of the Privy Council, but, as an advocate, he never rose to the first class. As a politician he was a loyal and ardent supporter of Mr. Gladstone, and was always an effective speaker on the platform. In the House of Commons he confined himself chiefly to the discussion of bills in committee, and made no special mark in the early stages of his career.

After the passing of the Redistribution Bill of 1885, the borough of Hereford became a single-member constituency, and Reid had to look elsewhere for a seat. At the general election of December 1885 he stood for Dumbartonshire and was defeated. This election was followed by the division in the liberal party over the question of Home Rule for Ireland. Another appeal to the country became necessary in June 1886, and, although the Gladstonian liberals were decisively defeated, Reid managed to win the seat of Dumfries as a supporter of the prime minister's Irish policy. He continued to sit for this constituency until 1905, when he became lord chancellor.

In 1892 the verdict of the electors was reversed, and the Home Rule section of the liberal party came into power. Less than two years later, when Gladstone had retired and Lord Rosebery had become prime minister, some rapid changes in the law offices of the Crown brought about the promotion of Reid. In May 1894 Sir Charles Russell was made a lord of appeal, his place as attorney-general was taken by Sir John Rigby [q.v.], and Reid became solicitor-general and was knighted. In the debates on Sir William Harecourt's Finance Bill of 1894 Reid took an active part, though the defence of the measure was mainly entrusted to Rigby as a Chancery lawyer. Rigby was promoted a few weeks later to be a judge of the Court of Appeal, and Reid became attorney-general. His tenure of the attorney-generalship was also short, for in June 1895 the liberal government was defeated in the House on a technical question of War Office administration. Although the division appeared unimportant, the increasing difficulties of the government rendered the dissolution of parliament advisable. At the general election which followed, the small liberal majority was turned into a substantial majority for their opponents, and the unionists remained in office for the next ten years. Reid retained his seat for the Dumfries district both at the 1895 election and at that of 1900.

Out of office Reid dropped much of his

practice, but other appointments followed. In 1899 he was chosen by the unionist government to act as arbitrator in the boundary dispute between Venezuela and British Guiana, and for his services in arranging a settlement he received the G.C.M.G. In the same year (1899) he was appointed standing counsel for Oxford University, a position which he held until 1906.

During the period of the South African War Reid, without regard to his professional or political prospects, took the unpopular side and supported the cause of the Boers. The unionists had obtained a further lease of power at the election of 1900, but three years later Mr. Chamberlain's tariff proposals revived the controversy between supporters of free trade and of protection, and this became again the party question of the day. In December 1905 Mr. Balfour's ministry resigned, and the liberals under Sir Henry Campbell-Bannerman took office. There were two other eminent lawyers whose claims to the woolsack were thought to be considerable, but Reid was preferred to them. As lord chancellor he assumed the title of Baron Loreburn (really 'lower-burn', a war-cry in faction fights at the old burgh in which his father had lived, and which he had himself represented in parliament). Immediately after Sir Henry Campbell-Bannerman had taken office parliament was dissolved. At the general election which followed, in January 1906, the liberals won many seats all over the country, and in the new parliament had a large majority.

Lord Loreburn's principal legal achievement as lord chancellor was the establishment of the Court of Criminal Appeal in 1907. This reform, which before it had long been in operation came to be looked upon as an obvious necessity, had met with strong opposition from many lawyers, whose prophecies proved to be signally mistaken. Another change which Loreburn advocated consistently was the extension of the jurisdiction of the county courts. From the first he set his face against long and rambling judgments. His own were clear and concise, and his gift of lucid expression made them easy reading. There may not have been much in them which was novel or illuminating to lawyers, but to the lay mind they were convincing proof that every effort had been made to secure justice. He was courteous and patient in hearing appeals, listening to counsel and not interrupting them.

In the duty of presiding over the House of Lords no chancellor has ever been so uncomfortably placed as was Loreburn, and it is a remarkable tribute to his personal qualities that he came through the ordeal with so much credit. He found an assembly almost united in its hostility to his party, and himself the spokesman of a government whose measures were received with suspicion and dislike. The climax was reached when in 1909, owing to the rejection by the House of Lords of the budget introduced by Mr. Lloyd George as chancellor of the Exchequer, the question of the relations of the two Houses was raised in the country. Two general elections were held in 1910—in January and in December—and at both the liberals were returned with majorities, which, although much reduced from the 1906 figures, were held to justify the policy of curtailing the powers of the upper chamber. Under the Parliament Bill, which was sent up from the House of Commons in May 1911, it was proposed that a measure passed by the House of Commons in three consecutive sessions should become law with or without the assent of the House of Lords. The crisis occasioned by this constitutional change was settled by the final withdrawal of unionist opposition after long and heated controversy. Loreburn spoke on the second reading, on 24 May, not, indeed, arguing with much force on the constitutional advantages of the Bill, but pleading with sincerity the disheartening effect from the liberal point of view of the conservative preponderance in the chamber over which he was presiding. Throughout the discussion, although he was tactful in his management of the House, he never made any attempt to disguise his own complete approval of the proposed reform, or to disarm resistance with conciliatory phrases. There is no doubt that his straightforward support impressed favourably political adversaries, many of whom were personal friends. On the occasion of his second marriage in 1907 a large number of peers on both sides of the house subscribed for his portrait, painted by Sir George Reid, as a wedding gift.

Generally speaking Loreburn was more effective as a debater in the House of Lords than he had been in the House of Commons. As lord chancellor, and throughout his public career, he showed himself a man of inflexible integrity. Liberals found fault with him for refusing to take into account political services in

the appointment of new magistrates. But he would not be influenced by party considerations, and insisted on fitness for the bench as the sole test. Although nothing could move him, it was characteristic of him that this controversy troubled him, for he was sensitive to criticism and easily depressed. Overwork and the anxieties of office told upon his health. He had not been long on the woolsack before some weakness of the heart showed itself, and he was obliged to rest from time to time. This eventually brought about his resignation, and he was succeeded as lord chancellor by Lord Haldane in June 1912. It was significant of his sense of public duty that he insisted on a substantial reduction of the life-pension to which he was entitled.

In 1911 Loreburn was advanced to an earldom, and in the same year was named one of the four councillors of state during the absence of King George V in India. He received the honorary degree of D.C.L. of Oxford University in 1907, and in 1912 his old college, Balliol, exercising its unique privilege, appointed him visitor. In the latter year he defrayed the cost of replacing the medieval glass in the windows of the college chapel, as a memorial to his first wife.

After his retirement Loreburn lived at Dover. He occupied his leisure in writing two books, *Capture at Sea* (1913) and *How the War Came* (1919). His health had failed for some time before his death, which took place at Dover 30 November 1923.

Loreburn married twice: first, in 1871 Emily Douglas (died 1904), daughter of Captain Arthur Cecil Fleming, first Dragoon Guards; secondly, in 1907 Violet Elizabeth, eldest daughter of William Frederick Hicks-Beach, of Witcombe Park, Gloucestershire, and niece of Sir Michael Edward Hicks-Beach, first Earl St. Aldwyn [q.v.], the conservative statesman. There was no issue of either marriage, and on his death the peerage became extinct.

The portrait of Loreburn by Reid now hangs in the council chamber of the Privy Council. There are also portraits of him by Fiddes Watt at Balliol College, Oxford, and by Ruth Garnett at Cheltenham College. A cartoon of him by 'Spy' appeared in *Vanity Fair* 10 January 1895.

[*The Times*, 1 December 1923; private information.]
A. COCHRANE.

REPINGTON, CHARLES A COURT (1858-1925), soldier and military writer, was born at Heytesbury, Wiltshire, 29 January 1858, the elder son of Charles

Henry Wyndham A Court (afterwards Repington), of Amington Hall, near Thimworth, Warwickshire, M.P. for Wilton 1852-1855, by his wife, Emily, eldest daughter of Henry Currie, banker, of West Horsley Place, Surrey. In 1903 he assumed the additional surname of Repington, according to the custom established by a great-uncle, on succeeding to the family property of Amington Hall. His grandfather was a general, one great-uncle an admiral, and another the diplomatist William A Court, first Baron Heytesbury [q.v.]. He was educated at Eton and Sandhurst, and joined the Rifle Brigade in 1878. After seeing active service in Afghanistan, he entered the Staff College, Camberley, by competition in 1887. His fellow students included (Field-Marshal Lord) Plumer, (General Sir) Horace Smith-Dorrien, and many other officers who rose high in the service; but all regarded Captain A Court as the most brilliant man of his year.

A Court left Camberley in time to take part in the Burma campaign of 1888-1889. Then, after duty in the Intelligence Department of the War Office and on the staff in the Atbara and Omdurman campaigns in the Sudan, having been promoted brevet lieutenant-colonel, he was in 1898 appointed military attaché at Brussels and The Hague. He proceeded, however, to South Africa in 1899 on the head-quarters staff of Sir Redvers Buller [q.v.]. After the relief of Ladysmith he was invalided home, and resumed his post of attaché. He was awarded the C.M.G. in 1900. In 1902 his military career came to an end owing to personal indiscretion. Whilst he was in Egypt A Court had carried on an intrigue with the wife of a British official. The affair had been condoned; but it had been brought to the notice of the military authorities, and before he had been allowed to take up his post in Brussels he had been called upon to give his word of honour to the military secretary that there should be no recurrence of the liaison. Nevertheless, it was renewed; the husband instituted divorce proceedings; and A Court was forced to resign his commission. He had married in 1882 Mellony Catherine, daughter of Colonel Henry Sales Scobell, of Pershore, and sister of Henry Jenner Scobell, an eminent cavalry general. As she refused to divorce him, he was unable to regularize the position of the lady whom he had compromised.

Repington (as he now became) turned

to his pen, obtained employment on the *Morning Post*, and then, from 1904, as a military correspondent of *The Times*. His articles in the columns of the latter paper on the Russo-Japanese War brought him international fame. There was some thought of reinstating him in the army, and as a step towards this he was in 1911 appointed editor of the *Army Review*, a pre-War General Staff quarterly. But the fact that he had divulged, in a letter to *The Times* in March 1908, private correspondence between Lord Tweedmouth, first lord of the Admiralty, and Kaiser Wilhelm II, of which he had obtained cognizance, caused the project of his reinstatement to be dropped. His influence on public opinion, however, continued to increase.

During the European War of 1914-1918 Repington served on recruiting and exemption tribunals, but went on with his work for *The Times*, frequently visiting France. The views which he expressed in 1917 did not, however, coincide with those of Viscount Northcliffe [see HARMSWORTH, Alfred Charles William], who had gained control of the paper, and in January 1918 he left *The Times* and returned to the *Morning Post*. He had already on several occasions made public more than was discreet in war time, and on 22 March, in consequence of having alluded in the *Morning Post* to the formation of an Allied General Reserve, he, with the editor, was charged with contravention of the Defence of the Realm regulations. Both men were found guilty and fined. After the War Repington became military correspondent of the *Daily Telegraph*, a post which he held until his death. His finances being in a desperate condition, he set about writing a record of his life, publishing in 1919 *Vestigia*, which carried his story as far as the Tweedmouth incident. This he followed up with *The First World War* (1920) and *After the War* (1922), in which he divulged a mass of private conversations and correspondence and dinner-table scandal. The books had a considerable success, but lost him his social position. His last book, *Policy and Arms* (1924), attracted no attention. He died 25 May 1925 at Hove, having some time previously been reconciled to his wife. He left two daughters.

[Repington's writings; personal knowledge.] J. E. EDMONDS.

RIDGEWAY, SIR JOSEPH WEST (1844-1930), soldier and administrator, the

second son of the Rev. Joseph Ridgeway, rector of High Roothing, Essex, by his wife, Eliza Letitia Chambers, was born at High Roothing 18 May 1844. Charles John Ridgeway (1841-1927), bishop of Chichester, and Frederick Edward Ridgeway (1848-1921), bishop of Salisbury, were his brothers. He was educated at St. Paul's School, London, and obtained a commission in the Bengal Infantry at the age of sixteen. In 1869 the viceroy, Lord Mayo, selected him for civil employment in the Central India and Rajputana agencies, and in 1873 he became an attaché in the Indian foreign department. He returned to Rajputana in 1875, serving as assistant agent to the governor-general and later as political agent of the Eastern States. Late in 1879 he succeeded (Sir) Henry Mortimer Durand [q.v.] as political secretary to Major-General Frederick Roberts (afterwards Earl Roberts, q.v.), and accompanied him on his march to Kandahar in August 1880. He was twice mentioned in dispatches, received the brevet rank of lieutenant-colonel, and was appointed junior foreign secretary to the government of India.

In 1884, owing to the occupation of Merv by the Russians in March and the continuous southward advance of Cossack outposts towards Herat, a serious position arose, and England and Russia agreed to send commissions to determine on the spot the ill-defined northern boundary of Afghanistan. This gave Ridgeway opportunity for important service. He was placed in command of the Indian section of the commission, a force of about a thousand men, and ordered to join the chief commissioner, Sir Peter Stark Lumsden, at Herat. Starting from the Pishin district, near Quetta, at the end of August 1884, Ridgeway conveyed his force across an arid desert to Kwajeh Ali on the Helmand without a single casualty and accomplished the remainder of the march through Seistan and its fanatical tribes with rapidity and success, joining Lumsden at Kuhsan, north-west of Herat, on 19 November. Lumsden and Ridgeway had been told to expect a Russian boundary commission with a small military escort: they found, instead, a considerable military force hastening to occupy the territory in dispute. In consequence, the work of the commission was held up, and Ridgeway remained for the winter with a small escort to keep the Turcoman population quiet and to give moral support to an Afghan force which was occupying

the district of Panjdeh, due south of Merv. By a combination of diplomacy and firmness he made friends with the Turcomans and held the Russians back throughout the winter; but on 29 March 1885, while he had gone to Herat to report to Lumsden, the Russians under General Komarow attacked and defeated the Afghans at Panjdeh. This incident brought England and Russia to the brink of war. Ultimately, the work of the commission was resumed in November, Ridgeway succeeding Lumsden as chief commissioner. By June 1886 the boundary had been settled as far as Dukchi, thirty miles from the Oxus, but the line to the Oxus could not be agreed upon. In August the commission was recalled, and the English and Russian cabinets decided to determine for themselves the remaining frontier line. Ridgeway on his return to India was invested with the K.C.S.I. in November 1886. In April 1887 he was sent from England to St. Petersburg in order to resume negotiations. He found the military party in Russia hostile, and on returning home to report progress 'was positively shocked to find that Lord Salisbury and his Cabinet wished to let the whole thing slide', and it was only with the assistance of Sir Edward Bradford and the under-secretary at the Foreign Office, Sir Philip Currie (Lord Currie), that he induced the government to continue negotiations. Fortunately he found the Tsar Nicholas II in favour of a settlement, and a final agreement was arrived at in July 1887, defining the whole north-western frontier of Afghanistan between the Hari Rud and Oxus rivers. The treaty contented the ameer Abdur Rahman and pleased the tribesmen by securing them their northern pasture-lands. It has proved permanent as well as satisfactory. In 1887 Ridgeway was promoted colonel for distinguished service.

On his return from Russia in 1887 Ridgeway was appointed under-secretary for Ireland, and in 1889 was sworn of the Irish Privy Council. He held office under Mr. Balfour and his successor, Lord Allerton, and materially assisted in framing Balfour's Land Purchase Act of 1891. He was created K.C.B. in the same year. Although Ridgeway's office was non-political it was thought advisable, when the liberals came back to power in 1892, to remove an under-secretary so closely associated with Balfour's policy. After being sent by Lord Rosebery on a special mission to the sultan of Morocco, he was

appointed governor of the Isle of Man from 1893 to 1895, and of Ceylon from 1896 to 1903. In Ceylon he reorganized the civil service, and by the Waste Lands Ordinance protected crown-lands from encroachment, and crown-forests from promiscuous timber-cutting. In 1900 he was made G.C.M.G., and on retiring he published a review of affairs in Ceylon during his administration.

On returning to England Ridgeway, who held free-trade principles, identified himself with the liberal party and stood as candidate for parliament for the City of London in January 1906 and for London University in 1910, in each case unsuccessfully. After the liberals came into office in December 1905, they set aside the limited measure of representative government proposed for the Transvaal by the Lyttelton constitution [see LYTTLETON, Alfred], and in March 1906 appointed Ridgeway chairman of a committee of inquiry to proceed to Africa and consider in detail the constitutions to be given to the Transvaal and Orange River Colony. Lord Selborne, the high commissioner, was at first opposed to granting responsible government, but Ridgeway was conciliatory, the home government supported him by telegram, and by the end of May he and Selborne reported in a joint telegram that a settlement was in sight. The commission easily gained the confidence of the Boer leaders, and General Botha [q.v.], who had insisted on negotiating in Dutch, with General Smuts as interpreter, began to converse in English. The committee reported in favour of immediate responsible government for both States. The Transvaal constitution was announced in parliament by Mr. Winston Churchill on 31 July and that of the Orange River Colony on 17 December—measures which prepared the way for the Union of South Africa effected by the Act of 1909. In November 1906 Ridgeway was promoted G.C.B.

In 1910 Ridgeway became president of the British North Borneo Company. After inducing Sir Richard Dane to visit Borneo and make a report, he took steps to reorganize the civil service and to improve the railway management there. In 1927 members of the civil service of North Borneo made an address and presentation to him in recognition of the progress made under his administration.

Ridgeway was an honorary LL.D. of Cambridge and Edinburgh Universities and a vice-president of the Royal

Geographical Society. He died suddenly in London 10 May 1930. He married in 1881 Carolina Ellen (Lina), younger daughter of Robert Calverley Bewicke, of Coulby Manor, Middlesbrough. She died in 1907, leaving one daughter.

E. I. CARLYLE.

RIDGEWAY, SM WILLIAM (1853-1926), classical scholar, was born 6 August 1853, the youngest son of the Rev. John Henry Ridgeway, of Ballydermot, King's County. His mother was Marianna, only daughter of Samuel Ridgeway, of Aghavilla, King's County. The Ridgeways were a Devon family, which settled in Ulster under James I and intermarried with Cromwellian settlers in King's County—in his own words 'all first-class fighting men'—and with Huguenot families round Portarlington. He belonged, therefore, to 'the Pale', and believed that he had 'not a drop of Gaelic blood in his veins'. But from his earliest years he was surrounded by those who had plenty; and they contributed much to his personality and outlook. He was educated at Portarlington School and at Trinity College, Dublin, where he won all the chief classical prizes, studied Sanskrit, and graduated as senior moderator in both classics and modern literature. From Dublin he proceeded in 1876 to St. Peter's College, Cambridge, whence he migrated to Gonville and Caius College in 1878, subsequently being elected a scholar of the college. He was bracketed fifth in the classical tripos of 1880, and was elected a fellow of his college in the same year. In 1881 a vacancy occurred on the classical staff of the college, but Ridgeway was not chosen. His disappointment was severe, and the partisan feeling then engendered delayed the recognition of his originality.

In 1883 Ridgeway was appointed to the chair of Greek at University College, Cork. This left him free to spend five months of every year in Cambridge. He published essays on the historical interpretation of Aristotle, on the size of the Homeric horse, and on the origin of the mathematical element in the teaching of Pythagoras. He was among the first English scholars to recognize the new scientific school of

comparative philology in Germany, in marked contrast with the attitude prevailing at Cambridge as late as 1890. But he was deeply indebted to the Cambridge Philological Society and to the encouragement of Dr. Henry Jackson [q.v.]. His discoveries, fiercely resisted, passed quickly into currency, and his fearless inquiry emancipated classical study in England from an unintelligent orthodoxy.

The turning-point of Ridgeway's career was his appointment in 1892, after the publication of his first substantial book, to the Disney chair of archaeology at Cambridge and his re-election to a fellowship at his own college. Although the Disney chair was then poorly endowed, he resigned his chair at Cork, in which he had rendered important services to Irish education. But his appointment in 1907 to the Brereton readership in classics established his position in Cambridge. The university was passing through a period of dissension, and Ridgeway's affection for the Anglican Church and for the traditions of Cambridge scholarship limited his enthusiasm for reform. The bitter struggle about women's degrees separated him from some of his oldest friends. In the controversy on compulsory Greek he was again one of the opponents of change. Yet after the end of the European War he was clear-sighted enough to discourage further resistance, a step since justified by steady increase in the study of Greek.

Ridgeway's first book, *The Origin of Metallic Currency and Weight Standards* (1892) attacked current theories of the purely religious origin of Greek coin-types, and threw a flood of light on the early life of the Mediterranean lands: thus, the tunny-fish, the plant silphium, or the ox (on early Athenian issues) were not objects of some unknown worship, but recognized tokens of local commerce. In the first volume of his *Early Age of Greece* (1901) he enforced the fundamental distinction between the authors of the Mycenaean culture with bronze weapons, figure-of-eight shields, and southern ways of life, and the Achaeans of Homer, whom he proposed to identify with warrior immigrants of the Early Iron Age bringing with them the round shields and long iron swords of central Europe and the sterner morals of the North. This work was never completed; of the second volume, parts already in type at his death (dealing with kinship and ancestor-worship in early Europe, and with Ireland in the Heroic

Age) were published by friends in 1931, with an introduction exhibiting later developments of Ridgeway's doctrine. This book is Ridgeway's chief contribution to history. Its main doctrine secured wide acceptance, even among those who attacked it in detail. But the bitterness of the controversy took a tragic colour in Ridgeway's memory, and he retained the conviction that in certain quarters he would never be fairly treated.

In strict logic Ridgeway was weak. In support of a theory, of the truth of which he was convinced, he would use all kinds of evidence, strong and weak alike. Nor did he always give enough consideration to difficulties. But (to quote his pupil Professor D. S. Robertson) 'his mind's eye surveyed so vast a range of facts that he saw in a flash the great lines of their connexion, and his lively knowledge of human nature kept him always within the limits of reasonableness and good sense. He did not love the bizarre or the exotic, and some delicate beauty escaped him. But his enjoyment of masterpieces was suffused with a glow of enthusiasm. Nor was it only poetry that stirred him to eloquence. In a lecture on ancient gems, he would suddenly break into a paean on the extraordinary beauty of jewels. His words had a rough splendour that stamped them imperishably on his listeners' minds. He did not like formal lecturing; but round a table, with half a dozen students, he was incomparable. His vivid imagination, his width of view, his unbroken contact with reality kept one spellbound, as gems, coins, axeheads, totem-spoons tumbled on to the table from his inexhaustible pockets. He must always have had sensitive fingers, and as his sight failed he depended more and more upon touch. And he knew at once from the way in which new pupils handled and spoke of the stuff which he passed round the table, whether or no they had the makings of real archaeologists.'

In *The Origin and Influence of the Thoroughbred Horse* (1905) Ridgeway showed the development of the horse from its small Homeric ancestor through admixture of zebraic blood by the horse-breeding Greeks of North Africa and their Mohammedan successors. This conclusion he reached almost simultaneously with, and independently of, the zoologists, J. C. Ewart and H. F. Osborn, completing their zoological results by his historical study. His *British Academy* paper *Who were the Romans?* (1907) revived by fresh evidence

Schwiegler's view of the racial distinction between the Sabine or Patrician element in Rome, and the Latin or Plebeian (cf. *Cambridge Ancient History*, vol. iv, c. xiii, 1926). In *The Origin of Tragedy, with special reference to Greek Tragedians* (1910) Ridgeway argued that tragedy arose from the commemoration of local heroes at their tombs, the representations being later drawn into the ritual of Dionysus and combined with the Satyric plays. In *Dramas and Dramatic Dances of Non-European Races* (1915) he confirmed his theory by comprehensive induction from China to Bolivia and Japan, from Australia and Central Africa to the Alaskan Eskimos. Other interests of his are represented by his studies of *Cuchulainn* (1905 and 1907) and unpublished papers on the (Danish) 'Origin of the Scots', and on the 'Origin of Ballads' in the praises of popular heroes (lecture delivered in 1920).

In later years Ridgeway was a frequent and valued correspondent of *The Times*, remarkable both for range of subject and vigour of style. His trenchant but genial criticism made him also a speaker in great request at such learned gatherings as had a popular side. To the last his enthusiasm for the great social ends of classical study remained unabated, and none of the honours that fell to him gave him more pleasure than his election as president of the Classical Association for 1914. The establishment of the Cambridge school of anthropology is a monument to another side of his influence. The general recognition of his work was marked on his sixtieth birthday (1913) by the presentation of a volume of *Essays and Studies* in his honour. Ridgeway was elected F.B.A. in 1904, was president of the Royal Anthropological Institute from 1908 to 1910, and received honorary doctorates from the universities of Dublin (1902), Manchester (1906), Aberdeen (1908), and Edinburgh (1921). He was knighted in 1919.

No picture of Ridgeway's life would be complete which did not indicate the extraordinary stimulus which he exerted upon others, and his untiring interest in the research and the prospects of younger men. His home at Fen Ditton, about four miles from Cambridge, with its pleasant garden, was the constant resort of scholars engaged in many kinds of research, not merely in classical or antiquarian learning. To all his visitors he gave the same unselfish and penetrating attention; no one went away without some new point of

view. Yet his intercourse with scholars and students was only a part of his cordial acquaintance with all sorts and conditions of men.

The last months of Ridgeway's life were darkened by the sudden death of his wife in May 1926. She was Lucy, eldest daughter of Arthur Samuels, of Kingstown, and sister of Arthur Warren Samuels, judge of the High Court of Justice in Ireland. His companion almost since his boyhood, he had married her in 1880; she shared his ideals and was hardly less interested than he was in his work. They had one daughter. His own death occurred suddenly at Fen Ditton 12 August 1926, not quite three months after that of his wife.

RIGG, JAMES McMULLEN (1855-1926), biographer, historian, and translator, the eldest son of James Harrison Rigg [q.v.], principal of the Wesleyan College, Westminster, by his wife, Caroline, daughter of John Smith, alderman of Worcester, was born at Brentford 28 September 1855. He was educated at the City of London School under Dr. E. A. Abbott [q.v.] and at St. John's College, Oxford, of which he was a scholar. He obtained a second class in classical moderations in 1876 and a third class in *literae humaniores* in 1878. Two years after leaving Oxford he entered Lincoln's Inn, and was called to the bar in November 1881. Although he enjoyed a small practice for a few years, he soon abandoned law entirely, and devoted the rest of his life to literary work.

Rigg's first book, published in 1884, was an edition of *The Bankruptcy Act, 1883*. It was carefully compiled, but contained little discussion of legal principles. In the following year he began to write articles for this *Dictionary*, to every volume of which, with one exception, he made contributions, upwards of 600 in all. A large number of his notices were of famous judges, ancient and modern. All were accurate and sufficient, but in some of the modern biographies he was thought to be rather daring in his criticism. Rigg's next work was an edition of Sir Thomas More's translation of the Latin life of Pico della Mirandola, which appeared in 'The Tudor Library' in 1890. Its luminous introduction has perhaps received less

attention than it deserves. This was followed in 1896 by *St. Anselm of Canterbury*, the book by which Rigg will be chiefly remembered. Although it treats Anselm as a thinker and writer rather than as a man of affairs, it remains a valuable contribution to ecclesiastical biography and to the history of medieval thought. In 1902 Rigg's *Select Pleas . . . from the rolls of the Exchequer of the Jews, 1220-1284*, with a translation and well-written introduction, was published by the Selden Society. The first two volumes of *A Calendar of the Plea Rolls of the Exchequer of the Jews* (vol. i, Henry III, 1218-1272; vol. ii, Edward I, 1273-1275), edited by Rigg, were published by the Jewish Historical Society in 1905 and 1910 respectively. In 1909 Rigg was appointed by the deputy-keeper of the records to make researches in the Vatican archives, and spent nine months of each of the years 1909 to 1915 in Rome. He edited two volumes of *A Calendar of State Papers, . . . Rome* (vol. i, 1558-1571, vol. ii, 1572-1578), partly from transcripts made by W. H. Bliss, who had recently died. They were published in 1916 and 1926 respectively. All Rigg's editorial work was distinguished by accuracy and scholarly expression. In addition to the books already mentioned, he published in 1903 a translation in two volumes of Boccaccio's *Decameron*, which has been several times reprinted, and in 1909 the section on 'The King's Friends' in chapter xiii of volume vi of the *Cambridge Modern History*.

In appearance Rigg was spare and ascetic; in manner shy and reserved. He usually spoke abruptly and very emphatically. Yet in friendly surroundings he was an excellent talker. His greatest interest in life was probably the history and philosophy of religion. In spite of his Wesleyan birth he seemed to be pleased when anybody referred to him, as sometimes happened, as a Roman catholic, although he was never in fact a member of that communion. He died at Brixton Hill 14 April 1926. Rigg was unmarried, and he lived with the elder of his two sisters, Miss Caroline Edith Rigg, headmistress for forty-one years of the Mary Datchelor School, Camberwell.

G. J. TURNER.

RIVAZ, SIR CHARLES MONTGOMERY (1845-1926), Anglo-Indian administrator, the second son of John Theophilus Rivaz, of Watford Hall, Watford, by his

wife, Mary, daughter of William Lambert, was born at Tirlings Park, Essex, 11 March 1845. His father served for thirty years in the Indian civil service, his maternal grandfather belonged to the same service, and through his mother he was also related to Sir Robert Montgomery [q.v.], a distinguished Indian civilian. Charles Rivaz himself accordingly, after a successful career at Blackheath Proprietary School, entered the Indian civil service in 1864, and was almost immediately appointed to the Punjab, the land of the five rivers. In after times three of his brothers were also serving in various capacities in the same province, a circumstance which went far to justify the local witticism which alluded to the family as 'the five Rivaz of the Punjab'.

After six years of district work Rivaz spent five years (1871-1876) in the provincial secretariat, and was then appointed to be superintendent of the Kapurthala State during the minority of the ruling chief. The autocratic powers which this post conferred were suited to his temperament, and he conducted the affairs of this important State with much success for nine years (1876-1885). In 1885 he received the C.S.I., and after two years (1885-1887) in the Kangra district was made commissioner of Lahore (1887-1892), and subsequently promoted to be financial commissioner of the Punjab—a post which he held from 1892 to 1897.

In October 1897 Rivaz was appointed to the executive council of the governor-general to serve as member in charge of the home department and of the revenue and agricultural departments. With the arrival of Lord Curzon [q.v.] as viceroy in December 1898 the work in these and in the other departments of the government of India became very strenuous, and Rivaz entered on a period of heavy and responsible duty. It was not in his nature to initiate large reforms, but he responded readily to all reasonable suggestions for administrative progress and gave them his vigorous support. In one direction, indeed, he may be considered an initiator, namely in the treatment of landed indebtedness in the Punjab. The alarming expropriation of the peasants by the commercial classes had long engaged the attention of the Punjab officials, but many of them hesitated to advocate the drastic remedy of restricting by law the power to alienate the land. With the support of Lord Curzon, however, and the assistance of (Sir) Denzil Ibbetson [q.v.], the secre-

tary of the revenue department, Rivaz prepared a measure which had this for its object, and took the extraordinary course of passing it through the Indian legislature (the Punjab Land Alienation Act, 1900) in opposition to the wishes of the head of the province. This courageous step has been justified by the subsequent history of the problem.

Rivaz was promoted K.C.S.I. in 1901, and early in the following year left the governor-general's council in order to become lieutenant-governor of the Punjab. He held the post until March 1907. He was indefatigable in visiting every place of interest in his province and he did much to improve the appearance and amenities of its capital, Lahore. During his term of office the province developed steadily. There were some recurrences of plague, and a terrible earthquake at Kangra on 4 April 1905, but assistance and relief were energetically organized by the lieutenant-governor. Large irrigation schemes were being carried through at this time; and the bold experiment of colonizing the newly irrigated wastes of the province proved eminently successful. Had it not been for threatenings of discontent, caused by the over-regulation of these colonies, which clouded the last few weeks of Rivaz's régime and led subsequently to popular disturbances, his tenure of the lieutenant-governorship could have been described as a triumph of firm and progressive administration.

As an Indian administrator Rivaz represented the best characteristics of the official class of his own period. He was not brought much into contact with, nor did he attempt to solve, problems connected with Indian nationalism. His interest lay rather in ensuring for the population, and more especially for the agricultural population, a just and efficient official rule, adapted to the needs and ideals of the people themselves. He had a wide acquaintance with the notables of his own province, and earned their respect by dealing with them searchingly and justly. By his own officials he was warmly esteemed, reposing, as he did, a full measure of confidence in his advisers and inspiring them with a sense of their responsibility. While never slackening his grasp on the course of events, he avoided all but the most necessary interference, and his orders were in every case decisive and brief, seizing the essential point and neglecting minor issues. Probably no Anglo-Indian official has ever exercised

such effective control of affairs with so little recourse to writing; among the voluminous records connected with the passing of the Punjab Land Alienation Act in 1900, for instance, there are probably few pages where more than five consecutive lines could be found in Rivaz's bold and characteristic handwriting, and yet he was the controlling spirit of the measure, fully cognizant throughout not only of the principles but also of the details under discussion.

Rivaz was a man of spare build and refined features, with an upright carriage, a penetrating eye, and a quick, slightly nervous temperament, coupled with great modesty and restraint; scornful of all pretence and yet contemptuously tolerant of much that would offend others. Although reserved in general society he was a cordial host, and to his intimates he was a genial companion and a good friend.

Rivaz married in 1874 Emily, daughter of Major-General Agnew, of the Bengal Staff Corps, and had three sons. After completing his service in India he settled in London and lived a retired life, seeing his personal friends but refraining from public connexion with Indian questions. He died in London 7 October 1926, and was buried at Walton-on-the-Hill.

E. D. MACLAGAN.

ROBECK, SIR JOHN MICHAEL DE, baronet (1862-1928), admiral of the fleet. [See DE ROBECK.]

ROBERTS, GEORGE HENRY (1869-1928), politician and labour leader, the only child of George Henry Roberts, by his wife, Ann Larkman, was born 27 July 1869 at Chedgrave, Norfolk, where his father was the village shoemaker. At the age of five he was taken to live in Norwich, and attended St. Stephen's national school, in which he rose in his eleventh year to the position of monitor; but he left school at fourteen and was apprenticed to the printing trade, continuing his education at evening classes in the higher grade and technical schools in the city. He completed his apprenticeship in 1889. As a journeyman printer he worked for a few years in London and joined the trade union of his craft, the Typographical Association. He returned to Norwich in 1894 to work first as a compositor on a local weekly journal and then as foreman printer, and by taking an active part in the local branch

of his union as president for some years and later as secretary, from 1899 to 1904, he found his way, through the Norwich trades council, into public life at a comparatively early age.

Roberts was active in local politics just at the beginning of the political organization of labour in the trade unions and the socialist societies. The focus of his activity in Norwich was the Independent Labour Party, in which he was soon recognized as a leader. He was the first labour member to be elected (in 1899) to the Norwich school board, and fought, unsuccessfully, his first contest as parliamentary labour candidate at a by-election in Norwich in 1904, in which year he also became the national organizer of his union and was adopted as its nominee for parliament. He entered parliament as labour member for Norwich in the general election of 1906. He was by this time widely known in the labour movement as a vigorous propagandist on the Independent Labour Party platform and as an able, well-informed politician; his standing in the party was attested by his immediate election as one of its whips in the House of Commons. He was a member of the party's executive committee; and he was, although an outspoken critic of extremist tendencies in socialist policy, an influential member of the group of Independent Labour Party leaders who practically controlled the labour political movement in those years.

In general politics, however, as well as in relation to labour and socialist policy, Roberts moved steadily towards the right wing. He parted company with the Independent Labour Party at the outbreak of the European War in 1914, and widened the breach with his old associates when he entered the Asquith Coalition ministry in 1915 as a lord commissioner of the Treasury; in the second Coalition ministry, formed by Mr. Lloyd George in December 1916, he became parliamentary secretary to the Board of Trade; and in the re-organization of the Lloyd George government, in the summer of 1917, he was given the post of minister of labour with a seat in the Cabinet. But in June 1918 the labour party withdrew its support of the Coalition government and terminated the political truce which had been observed by all parties during the War. This brought to a head the antagonism that had been developing between Roberts and the labour party. His relations with the local party organization had already been

strained for some years, and they had reached the stage of open rupture in 1917 when the Norwich labour party opposed him in the by-election necessitated by his acceptance of office in the government. He now broke finally with the labour party by refusing, with two or three other labour ministers, to withdraw from the Coalition, emphasizing his defiance by accepting in January 1919 the office of food controller vacated by his colleague, J. R. Clynes, in obedience to the party's decision. He held this office until February 1920, when he resigned from the government.

In the general election of 1918 Roberts had stood as an independent and had retained his seat at Norwich against the challenge of a local labour candidate; and he successfully resisted the labour attack in the following general election of 1922. But in August of the following year he avowed himself a supporter of the conservative government and applied for official recognition by that party. His conversion to conservatism, however, marked the end of his political career, for, standing as a unionist, he lost his seat at Norwich in the general election of December 1923, and thereupon withdrew from politics and turned his attention to business, becoming a director of several companies and taking an active interest in the development of the English beet sugar industry.

Roberts's political evolution was conditioned, in some measure, by his temperament, which did not permit him to brook rivalry within or criticism by the party organization at Norwich. But he was also genuinely opposed to what he regarded as manifestations of the labour party's sympathy with the doctrine of class-war and the method of revolutionary violence. He belonged essentially to that group of trade union politicians whose moderating influence in the labour party has counteracted the strong left wing tendencies of the socialist societies within it, especially those fostered by the Independent Labour Party. In the formative period of the labour party's history Roberts was, curiously enough, identified more closely with the Independent Labour Party than with the trade union elements in the party, but in the closing years of his political career he added the weight of his influence to the trade union side of the alliance. What drove him finally into conservatism was his conviction that trade unionism, too, had become corrupted by the propaganda of direct action and social re-

bellion, derived, as he believed, from the socialist teaching of the Independent Labour Party.

Roberts died at Sevenoaks from heart failure 25 April 1928. He had become a privy councillor upon his acceptance of a position in the first Coalition ministry (1915), and in 1918 he had received the freedom of Norwich, where he resided for nearly the whole of his life. He married in 1895 Anne, daughter of Horace Marshall, of Norwich, and had two sons and one daughter.

H. T. TRACEY.

ROBINSON, Sir JOSEPH BENJAMIN, first baronet (1840-1929), South African mine-owner, was born at Cradoek, Cape Colony, 3 August 1840, the youngest son of Robert John Robinson, by his wife, Martha Emily, daughter of William Henry Strutt. His father had emigrated from England twenty years earlier, and had become a farmer on a large scale. While still a lad, Robinson set up for himself as a wool-buyer, travelling among the Boers from farm to farm. In 1865 he fought with the Free State Dutch in their war against the Basuto. Three years later, at the rumour of a discovery of diamonds, he at once made for the Vaal river, and began digging at Hebron. His claims proved immensely rich. In 1871 he secured further valuable diamond claims in the area which was to become famous as Kimberley. It was mainly Robinson's vigorous denunciation of the illicit diamond traffic which secured the passing by the Cape parliament of the Diamond Trade Act (1882) which, by a strange inversion of British principles of justice, laid upon an accused person found in possession of an uncut stone the onus of proving his innocence.

Robinson was among the first adventurers to reach the Rand gold-field in 1886. Outspanning on the farm Langlaagte, he looked about for the outcrop, found it, panned it, and got gold. Thereupon he sank the first shaft on the Rand. He had already bought the farm for £7,000, which was considered an immense sum. Sceptics called it Robinson's 'cabbage-patch'. In 1889 he acquired the vast Randfontein block on the far West Rand. The development of this area, some 40,000 acres in which the reef outcropped for nearly ten miles, was to be his life's work.

[*The Times*, 31 Oct 1964, p. 10, col. 1, under heading "Memories, Mines, and Information."]]

Then, as now, the position at the Irish bar and accepted legal in every court, but conveyancer, drafter. His legal subtlety appreciated, and Naish [q.v.] became the Roman to be the general's devil, and time was largely of Crown briefs entailed. In 1887 J. G. Gibson to be Edward Carson (became the new most of the government had given so much was still employed

Robinson died at Cape Town 30 October 1929. He married in 1877 Elizabeth Rebecca, eldest daughter of James Ferguson, a Kimberley merchant, and had four sons and five daughters. He was succeeded

important cases. His reputation was now established. In 1888 he was called to the English bar by the Inner Temple, and for the greater part of that year, as one of the junior counsel for *The Times*, was engaged on the work of the Parnell commission. His leader, (Sir) Richard Webster (afterwards Viscount Alverstone, q.v.), attorney-general for England, acknowledged the exceptional value of Ronan's assistance by the gift of a silver cup.

In 1889 Ronan took silk in Ireland; in 1891 he was appointed senior Crown prosecutor for Cork city and county; in 1892 he became a bencher of King's Inns, Dublin, and in the same year his eminence in the Admiralty Court was recognized by his appointment as queen's advocate-general for Ireland. Thereafter no official preferment came his way for more than twenty years. Had he chosen to involve himself in politics, he would soon have gained a seat on the bench. Although he was in favour of the Union, he held radical views. But he had a shrinking from public life, a distaste for politics, and a large contempt for politicians. He devoted himself entirely to the practice of his profession. Concentrating more and more on the Chancery side of the courts, and on cases of purely legal argument, he came to be recognized as the most subtle if not the most profound lawyer at the Irish bar. He was briefed in every important case of the types he favoured, and was a frequent pleader before the bar of the House of Lords. He took silk in England in 1909.

For over a quarter of a century after he became a senior counsel, Ronan's history is to be found within the covers of the Irish Law Reports and nowhere else. He continued to carve his deep, narrow, and solitary groove. At last, in 1915, when he was sixty-seven years of age, he was made lord justice of appeal and was sworn of the Irish Privy Council. The appointment was non-political, and was a tribute to his pre-eminent position. Everyone expected great things from him. But the appointment came too late. He had been over-long an advocate easily to forsake the active for the passive role. As an assize judge he was prone to take the case out of the hands of counsel, and even in the Court of Appeal his impatient intellect led him continually to interrupt the course of the argument with questions on points which eventually proved to be unimportant. His judgments, clear, erudite, and lengthy, smacked too much of special pleading, and laboured under the tyranny

of multitudinous decisions. He lacked the temper of a great judge, the capacity to ground himself on broad principles, rather than on their exposition in decided cases, and to adapt the essence of those principles to the changing needs of the times. In 1924, when the new judicial system was established in the Irish Free State, Ronan retired. He died at his house, 45 FitzWilliam Square, Dublin, 3 October 1925.

Ronan's title to fame is that he was a great advocate. Although small and of the most fragile physique—he weighed only eight stone—his prominent nose, restless eyes, and long, aggressive beard gave him an unusual, but impressive, appearance; and his voice, clear and light, with the wide modulations of Cork, commanded instant attention. From his experience as a prosecutor he brought to the Chancery bar great skill in cross-examination, and he was able to overwhelm a witness with a hail of questions, delivered with great rapidity and capable of being answered with the unqualified 'yes' or 'no' upon which he insisted. Tensely strung to the point of pugnacity, he dominated both witness and judge. In a legal argument his powers reached their fullest development. He sifted and combined into a close pattern the mass of authority which his industry had collected, and presented it with a force of personality which seemed to paralyse opposition. Only at *nisi prius* was he a failure, having neither the instinct to penetrate the mind of a civil jury, nor the urbanity to attract it.

Outside his profession Ronan had few interests. In earlier life he was fond of cricket and yachting, and spent his vacations in travel, usually by sea; but in later days he lived as a recluse. Kindly to all, he had few intimate friends. He was unmarried.

[*The Times*, 5 October 1925; *Journal of the Cork Historical and Archaeological Society*, vol. xxx, p. 62, 1925 and vol. xxxvi, p. 35 n., 1931; *Irish Law Reports*; *Irish Law Times*, *passim*; private information; personal knowledge.] T. C. KINGSMILL MOORE.

ROSEBURY, fifth EARL OF (1847-1920), statesman and author. [See PRIM-ROSE, ARCHIBALD PHILIP.]

ROUND, JOHN HORACE (1854-1928), historian, the eldest child and only son of John Round, by his wife, Laura, daughter of Horatio (Horace) Smith, the poet [q.v.], was born at Brighton 22

February 1854. His father's family had been connected with Essex since the early part of the eighteenth century, and to the end of his life Round showed especial interest in the history of that county. He was a delicate child, and was educated privately, living at Brighton with his father and younger sister after his mother's death in 1804. He entered Balliol College, Oxford, in 1874, obtaining a second class in classical moderations in 1876 and a first class in the final honour school of modern history in 1878. He had developed an interest in history and genealogy during his isolated boyhood, and at Oxford he was fortunate in coming into personal relationship with William Stubbs [q.v.], then regius professor of modern history, who acted as tutor to a small number of pupils reading for the history school. The influence of Stubbs, a historian who was also a genealogist, was very important in determining the direction of Round's work, and his subsequent attitude towards Stubbs was always that of a pupil towards his master.

It was unnecessary for Round to follow any definite profession. After taking his degree he returned to Brighton, and lived with his father, whose health was failing, until he died in 1887. For the next sixteen years Round's head-quarters were in London, but in 1903 he returned to Brighton, where he spent the remainder of his life. He began to write for publication soon after leaving Oxford, and quickly developed the nervous, controversial style characteristic of his later work. Politically he was a strong conservative, and he first became known beyond the circle of his friends and fellow-students through an attack upon E. A. Freeman's paper of 1884 on the *Nature and Origin of the House of Lords*. These articles aroused considerable interest, but Freeman made no reply to Round's assaults, and the attack subsided. At this date, although a quick worker, and eager to engage in controversy, Round had not yet found himself as a scholar. His interests were beginning to centre round the Anglo-Norman period, but he was also attracted by the sixteenth century, and in 1886, in his *Early Life of Anne Boleyn*, he entered into a detailed criticism of J. S. Brewer's and J. Gairdner's *Calendar of Letters and Papers of the Reign of Henry VIII*. He had reached his thirty-second year before he gave any real promise of the work on which his reputation as a historian was to rest.

In 1886 the eight-hundredth anniversary of the Domesday Survey was marked by the preparation of papers by various scholars, published under the title *Domesday Studies* (vol. i, 1888, vol. ii, 1891). For this occasion Round wrote three essays, two of which are of especial importance as emphasizing the principle that the clue to the understanding of Domesday Book lies in the contemporary system of assessment to the Danegeld. In 1888 the Pipe Roll Society issued a volume of *Ancient Charters, Royal and Private, Prior to A.D. 1200*, with notes by Round on each document. These works, with which Round made his first important contribution to Anglo-Norman studies, were the forerunners of a succession of articles, notes, and reviews, which continued to appear at very short intervals throughout the next twenty-five years. The establishment of the *English Historical Review* in 1886 gave a new opportunity for the publication of detailed work, of which Round took full advantage, but his writings appeared in many different quarters. The volume of his work is very imperfectly represented by the actual books which he produced. He was a contributor to the *Encyclopædia Britannica*, to this *Dictionary*, and to many periodicals of general interest. He supplied articles to the *Genealogist*, the *Ancestor*, the Essex Archaeological Society's *Transactions*, and the Sussex Archaeological Society's *Collections*; he wrote introductions to the Domesday surveys of twelve counties for the *Victoria History of the Counties of England*, and prefaces to the Pipe Rolls of twelve consecutive years of the reign of Henry II. Although Round never founded a school of history, and, indeed, can hardly be said to have belonged to one, few scholars have supported a larger number of co-operative enterprises.

In 1892 Round published a book which gave him at last a place among the leading historians of the day. As an example of new methods applied to old materials, *Geoffrey de Mandeville, a Study of the Anarchy*, opened a fresh line of approach to Anglo-Norman history. The biographical narrative promised by the title is by no means a model of composition. Round was always unwilling to repeat what was well known, and the reader who hopes for a consecutive biography of the first Earl of Essex will be disappointed. The strength of the book lies in the use of charters as sources of information supplementing and sometimes correcting the

statements of chroniclers. These documents, which previous scholars had used primarily as sources of genealogical fact, became in Round's hands materials of the first importance for administrative and even political history. The central theme of the book is the process by which an ambitious baron increased his power by offering his support, alternately, to each of two rival claimants to the English throne. The study of this process involved the investigation of many incidental problems, such as the number and character of the earldoms created by Stephen and the Empress Matilda, the government of London in the twelfth century, and the nature of Anglo-Norman castellation. Some of these problems have been brought nearer solution by subsequent writers, and with others Round himself dealt more fully in later life. His articles on 'The Castles of the Conquest' and 'Castle Guard', published respectively in *Archaeologia* and the *Archaeological Journal* in 1902, carry the study of Norman defensive methods far beyond the point reached in *Geoffrey de Mandeville*; but that book marks a turning-point in the study of the relations between the baronage and the Crown, and it remains a model of investigation.

Three years later (1895) Round published under the title *Feudal England* a collection of essays bearing on English history in the eleventh and twelfth centuries. To the reader interested in the general history of the period this is probably the most important of all Round's books, for it contains his convincing description of the methods by which Danegeld was assessed in the eleventh century, and his demonstration that the English system of tenure by knight-service, regarded by most writers of the previous generation as a gradual development, was in reality the creation of William the Conqueror. It includes the text of a feudal survey of Leicestershire, which made an important addition to the existing materials for the reign of Henry I, and an article on Richard I's change of seal—a brilliant example of Round's method—proving from a large collection of royal charters that the king's second seal was put into use in 1198, not, as previous writers had believed, in 1194. In curious contrast to these studies, which are as fresh to-day as on their first appearance, the volume contains a number of essays directed against Freeman's *History of the Norman Conquest*, of which the interest has certainly faded. Already in

July 1892 an article by Round, challenging, in particular, Freeman's account of the battle of Hastings, had appeared in the *Quarterly Review*. The fact that Freeman had died in the interval between the writing of the article and its publication naturally intensified the controversy which followed. Freeman's narrative was defended by other scholars, to whom Round replied, and the debate was by no means over when *Feudal England* appeared. Apart from the political differences which first set Round in opposition to Freeman, the two writers represent very different types of historian. To Freeman the criticism of sources and the investigation of their origins, although an essential part of the historian's duty, were subordinate to the writing of an interesting narrative. Round had little gift of narration; his distinctive work was done through the discovery and combination of scattered pieces of evidence, and he was fundamentally out of sympathy with Freeman's methods. On most of the points at issue Round's was undoubtedly the better opinion; but he never undertook a complete investigation of the materials for the history of the battle of Hastings, and it was left for a German scholar, Dr. Wilhelm Spatz, to show that they were inadequate to support a detailed narrative on the scale attempted by Freeman [*Die Schlacht von Hastings*, Berlin, 1890].

Echoes of this controversy are still to be heard in Round's next volume of essays, *The Commune of London*, published in 1899, but the volume as a whole relates to the twelfth rather than to the eleventh century. It covers a wide range of subjects, beginning with an essay on the settlement of the South and East Saxons, and ending with a paper on the Marshalship of England, but its chief importance lies in a study of the origin of the Exchequer and in two contributions to the early history of London. In the first of these London studies Round brought together many facts illustrating the government of the city in Stephen's reign, a subject with which he had already dealt in *Geoffrey de Mandeville*, and in the second he entered more fully than any previous writer into the origins of the commune of 1191. In a brilliant paper on the struggle between John and William of Longchamp, Round compiled from the various contemporary authorities a convincing account of a series of events which previous writers had confused. This, the last of Round's books in which matters of

general history predominate, appeared almost simultaneously with a volume of very different character, the *Calendar of Documents preserved in France illustrative of the History of Great Britain and Ireland*. This volume arose from an invitation from the Public Record Office that he should prepare a calendar of a large collection of transcripts from documents in French archives, which had been made for the original Record Commission. Round devoted much time and energy to this work, travelling widely in order to secure accurate texts. The conditions of publication did not allow of any elaborate notes or discussions of problems, but Round was able to illustrate the interest of his materials in a long introduction, and the dates which he assigned to each document represent much investigation which is not set out in detail. Although some parts of the calendar have been superseded by the publication of documents *in extenso*, it remains a very valuable guide to these important and scattered texts.

The next book to appear was a series of essays, mostly of genealogical interest, entitled *Studies in Peerage and Family History* (1901). It contains some of Round's most characteristic work, and the three articles on 'The Origin of the Stewarts', 'The Counts of Boulogne as English Lords', and 'The Family of Ballon and the Conquest of South Wales' are admirable illustrations of the services which genealogical studies can render to history. The book attracted general attention through its destructive criticism of the alleged descents of a number of families, and this side of Round's work was carried much further in two volumes published in 1910 and called *Peerage and Pedigree*. In the following year there appeared the last of Round's books to be published in his lifetime, *The King's Serjeants and Officers of State*. The coronation of King George V had aroused interest in the services centred round the person of a medieval sovereign, and Round's book illustrates their variety and their place in the general scheme of English tenures. It does not offer an exhaustive account of these services, but it shows the true nature of many half-forgotten forms of tenure, and it was the first modern work to emphasize the historical interest of the medieval king's household.

These studies on the king's serjeants may be regarded as representing the general trend of Round's later work. He had always felt the interest of the survival, in England, of ancient institutions

such as the medieval offices of state and the peerage. He was anxious that their historic continuity should be preserved, and, in particular, that every claim to hold one of these offices at a coronation, or to succeed to a dormant peerage, should be decided in accordance with the principles governing the treatment of historical evidence. He had already given advice on the complicated case of the Lord Great Chamberlainship to the Court of Claims established in preparation for the coronation of King Edward VII in 1902, and in the early years of the twentieth century he wrote a series of reports on individual claims to peerages. His work in this direction was recognized by his appointment in 1914 as honorary historical adviser to the Crown in peerage cases, and he held this position until the beginning of 1922. The work was heavy, but he found it attractive, and although his opinion was not always adopted, his appointment meant that the historical issues underlying claims to peerages were not likely to be forgotten.

These official duties, combined with failing health, prevented Round during these years from carrying through any elaborate work on general history. His health had been uncertain from childhood, and it was only during the middle years of his life that he could mingle freely with other scholars. As time went on, it became difficult for him, at first, to leave home, and then to receive visitors, and long before the end, with few exceptions, his friends could only keep in touch with him by correspondence. He preserved his interest in history to the last. He gave valuable help when the English Place-Name Society was founded in 1923, supported the scheme for the publication of the early records of Lincoln Cathedral in 1925, and within a week of his death, wrote a long letter to the editor of the Pipe Roll Society on the volume then passing through the press. Despite the isolation of his last years, those who were working in the same field of study had never ceased to regard him as an active scholar, and it was with surprise that they learned of his death, which took place at Brighton 25 June 1928.

Round's life was marked by few notable incidents, and its character never underwent any sudden change after his father's death in 1887. He never married, or held any appointment involving routine association with other men. He received the honorary degree of LL.D. from Edinburgh

University in 1905, but declined other academic recognition. Apart from occasional intervention in local politics in youth, almost his only direct connexion with the world of affairs came through his investigations of claims to peerages and honorary offices of state. To an extent unusual even among scholars, his life was in his writings, and the form which they took was influenced by the uncertain health which always tended to isolate him. He was naturally unfitted for the task of large-scale writing, and his strength was given to a long succession of studies, each complete in itself, and dealing with some definite problem. Ill-health, moreover, goes far to explain the least attractive quality in his writings, the violence with which he attacked other scholars of whose work he disapproved. Most of those against whom he wrote deserved his criticism, and he warned his contemporaries against the acceptance of many ill-founded opinions and much unsatisfactory work. Unfortunately, in pursuit of error he sometimes lost all sense of proportion. His criticisms were often expressed immoderately, and he would return again and again to an attack which his earlier writings had made unnecessary. It should, however, be added that most of the objects of these attacks were writers of established position, and that Round could be very generous to the work of young scholars. His criticism might be severe, but it was never simply magisterial, and it was always written from the worker's standpoint.

Round's occasional aberrations in criticism are insignificant in comparison with his positive achievement. He founded the modern study of Domesday Book. His insistence on the importance of family history gave a new value to genealogical studies, and it is probable that no other scholar has made so many or such valuable contributions to this subject. He was the first modern historian to base a narrative on charters, and all subsequent use of these materials has been influenced directly or indirectly by his work. He showed the aristocratic character of the Anglo-Norman constitution, and effectively challenged previous assumptions of the continuity of English governmental institutions from Anglo-Saxon into Norman times. His work gave a new direction and precision to the studies which he had followed, and its permanent value is becoming clearer as the controversies in which he engaged are fading out of memory.

In 1930 a collection of papers which Round had intended to publish but had never revised for press appeared in a volume entitled *Family Origins and Other Studies*, edited by Dr. William Page. As the title implies, most of the essays relate to matters of genealogy, but the volume contains several historical studies recalling Round's earlier work, and, in particular, an illuminating article on the Bayeux Inquest of 1183. Dr. Page prefaced the volume with a portrait and memoir of Round and a bibliography of his writings. The bibliography, which fills twenty-six pages, first made it possible to appreciate the range and volume of Round's work, and the memoir, written with intimate knowledge, gives a vivid impression of his remarkable personality.

[*Memoir* by W. Page prefixed to *Family Origins*, 1930; article by James Tait in *English Historical Review*, October 1928; personal knowledge.] F. M. STENTON.

ROWNTREE, JOSEPH (1836-1925), cocoa manufacturer and philanthropist, was born at York 24 May 1836, the second son of Joseph Rowntree (1801-1859, q.v.), quaker educationist, by his wife, Sarah, daughter of Isaac Stephenson, of Manchester. He was educated at Bootham School, York, and at the age of fifteen joined his father in the grocery business which he had established at York in 1822. In 1860 Rowntree entered into partnership with his elder brother Henry Isaac, who in 1862 had acquired from the quaker grocers, Tuke & Co., the cocoa-manufacturing portion of their business. When his brother died in 1883, Joseph Rowntree became the sole owner of this business, known as H. I. Rowntree & Co., which in 1897 became a limited company. He acted as chairman until his retirement in 1923.

Rowntree was an industrial and social reformer who devoted wealth and business ability to practical philanthropy. Brought up as an earnest quaker, he was deeply conscious of the unhappy conditions imposed by the industrial revolution on many of his fellow countrymen, and he became convinced that such conditions were the result of improvised development and were not by any means a necessary accompaniment of industrial progress. He determined that his employees should work for reasonable hours and receive adequate wages, that they should be consulted about working conditions, and that provision should be made for periods

of unemployment and for old age and for widows' pensions. In 1891 he introduced social workers into his factory, and from that time onwards he gradually built up the welfare organizations associated with his name. He established three trusts—the Joseph Rowntree Village Trust, the Joseph Rowntree Social Service Trust, and the Joseph Rowntree Charitable Trust. The New Earswick model village was founded in 1904 under the management of the Joseph Rowntree Village Trust: in it well-designed houses and carefully provided resources for social and intellectual activities fulfilled Rowntree's intentions towards his employees. Rowntree's philanthropic undertakings were always the outcome of systematically prepared plans, the guiding principle of which he indicated in a memorandum written in 1904 for the direction of the trustees of the three charitable foundations already mentioned. 'I feel', he wrote 'that much current philanthropic effort is directed to remedying the more superficial manifestations of weakness or evil, while little thought or effort is directed to searching out their underlying causes.'

Rowntree was a man of gentle ways but of strong convictions. He was an ardent temperance reformer, and in collaboration with Arthur Sherwell wrote four books on temperance questions. In his later years he did much to promote adult education, especially within the Society of Friends. He was also a strong supporter of the League of Nations. From 1868 to 1874 he was an alderman of the city of York, and in 1911 he was made an honorary freeman of the city. The directors of his firm gave to the citizens of York Rowntree Park in memory of their employees who fell in the European War. He died 24 February 1925 at York, and was buried there.

Rowntree was twice married: first, in 1862 to Julia Eliza (died 1863), daughter of Benjamin Seebohm and sister of Frederic Seebohm [q.v.], the historian, and of Henry Seebohm [q.v.], the ornithologist, and by her had a daughter who did not survive infancy; secondly, in 1867 to Emma Antoinette (died 1924), daughter of Wilhelm Seebohm and cousin to his first wife; by her he had four sons and two daughters.

[*The Times*, 25 February 1925; private information.] A. E. WATKIN.

RUSSELL, Sir CHARLES, first baronet (1863-1928), solicitor, born in

London 8 July 1863, was the second son of Charles Russell, afterwards Lord Russell of Killowen [q.v.], lord chief justice of England, by his wife, Ellen, daughter of Joseph Stevenson Mulholland, M.D., of Belfast. Educated at Beaumont College, Windsor, he was admitted a solicitor in 1888, having served his articles with the firm of Hollams, Son, and Coward, of Mincing Lane, E.C. After a few years of partnership with Edward Francis Day, a son of Sir John Day [q.v.], he set up an independent practice in Norfolk Street, Strand, under the firm name of Charles Russell & Co.

In 1893 Russell acted as solicitor to the British agent in the Behring Sea arbitration, the arbitrators being Lord Hannen and Sir John Thompson (for Great Britain and Canada) and representatives of France, Italy, Sweden, and the United States. In that capacity he instructed his father, then attorney-general. As the representative of the eighth Marquess of Queensberry [q.v.] in the proceedings for criminal libel brought against him by Oscar Wilde [q.v.] in 1895, Russell had a further opportunity of showing his ability; and his industry resulted in the accumulation of a body of evidence which brought about the break-down of the prosecution and the subsequent criminal proceedings against the prosecutor. In 1896 Russell was appointed solicitor for the government of the Dominion of Canada, and thereafter he had the conduct of the many cases in the Privy Council in which the Dominion government was interested. He was appointed solicitor to the Stewards of the Jockey Club in 1903.

For some thirty years Russell had a large and varied litigating business in the Common Law and Chancery division and in the Divorce Court. He was essentially a man of the world, and his advice was sought by persons in every station of life. Full of shrewdness and common sense, he was able to foretell what view a jury would be likely to take upon a given set of facts, and he was discriminating in his choice of counsel. He was the first solicitor of standing to instruct (Sir) Edward (afterwards Lord) Carson when he began to practise at the English bar in 1893.

A liberal in politics, Russell stood unsuccessfully for Central Hackney in 1895 and for South Salford in 1910; he sat on the London County Council from 1910 to 1918; and he was on the political committee of the Eighty Club. Actively interested in Roman Catholic charities, he was

chairman of the board of management of the Hospital of St. John and St. Elizabeth, and during the European War he was chairman of the collections committee of the British Red Cross Society, of which Sir Robert Arundell Hudson [q.v.] was a member. In 1916 he was created a baronet with a special remainder to his brothers and their sons, and in 1921 K.C.V.O. and a knight of grace of the order of St. John of Jerusalem. He was a good public speaker, a pleasant companion, and an accomplished host. An enthusiastic member of the Johnson Club, he was a discriminating buyer of Johnsonian relics, and his collection of mezzotint portraits of Dr. Johnson's contemporaries was large and valuable. He died in London after an operation 27 March 1928.

Russell married in 1889 Adah Walmsley, daughter of William Williams, of Glanmawddach, Dolgelley, and granddaughter of Sir Joshua Walmsley [q.v.]. His only daughter, Monica, married her first cousin, Alec Charles Russell (born 1894, the eldest son of his younger brother, Cyril), who succeeded him as second baronet.

An admirable caricature of Russell by 'Spy' appeared in *Vanity Fair* 10 April 1907, and a portrait by P. A. de László is in the possession of his family.

[*The Times*, 28 March 1928; personal knowledge.] T. MATHEW.

RYLE, HERBERT EDWARD (1856-1925), successively bishop of Exeter and of Winchester and afterwards dean of Westminster, was born in London 25 May 1856, the second son of the Rev. John Charles Ryle [q.v.], bishop of Liverpool from 1880 to 1900, by his second wife, Jessy, eldest daughter of John Walker, of Crawfordton, Dumfriesshire. She died when Herbert Ryle was three years old, and in 1861 his father married Henrietta, daughter of Lieutenant-Colonel William Legh Clowes, of Broughton Old Hall, Lancashire, who proved a true mother to her stepchildren. Ryle and his brothers and sisters were brought up in their father's country parishes in Suffolk, first at Helmingham and after 1861 at Stradbroke. Throughout his life Ryle bore the marks of his upbringing in his love of country sights and sounds; and although he outgrew the somewhat narrow evangelical traditions of his home, he remained bound to his father by the closest ties of affection and admiration.

After a year at Eton as an oppidan, Ryle entered college in 1869. In 1875 he

won the Newcastle scholarship, and proceeded to King's College, Cambridge, as a scholar in the same year. An accident at football in 1877 not only deprived him of the chance of running against Oxford in the quarter mile, but also compelled him to take an *aegrolat* degree in 1879. Between 1879 and 1881, however, he won every distinction open at Cambridge to students of theology, including a first class in the theological tripos in the latter year. He was elected a fellow of King's College in April 1881, and thus entered upon twenty years of work as a teacher. He was ordained deacon in 1882 and priest in 1883. An interlude of eighteen months (September 1886-March 1888) spent as principal of St. David's College, Lampeter, enabled him to make proof of his administrative powers; but, apart from this, Ryle's work until 1901 lay at Cambridge, whither he returned from Lampeter on his election (1887) to the Hulsean professorship of divinity.

Ryle's main interest was in the study of the Old Testament, and he strove to commend to successive generations of students the methods and the more assured results of the higher criticism. His lecture-room was crowded. In the words of one of his pupils, 'As a teacher he was so clear and direct and so easy to follow; never any sort of parade of learning, but giving us all the greater impression of real knowledge, and at the same time stimulating us to dig for ourselves' [*Memoir*, p. 93]. During these years Ryle published a number of books connected with his special studies, including *The Early Narratives of Genesis* (1892), *The Canon of the Old Testament* (1892), and *Philo and Holy Scripture* (1895). After his election as president of Queens' College, Cambridge, in 1896 he found little leisure for literary work. Thenceforward, indeed, his Old Testament studies bore scanty fruit, save for his admirable edition of *Genesis* in the 'Cambridge Bible', published in 1914, when he was dean of Westminster.

In these books Ryle revealed the qualities of his mind. They exhibit a painstaking and accurate scholarship; a sound and balanced judgement, inclined to caution rather than yielding to the temptations of specious, but questionable, theories; and a stimulating freshness of treatment. While Ryle was at Cambridge the methods of the higher criticism still provoked widespread misunderstanding and suspicion. But in the face of opposition which was sometimes both unreasonable

and bitter, he took a leading part in laying a sound foundation for the historical study of the Old Testament in England, and in commending to a wider audience the work of other scholars of eminence in the same field. His influence over his pupils was increased by the friendly relations which he established with them; for he was sympathetic and sociable, and almost to the end retained much of the happy spirit of a boy. In all his social intercourse he was greatly helped by his marriage in 1883 to Nea, daughter of Major-General George Hewish Adams.

In December 1900 Ryle was appointed bishop of Exeter, and was consecrated in Westminster Abbey in January 1901. His time at Exeter was short, for he was translated to Winchester in the spring of 1903; but he was indefatigable in his endeavours to get into touch with both clergy and laity, and won their trust and affection in a singular degree. At Winchester he was less fortunate. He had been greatly overworked at Exeter, and in January 1904 the strain showed itself in an attack of *angina pectoris* followed by appendicitis. Unfortunately, within six weeks of his enthronement at Winchester he had issued a letter to the diocese which alarmed high churchmen by the peremptory tone in which it forbade certain ritual practices. This step, together with a mistaken impression that his health rendered him unequal to the burden of his episcopal duties, undoubtedly hindered him in winning the confidence which had been given him so readily at Exeter. Nevertheless, he steadily wore down initial prejudice, and his resignation of the see in 1911 was received with great regret throughout the diocese. As an administrator Ryle was strong, patient, and scrupulously fair. The organization of the diocese was steadily consolidated under his rule, and he left it, as was generally admitted, in a higher state of efficiency than it had ever attained before. His reputation at large may be judged from his appointment as chairman of the commission sent to Sweden in 1909 by the archbishop of Canterbury to investigate the possibility of closer relations between the English and Swedish Churches.

In December 1910 Ryle accepted the offer of the deanery of Westminster. For several months he had been crippled by an affection of the foot, and he reluctantly decided that it was his duty to exchange episcopal work for less exacting duties. He was installed in the Abbey in April

1911, at a time when the building was being prepared for the coronation of King George V. As it proved, his lot was cast in times which never allowed him leisure to resume a scholar's life. The years which he spent at Westminster were, in fact, among the most fruitful of his career. Under his guidance, and with the help of his advisers, the dignity and the beauty of the Abbey services were notably enhanced; and his name is commemorated in the 'Dean Ryle fund', a sum of £170,000 raised for the maintenance of the Abbey in response to an appeal issued by him in 1920. During the European War Ryle himself used to take the daily noontide service of intercession, and was responsible for the many special services held during those anxious years. His carefully prepared sermons were simple in form and direct in style, but of peculiar power. Archbishop William Temple has written of them: 'I do not think I have ever heard such exquisitely beautiful preaching of the simple Gospel' [*Memoir*, p. 205].

Apart from his duties as dean, Ryle's time was much occupied by committee work. As chairman of the so-called 'Grand Committee' of the Representative Church Council, he did much to prepare the way for the passing of the Enabling Act of 1920, while from 1919 to 1925 he was prolocutor of the lower house of the Canterbury Convocation, and there presided over the prolonged debates on the revision of the Prayer Book. His margin of strength was always slender, and in the autumn of 1924 his health broke down completely. After five months in a nursing-home at Bournemouth he returned to the deanery in May 1925; and he died there 20 August. He was buried in the Abbey in a spot close to the tomb of the 'unknown warrior'.

Ryle was a man of fine presence and a gracious courtesy of manner, and was possessed of a quick sense of humour and a wide and ready sympathy. But there was in his nature a strong element of reserve, and he had a scholar's dislike of pretention or self-advertisement. In ecclesiastical matters his standpoint was that of a 'central churchman'. His character was conspicuous for sanity of judgement and strong simplicity of faith. Bishop Francis Paget described him as 'a past master in equity'; and Archbishop Davidson bore witness to 'that gift of lucid vision and Christian common sense which gained for him the quite exceptional

confidence of his brother Bishops' [*Memoir*, pp. xi and xii].

Ryle was created C.V.O. in 1911 and K.C.V.O. in 1921. He had three sons, of whom the eldest died at birth, and the youngest at the age of eight in 1897.

A cartoon of Ryle appeared in *Vanity Fair* 27 March 1912.

[M. H. FitzGerald, *A Memoir of Herbert Edward Ryle*, 1928; private information; personal knowledge.] M. H. FITZGERALD.

SALTER, SIR ARTHUR CLAVELL (1859-1928), judge, was born in London 30 October 1859, the eldest son of Henry Hyde Salter, M.D., F.R.S., of Harley Street, London, by his wife, Henrietta Laura, eldest daughter of the Rev. Edward Powlett Blunt, vicar of Spetisbury, Dorset. He was educated at Wimborne grammar school and King's College, London, and graduated in arts and law. He was called to the bar by the Middle Temple in 1885, and joined the Western circuit in 1886. He took silk in 1904, and was recorder of Poole from 1904 to 1917. Salter unsuccessfully contested West Southwark in the conservative interest at the general election of January 1906, but he was elected at a by-election in the same year for the Basingstoke division of Hampshire, which he continued to represent until 1917. In the latter year he was appointed a judge of the King's Bench division of the High Court and was knighted. He was appointed chairman of the railway and canal commission in February 1928. He died in London 30 November 1928. Salter married twice: first, in 1894 Mary Dorothea (died 1917), daughter of Major John Henry Lloyd, Royal Artillery, by whom he had one son, who was killed in action in the European War; secondly, in 1920 Nora Constance, eldest daughter of Lieutenant-Colonel Thomas Heathcote Ouchterlony, of The Guynd, Arbroath, Forfarshire.

Salter kept steadily before his mind the view that the sole function of a judge is to adjudicate. In his civil judgments he eschewed irrelevant prolixity; so in his conduct of criminal cases he rigorously abstained from attempting to edify the prisoner or the public with moral aphorisms. He was at once too modest and too high-minded to wish to attract attention to himself by brilliant epigram or startling opinion. His brain was of the highest calibre, and he displayed an almost uncanny power of illuminating the dark recesses of a complicated case, and separating the vital from the non-essential.

His judgments contain no unnecessary word, and no word out of place. He saw no useful purpose in the elaborate enumeration of a chain of authorities; reserving his speech for the results, rather than the process of his thought. Having considered a problem from every angle, he would be content with a brief statement of his solution, delivered without circumlocution.

Perhaps Salter's most conspicuous criminal case was the trial of Horatio Bottomley for fraudulent conversion (1922). The case was a very difficult one, involving a search into the most intricate facts and figures, but Salter emerged from it with signal success. He presided with the utmost dignity and ability. His summing-up was masterly, marked by lucidity and conciseness of expression, a narrative in itself complete. Another trial over which he presided, the dramatic circumstances of which arrested public attention, was that of Colonel Rutherford for murder (1919). This case was far from simple in that the prisoner's action seemed to lie in the debatable border-land between hysteria and insanity; but Salter's admirable common sense overcame all difficulties, and directed the case to its just and logical conclusion.

Salter's civil judgments may in some sense be said to be an acquired taste. Their brevity is to be explained by the fact that he desired for them not the admiration of posterity, but the advancement of the law. This understood, they will be found to be replete with the concentrated essence of juristic wisdom. His judgments were seldom reversed, and in most of the cases in which they were reversed much remains to be said in favour of his opinion. A notable illustration of this is the case of *Blundell-Leigh v. Attenborough* (1921). Salter here annexed a qualification to the doctrine that an improper sub-pledge by a pledgee does not determine the bailment as between the pledgee and pledgor so as to entitle the pledgor to demand the return of the chattel pledged without a tender of the amount due on the sub-pledge. But in this case he found a series of facts which seemed to him to fall outside the ambit either of this doctrine or of the Factors Act, a bailee having parted with the actual possession of the chattel prior to entering into an agreement with the bailor to take it on a contract of pledge. In these circumstances Salter held that the bailor was entitled to the unconditional return of the chattel. His decision was

reversed by the Court of Appeal on a different view of the facts, but a considerable body of contemporary learned opinion regarded Salter's reasoning as the more convincing. Previously, in *Whiteley v. McGregor* (1918), Salter took a view of the nature of the contract of hire-purchase which has strong claim to approval. He regarded the act of a hirer who sells the chattel prior to the discharge of all instalments due upon it as a simple determination of a bailment, which confers no right whatsoever in the chattel to the purchaser. The Court of Appeal regarded it as an assignment of a chose in action, entitling the purchaser to keep the chattel on doing what should have been done by the hirer, that is to say, paying the unpaid instalments.

It is, however, because of their very rarity that cases in which Salter met with reversal recur to the memory, for in general the Court of Appeal, as also the Court of Criminal Appeal, regarded his decisions with the utmost respect. A bold paraphrase of Othello's estimate of himself might be applied to Salter—he did the law some service, but owing to his great modesty and devotion to truth few outside the profession which admired and honoured him can know it.

[*The Times*, 3 December 1928; private information.] H. G. HANBURY.

SALVIDGE, Sir ARCHIBALD TUTTON JAMES (1863-1928), political organizer, was born at Birkenhead 4 August 1863, the second son of Archibald Tutton Salvidge, of Sunnyside, West Kirby, by his wife, Sarah, daughter of William Croxton, of Hoylake, Cheshire. He was educated at a local Wesleyan school and at the Liverpool Institute. He entered as a youth the service of Bent's Brewery Company, Liverpool, of which in due course he rose to be the managing director.

Salvidge first came into notice as being interested in politics in 1892, when he was chosen leader of the local conservative democratic party. He built up the Liverpool Working-men's Conservative Association, and ultimately became leader of the party in the city council. He was returned unopposed to the Liverpool council in 1896, and was elected an alderman two years later. In the face of some prejudice, he gradually obtained recognition by his energy and organizing ability as the principal figure in Liverpool conservatism. Nominally he shared the leadership with Sir Charles Petrie, but it was generally

admitted that Salvidge was the real head, commanding as he did the confidence of the party workers in the divisions and wards. His approval was sought for all conservative candidates in the district, whether parliamentary or municipal.

Salvidge turned the Working-men's Conservative Association into a powerful electoral machine, and the value of his assistance was fully appreciated by his party. In 1913 his standing in national politics was such that he was elected chairman of the National Union of Conservative and Unionist Associations. More than once efforts were made to induce him to contest a parliamentary division, but he declined, pleading business as his excuse. He was equally resolute in his refusal to become lord mayor of Liverpool in 1910.

On the outbreak of the European War in 1914 Salvidge abandoned politics and became chairman of the Liverpool advisory committee on recruiting. He supported Mr. Asquith's government, and afterwards the Coalition, to the break-up of which he was opposed. After the general election of 1923, at which a number of Mersey-side conservative seats were lost, he criticized the party leadership, and protested against the country being plunged unprepared into a contest on what he held to be a forlorn issue. This remonstrance was followed by Mr. Baldwin's pledge against the introduction of a general tariff; and, as a result, a number of conservative gains ensued on the appeal to the constituencies in the following year. During the later part of his life Salvidge devoted much time and effort to opposing the labour movement in politics.

Apart from political work, Salvidge was a consistent advocate of the scheme for the Mersey road tunnel, which at the time of his death was in course of construction. Although the idea was not his, he saw the possibilities of the tunnel, and he deserves credit for helping to pilot the scheme through many difficulties.

Salvidge was knighted in 1916, created K.B.E. in 1920, and sworn of the Privy Council in 1922. He was awarded the honorary freedom of Liverpool in 1925, and the honorary degree of LL.D. was conferred on him by the university in 1928.

Salvidge married in 1885 Alice Margaret, daughter of Thomas McKernan, of Liverpool, and had two sons and one daughter. He died at Braxted, Hoylake, 11 December 1928.

A. COCHRANE.

SAMUEL, MARCUS, first Viscount BEARSTED, of Maidstone (1853-1927), joint-founder of the Shell Transport and Trading Company, was born in London 5 November 1853, the second son of Marcus Samuel, a London merchant, by his wife, Abigail, daughter of Abraham Moss, of London. He was educated privately, and began his commercial career as the owner of a small business in Houndsditch, trading principally in painted shells. Other lines were afterwards added, such as curios of all kinds, general produce, and rice. It was during a visit to Japan on behalf of this undertaking that Samuel first became acquainted with the petroleum industry. He took up the business of shipping oil from Russia to the Far East. The chief difficulty of transport up to that time was that steamers could only obtain freights one way: owing to the fact that it was considered impossible to clean them thoroughly, no attempt was made to carry merchandise on the return voyage. Samuel overcame this obstacle by adopting the system of cleaning out the hull with steam, a plan which was suggested to him by a captain in the merchant service. He was thus able to send his steamers home laden with rice and other Eastern commodities. Assisted by the financial support of the Rothschilds, the business became a success, and in 1897 a combination was formed of several firms trading with the East. The concern thus established was called the Shell Transport and Trading Company, the name being taken from Samuel's original business. When the company was formed the capital was £1,800,000: at the time of Samuel's death thirty years later this had increased to more than 26 millions.

For a time the British combination encountered a serious rival in the Dutch Petroleum Company, which obtained its oil from Java and Borneo, as the difference in freight-rates enabled the latter firm to undersell the Russian oil supplies. In consequence the Shell Company turned its attention to Borneo, and began to operate properties there on its own account. This undertaking proved much more costly than had been anticipated, and for a time the Shell Company had an arduous struggle. The issue of additional capital, however, enabled it to bring its new sources of supply to the producing stage. At this point, realizing the future importance of oil both for the navy and for the merchant service, the Shell Com-

pany invited the co-operation of the British government in its schemes, but these overtures met with no response. The success of the Borneo developments caused the Dutch Company to prefer partnership to competitive trading, and in 1907 the important step was taken of amalgamating the British and Dutch interests into a single large oil-producing, refining, and distributing organization.

Samuel was knighted in 1898 for services rendered in the salvage of H.M.S. *Victorious*. In February of that year this vessel grounded off Port Said, and she was pulled off by two of the Shell Company's tugs. Owing to the resources of his company, he was of assistance to Great Britain in the European War. Not only was every form of petroleum made available wherever it was required either for the land or the sea forces, but a petroleum distillate, which formed the basis of the high explosive T.N.T. (trinitrotoluene), was provided in large quantities. A refinery was established near Bristol for this purpose, the erection of the works being carried out, owing to Samuel's energy, in a few weeks.

Although he was one of the first to appreciate the value of oil fuel as a substitute for coal, Samuel's contention was that the burning of oil under boilers was a waste of power. He was always an advocate of the internal combustion engine for ships, and his efforts were directed to proving that this type of propulsion could be made suitable for large vessels. During the War he formed a company to test this possibility by experiment and inquiry.

Samuel was at one time a prominent figure in the life of the city of London. His municipal career began in 1891 when he was elected alderman of the Portsoken ward. He was chosen as sheriff in 1894, and was lord mayor of London in 1902-1903. In this capacity he presided over the committee which formulated the scheme for the Port of London authority. He carried out his duties as lord mayor with zest, paying a state visit to Brussels and other places, as well as entertaining the French president at the Guildhall. When his year of office came to an end he was created a baronet for his municipal and other services.

Samuel's benefactions to hospitals and other philanthropic schemes were considerable. In 1895 he bought for his residence the Mote, near Maidstone. When the European War broke out, he

turned this house into a hospital for non-commissioned officers, continuing to live there and interesting himself in the welfare of the patients.

In 1921 Samuel was raised to the peerage as Baron Bearsted, of Maidstone, and in 1925 was advanced to a viscounty. He received the freedom of Sheffield and of Maidstone and honorary degrees from the universities of Cambridge and Sheffield in 1925 and 1924 respectively.

Samuel married in 1881 Fanny Elizabeth, only daughter of Benjamin Benjamin, and had two sons and two daughters. The younger son was killed in the War; the elder, Walter Horace (born 1882), succeeded his father as second viscount. His wife died 16 January 1927, and he only survived her by a few hours, dying at his home in London 17 January 1927.

A. COCHRANE.

SANDERSON, FREDERICK WILLIAM (1857-1922), schoolmaster, was born at Brancepeth, co. Durham, 13 May 1857, the youngest son of Thomas Sanderson, of Brancepeth, who was employed in the estate office of Viscount Boyle, by his wife, Margaret Andrews. He received his early education at the village school of his native place, but later he became a student teacher in the neighbouring village of Tudhoe. In 1876 he entered Durham University as a theological student, was awarded the Van Mildert theological scholarship in 1877, and obtained a first class in mathematics and physical science in the B.A. examination in the same year. In 1881 he was elected fellow of the university. In 1870 he gained an open mathematical scholarship at Christ's College, Cambridge, was bracketed eleventh wrangler in 1882, and, in the same year, his performance in the examination for Smith's prizes, in which he was bracketed third, was highly commended.

Sanderson remained at Cambridge for some years, coaching and lecturing at Girton College, until, in 1885, he was appointed an assistant master at Dulwich College. The instructions he received were to develop the teaching of chemistry and to introduce the study of physics, but a year or two after his appointment he began an experiment which was to prove one of his most successful ventures, namely, the formation of what was called the engineering side of the school. The syllabus of work for this side included applied mechanics and physics, workshop practice,

and mechanical drawing. The work was not that of a technical school, but the experiments performed were on a larger scale than usual in public schools, and the apparatus consisted of actual working engines, dynamos, and testing machines, and not mere models.

In 1892 Sanderson was elected headmaster of Oundle School. From the day of his appointment he so completely identified himself with the school that it is impossible to separate the life of the man from the life of the school. The school, an old foundation dating back to the fifteenth century, had, like most of the old schools, experienced vicissitudes. In 1876 the Grocers' Company, its governing body, had brought out a new scheme for the working of the school which for some years had been very successful. But a period of depression had followed, and there were only 92 boys at the time of Sanderson's appointment. He was appointed with the definite object of reorganizing the teaching, introducing fresh subjects of study, and, if possible, not only checking the decline but also raising the status of the school and giving it fresh life. In this he was completely successful. The numbers in the school rose to 500 by 1920 and, by the time of his death, the reputation of Oundle was secure.

Immediately on his appointment Sanderson began his reforms. Science and engineering sides were established, at first consisting of only a few boys; but it was soon found that more and more boys took to these subjects and that many who found no interest in, and showed no capacity for classics, were by no means deficient in intelligence when confronted with the problems and inspiration of science. New laboratories and workshops were fitted up; and when after a few years Oundle boys gained open scholarships in science at the universities, and those who entered engineering professions found the work they had done at school was of real value, the new subjects began to assume an established position in the school.

As numbers increased fresh subjects were added. What was more important, as it was found possible to have whole forms of boys working on the same lines, the stimulus of numbers produced a very marked effect. New laboratories and workshops were built, machinery of a heavier type was installed, and it was found possible in 1905 to build a reversing engine for a 4,000 h.p. marine engine. The rough castings were supplied by a

firm of marine engineers, but the whole of the fitting and erecting was done in the school workshops. Finally, a full working test was carried out and, when this proved satisfactory, the engine was dispatched to the ship-yard and, without any alteration, installed in its appointed place. Other work of a similar nature followed. The system adopted was that of ordinary engineering shops, except that the staff (of boys) employed in testing and erecting was the same as that employed for fitting. Each boy had his job for which he alone was responsible; but the result of his efforts had to be combined with that of all the others, and the final success depended upon the independent work of each individual. This co-operative work appealed very strongly to Sanderson, and he attempted to introduce the method in other subjects. In the library it was notably successful. A subject for study was chosen, the boys in a form were divided into small groups each of which studied one aspect of the subject, and the results of their work were collected and combined into one whole. Each small group gained a detailed knowledge of that aspect of the subject which was its particular care, but each knew that its work was only a part, though an essential part, of the whole. Each was naturally interested in the work of all the other groups and gained a good general grasp of the whole subject. By this method it was possible to tackle a much bigger subject than would have been practicable if all the boys had done exactly the same work.

During the European War the school workshops were converted into munition shops and many schemes were tried in order to increase 'output'. The experience gained of running one department of the school on factory lines was most instructive, and many of the lessons learnt were afterwards applied to other departments.

After the War some portion of Sanderson's time was devoted to lecturing and addressing various societies, explaining his views on education and the part that schools and education should take in the work of national reconstruction; the subjects were often controversial and gave rise to much discussion. It was at the close of such an address, delivered in London on 15 June 1922, that Sanderson died from a sudden heart attack.

Sanderson married in 1885 Jane, daughter of Tom Hodgson, of Broughton Hall, Cumberland, and had two sons and one daughter. A portrait in oils, painted

from a photograph, hangs in the hall of Oundle School.

H. M. KING.

A. D. NIGHTINGALE.

SANDERSON, THOMAS HENRY, **BARON SANDERSON**, of Armthorpe, Yorkshire (1841-1923), civil servant, was born 11 January 1841 at Gunton Park, Norfolk, which had been rented from Lord Suffield by his father. He was the second son of Richard Sanderson, for many years conservative member of parliament for Colechester, by his wife, the Hon. Charlotte Matilda, elder daughter of Charles Manners-Sutton, first Viscount Canterbury [q.v.], Speaker of the House of Commons 1817-1835. The Sandersons were a Yorkshire yeoman family whose head-quarters were at Armthorpe, near Doncaster. Thomas Sanderson was sent to Eton, but in 1857 his father failed in business, dying not long afterwards, and he had to leave school when only sixteen years old. In 1859, after passing the recently instituted competitive examination, he was appointed to a junior clerkship in the Foreign Office.

Sanderson remained at the Foreign Office for forty-seven years, his only service abroad being with Lord Wodehouse's mission to King Christian IX of Denmark in 1863-1864, and at Geneva during the Alabama arbitration in 1871. His qualities are well described in a dispatch addressed to Lord Grawville by Lord Chief Justice Cockburn, the British arbitrator: 'His perfect mastery of the subject of the Alabama claims, extending even to the most minute details; his general information, his great intelligence, his indefatigable industry, his readiness, only excelled by his ability, to afford assistance, have excited my warmest admiration and deserve my sincerest acknowledgements.'

These qualities, enriched by long experience, and coupled with an admirable gift for the composition of official dispatches, made Sanderson an invaluable public servant. He was private secretary to two secretaries of state for foreign affairs, the fifteenth Earl of Derby from 1866 to 1868 and from 1874 to 1878, and the second Earl Granville from 1880 to 1885. He was promoted senior clerk in 1885 and appointed assistant

under-secretary in 1880 and permanent under-secretary in 1894, a post which he held until 1906. He was created C.B. (1880), K.C.M.G. (1887), K.C.B. (1893), and G.C.B. (1900). He was raised to the peerage as Baron Sanderson, of Armthorpe, co. York, in 1905.

As permanent under-secretary, Sanderson was an efficient administrator of the old school. He took care that work should be done with accuracy and rapidity, and he insisted successfully on good and clear drafting, setting up as a model for his juniors Wellington's dispatches. He even issued in 1891, in pamphlet form for the instruction of juniors, *Observations on the Use and Abuse of Red Tape*. The views expressed are sound, especially as regards the use of ordinary official language, and there is some humour about them, but the writer obviously did not contemplate any change of system.

Sanderson's conception of his own duties made him slow to offer opinions, but it is true that, while his colleagues generally considered this a serious defect, Lord Salisbury certainly, and Lord Lansdowne probably, would not have welcomed any great forwardness in this respect. It was natural, therefore, that he should not easily realize that reforms of organization were necessary, and it was only a short time before his retirement that he consented to appoint a committee of inquiry. The revolution, by which the diplomatic staff were relieved of the routine duties which occupied the whole time of all but a very few, and were allowed the use of their brains, only bore fruit after Sanderson's departure.

As a chief, Sanderson's justice and real kindness of heart were sometimes obscured by an irritability due probably to poor physique, and his popularity was consequently somewhat impaired. Nevertheless, he was a great official.

Although Sanderson served all secretaries of state alike with complete loyalty, his ties were closest with Lord Derby. After their official connexion had ended (1878) he continued to act as Lord Derby's general adviser, and by the earl's will he was appointed co-executor with Lady Derby and received a legacy of £10,000. In 1893 Sanderson published a volume of Lord Derby's speeches, prefixing an introduction in which he praised his friend's wisdom, impartial judgement, and devotion to the cause of international peace.

In private life 'Lamps', to give him the name by which he was universally known

throughout the service, was distinguished by a great gift for friendship and a very conscientious recognition of its claims. He was never married, but was a devoted son and brother. Like all men high up in the Foreign Office he was obliged to work many hours at home as well as in Downing Street, but he found time to entertain a good deal and to read widely. He also, rather surprisingly, played the flute. 'This', Lord Cromer used to say, when he thought that some dispatch would disturb the Foreign Office, 'will send Lamps's flute into a minor key.'

After his retirement Lord Sanderson served on various committees, such as the committee on Indian emigration to the Crown colonies, of which he was chairman (1909-1910), but increasing blindness made much public work impossible. He died in London 21 March 1923, when the barony became extinct.

[*The Times*, 22 March 1923; Foreign Office records; private information; personal knowledge.] J. TILLEY.

SANDERSON, THOMAS JAMES COBDEN- (1840-1922), bookbinder and printer. [See COBDEN-SANDERSON.]

SANDYS, Sir JOHN EDWIN (1844-1922), classical scholar, was born at Leicester 19 May 1844, the fourth son of the Rev. Timothy Sandys, of the Church Missionary Society, Calcutta, by his wife, Rebecca, daughter of Joseph Swain, of Leicester. He was educated at Repton, whence he won a scholarship at St. John's College, Cambridge, in 1863. His academic career was distinguished. He obtained a Bell scholarship (1864) and a Browne medal for Greek ode (1865), was twice Porson prizeman (1865, 1866), twice Members' prizeman for Latin essay (1866, 1867), and in 1867 was senior classic. He was elected fellow of his college in the last-mentioned year, when he was also appointed to a lectureship at St. John's, which post he held until 1907. Sandys's official connexion with his college was always close, for he was appointed to a tutorship in 1870, and held the office until 1900. In the university, his scholarship was early recognized by election to the post of public orator in 1876 and, after his retirement in 1919, he was given the title of orator emeritus.

In the academic world, Sandys was accorded a full share of honours, including honorary doctorates of Dublin (1892), Edinburgh (1909), Athens (1912), and

Oxford (1920). From Cambridge, where he had already taken the Litt.D. degree in 1886, he received the honorary degree of LL.D. in 1920. Added to these distinctions was a fellowship of the British Academy (1909), and a commandership in the order of the Saviour (1914)—an honour which gave him especial pleasure, as a recognition by modern Greece of his services to classical literature and archaeology.

For Greece was always Sandys's spiritual home; and, although his main interest lay in Greek oratory and poetry, he emphasized, both in his lectures and editions, the value of Greek art. But Sandys was much more than a Grecian; he exercised his great knowledge of the classics in papers on such subjects as *The Literary Sources of Milton's Lycidas* (for the Royal Society of Literature, 1914) and *Roger Bacon* (for the British Academy, 1914). No less than Sir John Cheke and Roger Ascham, of his own college, he was a great humanist.

Sandys's published work was remarkable in both quantity and quality. He worked rapidly, without loss of accuracy—indeed, his scholarship may be called impeccable. In his early years, he devoted his chief study to the Greek orators, his first edition being Isocrates, *Ad Demonicum et Panegyricus* (1868), followed by *Select Private Orations of Demosthenes* (1875). A succession of editions of the *Leptines* (1890), *Philippics* (1897 and 1900), and other Demosthenic speeches, brought him a reputation as the foremost editor of Greek orators; and to these he added Cicero's *Orator* (1885), besides valuable work on Aristotle's *Rhetoric* in editing the *Commentary* by E. M. Cope (3 vols., 1877) and the *Translation* by Sir R. C. Jebb (1909). His interest, however, was by no means confined to rhetoric: one of his early editions was the *Bacchae* of Euripides (1880), the illustrations of which showed the editor's archaeological taste and knowledge. This work passed into a fourth edition twenty years after (1900). In 1903 he edited the newly discovered *Constitution of Athens* by Aristotle—an edition which has been ranked very high by competent scholars; and, towards the end of his life, he contributed a translation of Pindar to the Loeb classical library.

Sandys's greatest book, however, was undoubtedly the *History of Classical Scholarship*, which he began in 1900, and finished in 1908, although a book of such magnitude and learning might well have been the lifework of an ordinary man. The

three volumes embrace the history of all scholarship from the sixth century B.C. to the year of publication, ending with an appreciative notice of Walter George Headlam [q.v.], who died in 1908. They are not only marked by great erudition, but are eminently readable, and likely to interest many who are outside the circle of classical scholars. His *Harvard Lectures on the Revival of Learning* (1905) show equal learning, on a different scale.

The academic public knew Sandys best as the orator who during more than forty years had presented nearly 700 distinguished men for honorary degrees, with speeches which, of their kind, were almost perfect. His style was modelled on Cicero, and could well pass the most stringent test of Latinity both in rhythm and language; but his speeches were as remarkable for their matter as for their manner. However eulogistic, Sandys went straight to the point, picking out the real merits of the person presented. He himself was honoured by a knighthood in 1911.

Sandys was known to many, but intimate, perhaps, with few. His pupils were apt to think of him as 'donnish', cold and impassive, unapproachable, and unsympathetic. This was largely a form of self-protection: he was extremely shy, and never able to take, or simulate, any great interest in the daily life and amusements of the average undergraduate. But beneath a rather frigid exterior, his friends and many of his pupils recognized the generosity of the man, and his warmth of affection for those whom he liked and trusted.

Sandys married in 1880 Mary Grainger, daughter of the Rev. Henry Hall, vicar of St. Paul's church, Cambridge; there were no children of the marriage. He died at Cambridge 6 July 1922. By his will, he left over £8,000 to Cambridge University for the purpose of founding a studentship for research in the language, literature, or other branches of classical study. He was also, in various ways, a benefactor of his college, to which he was loyally devoted.

[*The Times*, 7 July 1922; J. S. Reid, *Sir John Edwin Sandys, 1844-1922*, in *Proceedings of the British Academy*, vol. x, 1921-1923; N. G. L. Hammond, *Sir John Edwin Sandys, 1834-1922*; personal knowledge.]

E. E. Sikes.

SANTLEY, Sir CHARLES (1834-1922), singer, was born at Liverpool 28 February 1834, the elder son of William

Santley, an official in the employ of the Liverpool corporation and an organist and wood-wind player, the descendant of an old Welsh family, by his wife, Margaret Fletcher, who came of Cumberland stock. Santley was educated at the Liverpool Institute. As a boy he sang alto in the choir of the Unitarian Ancient Chapel, Toxteth Park. He passed the examination for admission among second tenors (later he transferred to the basses) of the Liverpool Philharmonic Society on his fifteenth birthday, and in the same year (1849) took part in the concerts at the opening of the Philharmonic Hall. Within a few years he was singing as an equal with the best-known soloists of the day, with the exception, perhaps, of Luigi Lablache [q.v.] who was shortly to retire. He also learned the piano and later the violin, on which he obtained such proficiency as to become leader of the second violins in a symphony orchestra.

As a youth, working for a living in the book-keeping department of large wholesale provision and leather merchants' houses in Liverpool, Santley devoted all his spare time to music, and his voice early developed into a fine baritone. The elder Santley, urged by the violoncellist Joseph Lidel, allowed his son to abandon commerce and become a professional singer. After giving a farewell concert on 15 October 1855, he left Liverpool for Milan, where he placed himself under Gaetano Nava, who later bequeathed to Santley his library. Santley made his début in opera at Pavia in 1857, in the part of the Doctor in *Traviata*. He also appeared at the Santa Radegonda Theatre at Milan in the same year. On the advice, however, of Henry Fothergill Chorley [q.v.], whom he met in Milan, he returned to England in October 1857. Arriving in London, Santley was engaged by John Pyke Hullah [q.v.] to sing the part of Adam in *The Creation* at St. Martin's Hall, Long Acre, on 16 November 1857, and made an immediate impression. After further studies in singing with Manuel Garcia [q.v.] and in acting with Walter Lacy [q.v.], he entered on a career as a singer probably unparalleled for length, versatility, and distinction. He appeared in opera in English (Pyne and Harrison Company), at Her Majesty's Theatre, in 1859, and in Italian opera (*Il Trovatore*) at Covent Garden, in 1862. Thereafter he sang in English and Italian opera, in London, Manchester, and elsewhere in England, in Dublin, Milan (La Scala

Theatre), Barcelona, and in America, vindicating his right to rank with such artists as Thérèse Tietjens and Ilma de Murska, and being a tower of strength to the Carl Rosa and Pyne and Harrison companies, as well as to John Hollingshead [q.v.] in an important English season at the Old Gaiety Theatre in 1870.

Among Santley's notable appearances may be mentioned Valentine in the first performance (1863) of *Faust* in England, which was so successful that Gounod wrote especially for him, at his suggestion, the air 'Even bravest heart'; the title-role in Ambroise Thomas's opera *Hamlet*, with Christine Nilsson as Ophelia (1869); and Vanderdecken in the *Flying Dutchman* (1870), the first Wagner opera ever given in the English-speaking world. His last appearance in opera was in this part in 1876. Santley's first festival engagement was at Birmingham in 1861, and from that time he was a prominent figure at all festivals, where his singing of Handelian numbers was always a noteworthy feature, as also was his dramatization of the title-role in *Elijah*, which he sustained for over half a century. He also made tours in Australia (1893-1899), New Zealand, South Africa (1893, 1903), and Canada. No sort of vocal music on any concert platform came amiss to him, whether Italian arias, with Grisi and Mario as colleagues, or *lieder* with Madame Schumann and Joachim, or French songs, or English, Irish, and Scotch ballads, homely, dramatic, or humorous—he excelled in them all.

In 1871 Santley received the gold medal of the Royal Philharmonic Society. His artistic jubilee was celebrated on 1 May 1907 by a concert at the Royal Albert Hall. When upwards of eighty years of age he sang with much of his old mastery at a concert at the Mansion House in aid of the Belgian Refugees' fund in February 1915.

Santley's voice was one of great beauty and carrying power, of extensive compass, and perfectly even. His technique in scales, roulades, &c., was remarkable, his enunciation in various languages and in dialect singularly clear, and his declamation, which showed complete realization of the meaning of the text, eloquent, and in accordance with the canons of the art of singing. As a man, while outspoken where inefficiency or anything that did not 'ring true' was concerned, he was a staunch and generous friend and ever ready to hold out a helping hand. A late instance of this was his active interest in

arrangements for concerts for the troops during the European War.

Santley published three books: *Student and Singer* (1892), *The Art of Singing* (1908), and *Reminiscences of my Life* (1909), written with characteristic humour and containing criticisms and advice of value. He also composed some works for services of the Roman Catholic Church, and a berceuse for orchestra was produced during his Australian tour. A collection of Santley relics—early letters, programmes of state concerts, &c.—is preserved in the Liverpool Corporation Library.

Santley joined the Church of Rome in 1880. In 1887 Pope Leo XIII made him knight commander of the order of St. Gregory the Great. He was knighted in 1907. He died in London 22 September 1922. A leading article in *The Times* (23 September) referred to him as a great singer, creator of a classical epoch, to whom the English people had granted the respect due to a high-minded gentleman and a simple, devout Christian.

Santley was twice married: first, in 1858 to Gertrude (died 1882), daughter of John Mitchell Kemble [q.v.], the historian; by her he had two sons and three daughters; secondly, in 1884 to Elizabeth Mary, daughter of George Rose-Innes, by whom he had one son. His eldest daughter, Edith, was well known as a concert singer.

J. M. LEVIEIN.

SARGEAUNT, JOHN (1857-1922), teacher and scholar, was born at Irthlingborough, Northamptonshire, 12 August 1857, the eldest son of John Barneby Sargeaunt, barrister-at-law, by his wife, Elizabeth, daughter of the Rev. William Drake, curate-in-charge of St. Giles's church, Northampton. He was educated at Bedford grammar school under James Surtees Phillpotts, and in 1876 went up with a classical scholarship to University College, Oxford, of which George Granville Bradley was then master and Samuel Henry Butcher senior classical tutor. He obtained a first class in classical moderations

(1878) and a second class in *literae humaniores* (1880). He was president of the Union Society in 1881.

On leaving Oxford, Sargeaunt went as a master to Inverness College, and in 1885 became master of the classical sixth form at Felsted School. Five years later, on the recommendation of Dr. Bradley, then dean of Westminster, Dr. William Gunion Rutherford [q.v.], headmaster of Westminster School, offered Sargeaunt a place on his staff, and in January 1890 Sargeaunt began his work there as master of the classical sixth form. That form is not the highest division in the school, for Westminster preserves the seventh form of Dr. Busby's day. Sargeaunt held his post for nearly twenty-nine years with a distinction which made him one of the select company of schoolmasters who enjoy a reputation and a memory far wider than the field of their main work.

Sargeaunt's exceptional capacity as a teacher was founded not only upon the versatility of his learning but also upon the breadth of his tastes. Fisherman, mountaineer, botanist, and gardener, he was also archer, amateur actor, and devotee of the chessboard and bridge-table. He was an antiquary and an ardent genealogist. He had a wide and thorough command of Greek and Latin literature, a lifelong passion for poetry, and a skilled and sensitive appreciation of English letters. He was most at home in the eighteenth century. It almost follows that he was first and foremost a Virgilian. The chief of his familiars was Dr. Johnson, whose distaste for music he shared, though not his toryism. All Sargeaunt's resources were at the command of a masterly memory, and all contributed copiously to his teaching. It was true in a narrow sense that he taught without method or discipline. He could afford to indulge his unpedagogic aversion from penalties, for he enjoyed an effortless hold upon boys and their interest, and boys were eager to justify his quiet assumption that they were responsible fellow-learners. The method was equally free. Sargeaunt taught by digression: there was no saying where the play of illustration, quotation, and parallel, not without dramatic impersonation and declamation at times, might not carry a lesson. It was not a system at work, but a personality, and the end was attained when a boy became fired with the determination to seek out Sargeaunt's treasures for himself.

Sargeaunt was a bachelor and, with his

easy, humorous temperament, a clubbable man. He availed himself fully of the social and literary opportunities which London offers. He was a member of the Literary Society, sometime 'prior' of the Johnson Club, and an original member of the Pepys Club.

Sargeaunt, claiming that 'boys have a right not to be taught by a sexagenarian', retired at Christmas 1918 to a small house which he had built near Fairwarp in Sussex. He intended to employ his leisure as an additional inspector under the Board of Education, in local government, and in writing. But in little more than three years a sudden illness cut short his life. He died at Hove 20 March 1922, and was buried in Brighton cemetery.

Sargeaunt's published output, like that of many who have given their lives to teaching, leaves too scanty a memorial of his scholarship. His principal works were the *Annals of Westminster School* (1898), an excellent example of lightly borne erudition, and an edition of the restored text of *Dryden's Poems* (1910). His observation of the annual Latin play on the Westminster stage is reflected in the translation and edition of the plays of Terence, which he contributed to the Loeb classical library in 1912. He contributed two essays to the *Johnson Club Papers* in 1899, and was joint-editor with Mr. George Whale of two volumes of the *Club's Papers* (1899 and 1920). He was also the author of *Virgil's Pastorals in English Verse* (1900), an edition of Pope's *Essay on Criticism* (1909), a little book on the *Trees, Shrubs and Plants of Virgil* (1920), an important tract on *The Pronunciation of English Words derived from the Latin* (1920), and of various school text-books of the Latin and English classics. At the time of his death he had completed a selection of his poems, posthumously published under the title of *Westminster Verses* (1922), and a translation of the *Odyssey* into English hexameters.

[*The Times*, 23 and 24 March 1922; Memoir by Dr. James Gow, prefixed to *Westminster Verses*, 1922; *The Elizabethan* (magazine of Westminster School), April and November 1922; personal knowledge.]

R. M. BARRINGTON-WARD.

SARGENT, JOHN SINGER (1856-1925), painter, was born at the Casa Arretini in Florence 12 January 1856, the second (but eldest surviving) child and only son of FitzWilliam Sargent, of Gloucester, Massachusetts, and Boston, a

distinguished surgeon attached to Wills Hospital, Philadelphia, from 1844 to 1854, by his wife, Mary Newbold, only child of John Singer, of Philadelphia. The Sargent family is descended from William Sargent who emigrated from Gloucester, England, to America in the seventeenth century and is first mentioned in 1678, as a resident of Gloucester, Massachusetts; while the descent of the Singer family can be traced from Caspar Singer, a native of Alsace-Lorraine, who settled in America in 1730. Mrs. FitzWilliam Sargent was a highly cultured woman, artistic as well as musical; and it was owing to her influence that in 1854 her husband, at the early age of thirty-four, gave up his practice—which had already brought him independent means, supplemented after his marriage by his wife's personal fortune—and went to live with her in Europe, settling first in Florence. After the birth of their only son, three daughters were born to Dr. and Mrs. Sargent, two of whom survived infancy.

John Sargent's early life was spent with his parents in making sojourns of varying length in different countries of Europe, chiefly however in Italy and France. Much care was expended on his education, and especially on his musical training. Originally intended for a naval career, his artistic inclinations were not slow in declaring themselves. Among those who first gave them guidance were, during a stay at Mürlen in the summer of 1868, Joseph Farquharson, R.A., who was then a young artist some ten years older than Sargent; and, during the winter of 1868-1869 in Rome, the landscape painter Feodor Karl Welsch (1829-1904), a pupil of Felix Ziem and Alexandre Calame, who had lived for eight years in America. During the winter of 1870-1871 Sargent studied at the Accademia delle Belle Arti at Florence, which was pronounced by him shortly afterwards to be 'the most unsatisfactory institution imaginable'; but although by now it had been decided that he was to follow the career of a painter, it was not until May 1874 that his artistic training was taken seriously in hand. As shown by a letter from him to Heath Wilson, written almost three weeks later (12 June 1874), he at that time (not, as has been stated, in October), entered the studio, in Paris, of Carolus Duran, one of the leading portrait-painters of the time and the artist who was to have the most far-reaching influence on Sargent's development. Later in the same year, he

was also admitted to work at the *École des Beaux-Arts* under Adolphe Yvon. To the next year (1875) belongs Sargent's first serious effort as a portrait-painter in oils, his portrait of Mr. Benjamin P. Kissam (now in the possession of Mrs. A. C. Train, U.S.A.). In May 1876 he sailed with his mother and sister Emily for his first visit to America, returning to Paris in October; and the next year (1877) he sent his first contribution to the Salon, a portrait of Miss Watts, which brought Sargent much praise. In the Salon of 1878 he followed up this success with his picture 'En route pour la pêche' (now in the Corcoran Gallery of Art, Washington), which was awarded the *mention honorable*.

Sargent had by now established for himself a recognized position among the younger artists of Paris. To his more notable works during the next few years belong, among portraits, that of Carolus Duran (Salon, 1879), 'Madame R. S.' ('a Chilean lady', Salon, 1881, awarded the second class medal), the 'Lady with the Rose' (Miss Burekhardt, also Salon, 1881), 'Mrs. Valle Austin' (Salon, 1882), and the 'Daughters of Edward Boit' (Salon, 1883, now in the Museum of Fine Arts, Boston, U.S.A.). Among subject pictures are the 'Fumée d'Ambre Gris' (Salon, 1880) and 'El Jaleo' (Salon, 1882, now in the Isabella Stewart Gardner Museum, Boston), which reflect the artist's experiences during a journey to Spain and Morocco in 1879-1880. While in Spain, Sargent executed many copies of works by Velazquez; and in the spring of 1880 he copied paintings by Frans Hals at Haarlem. For all this interest in the study of the old masters, he was yet enthusiastically identified with the art movements of his day; and it is on record that during his Paris years, in 1881, he described himself as an impressionist and an 'intransigent', entirely given up to the faithful reproduction of 'les valeurs'. His admiration for Claude Monet was, on the testimony of that painter himself, forcibly expressed as far back as about the year 1876.

The year 1884 was fraught with destiny for Sargent, for in the spring he exhibited at the Salon his portrait (begun in 1883) of Madame Gautreau, a celebrated Paris beauty; and the picture, daringly conceived in a spirit of simplification which is, perhaps, not untinged with sophistication, achieved on the occasion of its public exhibition a veritable *succès de scandale*. The picture is now in the Metropolitan Museum

of Art, New York, and an unfinished life-size variant hangs in the Tate Gallery. The storm of vituperative criticism which it met with had to some extent the effect of making Paris uncongenial to Sargent; he spent the summer of 1884 in England, which he had visited twice before and where, in 1882, he had first exhibited at the Royal Academy. The main artistic result of his sojourn in England was a portrait group, 'The Misses Vickers' (Salon, 1885, Royal Academy, 1886). After a brief return to Paris he settled in London at the beginning of 1885, taking J. M. Whistler's former studio at 13 Tite Street, Chelsea (subsequently renumbered 33 Tite Street), the house which was to remain his permanent home for the rest of his life. The central achievement of Sargent's early English days is his study of childhood, 'Carnation, Lily, Lily, Rose', painted at Broadway, Worcestershire, during the autumn of 1885 and the summer of 1886. The picture, exhibited at the Royal Academy in 1887 and immediately purchased by the Chantrey trustees, was Sargent's first considerable public success in England. In September 1887 he went to America in order to carry out a commission for a portrait of Mrs. Henry G. Marquand; he spent the winter of 1887-1888 mainly at Boston where, in December 1887, the first public exhibition of pictures by him held in America took place at the St. Botolph Club.

After his return to England in 1888 Sargent, with untiring energy and industry, continued his work as a portrait-painter, eventually gaining among his contemporaries in that department of painting an international prestige which is almost without parallel. He was a regular exhibitor at the Royal Academy, and was elected A.R.A. in 1894 and R.A. in 1897, his diploma work being 'Interior in Venice' (1899). Among his more outstanding successes as a portrait-painter during the period of his life which came to a close with the outbreak of the European War in 1914, there may be mentioned 'Miss Ellen Terry as Lady Macbeth' (1889, now in the Tate Gallery), the Spanish dancer 'Carmencita' (1890, now in the Musée du Luxembourg, Paris), 'Lady Agnew of Lochnaw' (1893, now in the National Gallery of Scotland), 'Coventry Patmore' (1894, now in the National Portrait Gallery), 'W. Graham Robertson' (1894), 'Mrs. Carl Meyer and Children' (1896, now in the Tate Gallery), '(General Sir) Ian Hamilton' (1898), 'Lady Elcho, Mrs.

Adeane and Mrs. Tennant' (1900), 'The Misses Hunter' (1902, now in the Tate Gallery), 'Lord Ribblesdale' (1902, now in the Tate Gallery), 'The Marlborough Family' (1905), 'Cora, Countess of Stratford' (1908), 'The Earl of Wemyss' (1909), and 'Henry James' (1918, now in the National Portrait Gallery). In this connexion mention should also be made of the series of nine portraits of Mr. Asher Wertheimer, the well-known Bond Street art-dealer, and his family which Sargent began in 1898 and which is now in the Tate Gallery.

Although Sargent during the period under review mainly devoted himself to portrait-painting he undertook, as far back as 1890—as part of an ambitious scheme with which other painters were also associated—to decorate the special libraries floor in the Boston Public Library with a series of paintings which it was eventually decided were to have as their subject 'The development of religious thought from paganism through Judaism to Christianity'. This great undertaking absorbed a considerable part of Sargent's energies for more than a quarter of a century, and was not finished until 1916. Sargent having made provision for the inclusion of a number of reliefs in his scheme of decoration, carried these out himself: to this series belongs a 'Crucifixion' of which the original bronze was presented by his two surviving sisters, as a memorial of their brother, to St. Paul's Cathedral, London, while another version is in the Tate Gallery. Sketching in oil and water-colour during his holidays in England and abroad still further added to the activities of Sargent's well-filled life. His work as a water-colour painter owed much to the inspiration of Hercules Brabazon Brabazon [q.v.], with whom he became acquainted in 1886 or 1887.

When the European War broke out Sargent was on a painting tour in the Austrian Tyrol; as an American citizen, and so at that time a neutral, his personal freedom was not interfered with, and it was not until November 1914 that he returned to London. The year 1915 was spent by him in England, but early in 1916 he went to America and stayed there for about a year. It was during this sojourn that his work for the Boston Library was finished; and he also now undertook to carry out the decoration of the rotunda of the Museum of Fine Arts in Boston—a work which continued until 1921 and was followed by the decoration of the

main staircase and library of the same building, which was completed by the time of his death. In June 1918 Sargent, in the company of Henry Tonks, Slade professor of fine art in the university of London, paid a visit to the war zone in France which lasted until the end of October. During this visit he witnessed in August at a dressing station near Arras the scene which provided the subject for his great picture 'Gassed', which was completed the same year, exhibited at the Academy in 1919, and is now in the Imperial War Museum, South Kensington. His work in connexion with the War also includes a large portrait-group 'Some General Officers of the Great War' (1922, now in the National Portrait Gallery) and two decorative panels in the Widener Memorial Library, Harvard University, Cambridge, Massachusetts (1922). Sargent never wholly gave up portrait-painting, although his output in that province became much restricted towards the end of his career; and to the very last he continued to produce rapid portrait-sketches in charcoal.

Official and academic recognition was extended to Sargent in large measure and from numerous quarters. He received the honorary degrees of D.C.L. from Oxford University in 1904 and of LL.D. from Cambridge University in 1913. He was a member of a large number of academies, including the Académie des Beaux-Arts of France, and he was awarded the Prussian order 'pour le mérite' in 1909. For the famous series of artists' self-portraits which hangs in the Uffizi Gallery at Florence, Sargent painted his own portrait in 1907. In the same year he was offered by the prime minister, Sir Henry Campbell-Bannerman, a knighthood, which he declined, pleading as an excuse his American citizenship, which he retained all his life. When in 1918 the presidency of the Royal Academy fell vacant, Sargent would undoubtedly have been elected to that position, had he allowed his candidature to be put forward: but his innate shyness and disinclination to appear in public caused him to decline all requests to that effect. Nevertheless, the influence of his forceful and highly cultured personality inevitably made itself felt in wide circles, entirely irrespective of any official position; and his personal kindness and sympathy, when he felt that they were needed, would at times go to quite unaccustomed lengths.

Sargent, who never married, died in his

sleep in his London house in the early hours of 15 April 1925, just as he was about to start on a voyage to America. A sale of the contents of his studio was held at Messrs. Christie's rooms 24 and 27 July 1925, and the pictures and drawings by Sargent included in it realized the huge total of £175,200. The entire Winter Exhibition of the Royal Academy in 1926 was devoted to a retrospective collection of his works [see *Illustrations of the Sargent Exhibition, Royal Academy 1926, 1926*]; it had been preceded by a memorial exhibition held at the Museum of Fine Arts at Boston in 1925.

It would be idle not to recognize the immense accomplishment of Sargent in many directions; the imposing series of portraits painted by him will doubtless retain permanent importance as a vivid commentary on the chapter of human history to which it relates. A certain essential lack of sensitiveness may, however, be said to detract from the value of his work as a whole; coupled with this defect is a disposition towards what is somewhat obviously bizarre or sophisticatedly eloquent. The result is that in his imaginative compositions Sargent's true limitations as an artist become only too plainly apparent.

A cartoon of Sargent appeared in *Vanity Fair* 24 February 1900.

[William Howe Downes, *John S. Sargent, his Life and Work*, 1926; the Hon. Sir Evan Charteris, *John Sargent*, 1927. For critical estimates of Sargent as an artist see *The Work of J. S. Sargent*, with an introductory note by Alice Meynell, 1903, re-issued with additional plates, and an additional introduction by J. B. Manson, 1927; Jacques-Émile Blanche in *La Revue de Paris*, 1 April 1926; Roger Fry in *Transformations*, 1926; and Henry James in *Harper's Magazine*, October 1887. On the comparatively little known circle of Sargent's student years in Paris, valuable information is contained in the letters (in Swedish) of his friend and fellow-student, the Finnish painter, Albert Edelfelt, notably those published by W. Söderhjelm in *Proffiler ur finskt kulturliv*, 1913. The beginning of Sargent's training under Carolus Duran is fully elucidated by him in two letters, unknown to his previous biographers and written to Henth Wilson 23 May and 12 June 1874; they are entered under No. 201 in the catalogue (No. 605) of autograph letters and historical documents offered for sale in the spring of 1935 by Messrs. Maggs Ltd., 34 and 35 Conduit Street, London, W.]

T. BORENIUS.

SATOW, SIR ERNEST MASON (1843-1920), diplomatist and historian, was born

at Clapton 30 June 1843. He was the fourth son of Hans David Christopher Satow, a Swedish merchant, who came from Riga to settle in London in 1825. His mother, Margaret Mason, was English. Ernest Satow was brought up in protestant traditions and had a stiff, puritan education at Mill Hill School. But his studies at University College, London, which he entered in 1859, and where he graduated B.A. in 1861, widened his outlook. His desire to see Asia was fired by reading a book of travel, and he seized the opportunity to compete for a student interpretership to the Far East (1861). He was placed first in the examination and assigned to the consular service in Japan.

Since 1858 the process of opening up Japan to the West had begun. The first years of transition proved dangerous for foreigners. Satow arrived in Japan on 8 September 1862, and six days later an Englishman was cut to pieces and two others severely wounded by the retainers of a Japanese nobleman called Saburo. Satow was on board a ship of the British flotilla which bombarded Saburo's castle in August 1863, and he was also with the Franco-British fleet when it fought the battle of the Shimonoseki Straits a year later. This defeat discredited the rule of the shogun, or prime minister, and induced the mikado to accept the terms of the Western powers and to open up the country. On the accession of a new mikado, Mutsu Hito, in 1867, the shogun finally abdicated. During these years Satow, who had learned the Japanese language, had become the indispensable interpreter at the legation, to which he was finally appointed Japanese secretary in 1868. On 23 March of the same year the minister, Sir Harry Smith Parkes [q.v.], and Satow were attacked by men with swords when proceeding to an audience with the mikado at Kyoto. The assassins missed their blows, and the mikado's horror at this incident ended the period of danger for foreigners. Internal unrest and rebellion continued for another ten years, and the work of adjustment for a generation longer. Satow received the C.M.G. in 1888 as a recognition of his services. He had not only learned the language but had got to know all the leading Japanese personalities, notably the Marquess Ito, the leader of reform, with whom his friendship began so early as 1864. In after days he was wont to say that the Far East was not mysterious to those who knew the languages and cultures of China and Japan.

Satow himself is, in fact, the only Englishman who hitherto has represented his country in both China and Japan, and spoken the language of each.

In 1884 Satow was appointed consul-general at Bangkok. He so distinguished himself that he was promoted to the rank of minister in 1885. But Siam did not suit his health, and in 1888 he became minister at Montevideo, an earthly paradise in which he found nothing to do. When transferred to Morocco as envoy extraordinary and minister plenipotentiary in 1893 he showed great ability in negotiating with the Sultan Mulai Hassan, and visited his successor, Abdul Aziz, at Fez in 1894. In June 1895 he received the K.C.M.G. and was appointed minister plenipotentiary at Tokio. He remained there until 1900.

The years during which Satow was at Tokio were of crucial importance in the Far East. No Englishman was so fitted as he to understand what was taking place or to warn his government as to the consequences of the growing power of Japan. During the years 1894-1895 Japan defeated China and forced her to surrender Korea. But she suffered a severe set-back when Russia combined with Germany and France to force her to give back Port Arthur to China. Still severer was the blow when Germany seized Kiaochaow at the end of 1897 and Russia followed this up by occupying Port Arthur for herself and obtaining China's consent thereto in March 1908. Great Britain followed suit by occupying Wei-hai-wei. Satow had long foreseen the results of Russian aggression. Even in 1896 he had predicted that Japan was preparing to be revenged on Russia. Russian expansion at Port Arthur and in Korea only illustrated his warnings.

In 1900 the Boxer rebellion broke out in China, and the foreign legations were besieged in Peking. After much trouble they were relieved by an international force. In October Satow replaced Sir Claude Maxwell Macdonald [q.v.], the existing minister at Peking, who was transferred to Tokio. On his arrival at Peking Satow undertook the difficult task of inducing the Chinese government to submit and to pay indemnities, and the still more difficult task of reconciling the claims of the various Allies, and of managing Count Waldersee, the German generalissimo of the Inter-Allied forces. During this negotiation Satow showed knowledge of the West as well as of the East,

of commerce and finance as well as of diplomacy, and combined suavity and charm of manner with great firmness and resolution. The agreement between China and the Powers, signed at Peking in September 1901, was one for which Satow deserved, and obtained, the credit.

Early in 1902 the Anglo-Japanese Treaty of Alliance was signed. Satow was not consulted about it beforehand, and he did not agree with the view of Sir Thomas (afterwards Lord) Sanderson [q.v.] that it would enable Great Britain to prevent Japan from making war upon Russia. He continued to point out the increasing danger of a Russo-Japanese war, and his predictions were finally realized in February 1904. Satow followed the course of the war with inside knowledge and, through his confidential intercourse with some Japanese statesmen, gave the first true accounts of the Japanese reasons for ending the war with Russia by the peace of Portsmouth (New Hampshire) on 23 August 1905. Satow was recalled from Peking in 1906. He had been made G.C.M.G. in 1902. He now became a privy councillor, and was also appointed for six years British member of the Court of Arbitration at The Hague. His last diplomatic service was to act as the second British delegate to the Second Hague Peace Conference in 1907. He came away with the belief that foreign nations generally expected a naval war between England and Germany, and by 1909 he had come to expect it himself.

Satow never married, and he spent the remainder of his life on his property at Ottery St. Mary, Devonshire. His splendid intellect remained quite unimpaired until within a few months of his death, which took place at Ottery St. Mary 26 August 1929 at the age of eighty-six. Originally a pronounced sceptic, he became converted to a personal form of Christianity in 1887 and was thereafter deeply religious. He was happy with his flowers and his books in retirement, and kept in touch with the outside world and with personal friends. He read deeply in the literatures of England, France, Germany, Spain, and Italy as well as of Japan and China.

Satow is one of the few British ministers abroad who have shown themselves as accomplished in the theory as in the practice of diplomacy, and of the still fewer who have written history. He received the honorary degree of D.C.L. from the university of Oxford and that of LL.D. from the university of Cambridge, and

gave the Rede lecture at the latter in 1908. He wrote various studies on international law and history, and delivered his final message in a work full of practical wisdom, legal acumen, and antiquarian knowledge, entitled *A Guide to Diplomatic Practice* (1917, 2nd edition 1922. The 3rd edition, 1932, is much altered and was not revised or authorized by Satow). He contributed a chapter on 'The Far East 1815-1871' to volume xi of the *Cambridge Modern History* (1909). Many articles by him on phases of the language, history, and literature of Japan, Korea, and Siam are contained in the *Transactions* of the Asiatic Society of Japan (1872-1899). His two most notable historico-legal articles are 'Private Property at Sea in Time of War' (*Nineteenth Century and After*, February 1918), and 'Pacta sunt servanda' (*Cambridge Historical Journal*, vol. i, no. 3, 1925). His own account of his early years in Japan (*A Diplomat in Japan*, 1921) is historically of high value.

Satow's comments on history and politics are difficult to find in his published works, as he remained invariably discreet. But some judgements known to his friends are worth recording. Castlereagh and Canning he considered the greatest British foreign ministers. He preferred the latter because of his handling of public opinion, and in view of the wonderful clearness of his dispatches. He condemned Palmerston for his policy in the Chinese War, but acknowledged the force of his character. Of his own chiefs he admired the massive character of Lord Salisbury, the worldly wisdom of Lord Lansdowne, and the integrity of Sir Edward Grey. A. J. Balfour and Sir Henry Campbell-Bannerman he thought too amateur to excel in foreign politics. He deplored the former's handling of the Port Arthur question in March 1898; he considered the latter had failed at the Second Hague Peace Conference, for he had not been clear in his views over disarmament and in respect of the capture of private property at sea. At The Hague he detected the rising abilities of (Sir) Eyre Crowe [q.v.], and he had a warm personal regard for Lord Curzon. Of ministers abroad in the past he thought Lord Stratford de Redcliffe the most powerful and the first Earl of Malmesbury the wisest. He thought Lord Lyons the most prudent and Lord Dufferin the most adroit of the diplomats of his own day. As regards the methods of diplomacy, he adhered to confidential intercourse but stipulated that honesty and integrity

should accompany it. He was a believer in constitutionalism and in parliaments and had a great suspicion of dictatorships. He sought to apply the rule of law to international politics, but, being a realist, knew the dangers of pressing it too far. He was at first inclined to question the usefulness of the League of Nations, but ended by acknowledging its value. The permanent Court at The Hague in especial appealed to him as laying down, for the first time, a standard of international justice. He believed that the future of international relations would represent a compromise between the pre-1914 diplomacy and the subsequent diplomacy of publicity and discussion.

A cartoon of Satow by 'Spy' appeared in *Vanity Fair* 23 April 1903.

[B. M. Allen, *The Rt. Hon. Sir Ernest Satow. A Memoir* (containing a portrait and a complete list of his writings), 1933; Sir Ernest Satow, *A Diplomat in Japan*, 1921. Satow's private papers are in the Public Record Office. Many of his dispatches, together with a selection of his private papers, are published in *British Documents on the Origins of the War*, edited by G. P. Gooch and H. W. V. Temperley, vols. i, p. 345, ii, p. 417, iv, p. 639, and viii, p. 750.] H. W. V. TEMPERLEY.

SCHARLIEB, DAME MARY ANN DACOMB (1845-1930), gynaecological surgeon, was born in London 18 June 1845, the only daughter of William Candler Bird, later of the Hollies, Kersal, Manchester, by his first wife, Mary Dacomb, who died ten days after the birth of her child. Five years later Mary Bird's father married again, and owing to the influence of an enlightened stepmother, she received an education unusually good for the time, first at a boarding-school in Manchester, then at a school in New Brighton, where she showed her aptitude for science, and later, at a school in St. John's Wood, where she again showed her interest in science and also in music, an interest which she preserved all her life. She was fond of riding, but never joined in games and disliked dances and parties.

In 1865, Mary Bird met her future husband, William Mason Scharlieb, son of Charles Scharlieb, of Madras; he was in England reading for the bar, and in December of that year they were married. Early in 1866 Mary Scharlieb and her husband, who had been called to the bar by the Middle Temple, sailed for Madras. Their elder son was born there in 1866, their younger son in 1868, and their

daughter in 1870. From her husband's clients and clerks Mary Scharlieb heard much of the sufferings of Hindu and Mohammedan women, and thus became aware of the urgent need of qualified medical women to attend and help them. After much delay and opposition, she, together with three other women, secured entrance to the Madras Medical School, where, after three years, in 1877 she duly became qualified. Then, early in 1878, for the sake of the health and education of her children, and also for her own health, she returned to England. She had determined to obtain medical qualification in the university of London, and during the the voyage home, in the intervals of looking after her children, she studied mathematics with one of the engineers of the ship, and read the other necessary subjects in preparation for the London matriculation examination. In 1878 she entered as a student at the London School of Medicine for Women and the Royal Free Hospital. In 1882 she passed the M.B. examination, being awarded the gold medal and scholarship in obstetrics.

In 1883 Mary Scharlieb went to Vienna in order to gain practice in operative midwifery, after which she and her husband, whom she joined in Brindisi, came to England to spend the Easter vacation with their children. In the autumn they returned to India, but before they left Mrs. Scharlieb was received by Queen Victoria and on the day before their departure by the Prince and Princess of Wales. The queen insisted on hearing details of the difficulties and sufferings of the caste and Gosha women, and finally said: 'How can they tell me that there is no need for medical women in India?' She sent Mary Scharlieb back with a message for her future patients: 'Tell them how deeply their queen sympathises with them, and how glad she is that they should have medical women to help them in their hour of need.' Back in India, Mary Scharlieb soon realized the necessity for hospital treatment for her patients, and the outcome of her work was the establishment about 1884-1886 of the Royal Victoria Hospital for Caste and Gosha Women in Madras. She built up a very large private practice, but, her health once more failing, she left Madras in February 1887, and came again to London. In 1888 she graduated M.D. of London University—being the first woman to do so—and in 1889 was appointed lecturer on diseases of women at the School of Medicine for

Women. Two years later (1891) her husband died, only a short time after he had returned to England.

After her husband's death Mary Scharlieb remained in England, and there followed a period full of work and recognition. From 1892 to 1903 she was senior surgeon at the New Hospital for Women (afterwards the Elizabeth Garrett Anderson Hospital), and was a member of its consultant staff until her death. She obtained the M.S. degree in 1897, and in 1902 she was appointed gynaecologist at the Royal Free Hospital, thus becoming the first woman to hold a staff appointment in a London general hospital. In 1913 she was appointed to serve on the royal commission on venereal diseases. In 1917 she was made C.B.E. and was also elected president of the London (Royal Free Hospital) School of Medicine for Women, and in 1926 she was created D.B.E. In 1920 she was appointed one of the first women magistrates, serving in one of the children's courts. She was a commissioner in lunacy for Marylebone, and one of the visiting magistrates for Holloway Gaol. In 1928 she received the honorary degree of LL.D. from Edinburgh University. She died in London at the house of her younger son 21 November 1930, having seen patients until within ten days of her death.

Dame Mary Scharlieb was an indefatigable worker and a remarkably skilful operator, and although she never had an operating knife in her hand until she was forty years of age she soon became one of the great abdominal surgeons of her day. She was not only a great surgeon but also a great physician. A keen sense of humour and a deep vein of common sense running through her thorough knowledge of human nature equipped her for dealing with the mental as well as the physical difficulties of her patients. She was interested in life from many angles and had the gift of true friendship. She was a woman of deep religious conviction, her faith dominating her life.

By her surgical skill and by her powers of diagnosis as well as by the sanity and charm of a remarkable and vigorous personality, Dame Mary Scharlieb secured for herself a very honoured place in the medical world of her day, and probably more than any one other woman she familiarized the general public with the work of medical women in Great Britain. The name of 'Mrs. Scharlieb' was a household word and, for many, she became the

embodiment of their idea of medical women.

[Mary Scharlieb, *Reminiscences*, 1924; private information; personal knowledge.]

W. C. CULLEN.

SCHLICH, SIR WILLIAM (1840-1925), forester, was born at Flonheim in Rhineland, Germany, 28 February 1840, the sixth son of Kirchenrat Daniel Schlich, a Lutheran pastor, of Hesse-Darmstadt, by his wife, Charlotte Frank. He was educated at Darmstadt, Karlsruhe, and at the university of Giessen, where he took his degree of Ph.D. in 1866. The same year he accepted an appointment in the Indian Forest department, and was posted to Burma, where he served until 1870, when he was transferred to Sind. In 1872 he was again transferred, on promotion, to the conservatorship of forests of Bengal, which at that time included not only Bengal proper but also Bihar and Orissa as well as Assam. Schlich administered this heavy charge until 1879, when he proceeded to Europe on furlough. On his return to India in 1880 he was posted to the Punjab as conservator of forests, but the following year he was appointed to act as inspector-general of forests to the government of India in place of Sir Dietrich Brandis [q.v.]. He was confirmed in this appointment in April 1883, when Brandis retired from the service, and held it until February 1885, when he finally left India in order to organize the forestry branch at the Royal Indian Engineering College at Coopers Hill, Englefield Green. Perhaps the most important measure passed during Schlich's term of office as inspector-general of forests was the formation of the Imperial Working Plans branch, which ensured the preparation of forest working plans on approved lines and their scrutiny by a central authority. Although he left India in 1885, he did not actually retire from the service until 1 January 1889. He became a naturalized British subject in 1886.

Valuable as had been Schlich's services in the Indian Forest department, his subsequent services in the cause of forestry were even more distinguished. His appointment in 1885 to the professorship of forestry at Coopers Hill gave him full scope for the display of those qualities which marked him out as an unusually successful teacher. Combining sound knowledge, judgement, and enthusiasm for his subject with a keen sense of humour, he succeeded in winning to a remarkable

degree the confidence and affection of his pupils. His duties at Coopers Hill were concerned primarily with the training of recruits for the Indian Forest service, although a few of his pupils obtained appointments in other parts of the British Empire.

On the decision, taken in 1905, to close the college, its forestry branch was transferred to Oxford, and although he had then reached the age of sixty-five, Schlich succeeded in building up a school of forestry worthy of the university which had adopted it. In its earlier years the Oxford school continued the tradition of Coopers Hill in being primarily a training centre for the Indian Forest service, and Schlich maintained an official connexion with the India Office until 1911, when the necessity for this connexion had ceased to exist; the university then appointed him reader with the status of professor of forestry. By this time, owing to the demand for trained forest officers in other parts of the Empire, the scope of the school had become considerably widened. Schlich's services to India, which were rewarded in 1891 with the C.I.E. and in 1909 with the K.C.I.E., may be realized from the fact that he was responsible, while at Coopers Hill and at Oxford, for the training of no fewer than 272 out of a total of 283 officers who joined the Indian Forest service during that period. At Oxford he worked strenuously to obtain full recognition for forestry as a branch of scientific learning in the university, first, by having it included among the subjects of the B.A. degree, and secondly, by securing the endowment of a permanent professorship. In 1919 he had the satisfaction of seeing his efforts crowned with success. He retired from his university post 1 January 1920, but continued to reside in Oxford, occupying himself with writing until his death five years later.

Schlich's activities were by no means confined to academic work. His advice on matters concerning forestry was widely sought, and the British Empire as a whole has reason to be grateful for the services rendered by him. Among other things, he constantly urged on the British government the importance of increasing the supplies of home-grown timber by afforestation and by improving the condition of British woodlands. He was a member of the forestry sub-committee of the Reconstruction Committee which was appointed in 1916 to consider this question, and whose final report, issued in 1918, led

to an extensive scheme of state afforestation. He was elected a fellow of the Royal Society in 1901, and an honorary fellow of St. John's College, Oxford, in 1909. He was president of the Royal English Arboricultural Society in 1913-1914, and was on the governing council of the Empire Forestry Association at the time of his death.

Among his published writings, Schlich's *Manual of Forestry*, in five volumes—three by himself and two by his colleague W. R. Fisher—ranks as a standard work. The first edition appeared from 1880 (vol. 1) to 1896 (vol. 5), and each volume went through two or more editions, the last (vol. 3, fifth edition) being published in 1925, when he was eighty-five years of age. His other publications include *Forestry in the United Kingdom* (1904), and numerous papers and reports. He was the first honorary editor of *The Indian Forester*, a professional journal started in 1875, and was a contributor to its pages until the year of his death.

Schlich died at Oxford 28 September 1925. He was twice married: first, in 1874 to Mary Margaret (died 1878), daughter of William Smith, civil engineer; secondly, in 1886 to Adèle Emilie Mathilde, daughter of Hermann Marsily, of Antwerp. By his first wife he had one son, who died in childhood, and one daughter, and by his second, one son and three daughters.

[*The Times*, 1 October 1925; *Nature*, 24 October 1925; *Empire Forestry Journal*, 1925; private information.] R. S. TROUP.

SCOTT, GEORGE HERBERT (1888-1930), airship commander, was born in Lewisham, London, 25 May 1888, the eldest son of George Hall Scott, civil engineer, by his wife, Margaret Wilkinson. He was educated at Alton School, Plymouth, at Richmond School, Yorkshire, and at the Royal Naval Engineering College, Keyham. From 1908 onwards he was engaged in general engineering, and just before the European War he was employed on the building of naval vessels in the yards of the Sociedad Española de Construcción, at Ferrol, Spain.

Soon after the outbreak of the European War in 1914 Scott joined the Royal Naval Air Service as a flight sub-lieutenant and was sent for training to the airship stations at Farnborough and Kingsnorth, Kent. In May 1915 he was appointed to the airship station at Barrow-in-Furness, and he remained there until October 1916 when he left in order to take command of the

airship station at Anglesea. In March of the following year he was back at Barrow as captain of the Parseval airship P. 4.

In April 1917 the first British rigid airship to fly, No. 9, which had been built by Messrs. Vickers at Barrow, was taken into service at Howden, Yorkshire, and Squadron Commander Scott was posted to Howden to take command of her. In July he took the ship on patrol off the north-east coast and was in the air for twenty-seven hours, a notable flight for a British 'rigid' at the time. He subsequently commanded the same airship at Cranwell, Lincolnshire, and at Pulham, Norfolk, and it was while he was at the latter station that he developed the system—with which his name is associated—of mooring airships at the head of a mast or tower.

On the formation of the Royal Air Force in April 1918, Scott was gazetted to the rank of major. In November 1918, soon after the signing of the Armistice, he went to Inchinnan, Renfrewshire, where Messrs. William Beardmore were building the 'rigid' R. 34, a copy of the Zeppelin airship L. 33 which had landed, owing to damage by anti-aircraft gun-fire, near Mersea Island in September 1916. He was given command of the R. 34 on her completion and received orders to prepare for a voyage to the United States of America. The journey was made in July 1919. The R. 34 left East Fortune, East Lothian, at 1.42 a.m. on 2 July and returned to Pulham, where she landed, at 6.57 a.m. on 13 July. The outward journey to Mincola, east of New York, during which mails were dropped at Newfoundland, was made in 108 hours 12 minutes, and the homeward journey, after circling New York, was completed in 75 hours 3 minutes. During her whole flight of some 6,000 miles, the R. 34 was in wireless touch with the Air Ministry in London. She encountered severe electrical storms, particularly off St. John's, and she was much thrown about; but the cool, alert, and expert handling of Scott brought the ship safely through the ordeal. This was the first airship flight across the Atlantic, and for his achievement Scott was awarded the C.B.E. He had already received the Air Force cross in 1918 for his work on airships during the War.

In October 1919 Scott retired from the Royal Air Force, but in 1920 he was appointed to the technical staff of the Royal Airship Works at Cardington, Bedford. Airship development in England,

however, after being stimulated by the War, began to languish in peace time, and soon ceased altogether, although a nucleus staff, including Scott, was retained at Pulham. About 1924, the government once again took up the problem of the airship, and Scott was appointed to the Air Ministry as officer in charge of flying and training in the directorate of airship development. The project was to open up airship communications throughout the British Empire, and in 1927 Scott visited Canada in order to advise the Canadian government on the selection of a site for an airship base. As a result of his visit a mooring tower was built at St. Hubert, Montreal.

In January 1930 Scott was appointed assistant director for airship development with responsibility for all airship flying operations and for the training of airship crews. He was also responsible for the trials of the new British 'rigids', the R. 100 and R. 101. He made his second flight across the Atlantic, although not in command, in the R. 100, which left Cardington, at 3.48 a.m. on 29 July 1930 and reached St. Hubert, Montreal, at 2.25 a.m. on 1 August after a journey of 3,364 miles. On 4 October 1930 he set out as a passenger in the R. 101 on a flight to India, and he was among the forty-eight victims when the ship crashed and caught fire at 2 a.m. on 5 October at Allonne, near Beauvais, France. He had been responsible with Lieutenant-Colonel V. C. Richmond, the designer of the R. 101, for the unbraced transverse frame, first used in that ship and regarded as one of the most important developments in airship construction.

Scott was a quiet, conscientious, and hard-working officer. A trained and experienced engineer, he had a firm belief in the future of the airship, and his life was devoted to the establishment of the airship as a safe and reliable form of transport. His pioneering efforts he regarded solely as incidental to this end, and in no sense as record-breaking achievements. He was, without doubt, the foremost British airship commander of his time.

Scott married in 1910 Jessie, the eldest daughter of Archibald Jack Campbell, general manager of Messrs. William Beardmore's shipbuilding yards, Dalmuir, and had one son and three daughters.

[Private information; personal knowledge.]
H. A. JONES.

SCOTT, SIR PERCY MORETON, first baronet (1853-1924), admiral, the son of

Montagu Scott, solicitor, by his wife, Laura Kezia Snelling, was born in Canonbury, North London, 10 July 1853. He was educated at Eastman's Naval Academy, Southsea, and entered the *Britannia* as a naval cadet in September 1866. In December 1867 he was appointed to the *Forte* frigate and sailed in her to the East Indies, where she became flagship of Commodore Sir Leopold Heath. He was rated midshipman in June 1868, and returned to England at the end of a three and a half years' commission in February 1872. After a year's service in the new armoured battleship *Hercules*, having been promoted sub-lieutenant in December 1872, he joined the *Excellent* gunnery school ship in order to complete examinations. When the Ashanti War broke out Scott volunteered for service on the West coast of Africa and was appointed to the *Active*, flagship of (Sir) William Hewett. He arrived too late for active service in the campaign. He remained in the *Active* until April 1877—a memorable commission covering a number of minor operations on the West coast of Africa. Scott was promoted lieutenant in November 1875, and recommended in dispatches for services in the Congo expedition of that year. In September 1877, he was appointed to the *Excellent* for a gunnery course, and remained in the school as junior staff officer until July 1880.

Scott was then appointed gunnery lieutenant of the *Inconstant*, flagship of Lord Clanwilliam's squadron, which was commissioned for a voyage round the world, was detained on the way for service at the Cape during the Boer War, and on the completion of the cruise was sent to the Mediterranean for the Egyptian campaign at Alexandria in 1882. Scott did valuable service in mounting some heavy Egyptian guns for the army, for which he was praised in military dispatches. In November 1882 he was appointed to the *Cambridge* gunnery school at Devonport as senior staff officer, and in April 1883 was again sent to the *Excellent*, where he remained until promoted commander in September 1886. From September 1887 until February 1890 he was commander of the *Edinburgh*, Mediterranean station, and then returned to the *Excellent* for another three years, during which he was very active in converting the gunnery school at Whale Island into a model naval barracks and training establishment. Scott was promoted captain in January 1893, and after two and a half years'

service on the ordnance committee at Woolwich, was in command of the *Scylla* in the Mediterranean from May 1896 to July 1899. While in that ship he developed and introduced a number of valuable inventions in signal apparatus and gunnery appliances. By the latter means he became a pioneer in the improvement of gunnery practice in the fleet and established a record for marksmanship and rate of fire in the firing of his own ship.

In September 1899 Scott was appointed captain of the *Terrible* for service on the China station; but owing to the trouble impending in South Africa, the ship proceeded via the Cape, and was detained there until March 1900. On the outbreak of the South African War, Scott rendered valuable service by devising land mountings and carriages for the heavy 4.7-inch naval guns which were landed for the defence of Ladysmith and undoubtedly saved the situation. He also mounted on mobile mountings a number of 4.7-inch and 6-inch guns which accompanied the naval brigades attached to the armies. For these very valuable services he received the C.B. (1900). For a short time Scott acted as military commandant at Durban. He reached the China station at the time of the Boxer rebellion, and once again he was able to devise mountings and to land heavy guns, which were used in the international operations against the Boxers. On the conclusion of the land operations Scott devoted himself with ardour to improving the gunnery efficiency of his own ship, and by example that of the whole squadron. The *Terrible* achieved remarkable success in her firings, and as a result Scott's methods were adopted throughout the service, thereby raising the standard of shooting to a far higher level. On returning home in 1902 Scott received a great public welcome, and was awarded the C.V.O. by King Edward VII.

In April 1903 Scott was appointed captain of the *Excellent*, and during the two years until his promotion to flag rank in 1905, made full use of his opportunities for improving the gunnery appliances and training of the fleet. As flag officer he was immediately given the new appointment of inspector of target practice, which he held until July 1907. The duties required him to attend the firing practices of the fleet, report on them, and make suggestions for improvements. Scott showed characteristic energy, inventiveness, and originality of mind in this task, with the result that the efficiency of the firing practice

of the fleet was doubled during these two years. The gunlayer's test and battle practice at towed targets were two of the methods which he instituted. In July 1906, on the occasion of the launch of the *Dreadnought*, he was created K.C.V.O. by King Edward. In July 1907 he was given his first and only flag appointment at sea in command of the second cruiser squadron (flagship H.M.S. *Good Hope*) of the Channel fleet, then under the command of Lord Charles Beresford [q.v.]. During the first year the personal relations between the two admirals became badly strained: both were naturally impulsive and critical of higher authority, and after an unfortunate incident in which Scott hoisted what Beresford considered an insubordinate signal, the Admiralty decided to remove the second cruiser squadron from the Channel fleet, and sent it under Scott on a special cruise to South Africa in connexion with the Convention of the Union of that Dominion, and to South America to show the flag. Scott was highly successful in this Imperial mission, and, having been promoted to vice-admiral in December 1908, hauled down his flag in February 1909. He spent the next four years, until promotion to admiral and retirement in March 1913, in developing and pressing for the introduction of various improvements in gunnery apparatus, particularly his invention of the director firing system. In 1910 he was promoted K.C.B., and given an award of £2,000 by the government for his various inventions and appliances, having had a previous award of £8,000 in 1905. He obtained considerable financial advantage from the arrangements which he made with armament firms for the production of his inventions. This enabled him to accept the offer of a baronetcy which was conferred on him in February 1913.

Soon after the outbreak of the European War, Scott was appointed to the Admiralty for special service, and continued on duty until May 1918. His first work was to fit out a fleet of dummy battleships by converting sixteen merchant steamers so as to give them with fair accuracy the appearance of some of the most important units of the British navy. He was then employed on various duties as adviser on the gunnery efficiency of the fleet and on measures for coping with the submarine danger, which, as he had prophesied some months before the War, had become very serious. In September 1915, when the zeppelins had begun their raids over Eng-

land, he was appointed by Mr. Balfour, then first lord, to undertake the gunnery defence of London against air attack until the army should be ready to take over the work, which it did in the following February. The Anti-Aircraft Corps which Scott created laid the foundations of the elaborate system of anti-aircraft defence which in the end largely defeated the zeppelin danger.

After the War was over Scott wrote a series of letters to *The Times*, reiterating the theory, which he had first propounded in June 1914, that the day of the battleship was over owing to the development of submarines and aircraft; he urged that Great Britain should no longer build battleships, but rely in future on smaller craft and submarines. He died in London 18 October 1924.

Scott was a man of very remarkable inventive power, and his numerous devices, inventions, and methods for improving the gunnery of the fleet, especially after he had obtained the powerful support of his senior, Admiral of the Fleet Lord Fisher [q.v.], for their adoption in the service, were of immense advantage to the royal navy in the European War. His methods and apparatus for improving gun drill and thereby the rate of loading, and also for training gun layers in accurately and rapidly aligning their weapons, have been adopted in all the navies of the world. The Scott director system for laying and firing numbers of guns from one gunsight was of particular value in the War, and has also been universally adopted. Scott's persistence in pressing his views, and his contempt for officers of the older school, continually brought him into conflict with the authorities, and, although he was popular with the lower deck, his equals and superiors in rank did not always find him easy to work with. He was a fine seaman, but his judgement in tactical matters was frequently at fault; and it is upon his inventive genius and the services which it enabled him to render to his country that his claim to fame principally rests.

Scott was twice married: first, in 1894 to Teresa Roma, daughter of Sir Frederick Dixon-Hartland, baronet, whom he divorced in 1911; secondly, in 1914 to Fanny Vaughan Johnston, daughter of Thomas Ramsay Dennis and formerly wife of Colonel A. P. Welman. He had two sons and a daughter by his first wife. The elder son was lost as a midshipman in the *Defence* at the battle of Jutland (1916).

The younger son, Douglas Winchester (born 1907), succeeded as second baronet.

A cartoon of Scott by 'Spy' appeared in *Vanity Fair* 17 September 1903.

[Admiralty Records; Sir P. Scott, *Fifty Years in the Royal Navy*, 1919; private information.] V. W. BADDELEY.

SECCOMBE, THOMAS (1806-1923), critic and biographer, born at Terrington St. Clement, Norfolk, 18 June 1806, was the eldest son of John Thomas Seccombe, a country doctor, and grandson of Sir Thomas Lawrence Seccombe, of the India Office. His mother was Elizabeth Margaret, daughter of Thomas Clout, of Lambeth. He was educated at Felsted School, and proceeded to Balliol College, Oxford, in October 1825. He won the Stanhope prize in 1827 with an essay on 'Political Satire in England in the Eighteenth Century', and obtained a first class in the school of modern history in 1829. He graduated B.A. in 1830 and M.A. in 1835.

In 1831 (Sir) Sidney Lee [q.v.], who had just succeeded (Sir) Leslie Stephen as editor of the *Dictionary of National Biography*, chose Seccombe as assistant editor, and he continued in that position until the editorial staff was disbanded on 31 December 1900 on the completion of the main work. In this post Seccombe's kindness and courtesy made him a favourite with the contributors and assisted materially to maintain those friendly relations among editors and contributors which characterized the whole period of publication. He himself contributed to the *Dictionary* over seven hundred biographies, mainly of eighteenth-century writers, and also of sportsmen and athletes. Among them may be mentioned particularly his articles on Smollett and Sir John Vanbrugh. Later he wrote a number of articles for the 1901-1911 Supplement of the *Dictionary*, including a memoir of George Meredith, an example of his best work.

After giving up his post on the *Dictionary*, Seccombe devoted most of his time to literary work. He had already edited *The Lives of Twelve Bad Men* in 1894, and had published in 1900 *The Age of Johnson*, an excellent summary of the literature of the later eighteenth century. After 1901 he collaborated for some time with (Sir) William Robertson Nicoll [q.v.] on the 'Bookman' *History of English Literature*, which appeared in 1905 and 1906. He edited, with introductory prefaces, many reprints of well-known authors, including

George Borrow, George Gissing, Mrs. Gaskell, Francis Parkman, W. H. Prescott, and Smollett's *Travels through France and Italy*. From 1907 to 1912 Seecombe was lecturer in modern history at the East London College in the university of London; from 1912 to 1919 he was professor of English at the Royal Military College, Sandhurst; and during the same period he lectured on history at the Staff College, Camberley. From 1919 to 1921 he was a lecturer in the school of English language and literature at Oxford, and in 1921 he accepted the chair of English literature at Queen's College, Kingston, Ontario. Illness compelled him to resign this post in the spring of 1923 and to return to England. He died at Torquay 20 June, within a month of his return.

Seecombe married in 1896 Elizabeth Jane, daughter of Henry Goddard, farmer, of St. Mary Bourne, Hampshire, and had a son and two daughters.

[*The Times*, 21 June 1923; *The Bookman*, July 1923; private information; personal knowledge.] E. I. CARLYLE.

SEYMOUR, Sir EDWARD HOBART (1840-1929), admiral of the fleet, born at Kinwarton, Warwickshire, 30 April 1840, was the second son of the Rev. Richard Seymour, rector of Kinwarton, by his wife, Frances, third daughter of Charles Smith, M.P., of Suttons, Essex. He was grandson of Rear-Admiral Sir Michael Seymour [q.v.], first baronet, and nephew of Admiral Sir Michael Seymour [q.v.]. He was sent to school at Radley, then under the headmastership of the Rev. W. B. Heathcote, where among his school-fellows were two other future admirals, Lord Walter Talbot Kerr and Lord Charles Thomas Montagu-Douglas-Scott. Seymour had little difficulty in choosing his profession: 'As soon as I had sense enough to form a real wish, it was to go to sea.' Having been offered a nomination for the royal navy, he was sent to Eastman's Naval Academy at Southsea in the autumn of 1852, and two months later passed the entrance examination at the Royal Naval College, Portsmouth. A sum in the rule of three and a 'dictation' of twenty lines from the *Spectator* comprised the test. The next day he joined the *Encounter*, screw corvette. He served in her for eight months and was then appointed to the *Terrible*, in the Mediterranean, a paddle-wheel frigate of 21 guns, which was one of the ships of the allied fleet which was sent to make a demonstration in the Black Sea

in January 1854. In the *Terrible* Seymour sailed for Odessa on the declaration of war with Russia in the following April, and thereafter he served in all the operations in the Black Sea until the final evacuation of the Crimea in 1856.

At the end of the War in 1857, Seymour, still a midshipman, was appointed to the *Calcutta*, flagship of his uncle, Sir Michael Seymour, on the China station. He took passage in the sloop *Cruiser*, and his experience in that vessel he afterwards described as 'a first-rate specimen of how youngsters were disregarded and neglected as to their instruction or care of any sort'. He reached China in time to take part in the operations which resulted from the *Arrow* incident [see PARKES, Sir Harry Smith]. Canton was being blockaded and an attack upon a Chinese fleet of about a hundred junks was in preparation. Seymour took part in the attack, during which the launch on board of which he was serving was sunk by a round shot. After the destruction of the fleet of junks the expedition moved up the Canton river to take the city, and Seymour served with the battery of the naval brigade; the other midshipman of the battery was (Sir) Arthur Knyvet Wilson [q.v.], afterwards admiral of the fleet. After the capture of Canton (December 1857) the squadron moved to the gulf of Peckili in order to get in touch with the Chinese government at Peking. Seymour took part in the severe engagement in which the mouth of the Peiho river, protected by the Taku forts, was forced (May 1858). This was his last service in that war, for shortly afterwards he was invalided home as a result of sunstroke.

On his return to England Seymour passed his examinations and was promoted mate (1859). Hearing that war had again broken out in China, he applied for a ship of that station and sailed for the East in the frigate *Impérieuse*. In Rhio Straits, on the way out, he went overboard to rescue a seaman in waters infested with sharks, and for this exploit he received the silver medal of the Royal Humane Society.

The commander-in-chief on the China station, Sir James Hope [q.v.], having a blank commission for a lieutenant, gave it to Seymour and took him into his flagship, the *Chesapeake*. In her, Seymour took part in the combined attack by British and French forces on the Taku forts in September 1860. An expedition up the Yang-tse river in a flotilla of light

craft and paddle-wheel vessels gave him a new experience; he served first as executive officer, and later was given command of the paddle-steamer *Waterman* on the Canton river. He returned to the flagship in 1861 and took part in the operations against the Tai-ping rebels (1862), in the capture of Ningpo and Kalhing, commanding small-arm parties. In 1863 he returned to England. He was now twenty-three, and had seen ten years' continuous active service, afloat and ashore.

On his return to England Seymour served for three years as flag-lieutenant to his uncle, Sir Michael Seymour, commander-in-chief at Portsmouth. He then received a 'haul-down' promotion to commander at the age of twenty-six (1866). Posts for commanders were few, and Seymour was on half pay for two years. Anxious to take part in a projected Arctic expedition, he took a cruise in northern waters in a Peterhead whaler, in order to gain experience of the ice. In 1868 he was appointed to the coastguard in Ireland, a position which, although enjoyable, was uncongenial to one whose whole desire was to serve at sea. In June 1869 he obtained his wish as commander of the gunboat *Growler* on the West coast of Africa. In the course of operations on the Congo in 1870 he was shot in the leg. The wound was severe and he was invalided; consequently, when he applied in 1875 for the command of the *Discovery* in the Polar expedition under (Sir) George Nares, he was rejected on medical grounds.

An enforced leisure of eighteen months on half pay was used by Seymour to improve his French by visiting France and Switzerland. In January 1872 he was given command of the paddle-wheel dispatch vessel *Vigilant* for service in the Channel fleet. In March 1873, at the age of thirty-three, he was promoted to post captain. A further period on shore followed, but caused him no deep regret. He spent a year at the Royal Naval College and then travelled in France and Italy. Normally, officers at that time spent at least five years on half pay on promotion, but the Admiralty, taking into consideration Seymour's loss of the command of the *Discovery* in the Arctic expedition, appointed him at his own request to the troopship *Orontes*. Three years' experience, in his own words, 'greatly enlarged my knowledge of that seemingly volatile yet really constant element called "human nature"'. Although he considered that 'trooping was not proper naval work',

he saw value in it for the contact which it promoted between the services.

In 1879 Seymour found himself once more on half pay, and used the opportunity to study at the torpedo school and, as before, to travel abroad and refresh his knowledge of French. His service in combined operations with foreign officers in his early days, and later in China as commander-in-chief, impressed him greatly with the need for naval officers to have a knowledge of foreign languages. 'I should make it a rule', he wrote in his memoirs, 'that no boy might become a naval cadet unless he could hold an ordinary conversation in at least one foreign language.' In April 1880 Seymour commissioned the cruiser *Iris* in the Mediterranean, and in the following July joined the fleet commanded by Sir Beauchamp Seymour (afterwards Lord Alcester, q.v.). When the rioting took place at Alexandria in July 1882, Seymour was detached to guard the Suez Canal. Later, he dismantled the forts on the Rosetta mouth of the Nile. In November he succeeded Captain J. A. Fisher (afterwards Lord Fisher) in command of the battleship *Inflectible*; he hauled down his pennant in February 1885. Three months later, when war threatened with Russia, he was placed in command of the Cunard liner *Oregon*, commissioned as an auxiliary cruiser—an experience which convinced him that the fighting value of such vessels is very small.

Ten months on half pay followed. From May 1886 to December 1887 Seymour served as flag-captain to Admiral Sir George Willes, commander-in-chief at Portsmouth, and was then made assistant to the admiral-superintendent of naval reserves; this post he held until his promotion to flag rank at the age of forty-nine (1889). A long period of half pay was then employed in again visiting foreign countries: he travelled in France, Russia, the West Indies, and the United States. In July 1892 he hoisted his flag for the first time on board the *Swiftsure* for the annual manœuvres, after which he became second-in-command of the Channel squadron with his flag on board the *Anson*. It fell to him to take part in the raising of the *Howe* when she grounded at Ferrol, but apart from that particular service the command gave him less work than his energetic mind required. More active work followed when he was appointed, for three years, admiral-superintendent of the reserves.

In December 1897 Seymour was appointed commander-in-chief on the China station. Service there was peaceful until the Boxer rising in 1900. On 31 May he received news from the British minister, Sir Claude Macdonald, that the situation at Peking was precarious. Having already detached a small force for the defence of the legations, Seymour proceeded at once to the Taku forts. A naval force of ships of several nations shortly assembled, of which, as senior admiral, Seymour assumed command. At a consultation with the foreign commanders it was decided to form a naval brigade under the command of Seymour, to march, if necessary, to Peking. Matters moved fast. Immediate help was urgently called for from the legations on 9 June; the next day the brigade—a mixed force of 2,000 marines and bluejackets—was landed, and a sharp encounter with the Boxers took place on the 11 June at Lang Fang, about half way to Peking. Seymour then found himself unable to proceed. He was faced by considerable forces, the railway was cut, and he had no other means of transport. He held on for a week, but was then forced to retire on Tientsin, his short-rationed force harassed by the enemy. At Hsika, an important arsenal, he was attacked by regulars of the Chinese army. He stormed the arsenal and there defended himself against continued assaults until relieved by a body of Russian troops, when he withdrew his brigade and left the operations in the hands of military forces. Seymour's conduct throughout these difficult operations was highly commended, and his command was extended for a further six months. In March 1901 he was promoted to admiral and returned to England, hauling down his flag on 21 August.

In 1902 Seymour accompanied the Duke of Connaught on his mission to Madrid for the coronation of King Alfonso XIII. In the same year he served on Sir Edward Grey's committee on the manning of the navy. In 1903 he was appointed to the command at Devonport, which he held until February 1905, when he was made admiral of the fleet. In accordance with custom, he would have then hauled down his flag, but an exception was made on account of his distinguished service, and he kept his flag flying for another month. In 1906 Seymour accompanied Prince Arthur of Connaught on his state visit to Japan, and in 1909 he had the unusual honour of re-hoisting the flag of an admiral

of the fleet on board the *Inflexible* when he commanded a squadron sent to Boston, Massachusetts, for the Hudson-Fulton celebrations. He retired in 1910 and took no further part in public affairs. He died at his home at Maidenhead 2 March 1920. His honours included the Order of Merit (1902), the G.C.B. (1901), and the G.C.V.O. (1906); he was a privy councillor (1900), and received the honorary degree of LL.D. from the university of Cambridge.

Seymour was a man of a singularly broad and humane outlook, with a particular capacity for appreciating the point of view of others; this contributed largely to the harmony of his relations with foreign officers serving under him. He was widely read and a good linguist. He described his services with great modesty and a total lack of self-consciousness in *My Naval Career and Travels* (1911). He was unmarried.

There are portraits of Seymour by H. G. Herkomer (1906) and by P. F. Spence (1907).

A cartoon of him by 'Spy' appeared in *Vanity Fair* 31 October 1901.

[Admiralty records; Sir E. H. Seymour, *My Naval Career and Travels*, 1911; private information.] H. W. RICHMOND.

SHACKLETON, Sir ERNEST HENRY (1874-1922), explorer, was born at Kilkee, co. Kildare, 15 February 1874, the second child and eldest son of Henry Shackleton, M.D., by his wife, Henrietta Letitia Sophia, daughter of Henry John Gavan, inspector-general of police in Ceylon and formerly of the Royal Irish Constabulary. Shackleton's descent from north of England Quaker stock on his father's side and his Irish ancestry on his mother's may have accounted for the mingling of caution, perseverance, reckless courage, and strong idealism which were his leading characteristics. After private education in Ireland he was sent to a preparatory school at Sydenham, and thence to Dulwich College (1887-1890), where he was described as 'backward for his age'. In 1890 he went to sea as an apprentice in the mercantile marine, serving in the *Hoghton Tower*, a sailing ship of the White Star line, until 1894 when he transferred to steamers of the Shire line, qualifying as first mate in 1896 and master in 1898. Shackleton then joined the Union Castle line, and when third officer in the *Tintagel Castle* collaborated with Dr. W. McLean in a book entitled *O.H.M.S.* (1900), describing experiences in carrying troops to the South

African War. In 1901 he became a sub-lieutenant in the Royal Naval Reserve.

Desire for adventure, not unmixed with the hope of fame, led Shackleton to apply successfully for a post on the National Antarctic expedition under Commander Robert Falcon Scott [q.v.] in the *Discovery* in 1901. As junior officer, an appointment due largely to his knowledge of sails, he took a leading part in the expedition and was one of the two men chosen to accompany the leader in his long southern sledge journey over the Ross barrier to lat. 82° 18' 33" S. On the return journey, although weakened by scurvy, he refused to give in and struggled back on foot with the others. After being invalided home in the relief ship *Morning* in 1903, Shackleton left the sea as a profession and took up various engagements, each of which in turn attracted his optimistic mind and in turn was abandoned. From 1904 to 1905 he was secretary of the Royal Scottish Geographical Society where his enterprise was quickly felt. After standing unsuccessfully for parliament as liberal-unionist candidate at Dundee in January 1906, he entered Messrs. W. Beardmore's engineering works in Glasgow, but was already busy maturing plans for returning to the Antarctic. One of his main objects was to reach the South Pole, but he laid stress also on the importance of exploring the Barrier, discovering its southern limits, and solving the problem of its origin, as well as tracing to the south the lofty mountain ranges discovered by Scott, ascending the high plateau to the west and reaching the South Magnetic Pole. He hoped also to explore King Edward Land.

His plans, announced in 1907, showed characteristic daring in conception with admirable foresight in methods, equipment, and choice of staff. Funds were obtained largely by guarantees to be redeemed on the return of the expedition by the proceeds of lectures and the narrative of the voyage, a financial undertaking which appealed to Shackleton's sanguine temperament. Shackleton sailed in the small whaler *Nimrod* in August 1907, and reached the Ross barrier in the following January. Forced by pack ice to abandon his intention to land on King Edward Land, he made his base in McMurdo Sound, and accompanied by Dr. Eric Marshall, Lieutenant Jameson Boyd Adams, R.N.R., and Frank Wild, R.N., by way of the Barrier and the Beardmore glacier, which he discovered, succeeded in reaching lat. 88° 23' S. on the Antarctic plateau (9

January 1909). The expedition also sent a party under Professor (Sir) T. W. Edgeworth David to the South Magnetic Pole, which was reached 10 January 1909, and another to the summit of Mount Erebus (13,200 ft.), which was gained 10 March 1908. On his return in March 1909 Shackleton was the hero of the hour and enjoyed to the full his well-merited popularity. He received the C.V.O. and a knighthood, was elected a younger brother of Trinity House, and was awarded a score of medals from the leading geographical societies of the world, including a special gold medal from the Royal Geographical Society and the Livingstone gold medal of the Royal Scottish Geographical Society. Parliament voted £20,000 to defray the liabilities of the expedition, and Shackleton paid other costs by a prolonged lecturing tour in Europe and America. The expedition is described in his *The Heart of the Antarctic* (1909).

After various attempts to enter business in his persistent dream of making a fortune with which to endow his family, Shackleton began to plan an even more ambitious Antarctic expedition which was to solve the problem of the extent of the Weddell Sea and the relation of the ranges of Graham Land with those of Victoria Land. A proposal to cross the Antarctic continent with this end in view had been made in April 1908 by William Speirs Bruce [q.v.], who had, however, failed to raise the funds required. Shackleton was more successful, and his scheme for an imperial trans-Antarctic expedition involved the use of two ships, one, the *Endurance*, to land a sledging party in the Weddell Sea and another, the *Aurora*, to land a depot-laying party at McMurdo Sound in the Ross Sea to meet the trans-polar party. Funds were supplied chiefly by (Sir) James Caird, (Dame) Janet Stancomb-Wills, and a government grant of £10,000. All was ready in August 1914, when war broke out. Shackleton's offer to the Admiralty of his ships and men for war service was refused and he was told to proceed. Reaching South Georgia, the *Endurance* left for the south in what proved to be a bad ice year. Bruce's Coats Land was passed and Caird Coast was discovered (11 January 1915) when the ship was beset on 18 January in heavy pack ice in lat. 76° 34' S. long. 31° 30' W. After drifting for nine months she was crushed in the ice on 27 October 1915 about 200 miles from the nearest land and 1,000 miles from human help. Shackleton now showed his supreme

qualities of leadership. In the face of difficulty and danger he was always at his best. Proceeding by sledges and boats the party eventually reached Elephant Island on 15 April 1916 and camped on the small ice-free area of a forbidding land. Realizing that no search expedition would be likely to visit Elephant Island, Shackleton determined to reach South Georgia in an effort to bring help. With five companions he made a voyage of 800 miles in a twenty-two foot boat through some of the stormiest seas in the world, crossed the unknown lofty interior of South Georgia, and reached a Norwegian whaling station on the north coast. After three attempts in different vessels Shackleton succeeded (30 August 1916) in rescuing the rest of the *Endurance* party and bringing them to South America. He then went to New Zealand and sailed in the *Aurora* to rescue his Ross Sea party. An account of the whole expedition is given by Shackleton in *South* (1919).

In 1917 Shackleton was sent by the British government on a special mission to South America in order to explain to neutral countries the war aims of the Allies. On his return he spent the winter of 1918-1919 with the North Russian expeditionary force, with the rank of major, organizing the winter equipment. In February 1919 he resigned his commission and turned again to various commercial projects, none of which led him far. A plan to explore the Beaufort Sea under Canadian government auspices did not mature, and once more he planned an Antarctic expedition. This expedition, largely financed by John Quiller Rowett, was designed chiefly to explore the little known region round Enderby Land. The *Quest* sailed in September 1921, and after several delays due to faulty engines, reached South Georgia on 4 January 1922. On the following morning Shackleton died suddenly of *angina pectoris*. He was buried at the whaling station at Grytviken on South Georgia Island. On 2 March a memorial service was held in St. Paul's Cathedral and was attended by King George V and Queen Mary.

In addition to his knighthood and C.V.O., Shackleton received the O.B.E. (military) in 1919. He held the Polar medal with three clasps and many foreign decorations. The university of Glasgow conferred on him the honorary degree of LL.D. in 1914. A statue of Shackleton by Charles Sargeant Jagger was placed as a memorial outside the Royal Geographical

Society's house in Exhibition Road, South Kensington. His name is perpetuated in Mount Shackleton in the Canadian Rockies, Shackleton Inlet and Shackleton Ice Shelf in the Antarctic, and Mount Shackleton in East Greenland.

Shackleton married in 1904 Emily Mary, daughter of Charles Dorman, of Wadhurst, Sussex, and had two sons and one daughter.

Shackleton found in polar exploration an outlet for his restless energy, love of adventure, and zest for life. In the more ordered walks of civilization his lack of convention, his intolerance of shams, and his impetuous candour made him less easy to satisfy. His success as an explorer lay in the boldness of his conceptions, his resourcefulness, and his good leadership. Apart from his considerable discoveries and the scientific results of his expeditions, he left his mark on Antarctic exploration by his adoption of a new technique in sledge travelling and his abandonment of many of the old traditions of polar exploration.

A cartoon of Shackleton appeared in *Vanity Fair* 6 October 1909.

R. N. RUDMOSE BROWN.

SHANDON, BARON (1857-1930), lord chancellor of Ireland. [See O'BRIEN, IGNATIUS JOHN.]

SHANNON, SIR JAMES JEBUSA (1862-1923), painter, was born at Auburn in the state of New York 3 February 1862, the third son of Patrick Shannon, a contractor and railway builder. Both his parents were Irish. At the age of sixteen (1878), having received some slight tuition in art, Shannon left America for England, where he studied for three years at the National Art Training Schools, South Kensington (afterwards the Royal College of Art), his teacher in painting being (Sir) Edward John Poynter [q.v.]. Shannon's record as a student was a creditable one; and in 1881, at the early age of nineteen, he received an unusual honour: his portrait of the Hon. Horatia Stoford, maid-of-honour to Queen Victoria, painted for the queen, was exhibited at the Royal Academy by royal command. This was Shannon's first appearance at Burlington House, where he subsequently became a regular contributor to the Academy

exhibitions, eventually gaining a very widespread clientele for his portraits. His first outstanding success was his full-length portrait of Mr. Henry Vigne, master of the Epping Forest harriers, in hunting dress, exhibited at the Grosvenor Gallery Summer Exhibition in 1888.

Shannon's portraits constitute the bulk of his production, and while certainly not the work of a master of the first rank, possess undeniable qualities of colour and arrangement. In style, like so many other artists of his generation, he had a tendency towards what may be termed a modified impressionism. He received many medals at exhibitions held on the Continent and in the United States. He was elected A.R.A. in 1897 and R.A. in 1909, his diploma work being a portrait of a lady with a dog, entitled 'Black and Silver'. He was a foundation member of the New English Art Club (1885), although his association with it did not last long; and he held successfully the office of president of the Royal Society of Portrait Painters from 1910 until his death. At the Tate Gallery Shannon is represented by three pictures, among them being 'The Flower Girl' (exhibited at the Royal Academy in 1901, and purchased in the same year by the Chantrey trustees), and a portrait of Phil May (exhibited at the Royal Academy in 1902, purchased by the Chantrey trustees in 1923).

Shannon, who was knighted in 1922, died in London 6 March 1923. He married in 1880 Florence Mary Cartwright. She survived him together with their only child, a daughter. A memorial collection of his works was hung in the Burlington House Winter Exhibition in 1928; this collection included (No. 38) a self-portrait of Shannon, lent by Lady Shannon.

[*The Times*, 7 March 1923; Kitty Shannon, *For My Children*, 1933; Mentle Fielding, *Dictionary of American Painters, Sculptors, and Engravers*, 1926; Algernon Graves, *The Royal Academy of Arts, a complete dictionary of contributors and their work*, vol. vii, 1906; subsequent Royal Academy Exhibition Catalogues, including that of the Memorial Exhibition of 1928.] T. BORENTUS.

SHARP, CECIL JAMES (1859-1924), musician, author, and collector and arranger of English folk-songs and dances, was born in London 22 November 1859, the eldest son of John James Sharp, slate-merchant, by his wife, Jane Bloyd. He was educated at Uppingham School and at Clare College, Cambridge. He had inherited a love of music from his father,

and in his early days had studied music, practically and theoretically. While at Cambridge he entered fully into the musical activities of the university. After taking his degree (a third class in the mathematical tripos), Sharp went in 1882 to Adelaide, where he held the legal post of associate to the chief justice of South Australia. He was also during this period assistant organist of the cathedral and conductor of the Philharmonic Society. From 1880 to 1891 he was co-director of the Adelaide College of Music. While in Australia he composed two light operas and some smaller pieces. Early in 1892 he returned to England. In 1893 he married Constance Dorothen (died 1928), daughter of Priestley Birch, of Woolston, near Kingsbridge, Devon, and had one son and three daughters. He became conductor of the Finsbury Choral Association (1893-1897), music master at Ludgrove School (1893-1910), and principal of the Hampstead Conservatoire of Music (1896-1905). From 1910 to 1912 he held no official position. From 1912 to 1924 he was director of the English Folk-Dance Society. From 1919 to 1923 he held the post of occasional inspector to the Board of Education with special reference to the teaching of folk-dance. In 1923 he received the honorary degree of Mus.M. of Cambridge University. He died at Hampstead 23 June 1924, after a short illness.

Such are the external facts of Sharp's career, but interest centres in the last twenty-five years of his life and in the gradual growth under his influence of the knowledge of the English traditional arts of music and dancing. In 1902 his experience as singing-teacher at Ludgrove School led him to prepare and publish *A Book of British Song*. This contains both traditional melodies (gleaned from William Chappell's *Popular Music of the Olden Time*, 1838, and other printed sources) and 'composed' music of a simple kind. It was probably his work on this book which led Sharp to realize the essential importance of traditional art, and in 1903 he decided to find out for himself how far traditional music survived in England and what was its quality. His first experiment was made in September 1903 at Hambridge, in Somerset, where, with the help of the vicar, the Rev. C. L. Marson, he made an exhaustive search of the neighbourhood with surprising results. A selection from the songs which he discovered, called *Folk-Songs from Somerset*, was published in 1904 and aroused great

interest. That such beautiful and vital melodies should have been sung for generations in 'unmusical' England was indeed a remarkable discovery.

Opinion had, however, been ripening. (Sir) Hubert Parry [q.v.] had in 1893 published his *Art of Music*, in which he applied the theory of evolution to music and showed the line of succession from the simplest of folk-tunes to the most elaborate symphony. Already, also, a certain number of traditional melodies had been collected. In 1898 the Folk-Song Society had been founded, and in 1904 Sharp was elected on to its committee. Nevertheless, his ideas were not cordially welcomed by the leading members of the society, whose ideal was that of quiet research, while Sharp was above all a teacher and a propagandist. He used scholarship and research as a means to an end; for he believed in folk-song, not as a relic of the past, but as a thing of living beauty. These simple and lovely melodies have awakened in thousands of people a musical consciousness hitherto dormant. In 1906, after the Board of Education had published a list of recommended songs for children in which no distinction was made between songs which were traditional and those which were merely popular, Sharp vainly urged the Folk-Song Society to make a protest.

Meanwhile Sharp persistently pressed the claims of folk-song by lectures, articles, and letters to the newspapers, thereby arousing some bitter opposition. In 1907 he tabulated his experiences in his book *English Folk-Song: some Conclusions*. The theories set out therein are not new, nor do they pretend to be so. They are the logical conclusions of the evolutionary theory of music and that of the communal authorship of folk-song already vaguely formulated by others. It should be noted that Sharp claimed communal authorship, but not communal origin, for the folk-song. He held, together with Jacob Grimm and others, that folk-music, developing as it does by purely oral tradition without being stereotyped by print or writing, tends to evolve as it passes through the minds of generations of singers; that therefore no individual singer can at any given moment be said to be the author of the song, but that it truly represents the communal mind of those to whom it belongs. Moreover, he held that the law of the survival of the fittest applies here, and that the process is one not of disintegration but of evolution.

All this time Sharp was collecting more songs and publishing the cream of them in further volumes of *Folk-Songs from Somerset* (five series, 1904, 1905, 1906, 1908, and 1909). His example fired others, and it soon appeared that there was hardly a village in England where this native art did not survive.

Sharp's final adventure in search of songs was his visits to the Southern Appalachian Mountains in North Carolina, Tennessee, Kentucky, and Virginia in 1910 to 1918. In these remote parts of the United States there lives a people descended from early English colonists segregated by natural surroundings from the rest of the world. They have preserved the customs, speech, and above all the songs, which they brought with them from England in the early eighteenth century. When Sharp heard of this community he characteristically determined to get at the facts of the alleged survivals, and he paid several visits (lasting forty-six weeks in all) to the Appalachian Mountains, although he was in indifferent health and had to make his investigations in circumstances of the most primitive discomfort.

Sharp noted down altogether nearly five thousand tunes and variants, about one-third being collected in the Appalachian Mountains. Of these he published some five hundred for use with pianoforte accompaniment, and a further thousand are printed in the *Journal of the Folk-Song Society* and other scientific publications. The rest remain in his manuscript books which he left to Clare College, Cambridge. These figures conclusively dispel the idea that Sharp imagined that all folk-songs were of equal value.

The other main subject of Sharp's activities was the folk-dance, in which he was practically first in the field. This was a much more difficult problem than the folk-song, for it takes only one man to sing a song while it takes six to dance a morris, and by the time Sharp began to collect there were few complete morris 'sides' left. Most of the dances had, therefore, to be reconstructed from the explanations and partial demonstrations of old and infirm men. Further, there is no recognized notation of the dance as there is of the song; so the only thing to do was to invent a notation for the purpose. Sharp's first dance researches, dating from 1905 (he had previously, in 1899, noted the tunes of several morris-dances from Headington, Oxfordshire), were in the Midlands, the home of the morris-dance.

In 1910 he turned his attention to the corresponding ceremonial dance of northern England, the sword-dance. Less artistically important, but, as it proved, socially more far-reaching, was the country dance. This is not a ceremonial dance for experts, but a form of social enjoyment; moreover it is danced by both sexes, whereas the morris and sword dances are traditionally danced by men only. Sharp collected some examples of the country dance from living tradition, but most of those which he published were transcribed by him from the seventeen editions of John Playford's *Dancing Master* (1650-1728). Here his unflinching instinct enabled him to select those dances which reflect the spirit of tradition, even though some of them have no doubt been consciously worked on by individuals.

Sharp was, of course, not content merely to collect; he also wanted to teach, and between 1907 and 1914 he published over three hundred dances with their tunes. He recognized, however, that these things cannot be learned from books only. In 1905 he had come into contact with Mary Neal and her *Espérance* club for working-girls in Cumberland Market, London; and it was here that practical folk-dance teaching was first undertaken. For a time Sharp and Miss Neal worked together; but the object of the *Espérance* club was social regeneration rather than artistic excellence. Miss Neal held that Sharp's interpretation of the dances was formal and pedantic and robbed them of the joyousness which it was the object of her club to encourage: Sharp considered that the joy of doing a good thing well was the ultimate object to be secured. So the two parted company, and Sharp found new allies in the Chelsea College of Physical Training, where he established a school of folk-dance in 1909.

In 1911 Sharp founded the English Folk-Dance Society, the object of which was to 'preserve and promote the practice of English folk-dances in their true traditional forms'. From this time forward his life became that of an inspiring teacher and an efficient and autocratic organizer, and with the exception of a few flying visits to discover new folk-songs and dances and the expeditions to America already recorded, the rest of his life was devoted to the society which he founded. The English Folk-Dance Society prospered far beyond his expectations, and since his death it has gone on growing. In 1931 the membership was 1,680, besides

fifty-two local branches (including two in the United States) with a membership of over twenty-two thousand, and early in 1932 an amalgamation with the Folk-Song Society was effected.

On Sharp's death a fund was opened to build a house where his memory could be kept alive by preserving, practising, and teaching folk-songs and dances. In June 1930 Cecil Sharp House in Regent's Park Road, London, was opened, and on its foundation-stone are inscribed the words: 'This building is erected in memory of Cecil Sharp who restored to the English people the songs and dances of their country.'

Sharp won the admiration of all who came into contact with him, even those whom his uncompromising methods of controversy had antagonized before they got to know him. His absorption in his mission did not prevent him from taking an intelligent interest in all that was going on in the world, about which he always had something pregnant to say. In politics he inclined to the Fabian socialist view. His favourite composers were Beethoven, Wagner, and Handel. He suffered all his life from ill-health, but this only added to the energy with which he worked for the causes that he loved.

A portrait by Sir William Rothenstein hangs in the library at Cecil Sharp House.

[*The Times*, 27 June 1924; *Journal of the Folk-Song Society*, December 1924; *English Folk-Dance Society News*, November 1924; A. H. Fox Strangways, *Cecil Sharp*, 1933; private information; personal knowledge.]

R. VAUGHAN WILLIAMS.

SHATTOCK, SAMUEL GEORGE (1852-1924), pathologist, was born 3 November 1852 in Mornington Street, Regent's Park, London, the son of Samuel Chapman Betty, chemist, by his wife, Jane Betty, née Brown. Some thirty years later he changed his name to Shattock. He married Emily Lucy Wood, and had three sons and one daughter. He died at Wimbledon 11 May 1924.

Shattock was educated at University College, first at the boys' school and afterwards as a medical student, qualifying in 1874. After a few years as curator of the museum at his own school, he moved to St. Thomas's Hospital, where he rearranged the museum and was one of the teachers of pathology for the rest of his life. Shattock's connexion with the Royal College of Surgeons began informally soon after he graduated. In 1897 he became curator of

the pathological museum and he gave it devoted service for twenty-seven years, reorganizing the whole collection on improved and original lines. From 1880 onwards he was one of the mainstays of the Pathological Society of London and its successor, the section of pathology of the Royal Society of Medicine, editing its *Transactions* and *Proceedings* for many years and himself contributing about 150 papers. He was elected a fellow of University College in 1910 and a fellow of the Royal Society in 1917.

For forty years Shattock was one of the chief influences in London which moulded the course which pathology was to take in a time of transition. As he came to maturity, it was just beginning to be recognized that pathology was a science with its own methods and results and that it could no longer be dealt with satisfactorily as a casual interest of men engaged in medical practice. Its scope was also being greatly enlarged by the development of bacteriology and by the appreciation of the importance of experimental and chemical methods of investigation. Shattock was one of the first to give his whole time to pathology and was able to play an important part in this revolution of outlook. He was a devoted and industrious student who made it his first business in life to have a scholar's knowledge of his subject, and he became the most erudite pathologist of his time. He had also a catholic conception of the content of pathology: he was an acknowledged authority on morbid anatomy, and he investigated the virulence of bacteria, the healing of wounds in plants, the microbic origin of cancer, and secondary sexual characters. His teaching was clear and dramatic, and although he was too aloof to make intimate personal contact with his students, his influence was durable.

Shattock was a strangely shy and reserved man with curious fads and habits. His immense knowledge was cordially at the disposal of any serious student, but apart from his work he was a difficult man to know. He was a devout Roman Catholic, and the posthumous publication of his *Thoughts on Religion* (1926) revealed an aspect of his life of which few of his associates had been aware.

A. E. BOYCOTT.

SHAUGHNESSY, THOMAS GEORGE, first BARTON SHAUGHNESSY, of Montreal, and of Ashford, co. Limerick (1853-1923), Canadian railway administrator, was born 6 October 1853 at Milwaukee, Wisconsin, U.S.A. He was the son of Thomas Shaughnessy, an officer in the Milwaukee detective police, a native of Ashford, co. Limerick. His mother was also of Irish birth. He was educated in the common schools of Milwaukee, where he showed a special aptitude for mathematics. In 1869 he obtained employment in the purchasing department of the Milwaukee and St. Paul Railway. For some time he studied law privately, hoping to escape into the legal profession; but as his energy and enterprise gained him promotion, he became reconciled to his calling. Shaughnessy attracted the favourable notice of (Sir) William Cornelius Van Horne [q.v.], the general superintendent of the railway company, at whose instance he was in 1879 appointed its general storekeeper. In 1882, however, Van Horne, now general manager of the lately formed Canadian Pacific Railway company, persuaded Shaughnessy to accept the post of general purchasing agent to that undertaking. He thereupon settled in Montreal, where he resided for the rest of his life.

During Shaughnessy's first years in Canada the financial situation of the Canadian Pacific Railway was often extremely precarious, and he rendered invaluable service in placating and reassuring alarmed and importunate creditors. Van Horne's biographer, Walter Vaughan, goes so far as to say that in the early months of 1885, when the very difficult section of the line along Lake Superior was being built 'on faith and credit', 'the one bright spot in the darkness was the success of the indefatigable and resourceful Shaughnessy'. In 1885 he was appointed assistant-general manager; in 1891 he became vice-president, and in 1899 president in succession to Van Horne, who had relied much on his business acumen and organizing ability.

The period of Shaughnessy's presidency saw the Canadian Pacific at the height of its prosperity and renown. It is true that the general condition of Canada during the first years of the twentieth century was strongly in its favour; but much of its progress and success was undoubtedly due to Shaughnessy. He seldom missed a chance of applying the policy of his predecessor to new ventures. Perhaps his most notable achievement was the creation,

partly by purchase, partly by new construction, of the company's Atlantic fleet, which for the first time attracted large numbers of well-to-do passengers to the St. Lawrence route to North America. On the collapse of the long-continued boom in 1913—a misfortune aggravated by the outbreak of the European War—Shaughnessy showed that his old resourcefulness had not left him, and his shrewd and daring financial measures enabled the company to weather the crisis with astonishing success and, alone among the important railways of Canada, to continue as a private undertaking. He resigned the presidency in 1918, becoming chairman of the board of directors.

Shaughnessy was knighted in 1901 and created K.C.V.O. in 1907. In 1916 he was raised to the peerage of the United Kingdom. In 1911 he received the honorary degree of D.C.L. from Trinity College, Dublin. The public honours bestowed on him were a recognition of his contribution to the economic development of Canada. He would never accept any political post or associate himself definitely with any political party. Soon after he joined the staff of the Canadian Pacific Railway he was naturalized as a British subject, and in his later years his Canadian patriotism led him now and then to take a strong line on political questions. He was, for instance, very hostile to the liberal government on the Reciprocity issue of 1911, although when he cried, 'Fix the channels of Canadian trade eastward and westward', his critics naturally pointed out that such advice was in striking accord with the interests of the shareholders of the Canadian Pacific Railway. During the European War Shaughnessy turned his experience and energy to the promotion of his country's cause: he was freely consulted by both the Dominion and the Imperial governments; he rendered very valuable service in negotiations between the British government and big financial interests in America, and his counsel carried especial weight with Mr. Lloyd George's Coalition ministry.

Shaughnessy married in 1880 Elizabeth Bridget Nagle, of Milwaukee, by whom he had two sons and three daughters. He died at Montreal 10 December 1923 after a very short illness. He was succeeded as second baron by his elder son, William James (born 1883). His younger son was killed in the European War.

Although not obstinate or arrogant, Shaughnessy was wont to place great trust

in his own judgement. He had a quick wit and a keen sense of humour. Despite the defects of his early education, he was a well-informed man and an omnivorous reader. He was fond of music, but he cared little for pictorial art. Much of his success was due to his faculty of detaching his mind from his work when business hours were over. For many years he habitually drank a pint of champagne with his dinner; he was fond of billiards and bridge; for some time he owned one or two race-horses; but he took no exercise whatever until, when quite elderly, he became interested in golf. His vigour was astonishing, and his health remained very good until a few hours before his death. In religion he was a Roman Catholic.

A cartoon of Shaughnessy by 'Spy' appeared in *Vanity Fair* 26 August 1903.

W. T. WAUGH.

SHAW-LEFEVRE, GEORGE JOHN, BARON EVERSLEY (1831-1928), statesman, the only son of Sir John George Shaw-Lefevre [q.v.], and nephew of Charles Shaw-Lefevre, Viscount Eversley [q.v.], was born in London 12 June 1831. His mother was Rachel Emily, daughter of Ichabod Wright, of Mapperley Hall, Nottingham, and sister of Ichabod Charles Wright [q.v.], the translator of Dante. From his father, a man of great ability, who was reputed to know fourteen languages, Shaw-Lefevre imbibed a keen interest in politics and a taste for foreign travel, as well as great industry, considerable powers of observation, and a memory which was especially retentive of curious and often grotesque stories about strange characters and persons of note whom he had met. Few could match his experience and knowledge of public affairs. He had known personally—he was heard to say—thirteen prime ministers, seventeen lord chancellors, and seven archbishops of Canterbury. As clerk of the parliaments, his father was acquainted with most of the public men of his day, and thus from his boyhood young Shaw-Lefevre was familiar, like his friend and contemporary, Sir George Otto Trevelyan [q.v.], with political society. Like Trevelyan, he was by tradition and upbringing a whig, but like Trevelyan also, he rapidly developed strong liberal, and even radical, leanings. He was educated

at Eton and at Trinity College Cambridge, taking his degree in 1853. In the previous year he carried the coronet at the Duke of Wellington's funeral.

After leaving Cambridge in the summer of 1853, Shaw-Lefevre visited the United States, and saw the slave market at Richmond, Virginia. In the following year he was called to the bar by the Inner Temple, and in the spring of 1855 went on circuit. In September 1855 he sailed in Sir Edward Colebrooke's yacht to the Crimea, taking with him an early form of photographic camera. His photographs from the lines before Sebastopol are still in the possession of his family. In 1857 Shaw-Lefevre rode on horseback from Vienna to Constantinople, and afterwards visited Athens. This journey gave him an abiding interest in the Eastern problem and in the declining fortunes of the Turkish Empire.

After contesting Winchester unsuccessfully at the general election of 1859, Shaw-Lefevre was elected member for Reading in the liberal interest in 1863, and held the seat until 1885. In the House of Commons he soon made his mark. His maiden speech, delivered in 1864—inspired by a then unfashionable sympathy for the North in the American Civil War—was a plea for the stopping of the *Alabama* before she left port. Most of his friends tried to dissuade him from his motion, but Cobden urged him to persevere. It was, of course, unsuccessful, although its wisdom and foresight were speedily proved. His second speech (March 1865) was directed against the fortification of Quebec. The motion, although defeated, eventually took effect, and the scheme was dropped. His third speech (also in 1865) aimed at establishing public rights over all commons. This was a principle for which he contended all his life, and he had the satisfaction in 1925 of seeing it embodied in a statute, although even then it was only applied to commons in urban districts.

On 10 July 1866 Shaw-Lefevre invited a number of friends to a meeting, at which it was decided to form a new society called the Commons Preservation Society, for the immediate purpose of organizing resistance to the threatened enclosure of commons. Among its first members were Edward North Buxton, John Stuart Mill, Thomas Hughes, Leslie Stephen, George Grote, Henry Fawcett, Thomas Farrer, and James Bryce. Shaw-Lefevre was appointed chairman, and held the office, with a few brief intervals, down to his

death. To the exertions of this society England owes the preservation, from the enclosing landlord and the encroaching builder, of Hampstead Heath, Wimbledon Common, Epping Forest, and many other famous common lands. The Commons Preservation Society and its achievements constitute a lasting memorial to the industry and public spirit of its founder. His exertions in this cause never flagged. The story of what he accomplished is well told in his own book, *Commons, Forests, and Footpaths* (1894), which remains a standard work on the subject.

In the same year (April 1866) Shaw-Lefevre joined the government of Lord John Russell as civil lord of the Admiralty, but it fell two months later. His next success was in opposition, when, in 1868, he carried a resolution in favour of submitting the *Alabama* claims to arbitration. After the general election of 1868, Mr. Gladstone appointed him secretary to the Board of Trade, of which John Bright was president. After carrying the General Tramways Act (1870), he was transferred in 1871 to the Home Office as under-secretary, and later in that year to the Admiralty as secretary; this post he held until 1874, when Mr. Gladstone's first ministry fell.

On the formation of the second Gladstone administration in 1880, Shaw-Lefevre was appointed first commissioner of works, an office which gave him considerable scope, although it did not carry Cabinet rank. He was responsible for several important public works, including improvements at Hyde Park Corner and at the Tower of London, the restoration of the front of Westminster Hall, and the removal of the old Law Courts from Westminster to the new buildings in the Strand. After a long controversy with the Treasury and Office of Works, Shaw-Lefevre also succeeded, by personally arguing the case before Mr. Gladstone, in throwing open to the public a number of private enclosures in Regent's Park, thus affording access along the whole length of the lake. In 1883 he was appointed postmaster-general with a seat in the Cabinet. While in office he initiated the sixpenny telegram.

Probably the most bitter disappointment of Shaw-Lefevre's public career was his defeat, at Reading, in the general election of 1885, which wrecked his natural expectation of a seat in Mr. Gladstone's Home Rule Cabinet. A strong supporter of Home Rule for Ireland, he wrote several books and pamphlets on the subject. At

the election of 1886 he was returned for Central Bradford, and retained the seat until 1895. In Mr. Gladstone's fourth administration (1892-1894) he was again appointed first commissioner of works, this time with a seat in the Cabinet. During his second term of office he obtained the queen's consent to the throwing open of Hampton Court Park, and also of Kew Palace, with consequent valuable additions to Kew Gardens. He was the only Cabinet minister who fully supported Mr. Gladstone's opposition in 1898-1899 to the increased naval estimates. After his own resignation in 1894, Mr. Gladstone regretted that he had not appointed Shaw-Lefevre, instead of Lord Spencer, first lord of the Admiralty. In that position, Shaw-Lefevre, whose passion for public economy and objection to increased armaments were as strong as Mr. Gladstone's, would indubitably not have acquiesced in the demands of the naval lords, and the sharp crisis which ended Mr. Gladstone's fourth administration, with disastrous consequences to the liberal party, would almost certainly have been avoided. In the brief administration of Lord Rosebery (1894-1895) Shaw-Lefevre remained in the Cabinet as president of the Local Government Board. In that capacity he took the initiative in the Equalization of Rates (London) Act (1894), and in a very useful measure providing that disused burial grounds should be converted into public gardens.

Like several of his colleagues, Shaw-Lefevre suffered defeat at the general election of 1895, and decided not to re-enter the House of Commons. His devotion to public administrative work, however, found scope on the London County Council. He was elected as a progressive for the Haggerston division in 1897, and acted as chairman of the improvements committee until 1901. In that capacity he brought about the Kingsway and Aldwych Street improvements and the extension of the Thames embankment to Lambeth bridge, as well as the removal of many slums.

In 1912 increasing deafness induced Shaw-Lefevre to retire to his country home, Abbotsworthy, near Kingsworthy, a pleasant seat on the Itchen, where he lived, with occasional visits to London, for the rest of his life. In 1906, at the instance of his old colleague, Sir Henry Campbell-Bannerman, he was raised to the peerage as Baron Eversley, of Old Ford; but he seldom attended the House of Lords or intervened in its debates.

In addition to his work for the Commons Preservation Society, Lord Eversley was a very active member of the Cobden Club, and took a leading part in the preparation of several of its publications, notably *Fact v. Fiction*, a reply to Joseph Chamberlain's Tariff Reform speeches, in 1904, and *The Burden of Armaments*, a plea for the reduction of military and naval expenditure, in 1905. During the European War his interests reverted to foreign policy, and in 1915 he published a book on *The Partitions of Poland*, and in 1917 another on *The Turkish Empire, its Growth and Decay*. He found diversion later in a series of reminiscences, which appeared in the *Cornhill Magazine*; and until a few weeks before his death, which took place at Abbotsworthy 10 April 1928, he retained a keen interest in politics, reading, or having read aloud to him, the daily newspapers and most of the important debates in Hansard. He kept up almost to the end a vigorous and animated correspondence on public affairs with friends who shared his views on public economy, fiscal policy, and other subjects.

Lord Eversley married in 1874 Lady Constance Emily (died 1929), only daughter of Henry John Moreton, third Earl of Ducie. They had no children, and on his death the barony became extinct.

Shaw-Lefevre was a statesman and administrator of extraordinary industry and public spirit. At one time in the 'sixties, he was spoken of as a future prime minister. That he did not fulfil these high expectations is perhaps attributable in part to a lack of personal magnetism, and to a certain self-absorption which alienated sympathy and prevented others from appreciating fully the value and real disinterestedness of his public work. It may be added that he never deserted, or failed to support, any of the principles, causes, and ideals with which his public life is associated. As a speaker and debater he was competent but not brilliant, and the same may be said of his style as a writer.

[Private information; personal knowledge.]
F. W. HIRST.

SHEARMAN, SIR MONTAGUE (1857-1930), judge, was born 7 April 1857 at Wimbledon, the second son of Montagu Shearman, solicitor, of Wimbledon, by his wife, Mary, daughter of Frederic Adam Catty, whose father, a royalist refugee from France, was French master at the Royal Military Academy, Woolwich. He went from Merchant Taylors' School,

where he was head-monitor and captain of the rugby football XV in 1874-1875, with a scholarship to St. John's College, Oxford. At the university he was distinguished both as a scholar and as an athlete. He obtained first classes in classical moderations (1877) and in *literae humaniores* (1879). He played in the university rugby football XV both as a forward and three-quarter; he was president of the university athletic club in 1878 and represented the university between 1876 and 1879 in the hundred yards—the 'classic perfection' of his style was noted in 1876—the quarter-mile, and putting the weight; he was a good long jumper; and he rowed in his college eight. Shearman was also amateur champion for the hundred yards (1876) and the quarter-mile (1880); he played rugby football for the South of England, and twice was 'reserve' for England; and in 1881 he swam the Niagara River below the Falls. In 1915 he succeeded Lord Alverstone as president of the Amateur Athletic Association. He was joint author with J. E. Vincent of *Football: its history for five centuries* (1885), and author of *Athletics and Football* (Badminton Library, 1887).

After taking his degree in 1879, Shearman read in chambers with C. M. Warming-ton, then a flourishing chancery junior, and was called to the bar by the Inner Temple in 1881. He was soon busy in London, on the Midland circuit, and at the Birmingham sessions. A fluent speaker, with a good appearance and an even temper, he got on well with his tribunal. For the most part his cases demanded skilful advocacy rather than deep knowledge of the law, and he relied much on his tact and common sense. Shearman thoroughly understood the mentality of jurymen, who appreciated addresses which, if sometimes unpolished, were always plausible. Money-lenders, especially, recognized his qualities as an advocate and for some years he was standing counsel to the leading firms. Taking silk in 1903, he acquired a substantial practice in the front row at a time when competition at the bar was keen.

On the retirement of Lord Justice Vaughan Williams and Mr. Justice Channell in 1914, Lord Haldane chose Shearman to fill one of the vacant judgeships in the King's Bench division, and he was knighted. His wide experience in the courts made him a useful judge of first instance. Although he never pretended to be a profound jurist, he was not afraid of

grappling with legal problems or of making up his mind. Shortly after his appointment he presided over the trial of Nicholas Ahlers, the German consul at Sunderland, who was charged with 'adhering to, aiding and comforting the King's enemies'. The evidence for the prosecution showed that Ahlers had assisted German subjects of military age with money and information in order that they might return from England to Germany. The conviction of the accused man at the Durham autumn assizes in 1914 for high treason was subsequently set aside by the Court of Criminal Appeal. In 1916 Shearman served with Lord Hardinge of Penshurst and Sir Mackenzie Chalmers on the committee appointed to inquire into the origin and causes of the Easter Rebellion in Ireland. He was the judge of assize at Carmarthen in November 1920, when Harold Greenwood, after a seven days' trial, was acquitted on a charge of having poisoned his wife; and in 1922, at the Central Criminal Court, he tried Frederick Bywaters and Mrs. Edith Thompson who were convicted of the murder of Mrs. Thompson's husband: after an unsuccessful appeal both were hanged. During the same year he tried at the Central Criminal Court and sentenced to death the murderers of Field-Marshal Sir Henry Wilson [q.v.]. An operation necessitated by an old injury in the football field gravely impaired his powers of speech, and he struggled against this disability for some two years before his retirement in October 1929. He died at his London residence 6 January 1930.

Shearman married in 1884 Mary Louise, daughter of Job Long, of New York, by whom he had two sons, the younger of whom died from wounds received in the European War.

A cartoon of Shearman appeared in *Vanity Fair* 4 July 1895, and an oil painting by Miss May Clifford is in the possession of his family.

[*The Times*, 7 January 1930; *Law Journal*, 11 January 1930; personal knowledge.]

T. MATHEW.

SHEFFIELD, fourth BARON (1839-1925). [See STANLEY, EDWARD LYULPH.]

SHIPLEY, SIR ARTHUR EVERETT (1861-1927), zoologist, was born at Walton-on-Thames 10 March 1861, the second son of Alexander Shipley, of The Hall, Datchet, Buckinghamshire, by his wife, Amelia, daughter of William Henry

Burge, of Windsor. In 1877 he was sent to University College School, London. Two years later he entered St. Bartholomew's Hospital as a medical student. In 1880 he proceeded with a scholarship in natural sciences to Christ's College, Cambridge, where he resided continuously until his death forty-seven years later. He obtained first classes in both parts of the natural sciences tripos (1882 and 1884); in the second part he took zoology as his subject. He received encouragement in his scientific studies from S. H. Vines, who was then a fellow of Christ's College and Shipley's director of studies, but it was undoubtedly the influence of Francis Maitland Balfour [q.v.], professor of animal morphology at Cambridge, which led Shipley to devote himself to the study of zoology. Balfour's work on *Comparative Embryology* had appeared in 1880-1881 and had revealed a new field for zoological research. Moreover, the study of the morphology of the smaller animals and embryos had been greatly facilitated by the invention in 1883 by W. H. Caldwell and R. Threlfall in the zoological laboratory at Cambridge of the rocking microtome, which enabled a series of microscopic sections to be cut and mounted. This invention was fully employed by Shipley and his contemporaries. Shipley's early interest in zoology and his capacity for research were shown by a visit to the Stazione Zoologica at Naples, and by the publication of the results of his work there in a paper on the structure and development of the Brachiopoda before he had taken the second part of his tripos. His next publication was an account of the development of the river lamprey, which appeared in 1887. Shipley's early publications give little indication of the lines of work which established his reputation as a zoologist. After the publication of an important memoir on one of the Gephyrean worms (*Quarterly Journal of Microscopical Science*, vol. xxxi, 1890), he turned his attention to the study of parasitic worms. His published work on parasitic worms, which eventually extended to nearly fifty papers in scientific journals, gradually built up his scientific reputation as a competent and successful researcher, and led, in 1904, to his election as a fellow of the Royal Society.

At Cambridge Shipley successively held the posts of university demonstrator in comparative anatomy (1886), lecturer in the advanced morphology of the Invertebrata (1894), and reader in zoology (1908).

This last post he resigned in 1920, after which he held no official teaching post in the university. Shipley's teaching was enlivened by many touches of humour, which are also present in all his writings. In addition to his scientific papers, he produced in 1893 a text-book, *The Zoology of the Invertebrata*, which was much used by students. He collaborated with Professor E. W. MacBride in writing a *Text-book of Zoology*, which was published in 1901 and passed through four editions, the last in 1920. He also collaborated with (Sir) S. F. Harmer in editing the *Cambridge Natural History*, a work in ten volumes which appeared between 1895 and 1909, and of which Shipley himself wrote several sections. He edited the biological series of the Pitt Press Natural Science Manuals and, for a time, the 'Fauna of British India' series. He was co-editor with Professor G. H. F. Nattall of the journal *Parasitology* from 1908 to 1914, and he also assisted in editing the *Journal of Economic Biology* from 1905 to 1913.

Shipley was perhaps at his best when writing as a popular exponent of zoology. His first book of this nature was a collection of essays entitled *Pearls and Parasites*, published in 1908. It was about this time that he gave up active research in zoology, and turned to literary work. In 1913 he published a memoir of his friend, John Willis Clark [q.v.], under the title of 'J', a *Memoir of John Willis Clark*. *The Minor Horrors of War* (1915) passed rapidly through three editions and was so successful that a year later he wrote *More Minor Horrors*. These two books introduced parasitology to a public which had, at the time, practical experience of the parasites therein described. *Studies in Insect Life* appeared in 1917, and in 1923 Shipley published a small book entitled *Life*, which he had written at the request of the Cambridge University Press in order to serve as an introduction to the study of elementary biology. This book had a very wide circulation and encouraged the teaching of this subject in schools. In 1924 appeared *Cambridge Cameos and Islands—West Indian and Aegean*. Shipley's last book, *Hunting under the Microscope*, was posthumously published in 1928, being prepared for publication by his friend and former pupil, C. F. A. Pantin. Shipley was for many years Cambridge University correspondent of *The Times*, and he contributed numerous articles to that paper, as well as to many other papers,

encyclopaedias, and reviews, on a great diversity of subjects.

Shipley had been elected a fellow of Christ's College in 1887. At the time of his election the study of natural sciences in Cambridge was beginning to make great strides. Contemporary teachers of science were J. G. Adami, William Bateson, (Sir) S. F. Harmer, (Sir) Henry Head, (Sir) C. S. Sherrington, and D'Arcy Thompson, all of whom achieved distinction as biologists in later life. Shipley's reputation as a scientist is overshadowed by some of his contemporaries, but it must be remembered that his intellect was essentially versatile. As early as 1887 he was sent by the Colonial Office to the Bermudas in order to investigate a plant disease. This was the beginning of a connexion with the Colonial Office which lasted until his death. In the administration of the affairs of his college and of the university Shipley played a leading part. In 1891 he was appointed secretary to the museums and lecture rooms syndicate, a post which constituted him virtually business manager of the university laboratories and museums. In the following year he became tutor in natural sciences at Christ's College. From 1896 to 1908 he was a member of the council of the senate of the university, besides serving on many other boards and syndicates. Shipley's life was a successful combination of scientific research and administration. He made administration easy by an unusual sympathy with all sorts and conditions of men, and by a gift for entertaining which made his hospitality a notable feature of Cambridge during his period of residence. He travelled a great deal, frequently visiting the United States of America. It was on one of these visits that he received the honorary degree of D.Sc. from Princeton University (1906), and on another occasion (1909) he visited Canada in order to preside over the zoological section of the British Association which was holding its meeting in Winnipeg. He was an excellent talker, and could always entertain a large company with a good story well told.

Outside the university Shipley accomplished a notable amount of public work. He was chairman of the Marine Biological Association, treasurer and vice-president of the Research Defence Society, a member of the Central Medical War Committee and of the managing committee of the Imperial Bureau of Entomology. He was also a member of the royal commissions on the civil service (1912), on Trinity

College, Dublin (1920), and on the importation of store cattle (1921). He was consulted by Lord Milner about the foundation of a college of agriculture in the tropics, and in 1919 was appointed chairman of a Tropical Agriculture Committee. When the Imperial College of Tropical Agriculture was established in Trinidad in 1921, Shipley was appointed chairman of the governing body.

In 1910 Shipley was elected master of Christ's College, in succession to John Peile [q.v.]. The Master's Lodge, which was to be his home for the rest of his life, was an old portion of the college which had undergone many previous internal alterations. Under Shipley's direction the Lodge was largely restored to its original condition, and became one of the most interesting of the older buildings in Cambridge. He furnished it with great taste, and at his own expense panelled one of the larger rooms, which served as his study. The ampler quarters of the Lodge provided Shipley with additional opportunities for entertaining. To his frequent lunch and dinner parties he invited not only men of distinction, but also undergraduates; and it was remarkable how he was able to bring together people of dissimilar ages and vocations. During the European War, when ordinary entertaining was suspended, he entertained at the Lodge a long succession of wounded officers, who were convalescing after discharge from hospital.

From 1917 to 1919 Shipley was vice-chancellor of the university. During his period of office he visited the United States as a member of the British university mission, which was sent out in 1918 by the Foreign Office on the invitation of the Council of Defence at Washington in order to counteract German propaganda in American universities, and to make known the facilities for postgraduate work in British universities. He was in America when the Armistice was signed on 11 November. He afterwards wrote an amusing account of this visit in his book *The Voyage of a Vice-Chancellor* (1919).

In 1920 Shipley was created G.B.E. in recognition of his public services. After the end of the War he took no further part in university administration. But he still continued to entertain and to write, and he also retained his interest in the affairs of his college. Moreover, he did not retire from public work outside the university, and in 1924 he visited Trinidad in order to lay the foundation stone of the

new buildings of the College of Tropical Agriculture. It was probably due to principle that Shipley withdrew from university administration at this time in order to make way for the younger generation which had returned to Cambridge after the War. He had always urged that younger men should interest themselves in administration, believing that the university would be best administered by those who combined, as he did, administrative skill with academic distinction. The university was preparing for the royal commission which was appointed in 1923, and which eventually made far-reaching changes in the administration of the colleges and of the university as a whole. This work of reorganization Shipley left to others. He lived to see the new statutes come into operation in 1926, but before this there were signs that his health was beginning to fail. He suffered during the early part of 1927 from a serious illness, from which he recovered, but a second attack later in the same year proved fatal, and he died at the Master's Lodge 22 September. He was not married.

In appearance Shipley was dark and short, and, in later life, he was decidedly stout. In his early years at Cambridge, although he never played games and showed little interest in them, he took regular exercise, walking, bicycling, and riding, but latterly he gave this up and became, as he himself expressed it, 'quite rotund'. He was a person of most regular habits, who maintained a high standard of private and public duty. He was both punctual and punctilious, and it was an ideal of his to answer all his correspondence by return of post. In spite of the fact that he was always occupied with administrative and social duties, Shipley's output of literary work was considerable, if account be taken of all his scientific papers, articles, and reviews. That he could accomplish so much was due to his power of being able to write both articles and books at odd moments, even when others were talking in the room, as was often the case during the War, when convalescent officers were staying in his Lodge. He had no appreciation of music, and he attended the theatre only on rare occasions, but he had a keen appreciation of painting and architecture. He also collected furniture, and he filled his rooms in college and, later his Lodge, with many valuable pieces, which he delighted to show to his visitors.

There is a portrait of Shipley by P. A.

de László in the hall of Christ's College, and another by J. Nicholson at the Imperial College of Agriculture, Trinidad.

[*The Times*, 23 September 1927; *Proceedings of the Royal Society*, vol. ciii, B, 1928; personal knowledge.] J. T. SAUNDERS.

SHORTER, CLEMENT KING (1857-1926), journalist and author, was born in Southwark 19 July 1857, the youngest of the three sons of Richard Shorter, who came of Huntingdonshire and Norfolk stock, by his wife, Elizabeth Clemenson, who had some Spanish blood. Richard Shorter, of the historic Bull Inn, Bishopsgate, was a carrier between London and Cambridge, who was ruined by the competition of the Great Eastern Railway and emigrated to Australia, dying in poverty at Melbourne while his son Clement was still a child. Clement Shorter was sent to school at Downham Market, Norfolk, from 1863 to 1871. On leaving school he went to London and filled three different situations in four years with booksellers and publishers in Paternoster Row. He then returned to school for three months in order to study for the junior branch of the civil service. From 1877 to 1890 he was a clerk in the Exchequer and Audit department at Somerset House. At first he continued his education by attending evening classes at the Birkbeck Institution, where he had lessons in French and German, and 'had a try at Latin and Italian'. His adolescent reading was chiefly in the works of Carlyle, Emerson, Ruskin, and the English historians. By running two annual holidays into one, he was once able to spend three months in the family of a Lutheran pastor at Mecklenburg-Schwerin, where he improved his German. He writes in his *Autobiography* that he knew all the best German fiction, was enthusiastic over Goethe and Schiller, and was much influenced by Lessing, especially by his *Nathan der Weise*. In 1890 he annotated, very briefly, a reprint of *Wilhelm Meister*, and in 1892 he prefixed 'The Private Life of Ferdinand Lassalle' to a revised edition of George Meredith's novel, *The Tragic Comedians*. In the same year he issued a selection of Wordsworth's lyrics and sonnets.

In 1888 Shorter was writing twice weekly a column of gossip about books for the *Star* newspaper, as well as, a little later, a weekly column for the *Queen*. In 1890 he left Somerset House in order to become, at the invitation of (Sir) William James Ingram, editor both

of the *Illustrated London News* (in 1891) and of the *English Illustrated Magazine*. He had already been sub-editing, for Ingram, the *Penny Illustrated Paper* in his evenings. In 1893 Shorter founded, and edited for the *Illustrated London News* Company, the *Sketch*, 'on less serious lines'; he called this his one positive achievement in journalism, because in it he was the pioneer of the use of half-tone blocks in newspaper production. He writes: 'I knew nothing about art and cared less', and much later he wondered whether he had not done some harm to the national intellect, quoting against himself Wordsworth's sonnet on illustrated books and newspapers:

'Now prose and verse sunk into disrepute
Must lacquey a dumb Art that best can
suit

The taste of this once-intellectual Land.'

Shorter's journalism was, for himself, a joyous adventure, out of which he made much less profit than he might have done if money had been his main object. In 1897 he was editing five papers at once—the three already mentioned, together with the *Album* and *Pick-me-up*. In 1900 he parted from Ingram, in pique over a criticism of the *Sketch*, and founded the *Sphere*. Shorter remained editor of this paper until his death, contributing every week from 27 January 1900 (its first number) to 17 April 1926 a literary letter, always lively but often controversial and even personal, and much concerned with his hobbies—the Brontës, George Borrow, Samuel Johnson, and Napoleon. In 1903 he founded the *Tatler*, 'on more frivolous lines'—again it is his own description.

As early as 1889 Shorter had written an introduction to *Jane Eyre*. His first book, *Charlotte Brontë and her Circle*, appeared in 1896 (re-issued in 1914 as *The Brontës and their Circle*). This was followed by *Charlotte Brontë and her Sisters* (1905), *The Brontës: Life and Letters* (2 vols., 1908), an attempt to present a full and final record of the lives of the three sisters, from the biographies of Mrs. Gaskell and others, and from numerous hitherto unpublished manuscripts and letters. He edited Mrs. Gaskell's *Life of Charlotte Brontë* (incorporating many new letters) in 1899 and again (for 'The World's Classics') in 1910, and in 1910-1911 the *Complete Poems of Emily Brontë and Wuthering Heights*, in texts which left much work to be done by later editors. *George Borrow and his Circle* appeared

in 1913, containing hitherto unpublished letters of Borrow and his friends; and in 1923 he edited Borrow's *Complete Works*, in sixteen volumes. In 1908 he published *Napoleon and his Fellow-Travellers*, narratives of the emperor's voyages on the *Bellerophon* and *Northumberland* to exile in St. Helena, with an introduction; and in 1910 appeared *Napoleon in his own Defence*, with notes and an essay on Napoleon as a man of letters. Shorter's biographies of the Brontës and of George Borrow were compilations of facts, governed much more by the novelty of their discovery than by their importance, set forth with no literary grace, and with hardly any attempt at critical appreciation. He himself was conscious of this, and excused his own abstention from literature on the score of his all-exacting journalism.

Shorter, who was a very contentious man, was much satirized in his lifetime, but *C.K.S., an Autobiography*, a fragment posthumously published in 1926, shows him to have been a happy man, happy in his unthinking energy, enjoying controversy, naïve, and affectionate. He was an industrious collector of books, manuscripts, and literary material of all kinds; he possessed unique Brontë manuscripts and a valuable collection of grangerized books.

Shorter married twice: first, in 1896 the poet, Dora Sigerson (died 1918), daughter of George Sigerson, M.D., of Dublin; secondly, in 1920 Annie Doris, daughter of John Banfield, shipowner, of Penzance, who survived him with their daughter. He died at his home at Great Missenden, Buckinghamshire, 19 November 1926, and was cremated at Golders Green.

Among Shorter's writings not previously mentioned are *Victorian Literature: sixty years of books and bookmen* (1897), *Immortal Memories: Essays and Addresses* (1907, Lassalle, Cowper, Borrow, Crabbe, Johnson, &c.), and *Highways and Byways in Buckinghamshire* (1910). He also produced editions of the novels of Henry Kingsley (1894-1895, with a note on Kingsley in *Geoffrey Hamlyn* and a note on Old Chelsea church in *The Hillyars and Burtons*), of the novels and tales of Mrs. Gaskell (1907-1913, with introductions to each volume), and of Boswell's *Life of Johnson* (1924).

A cartoon of Shorter by 'Spy' appeared in *Vanity Fair* 20 December 1894.

SIFTON, SIR CLIFFORD (1861-1920), Canadian statesman, was born 10 March 1861 at St. John's, Middlesex, Ontario, the second son of John Wright Sifton by his wife, Kate Watkin. He came of Irish Protestant stock, his great grandfather, Charles Sifton, having emigrated from Clonmel, Ireland, to Upper Canada in 1819. His father built the first section of the Canadian Pacific Railway in Manitoba, and was afterwards active in public life, becoming speaker of the Manitoba legislative assembly. Sifton was educated at the High School, London, Ontario, and the Boys' College, Dundas, and graduated from Victoria University, Cobourg, in 1880, as gold medallist in mathematics. In 1882 he was called to the bar and began the practice of law in Brandon, Manitoba. Elected to the Manitoba legislature for North Brandon in 1888 as a liberal, he became attorney-general and minister of education in 1891. His activities in defence of the school law of 1890, which abolished denominational schools in the province and established a non-sectarian system, made him a national figure at an early age. The remedial order issued by the federal government instructing the province to restore Roman Catholic schools was rejected by the Manitoba legislature and by the electors of Manitoba under the leadership of Sifton; and after the defeat of the conservative federal government of Sir Charles Tupper [q.v.] upon this issue in 1896, Sifton entered (17 November 1896) the liberal government of Sir Wilfrid Laurier [q.v.] as minister of the interior. As the representative of Western Canada he took charge of the developmental programme of the government, and his policies with respect to immigration, colonization and land settlement, railway building, and the administration of the Yukon goldfields became the major political issues of the time. His methods were effective in inducing immigration and settlement, and during his nine years of office the prairie west, which had long suffered from stagnation, underwent an almost magical transformation. The yield of wheat in Western Canada was multiplied tenfold during these nine years, the population was trebled, and nearly three thousand miles of railway were built. His immigration policies were particularly successful in inducing farmers in the United States to remove to Canada.

Sifton's resignation from the government in March 1905 was the result of a disagreement with the prime minister,

Sir Wilfrid Laurier, over the educational clauses in the constitutions of the new provinces, Alberta and Saskatchewan. He organized an opposition which was successful in forcing a modification of these provisions, as a result of which the rights of the minority were limited to those which they had enjoyed under the territorial ordinances. He continued to sit in parliament as a liberal; but in the session of 1911 he joined with the conservatives in opposing the reciprocity agreement made with the United States by the liberal government. In the general election which followed he conducted a vigorous campaign against the agreement and was a prime agent in bringing about the government's defeat. He did not offer himself for re-election, and thereafter was not officially in public life; but he continued until the end of his life to be an influential figure in politics. He retained a strong influence in the liberal party; and this was manifested in 1917 when, again in opposition to Laurier, he was chiefly instrumental in bringing about a coalition, for war purposes, between the conservatives and those liberals who favoured conscription.

In 1909 Sifton organized the commission for the conservation of natural resources, and was for nine years its chairman. His tenure of the chairmanship was notable for the successful defence of the water-power of the St. Lawrence against attempts at alienation by private interests; this led to the formulation of a Dominion policy which preserved the public ownership of the water-power permanently. Sifton gave his name to a number of places in Canada: Lake Sifton in the province of Quebec; Mount Sifton in the Selkirk Mountains, British Columbia; Sifton Mountains and Sifton Pass in the Yukon district; and the town of Sifton in Manitoba.

Sifton was prominent in the nationalist movement which sought to have the relationship of Great Britain and Canada within the British Commonwealth defined in terms of constitutional and legislative equality. His interest in this question dated from 1903 when, as British agent, he had charge of the Canadian case in the Alaskan boundary arbitration. He supported the two Canadian commissioners in their protest against the finding by their British associate, Lord Alverstone [q.v.], in favour of the United States; thereafter he held the view that Canada should have control of her external affairs—a claim in which the policy of constitutional equality

with Great Britain was implicit. From 1915 onwards he publicly advocated a restatement of the relationship between Great Britain and the Dominions, giving formal recognition to the already conceded principle of equality.

During the last decade of his life Sifton had a recognized position in Canada as an elder statesman, and his views on public issues exercised great influence. As he advanced in life he regained, in his own words, his 'pristine radicalism' and on public questions, such as control of transportation rates, the tariff, banking and credit policies, he was accepted as an unofficial exponent of left-wing liberal opinion.

Upon his retirement from the government in 1905 Sifton did not resume the practice of law; but he was thereafter extensively engaged in business operations. He was the principal proprietor of a group of Canadian newspapers, chief of which was the *Free Press* of Winnipeg; and he was actively associated with their editorial management.

Sifton was created K.C.M.G. in 1915 for public and war services. He married in 1884 Elizabeth Arminella (died 1925), daughter of Henry Joel Burrows, of Ottawa. Five sons were born of the marriage.

Portraits of Sifton by Kenneth Forbes and Wyly Grier are in the possession of the family.

J. W. DAFOE.

SIMS, CHARLES (1873-1928), painter, was born 28 January 1873 in Islington, the elder son of Stephen Sims, costume manufacturer, by his wife, Alice Metcalfe. He became lame in the right leg in early infancy, probably as the result of a fall. He was put to school at the age of three, at Margate; later he went to school in London. In 1887 he was placed in the office of a commission agent in Paris, with the idea of learning French and commercial practice; in the following year he entered the counting house of a drapery firm in Holloway; but his heart was not in office work. He had taken violin lessons in Paris from John Tiplady Carrodus [q.v.], and showed considerable promise as a musician. At this time also he drew a great deal, but without showing special ability; and about 1887 he sought employment with a firm of engravers. In 1890 he

became a pupil at the National Art Training Schools, South Kensington (afterwards the Royal College of Art), and in 1891-1892 he studied at the Académie Julian, in Paris, under Jules Lefebvre and Benjamin Constant.

On his return to England, Sims spent a year in vainly trying to earn a living as a landscape painter; then, in 1893, he joined the Royal Academy Schools. There he did well, winning the silver medal for drawing, and the Landseer scholarship. In 1895, however, he and four other students were expelled from the Schools for a trivial breach of discipline. None the less, Sims had two paintings in the next year's Academy exhibition, and one of them, 'The Vine', aroused critical interest. In January 1897 Sims married Agnes Helen, elder daughter of the landscape painter, John MacWhirter [q.v.]. A few months later he exhibited at the Academy a picture called 'Childhood', which was shown at the Paris Salon of 1900, whence it was bought for the Musée du Luxembourg. In 1900 Sims took a cottage at St. Lawrence, Essex, and began the outdoor figure-painting of which he was to do so much. The next year, when his eldest son began to walk, he began the delightful, sympathetic series of mother-and-child pictures which are associated with his name. 'The first of these, 'Top o' the Hill', was exhibited at the Academy of 1902, and was bought by the Sydney Art Gallery. For the next few years Sims spent his holidays in Arran, while he was living first in London and later at Étaples and Bruges. His first 'one-man' show, at the Leicester galleries, in February 1906, resulted in the immediate sale of thirty out of fifty-four pictures. His period of economic struggle was now at an end, and he was able to settle securely to work at Fittleworth, Sussex.

Sims's subsequent career was a record of success broken only by the production of works in which originality of conception outran public and academic taste. 'An Island Festival', exhibited at the Academy of 1907, was highly praised; 'The Fountain' (1908) was bought for the Tate Gallery by the Chantrey trustees; and in 1910 he held his second 'one-man' exhibition. In 1907 he had been elected A.R.A. In 1912 he won the gold medal of the Carnegie Institute, Pittsburgh, and also that of the international exhibition held at Amsterdam. 'The Wood Beyond the World' (1913), the second of his pictures in the Tate Gallery, was purchased

the same year, again by the Chantrey trustees. During the last year of the European War (1918), Sims was an official artist in France. His Canadian War Memorial panel is in the Parliament House at Ottawa; two more of his War pictures are in the Imperial War Museum, South Kensington. He was elected R.A. in 1915; and in 1920 he was appointed keeper of the Royal Academy Schools—a position which he resigned six years later, owing to heavy pressure of engagements in New York, following a successful exhibition at Knoedler's galleries.

In April 1928 Sims was staying with friends at Ravenswood, St. Boswell's, Roxburghshire, and on the morning of 13 April his body was recovered from the river Tweed, after the finding of a letter in which he expressed the intention of taking his life. The nature of the mental affliction which brought about his tragic end is known, if known at all, only to his intimates. It is certain that some profound mystical apprehension ruled him in his latter days; for the six 'spirituals' which he painted in 1928 (and which were exhibited posthumously at the Royal Academy of that year) are in a style and temper totally alien from any former manner of his. They are impressive but somewhat obscure records of spiritual states, executed in a technique which includes some use of cubist formulae, and bizarre colours; they show, despite vital differences, some affinity with the predominant mood of William Blake. They are in the possession of various owners, notably Mrs. William Younger.

Both his work itself and his posthumously published book *Picture Making: Technique and Inspiration* reveal Sims as one of the most assiduous and fertile technical experimenters of his day. His method of using tempera and oil together, which is his most interesting personal technique, is seen to advantage in 'The Countess of Rocksavage and her Son' (1922), a most attractive rendering of feminine beauty and childish grace, executed without the least trace of sentimentality. His joy in breezy, sunny, open-air portraits and landscapes, and in playful action, is explained by his son and biographer as a sublimation arising out of his lameness, which, although it became less severe than had been at first feared, remained a serious disability throughout his life. The best of these open-air lyrics, like 'The Kite' (1905) and 'The Fountain' (1908), are delightfully loose and free as

records of exuberant joy in sunlight and movement and fresh air. As a portrait-painter Sims eschewed conventional arrangement and painted with sympathy and penetration; the official royal portrait (1924) was deemed unacceptable, however, and was destroyed by the artist. His colour, in general, is bright and joyous, but in composition he is less sure, several of his pictures betraying a lack of co-ordination and balance.

Sims was a close student of the masters, old and modern, and his book *Picture Making* contains valuable observations on their methods and results. The various influences to which he was subject from time to time can be detected in such works as 'The Wood Beyond the World', where Perugino and Puvis de Chavannes provide the dominant inspiration, and 'The Seven Sacraments of Holy Church' (1917), which shows clear traces of the influence of Italian primitives. These pictures are more purely decorative than most of his work. In addition to his large oil-paintings, Sims was expert in water-colour, and made the most of the airiness and transparency to which that medium lends itself. He did a good deal of mural work, a notable example being at Sir Philip Sassoon's house in Park Lane; but his official efforts in this kind (in St. Stephen's Hall and the House of Commons) caused much controversy, largely on extra-aesthetic issues.

Sims's wife survived him. The eldest of their three sons was killed in action in the European War.

H. B. GRIMSDITCH.

SINCLAIR, JOHN, first **BARON PENTLAND** (1860-1925), politician, was born at 6 Moray Place, Edinburgh, 7 July 1860, the eldest son of Captain George Sinclair, an officer of the Bengal army, by his wife and cousin, Agnes, daughter of John Learmonth, of Dean, Edinburgh, who built and presented to the city of Edinburgh the Dean bridge. His grandfather was Sir John Sinclair, sixth baronet, of Dunbeath, in Caithness, where this branch of the family had been settled since about 1680.

Sinclair was educated first at Edinburgh Academy, then at Wellington College, and

entered Sandhurst in 1878. He passed out fifth, and joined the 5th Royal Irish Lancers in 1879. He hunted regularly in England and Ireland, rode in point-to-point races, and played polo for his regiment. He served with the Sudan expedition of 1885, earning the medal and clasp. Returning home with his regiment, he was appointed aide-de-camp to the lord-lieutenant of Ireland, the Earl of Aberdeen, in 1886. He contested the Ayr Burghs as a liberal, without success, in the second general election of that year.

Early in 1887 Sinclair left the army, and began to read law and study economics, becoming a resident at the recently founded Toynbee Hall. In 1889 he was elected a member of the first London County Council, as a progressive, for East Finsbury. In that capacity he did much work on committees; he also founded the London Playing Fields Society. He was returned as member of parliament for Dumbartonshire at the general election of 1892; and the secretary of state for war, (Sir) Henry Campbell-Bannerman, made him his assistant private secretary. At the general election of 1895 Sinclair lost his seat. But after serving for a year (1896-1897) as private secretary to Lord Aberdeen, who was at that time governor-general of Canada, he was elected to parliament in 1897 for Forfarshire, winning a critical by-election for the liberals. This seat he retained until he became a peer in 1909; and during the ministries of Lord Salisbury and Mr. Balfour he was closely associated, from 1900 to 1905, as Scottish liberal whip, with the leaders of the opposition, when his universal popularity helped to keep the party together.

After Mr. Balfour's resignation in 1905 Sinclair was appointed secretary for Scotland. In office, his intimate relations with Campbell-Bannerman (who made him his executor and left him his papers) enabled him to exercise considerable influence upon the general policy of the liberal party. His secretaryship was marked by several measures of importance to Scotland. In the first session (1906) he carried through the National Galleries (Scotland) Act; and the improvements in the accommodation of the Scottish galleries, as well as in the various collections, are largely due to his reorganization. As political head of the Scottish education department Sinclair was responsible for the Scottish Education Act of 1908, which provided for better physical care of children, improved the training of teachers and the secondary

school system, and gave greater facilities for continued instruction after school age. His Small Landholders' (Scotland) Bill, the object of which was to extend to small-holders in the rest of Scotland the security of tenure already granted to the crofter counties, was rejected by the Lords in 1907 and 1908; but it became law in 1911, Sinclair having been raised to the peerage (as Baron Pentland, of Lyth, Caithness) in February 1909 in order to take charge of the Bill.

In 1912 Lord Pentland was appointed governor of Madras, where he took special interest in the administrative, educational, and economic development of the Presidency. His tenure was extended, owing to the European War, until 1919, the additional period being largely occupied by the discussions on the Montagu-Chelmsford reforms. After his return to England he did much public and philanthropic work.

Lord Pentland, who was sworn of the Privy Council in 1905, and created G.C.I.E. in 1912 and G.C.S.I. in 1918, died of pneumonia at his home at Hampstead 11 January 1925. He married in 1904 Lady Marjorie, daughter of John Campbell Gordon, seventh Earl and first Marquess of Aberdeen. He left a son, Henry John (born 1907), who succeeded him as second baron, and a daughter.

[Lady Pentland, *The Rt. Hon. John Sinclair, Lord Pentland. A Memoir*, 1928; Scottish Office records; family records.]

M. F. HEADLAM.

SINHA, SATYENDRA PRASANNO, first BARON SINHA, of Raipur (1864-1928), Indian statesman, was born in June 1864 at the village of Raipur in the Birbhum district of Bengal, the youngest son of Babu Siti Kantha Sinha, a small Kayastha landowner. At the age of fourteen (1878), on leaving Birbhum Zilla school, Sinha matriculated in the university of Calcutta, entering Presidency College with a scholarship. He left in 1881, however, without taking a degree, and came to England to be called to the bar. Owing to the prejudice which still prevailed against travel oversea, Sinha's preparations for departure had to be made in secret, and he arrived in England with insufficient means; but the scholarships and prizes which he won relieved him from financial difficulty. In 1886 he was called to the bar by Lincoln's Inn, and returned to Calcutta.

As a barrister Sinha built up a large

practice, and in 1903 was appointed standing counsel to the government of Bengal. His personality made the appointment popular even with many who felt that the claims of a senior candidate, an English barrister, had been slighted. In 1905 he was promoted to officiate as advocate-general of Bengal, and he was confirmed in the post in 1908. He was the first Indian to fill the position. He was thus the constitutional legal adviser of the governments both of India and Bengal during the troubled years of the anti-partition agitation, in which many of his associates were taking a leading and even an extreme part. Nevertheless, he was able to command the confidence of government without forfeiting the intimacy of his friends or the trust of his fellow countrymen.

In 1909 Lord Morley, in pursuance of his policy, appointed Sinha to be legal member of the governor-general's council. No Indian had previously been a member of the government of India. The acceptance of this post involved great pecuniary and other sacrifices: the duties are not purely legal in character but involve a joint responsibility, like that of an English Cabinet minister, for the policy of government. There were those who doubted the wisdom of the appointment, for the post had never before been filled except by an English barrister appointed from practice in England; but of the universal satisfaction with which Sinha discharged the duties the viceroy, Lord Minto, bore testimony in a letter to King Edward VII. Differing from his colleagues over certain clauses of a bill for the control of the press, Sinha resigned: but of his own motion withdrew his resignation rather than desert his post at a time when political assassination was rife. Returning to the bar in 1910 he immediately recovered all his old practice.

In 1915 Sinha was elected to the presidency of the Indian National Congress. This incursion into the realm of controversial politics was due to the influence of two men: Sir Lawrence Hugh Jenkins [q.v.], who persuaded the congress leaders that the cause of Indian self-government would be advanced by the election of an Indian so universally trusted and liked by the English both in India and Whitehall, and Mr. B. N. Basu, who with some difficulty persuaded Sinha that it was his duty to accept the task thus thrust upon him. The result was as Jenkins and Basu had anticipated; in a closely reasoned

address Sinha claimed an authoritative definition of the ultimate goal of British policy for India, and the claim was met by the historic declaration made in parliament 20 August 1917 [See MONTAGU, Edwin Samuel].

With the carrying out of that policy the next period of Sinha's career is closely connected. In 1917 he became a member of the Bengal executive council; but, together with the Maharaja of Bikaner, he was summoned to England almost at once, and until 1919 was in the closest association with the secretary of state, E. S. Montagu, first as an assistant, and then as a member of the Imperial War Cabinet and Conference, sharing the inter-allied deliberations at the close of the European War and in the settlement of peace terms. In 1919 he was made parliamentary under-secretary of state for India and was raised to the peerage as Baron Sinha, of Raipur. He piloted the Government of India Act (1919) through the House of Lords.

Sinha returned to India in 1920 in order to take up the post of governor of Bihar and Orissa under the constitution which he had largely helped to create. This position he held for eleven months (1920-1921). On broad questions of policy his judgement was probably as sound as ever; but he felt acutely his lack of training for the detailed administration and innumerable minor decisions, of which a governor's work largely consists. The strain on a constitution never very strong was too great and he was compelled to take a prolonged rest. Towards the close of 1925 Sinha again began to interest himself in public life, contributing to the editorial columns of the *Bengalee* a series of articles embodying his faith in the association of England and India and pleading with his countrymen for patience, moderation, and goodwill. By his welcome to the Indian Statutory Commission under Sir John Simon (1927) he strove to give a lead and to smooth the path of that body in India. In 1926 he was appointed to the Judicial Committee of the Privy Council: but he was twice compelled by his health to winter in his own country, and during the second of these trips he died 4 March 1928 at Berhampore in Bengal.

Lord Sinha's interests lay in his own profession of the law: he was never so happy as at the bar, and although probably he preferred the position of advocate, his short tenure of a seat on the Judicial Committee gave proof of high judicial

capacity. The most individual achievement of his career, his congress address, was a triumph of careful advocacy as well as a statement of deep convictions. Socially he appeared to all who knew him a perfect combination of the culture of East and West; and this favourable opinion was heightened by an absence of self-seeking and by a modesty which no success could spoil. He came to be the accepted type of the educated Indian whom British politicians could summon to a share in the government of India and the councils of the Empire. Hence the numerous honours and official positions (1909 to 1921) which he was the first Indian to hold. Many of these he would have preferred to refuse, but his sense of duty to his countrymen compelled acceptance.

Sinha was knighted in 1914 and created K.C.S.I. in 1921. He took silk (the first Indian to do so) in 1918. He was sworn of the Privy Council in 1919 and received the freedom of the City of London in 1917. In 1926 he was made a bencher of Lincoln's Inn. He married in 1880 Gobinda Mohini, daughter of K. C. Mitter, a landowner; and the conversion about 1886 of himself and his wife to the *Sadharan Brahmo Samaj* rendered this in law what it always was in fact, a monogamous marriage. His wife survived him with four sons and three daughters.

[*The Times*, 6 March 1928; *Calcutta Weekly Notes*, 12 March 1928; private information.]
S. V. FITZGERALD.

SMARTT, SIR THOMAS WILLIAM (1858-1929), South African politician, was born at Trim, co. Meath, Ireland, 22 February 1858, the son of Thomas William Smartt, by his wife, Sarah Rerdon, of Kilcooly, co. Meath. He studied medicine at Trinity College, Dublin, qualifying L.R.C.S., Ireland, and went to South Africa in 1880. There he settled in Britstown, Cape Colony, where he began practice as a doctor.

Smartt speedily established himself in his profession and became one of the most popular medical men in that very large, sparsely populated area. He was genial in disposition, a good 'mixer', devoted to his work, and impulsively self-sacrificing in the cause of others; these qualities won for him prosperity and the affection of those whom he served, just as their support afterwards became invaluable to him as a political leader. He gathered, too, a wide knowledge of agriculture,

learned the language of the Dutch among whom his practice lay, and was soon persuaded to embark on a political career, entering the house of assembly, the lower house of the Cape parliament, as member for Wodehouse in 1893.

Smartt, in addition to his other qualities, had an Irishman's eloquence and a magnificent voice. He was a powerful platform speaker, revelling in the cut-and-thrust of political controversy. A retentive and ready memory completed his equipment for a political career. He soon made his mark in Cape politics, becoming a member of the Afrikaner Bond, which, under the leadership of Jan Hendrik Hofmeyr [q.v.], the *éminence grise* of the Cape Colony, was at that time in close alliance with Cecil Rhodes [q.v.]. The Jameson Raid (29 December 1895) broke this alliance for ever, and threw Smartt into personal association with Rhodes, although their political ties were not yet close, as Smartt became colonial secretary in the ministry of Sir John Gordon Sprigg [q.v.], which came into power when Rhodes fell in 1896. When the Sprigg cabinet fell in 1898 Smartt returned to parliament as member for Cathcart, in an opposition which was loosely knit, a section of it being in increasing sympathy with Rhodes. Of this section Smartt was the natural leader. When war with the Boers became inevitable he and Rhodes took train for Kimberley, arriving just before it was surrounded by the Boer commandos. Smartt and Rhodes became bosom friends during the siege, and the friendship profoundly influenced the rest of Smartt's career.

Through Rhodes's last illness—he died in March 1902—Smartt shared with (Sir) Leander Starr Jameson [q.v.] a devoted attendance on the dying man; and for the rest of their lives both held themselves pledged to fight for Rhodes's plans and ideals in South Africa.

In the course of the Boer War Sprigg again became prime minister of the Cape Colony (June 1900), and Smartt took office under him with the portfolio of public works. They split on the question of the suspension of the constitution, and Smartt became the leader of the progressives in opposition to Sprigg. When the Sprigg ministry fell in 1904, Smartt had every right to expect to be called upon to form a ministry. But he saw that Jameson was the man for the leadership, and, resigning his claims, became the loyal lieutenant of his friend.

The Jameson cabinet lasted till 1908,

with Smartt commissioner of crown lands and public works. He and Jameson together attended the Imperial Conference held in London in 1907, when Alfred Deakin [q.v.], prime minister of Australia, urged the policy of Imperial preference. Smartt and Jameson strongly supported Deakin. They returned home to certain defeat, but they had laid the foundations, in alliance with General Louis Botha [q.v.], prime minister of the Transvaal, of that Union of the four states of South Africa which came into being in 1909. Jameson and Smartt were members of the National Convention which drafted the South Africa Act, and at the suggestion of Botha, the first prime minister of the Union, Smartt received the K.C.M.G. in January 1911.

When the Union was accomplished there were hopes that the political antagonism between Dutch and English South Africans, which was the legacy of the Boer War, might be buried for good. But Botha found himself unable to form the first Union cabinet on those lines. Jameson and Smartt then organized the unionist party, whose policy was to help Botha against the extremists on his side and at the same time to fight for the traditional policy of Cecil Rhodes. Failing health forced Jameson to resign the unionist leadership in 1912 and Smartt succeeded him. The split between General Botha and General Hertzog, followed two years later by the outbreak of the European War, made Smartt's task one of great delicacy. Although not a born leader, he came through the trial unshaken and with enhanced personal prestige. When Botha died in 1919 and was succeeded as prime minister by General Smuts, the Hertzog nationalists gained rapidly in political strength, and the election of 1920 left Smuts without a majority. Labour had won seats from the unionists, and Hertzog's nationalists were the strongest single party in the house of assembly. If the republican nationalists were to be kept at bay, a combination between the parties of Smuts and Smartt was essential. This combination took place in 1920. Smartt once more stepped down from the leadership of a party and became as loyal a lieutenant to Smuts as he had been to Jameson. He received the office of secretary of agriculture, which he held from 1921 to 1924. He was invaluable to Smuts as a colleague, both in the cabinet and in the opposition, for the rest of his parliamentary career, which ended with his re-

tirement, owing to sudden failure of health, in March 1929. He died a month later, 17 April 1929, at Cape Town, and was buried on his farm, Glenban, in the Stellenbosch district.

Smartt was conspicuous among the many men from Great Britain who have made South Africa their home. He won the affection of the Dutch—not a very common achievement. To his own people he was almost an idol. Although not in the very front rank of South African leaders, he excelled them all, with the single exception of Botha, in his power of commanding the loyalty and affection of a political party. He was an ideal political lieutenant, loyal, disinterested, and always ready to throw himself, without display, into the thick of political fighting.

Smartt married in 1891 Sybil Anna, daughter of Edmund Lombard Swan, of Allworth, Abbeylisle, Ireland. They had one son, who died in infancy, and two daughters.

B. K. LONG.

SMITH, ARTHUR LIONEL (1850-1924), historian, the second son of William Henry Smith, civil engineer, by his wife, Alice Elizabeth, daughter of Jacob George Strutt [q.v.], painter and etcher, was born in London 4 December 1850. His father was at one time employed on the Blackwall Tunnel and was the author of several ingenious but unsuccessful inventions: he died at the age of thirty-seven, leaving his family in difficult circumstances. A nomination for Christ's Hospital was offered to Mrs. Smith by a friend and accepted on behalf of the second son, as the eldest boy decided to go to sea. Smith went to the school at the age of six, and remained there continuously for over twelve years, his mother, with the younger children, having settled in Italy. She afterwards married again, was again widowed, and lived for many years in Chicago, where her son visited her in 1910, shortly before her death. At Christ's Hospital Smith was second Grecian in 1868, and in the same year he won an exhibition at Balliol College, Oxford. He came into residence in 1869, his chief school friend, R. H. Roe, afterwards headmaster of Brisbane grammar school, Australia, being his exact contemporary in college. He obtained first classes in classical moderations (1871) and *literae humaniores* (1873), and in the latter year divided the Jenkyns exhibition, the chief Balliol prize

for classical men. He then read modern history in one year and obtained a second class in 1874. In the same year he won the Lothian prize with an essay on Erasmus. He rowed bow in the college eight which went head of the river in 1873.

In 1874 Smith was elected a fellow and lecturer of Trinity College, Oxford. He retained his fellowship until it was vacated in 1879 by his marriage: he resided and taught at Trinity and rowed in the college eight until 1876, but in that year he began to read for the bar at Lincoln's Inn. The offer of a tutorship in modern history from Balliol brought him back to Oxford in 1879, and in 1882 he was elected a fellow of the college. The same year he was elected junior proctor, his colleague being Henry Scott Holland [q.v.], then a student of Christ Church. He first examined in the final school of modern history in 1884—continuing until 1887 and examining again in 1895 and from 1901 to 1908—and he was one of the small band of tutors, including Arthur Johnson, Edward Armstrong, (Sir) Richard Lodge, and C. R. L. Fletcher, who were active in building up the position of the school in the university. He found time to contribute some incisive articles to *Social England*, edited by H. D. Traill, the *Dictionary of Political Economy*, and the *Dictionary of English History*, and in 1905 he published the *Notes on Stubbs's Charters* which he had compiled for his pupils. But Smith's main work in these years was that of a college tutor. He was absent for only one term, in 1902, when he went to Egypt after an attack of rheumatism. During the last years of the mastership of Benjamin Jowett [q.v.] he was an enthusiastic champion of the master's ideas and projects, and enjoyed much of his confidence. He developed a distinctive style as a teacher of history, and his sympathy, humour, and generosity won him the loyalty and affection of many generations of undergraduates. A succession of resident pupils, most of them preparing for entrance to Balliol, shared with his growing family first his small house in Crick Road and subsequently 'The King's Mound, Mansfield Road, built for him by the college, whither he moved in 1893. In the same year he took a house at his wife's old home at Bamburgh, Northumberland, which became the scene of many reading parties. From 1879, when he coached the college crew which went head of the river, he maintained a close interest in the Boat Club; he was an advocate and for many years an exponent

of hockey from its first appearance at Oxford, an early champion of the bicycle, and a propagandist of the theory and practice of skating. Believing as he did—and claiming to have made a convert of Jowett—in the value of athletics as a solvent of social barriers in college, he gave much time to raising funds for the college field and to organizing a system which brought games within the means of the poorer undergraduates. The movement initiated in 1904 by his pupil and friend, the Hon. T. A. Brassey (afterwards second Earl Brassey), to put the finances of the college on a better footing owed much to his influence and encouragement.

In 1905 Smith's work for the history school was recognized by his appointment as Ford's lecturer in English history. He took as his subject 'Some Sidelights on English History in the Thirteenth Century'. The lectures were published in 1913 under the less suitable title of *Church and State in the Middle Ages*. In 1908 Smith published two lectures of generous appreciation of the work of the historian Frederic William Maitland [q.v.], together with a bibliography of his works, and in 1909 he contributed a chapter on 'English Political Philosophy in the Seventeenth and Eighteenth Centuries' to volume vi of the *Cambridge Modern History*. But the increased leisure which he obtained by his appointment in 1906 as one of the first two Jowett fellows, on the foundation of his Balliol contemporary, Lord Newlands, was largely absorbed by a new interest.

In 1907 Smith was nominated by the vice-chancellor as one of the seven representatives of the university of Oxford appointed to form a joint committee with representatives of the Workers' Educational Association and to prepare a report on the higher education of workpeople, and in 1908 he began his membership of the standing joint committee of the University Extension Delegacy set up as a result of that report. For the rest of his life he threw himself eagerly into every stage of the movement for the establishment and extension of tutorial classes for working men, devoting, in particular, much attention to the summer school held each year at Balliol by the Workers' Educational Association.

It was this sympathy with and understanding of working-class people which brought Smith his main opportunity for useful work during the European War. At its outbreak he had been dean of the

college and senior resident fellow for seven years, since the retirement from the mastership in 1907 of Edward Caird [q.v.]. In April 1916 he succeeded James Leigh Strachan-Davidson [q.v.] as master. He was thus occupied throughout the War with the task of keeping the college in being, and he also showed much kindness to the cadet officers in training who soon came to form the main body of residents in the college. But the bulk of his time was given to lecturing all over the country, largely to working-class audiences, and, particularly after his appointment as master, to active membership of various public or semi-public bodies concerned with industrial and social questions. He was appointed early in 1914 to the Archbishops' Committee on Church and State under the chairmanship of Lord Selborne, and with Sir Lewis Dilldin wrote the section of its report, published in 1917, dealing with the history of the relations of church and state in England. In 1916-1917 he served on one of the five committees appointed by the archbishops in 1916, that concerned with 'Christianity and Industrial Problems', and was responsible for the section of its report, published in 1918, which dealt with 'historical illustrations'. In July 1917 he was appointed chairman of the Adult Education Committee set up by the Ministry of Reconstruction, the final report of which was published in 1919.

During the last five years of his life Smith was in failing health, and in October 1921 he underwent an operation. He exerted himself, however, to play an active part in the revival of Balliol and of the university after the War. He served on the Hebdomadal Council, acted as a curator of the Bodleian Library, and as a trustee of the University Endowment Fund, and continued to teach and lecture in college. In February 1924 he was taken suddenly ill, and he died at the Master's Lodgings 12 April. He is buried in Holywell cemetery.

Smith was an almoner of Christ's Hospital, and in 1919 he received the honorary degree of LL.D. from the university of St. Andrews. He married in 1879 Mary Florence, eldest daughter of John Forster Baird, of Bowmont Hill, Northumberland, who survived him together with their two sons and seven daughters. After his death a fund for the endowment of an A. L. Smith fellowship at Balliol was subscribed by friends and pupils.

Smith's portrait by Fiddes Watt hangs in the hall of Balliol College, and a memorial tablet to him is in the college chapel.

[*The Times*, 14 April 1924; *Arthur Lionel Smith, Master of Balliol (1916-1924), a Biography and some Reminiscences*, by his Wife, 1928; personal knowledge.] K. N. BELL.

SMITH, SIR FREDERICK (1857-1920), major-general, Army Veterinary Service, was born at Hull, the elder of twins, 10 April 1857. His father, Joseph Smith, a quartermaster who had served in the Crimean War, died while Smith was at school, leaving a widow (Ellen, *née* McCaffery), and three younger children, the other twin having died.

At the age of sixteen (1873) Smith entered the Royal Veterinary College, London. In April 1876 he obtained his diploma 'with great credit', gaining prizes in physiology and cattle pathology, and the Coleman medal for an essay on specific ophthalmia. Having passed his army veterinary examination in December 1876, he was commissioned to the Artillery (veterinary captain 1880, major 1896, lieutenant-colonel 1899, colonel 1905, major-general 1907), and in October 1877 sailed for India, but came home for medical treatment early in 1879. The same year he married Mary Ann, daughter of Arthur Samuel Briggs, of Spigot Lodge, Middleham, Yorkshire, a trainer of racehorses. They had a son and a daughter.

Returning to India at the end of 1879, Smith investigated the cause of sore backs among the 480 horses of his new regiment, the 12th Lancers. Contrary to prevailing opinion, he showed that the main cause was ill-fitting saddles and not errors of riding. In 1882, with J. H. Steel, he established the *Quarterly Journal of Veterinary Science in India*, which lasted seven years.

In 1886 Smith was appointed professor at the Army Veterinary School at Aldershot, where he spent five years of strenuous work, only relieved by a tour of the continental veterinary schools, one consequence of which was the establishment at Aldershot in 1888 of a Vaccine Institute which supplied all the calf lymph required for the army. From Aldershot he wrote forty-nine original papers for the professional journals, besides his *Manual of Veterinary Hygiene* (1887, 3rd edition 1905), *Manual of Veterinary Physiology* (1892, 5th edition 1921), and *Manual of Sore Backs* (1891, subsequently embodied

in the army *Manual on the Care and Management of Horses*). The first two became the recognized text-books for all English-speaking veterinary students.

Among the many papers which Smith published between 1893 and 1898 may be mentioned *The Physiology of the Horse's Eye*, *The Loss of Horses in War*, and *The Physiology of the Horse's Foot*. He also worked at the control of strangles and pneumonia.

Smith served in the Nile campaign of 1898, and in the following year went on active service to South Africa. After the War he was for two and a half years principal veterinary officer in South Africa, and then returned to England as principal veterinary officer, Eastern command. In 1907, at the age of fifty, he was appointed director-general of the Army Veterinary Service with the rank of honorary major-general.

An Army Veterinary Corps having already been created, Smith reorganized the system of veterinary stores. He also succeeded in obtaining the inclusion of veterinary cadres in the organization of Viscount Haldane's Territorial Force, and strove to get the veterinary service, then subordinate to the remount department, placed directly under the quartermaster-general. The claim was not conceded until 1911, and Smith had retired in 1910. It can be said, however, that the subsequent development of the Service, culminating in its conspicuous efficiency during the European War, followed naturally on the reforms introduced at Smith's instigation.

Save for the years of the War, when he was re-employed, first as deputy director of veterinary services, Southern command, and then as assistant director-general, the remainder of Smith's life was devoted unremittingly to the completion of his historical works. *The History of the Royal Army Veterinary Corps* (1927) and *The Veterinary History of the War in South Africa* (1919) are of the highest interest and importance for this branch of the army. He saw through the press two volumes of his *History of Veterinary Literature* (i, 1919, ii, 1924), and passed the proofs of the third volume (issued 1930). The fourth volume he left in manuscript to the writer of this notice together with all his other papers.

Smith died at St. Leonards-on-Sea 27 July 1929; his body was cremated at Golders Green, and his ashes are preserved, together with his heart, at the Royal Veterinary College. His fortune of about

£12,000 he left, after the life interests of his widow and two children, to the Royal College of Veterinary Surgeons for the establishment of a fund for veterinary research. No man of his generation deserved better of his profession or rendered it greater service. His portrait by Dorsfield Hardy hangs in the council chamber of the Royal College of Veterinary Surgeons.

[A. G. Todd, 'The Royal Army Veterinary School', in *Veterinary Journal*, vol. lxxxiii, pp. 14-30, 1927, gives a fuller account of Smith's work at Aldershot; personal knowledge.]

F. BULLOCK.

SMITH, FREDERICK EDWIN, first EARL OF BIRKENHEAD (1872-1930), lord chancellor, was born at Birkenhead 12 July 1872, the eldest son of Frederick Smith, of Birkenhead, by his wife, Elizabeth, daughter of Edwin Taylor, of Birkenhead. His father, after an adventurous early manhood, had settled down to the family business of an estate agent, in which he prospered. He took part in local politics, was called to the bar by the Middle Temple, and became mayor of Birkenhead. He died in early middle age (1887), leaving his widow with three sons and two daughters. Frederick Edwin Smith always acknowledged that he inherited from his father his rhetorical gifts, his inclination to the bar as a profession, and his ambition. From his mother, perhaps, came the more stable elements in his character. Mrs. Smith's financial resources were slender, though in later years her son was disposed to exaggerate the poverty of the family. She, with help from a relation, was able to provide a good education for her children. F. E. Smith was sent to Birkenhead School, whence, in 1891, he obtained a scholarship at Wadham College, Oxford.

Wadham was then a small college and of no great reputation in the university, but among Smith's contemporaries were several men who attained eminence in after life: of these the most distinguished were J. A. (afterwards Sir John) Simon, C. B. Fry (outstanding in every field of athletics), A. A. (afterwards Lord Justice) Roche, F. W. Hirst, the economist, and H. M. Giffen, afterwards junior counsel to the Treasury on the common law side. Smith plunged with zest into the social life of the undergraduate. He played Rugby football, coming within measurable distance of a place in the university XV; he achieved fame at the Union, of which

he was elected president (1893); he read widely, though not the books necessary for success in the schools; he ran into debt; he reached the second class in classical moderations (1893); then, taking up law instead of reading for *literae humaniores*, after a burst of intensive reading, gained a first class in jurisprudence (1895). He remained at Oxford in order to read for the Vinerian scholarship, which he was awarded in 1896, and the same year he was elected a fellow of Merton College. There, and at Oriel College from 1897, Smith taught law for the next three years, adding to his income by delivering university extension lectures on modern history. During part of this time also he passed his vacations as a pupil in the chambers of Mr. (afterwards Sir) Leslie Scott, who carried on a large practice in Liverpool. During this period also, Smith made the acquaintance of the lady who afterwards became his wife, Margaret Eleanor, second daughter of the Rev. Henry Furneaux, fellow of Corpus Christi College and editor of *Tacitus*. Further, he acquired that love of horses and of horsemanship which was one of the main pleasures of his life, and that love of Oxford as a place and of the university as an institution, which remained his passion.

Smith entered as a student at Gray's Inn in 1894. In 1899 he was called to the bar and began to practise in Liverpool. He was already well known there. His father's memory still lingered, and his own successes at the Oxford Union had attracted the attention of Mr. (afterwards Sir) Archibald Salvidge [q.v.], the leader of the conservative party on the Liverpool city council. As early as 1894, while still an undergraduate, Smith was addressing important political meetings. Liverpool politics at this time turned on the Irish question. The Irish population commanded the representation of one of the parliamentary divisions of the city and formed an important element in another. Thus, the natural tendency of local toryism was to assume an Orange colour, and Smith found a congenial place in the conservative ranks. Sympathy with Ulster, engendered at his entrance into politics, remained with him throughout his career.

Smith's first chance at the bar came to him in the shape of a number of briefs at licensing sessions owing to Scott's absence during the long vacation of 1899. In his first complete calendar year he earned more than £500. His next year showed a

further advance, and on the strength of it he married (1901). In 1902 came his first *cause célèbre*, the defence at the Central Criminal Court of Goudie, a Liverpool bank clerk, who was indicted, together with a number of confederates, for frauds on the bank in which he was employed. Goudie's case was hopeless and he pleaded guilty. But Smith greatly increased an already growing reputation by his speech for the mitigation of sentence. During the next few years he was engaged in several cases which attracted public attention: the defence of a girl named Rollinson from the charge of a peculiarly cold-blooded murder (1902); the long and complicated litigation arising from the trade war between the Imperial Tobacco Company and an American combine (1902-1900); the prosecution of the youth John McKeeven, charged with the manslaughter of John Kensit [q.v.], the protestant agitator (1902), and that of the murderers of the master and members of the crew of the *Veronica* (1903). By the end of 1905 he was firmly established in a large local practice, and was well known to bench and bar generally by his occasional visits to London.

In January 1906 Smith was elected member of parliament for the Walton division of Liverpool. He at once moved his chambers to London. But his forensic success was unchecked and was indeed accelerated. His most lucrative employment about this time was in the series of actions brought in 1907 by Lever Brothers against the newspapers under the control of Lord Northcliffe [see LEVER, William Hesketh, first Viscount Leverhulme]; his most famous case, the defence of Ethel le Neve, the mistress of the murderer Crippen (1910). But Smith had now reached the stage of his career at which, having attained a secure place in his profession and the certainty of earning a substantial income, he was able to employ his ambition more fully in the wider field of politics. Unfortunately, by this time he had acquired habits of extravagance which he never shook off. Probably he had never possessed any sense of the value of money: he had always spent what he was about to earn. Thenceforth he acted on the theory that he could earn to-morrow whatever he spent to-day.

Smith was fortunate in the moment of his entry into parliament. His party had suffered a crushing disaster at the polls. At St. Stephen's there was nothing to lose and everything to gain. On 12 March 1906

he made his maiden speech. He spoke for an hour. The subject of the debate was fiscal policy. He poured forth invective and epigram; he kept the House amused; he put new heart into his friends; he exasperated his opponents. The effect was exactly what was required by a beaten and dispirited party. Smith sat down having achieved a parliamentary reputation.

During the remaining years of the 1900 parliament Smith maintained with energy the fight against overwhelming odds. At the same time he formed enduring friendships not only with members of his own party but among his opponents, and particularly with Mr. Winston Churchill. But the brilliance of his first appearance, the rapidity of his wit, and the ferocity of his attack caused men to take a false view of his character and of his attainments. He was regarded as a swashbuckler, witty and courageous, but headstrong and superficial—in the courts, as the man for a crushing cross-examination or a speech to a jury rather than for a serious legal argument, and in the House, for the brilliance, raillery, and rhetorical display of a partisan rather than for the measured view and wise counsel of the statesman. His appearance and his manner of life contributed to this view. He was strikingly handsome, six feet one inch in height, of a distinguished figure, slightly marred by sloping shoulders. His clothes, although not in any one particular out of the ordinary, gave the impression that he was over-dressed. The hat worn on the back of his head, the red flower in his button-hole, the very long cigar always carried in his mouth, made him a ready subject for the caricaturist. The great houses in which he stayed, the late hours which he kept, his fondness for gaiety and for gay people, for cards, for horses, and for all the bright and expensive things of life, confirmed the opinion that he was a reckless partisan, fighting hard for his own side, grasping at his own enjoyment and advantage, not a responsible or serious person either as a lawyer or as a parliamentarian. Furthermore, his sharp tongue, his aggressive demeanour, and the cynical attitude which he at times assumed made many enemies and not only among his political foes.

Smith was in part conscious of the effect which he produced, and having moral as well as physical courage he intensified these traits, which were rather of outward conduct than of inward character. Regarding ambition as one of the most

powerful spurs to fine action, he gloried in it. He had an artist's pleasure in getting the most out of life as he conceived it. And knowing that he could stir masses of men and that he enjoyed the affection of those who knew him best, he unduly disregarded the dislike which he inspired among the soberminded. Without any pretence at black-letter learning, Smith knew that he possessed a firm grasp of legal principles and could apprehend the most subtle doctrine. In politics he seemed to be dazzled by his own fireworks. Inwardly he felt a deep and sincere sense of responsibility. He looked upon the mass of attempted liberal legislation as a mean revenge upon the enemies of the party in power (as in the Education and Licensing Bills), or as an unprincipled concession to electioneering needs (as in the Trades Disputes Bill). He therefore attacked these measures and their promoters with passionate violence, spurred on the more because, nonconformist though he was by upbringing, he did not understand the sincerity of some at least of their supporters. On these matters he was content to be a partisan and to fight with every weapon in his armoury. But beyond these conflicts, which seemed to him ephemeral, more vital issues loomed in his vision. He believed that these could be faced only by a government comprising men of all the constitutional parties.

An opportunity for putting this theory into action soon arose. The chief parliamentary event of 1900 was the passage through the Commons of Mr. Lloyd George's land valuation budget. Smith fought it fiercely in that House, but when the Bill reached the Lords, he did his utmost to persuade his friends there to allow it to pass. To reject it seemed to him to be to present the liberals with the opportunity which they desired. As a party manager he was unquestionably right. The decision against him was of momentous historical consequence. But in his own career the controversy with his friends was of even greater import. It showed to himself and to others on what side he would be found when the strain between immediate party loyalties and national interests became acute. For the moment his party forgave his lukewarmness.

The general election of January 1910 justified Smith's fears. The government majority fell from 856 to 126. But for the opposition to fail by so much was to fail altogether. The government at once

launched its direct attack on the Lords' veto. The eventual result was the Parliament Act, and, as its inevitable consequences, the disestablishment of the Welsh Church and Home Rule. Smith's attitude was consistent and courageous. In parliament and in the country he continued his opposition unabated. But when the leaders of both parties, recognizing that party passions were driving them to an end which they could not foresee, entered into a conference (June 1910), he was instant openly for the party truce, and in secret negotiation, for a settlement and for the formation of a national government which should include moderate men of both shades of opinion. The conference failed and Smith's efforts proved futile. Once again (December 1910) Mr. Asquith went to the country, and with the same result. In May 1911 the Bill for the Parliament Act passed the Commons. The Lords amended it, but the government refused to accept their amendments.

The strife now shifted from parliament to the councils of the unionist party. Should the Lords give way, or should they stand fast and leave to the government the final stroke of advising the creation of peers sufficient in number to pass the Bill? Smith was unhesitatingly for the latter course. He did not believe that the government would dare to carry out its threat, and to the end of his life he held the same opinion. All the evidence which has come to light in recent years is against that opinion. His own party leaders, with the exception of Lord Halsbury [q.v.], were against him at the time. The extreme right wing was voted down, though by a small majority (10 August 1911). It was the only occasion in Smith's political career when, bearing responsibility, he threw the weight of his authority on to the side of extreme measures. The full consequences of the Parliament Act and of the Lords' surrender are not yet discernible. Years must pass before a final judgement can be pronounced on his action.

For the moment, the crisis had the effect of confirming Smith in the affection of the more unbending Tories. It also effected a revolution in the party itself. In November Mr. Balfour resigned the leadership and Mr. Bonar Law was elected in his room. At the coronation of King George V, Mr. Asquith had recommended that a privy councillorship for Smith should be included in the honours list. Mr. Balfour, who had not been consulted, objected and did not invite Smith to take his seat on the

front opposition bench. Mr. Bonar Law repaired the omission, and Smith found himself at the age of thirty-nine, after less than six years' service in parliament, one of the accredited leaders of the unionist party.

The next two-and-a-half years were occupied in the struggle which raged round the Home Rule Bill. Smith seemed absorbed in the preparations for resistance in Ulster. He visited Belfast with Sir Edward Carson in 1912 and addressed a great audience on the anniversary of the battle of the Boyne (12 July). In the following year he 'galloped for Carson' at a review of the Belfast volunteers. But in the same month (September 1913) Smith was endeavouring first to bring his own friends to consider the question of an accommodation, and secondly to open some communication with the other side. Then, as nine years later, he took his stand on the security of Ulster. If this end could be attained, he was prepared to make sacrifices and to recommend them to his friends. 'It was impossible', he wrote, 'to ignore the unbroken parliamentary representation of that part of Ireland which was in favour of Home Rule.' Having opened the matter to Sir Edward Carson, and received a response which was not wholly discouraging, he began to discuss it with Mr. Lloyd George, who was equally willing. Mr. Churchill was of the same mind. In October Smith, with his leader's unacknowledged authority, in a public speech proposed a settlement, with Ulster excluded. Negotiations, both open and secret, went on through the first half of 1914. They broke down again and again, but were resumed at a conference at Buckingham Palace and finally broke down in the last week of July. In August party passions were suddenly stilled by the outbreak of war.

During the exciting events which crowded the years of Smith's life as a private member of parliament, he had carried on an ever-increasing practice at the bar. He took silk in 1908. By 1914 he was in the front rank of fashionable advocates and was making an income which was, by the standards of those days, prodigious. He was also spending as much as he earned. The European War changed his life. Thenceforth, except for the short periods when he was out of office, he was continually engaged on constructive work for the government. In the days immediately preceding 4 August 1914 his friendship with Mr. Churchill and his qualities of

courage and resolution made him a suitable go-between through whom the government might be assured of the support of the opposition in any measures necessary for the safety and honour of the country. He then accepted the post of head of the Press Bureau, a thankless and indeed well-nigh impossible task. The chief incident of this interlude was his emendation of the bulletin describing the retreat of the British forces from Mons, still a matter of controversy. His next employment was in France as a descriptive writer attached to the Indian Corps. The experiment was not a success. He did not understand soldiers, nor they him. On the formation of the first Coalition government in May 1915, Smith returned to England in order to become solicitor-general. In November he succeeded Sir Edward Carson as attorney-general. This year he was knighted.

The office of attorney-general, in peace perhaps the most laborious in the public service, becomes in war almost unbearably burdensome. The attorney-general was necessarily consulted on the enormous mass of legislation passed or authorized by parliament. The law of prize, which must necessarily occupy the attention of the law officers during any war, had to be developed and adapted to modern needs. The necessary interference of government with the business and private affairs of the individual incessantly raised new problems. It would have been impossible for any man efficiently to discharge the duties of the office if he had not possessed, as Smith did, the power of delegation to a most unusual degree. He absorbed instructions very quickly. Confident in his judgement of men, he was prepared to rely upon the help of others. He chose his instruments carefully and, where he gave his trust, he gave also his complete loyalty and support.

The most famous cases in which Smith was engaged in court were, perhaps, those of the *S.S. Zamora* (1916) and the *S.S. Ophelia* (1916), both heard on appeal in the Judicial Committee of the Privy Council sitting as an appellate court in prize; the trial of Sir Roger Casement [q.v.] for high treason (1916); the trial of the Wheelclons for a conspiracy to murder the prime minister (1917); and the Rhodesian land case before the Judicial Committee (1918). During this time also, and until the end of the War, Smith had a seat in the Cabinet. He found time towards the end of 1917 to pay a lightning visit to the

United States of America and to Canada, where he expounded to crowded audiences the Allied case against Germany. Before he went he had been elected treasurer of Gray's Inn for the year 1917-1918, and, during his absence, in the New Year honours list of 1918, he received a baronetcy. At the general election of 1918 Smith abandoned his old constituency and was returned for the West Derby division of Liverpool. He held the seat for a month only, for, upon the reconstruction of the government, Mr. Lloyd George offered him either continuance in office as attorney-general without a seat in the Cabinet or advancement to the woolsack. The choice was painful, but it was not difficult. Although the chancellorship had always been among the objects of his ambition, Smith did not wish to leave the Commons or to cut off the possibility of his eventual return to the bar. But he could not deprive himself of the opportunity of taking part in the work of government in the dangerous days which he foresaw, nor could he, without Cabinet rank, identify himself with a policy in the shaping of which he could have only a minor share. He inevitably took the course which, however splendid, was the more disagreeable to him. It was not rendered more agreeable by the public reception of the announcement. Except among his private friends, who welcomed it with some regret, the appointment was unpopular.

Smith received the Great Seal on 14 January 1919, and on 31 January he presided as lord chancellor at the hearing of his first cause. On 3 February the patent creating him Baron Birkenhead passed the Great Seal, and on the following day he was 'introduced' as a peer. During his chancellorship, Lord Birkenhead sat regularly as Speaker of the House of Lords for judicial business or as chairman of the Judicial Committee of the Privy Council. He soon acquired great authority among his legal colleagues. The time had come when he could bring into play the learning which he had acquired as a teacher and as a practitioner. His demeanour as a judge was dignified and impressive. He kept the court together, and strove earnestly to do justice and to make it clear that justice was being done. His judgments were composed with great care and after close consultation with his colleagues. In style they were vigorous and often witty. His most famous cases, while he held the Great Seal, were *Bourne v. Keane* (legality

of a bequest for Masses for the dead, 1910); *Sutlers v. Briggs* (Gaming Act [1835], 1921); *Admiralty v. S.S. Volute* (contributory negligence in a maritime collision, 1921); *Rutherford v. Richardson* (an illustration of his methods when considering conflicts of testimony on fact, 1922). All these cases were heard by the House of Lords in the exercise of its ordinary appellate jurisdiction. In the Judicial Committee Smith presided at the hearing of two cases raising constitutional points of importance—one from British Columbia (*Canadian Pacific Company v. Tuley*, 1921), the other from Australia (*McCawley v. the King*, 1920). *The Director of Public Prosecutions v. Beard* (1920) was an appeal to the House of Lords, under section 1 (6) of the Criminal Appeal Act (1907), involving an examination of the doctrines as to the effect of drunkenness on criminal responsibility; *Wakeford v. the Bishop of Lincoln* (1921) was a case turning purely on fact heard by the Judicial Committee with ecclesiastical assessors on appeal from the consistory court of Lincoln under the Clergy Discipline Act (1892); *C. (otherwise H.) v. C.* (1921) and *Gaskill v. Gaskill* (1921) were cases heard before him sitting to try matrimonial causes as an additional judge of the Probate, Divorce, and Admiralty division of the High Court when that division was hard pressed. In the Rhondda peerage case (1922), sitting under the chairmanship of the lord chairman (Lord Donoughmore) in the Committee for Privileges, Birkenhead delivered the very elaborate leading judgment. After he had left office in 1922 and before he became secretary of state for India in 1924, he sat in a few cases. In *Russell v. Russell* (1924), a case heard on appeal from the decision of the Court of Appeal in England, he held, with the majority, that a husband's evidence of non-access was not admissible on his petition for divorce in a case in which the only evidence of adultery consisted in the birth of a child.

Birkenhead, who avowed himself to be eager for posthumous fame, was inclined to rest his claim to remembrance on the part played by him as a law reformer. The heaviest task which he set himself in this capacity was the amendment of the law relating to the transfer of land. Renewing the efforts made by Lord Haldane [q.v.], he caused to be prepared and passed through parliament the gigantic piece of legislation which reached the statute book as the Law of Property Act (1922). The work was accomplished in the face of many

difficulties. It was highly technical; its details were of no great interest either to the public or to parliament; and it had to withstand the force of some persistent professional opposition. Using, as he always did, the learning of others, Smith had many ready helpers. But the successful passage of the bill was due to his energy and parliamentary skill. In other fields of legal administration he worked hard. He prepared the way for the Supreme Court of Judicature (Consolidation) Act (1925), by the passage of a number of minor measures dealing with the administration of justice in the Supreme Court. With the assistance of the Supreme Court Rule Committee he remodelled the Rules relating to the conduct of litigation by and against poor persons, and caused provision to be made for the trial on circuit of poor persons' divorce cases. He effected considerable improvements in the tenure of office of county court judges and, by inaugurating an inquiry into the administrative machinery of the county courts, laid the foundation for the County Courts Act (1924).

In the administration of his patronage Birkenhead was entirely free from political bias. Six judges of the High Court (of whom one afterwards became a lord of appeal in ordinary and two became members of the Court of Appeal) were appointed on his recommendation. He appointed ten judges to the county court bench.

Throughout his tenure of office Birkenhead was a vigorous and impressive exponent and defender of the government's general policy. On occasion he allowed himself to speak on matters which were not the subject of political controversies of the moment. His most famous effort was his speech upon the bill designed to give effect to the majority report of Lord Gorell's committee on divorce. No one who heard the speech could doubt his ability as a parliamentary orator; but most of those who heard it were surprised not so much at its eloquence as at its deep moral earnestness and at its evidence of mature consideration of the social question involved.

Birkenhead's place as one of the statesmen of the third Coalition government must stand or fall, however, by his attitude on the Irish question. Once more, as in the days preceding the War, that question formed the major problem. So long as the only course open to the government seemed to be that of resistance to a

criminal conspiracy, Birkenhead was for the maintenance of the struggle. So late as 21 June 1921, he delivered in the House of Lords a speech which gave no indication of any intent to seek peace. But negotiations had already begun between the British government and the Irish republican leaders. On 10 August Birkenhead spoke in the House advocating a settlement by consent. He maintained then, and afterwards, that there was no inconsistency in his attitude. It was, as he thought, the natural development of the views which he had held in 1913-1914. He desired to save the effusion of English blood and the waste of English treasure in Southern Ireland provided only that he could secure the independence of Ulster. In this spirit he attended the Gairloch meeting in August and entered upon the London conference in October. As soon as he met the Irish negotiators he became convinced of their sincerity, and of the possibility of healing the long quarrel between Southern Ireland and Great Britain. He acquired a respect which amounted almost to affection for Arthur Griffith [q.v.] and Michael Collins [q.v.], and it was in the spirit not of one who had been defeated but of a statesman bent on securing a long-desired aim that he supported the proposals of the government to give effect to the Irish Treaty (6 December 1921) and to the bill confirming the Free State constitution (1922).

These efforts, however, laid a heavy strain upon the ties between Birkenhead and many of his political and personal friends. For other reasons, certain sections of the conservative party were impatient at the continued existence of the Coalition. Birkenhead strove for its safety. As in past years, he still believed that the country required a national government and a national party. He was unsuccessful, and the Coalition fell in October 1922. It would be idle to deny his feeling of extreme bitterness towards those who had destroyed the work which he had in hand. He expressed himself in the country with acrimony and in the House of Lords in speeches which were regarded as vindictive and flippant. He doubted the wisdom wherewith affairs were conducted under Mr. Stanley Baldwin's first administration, and he anticipated the catastrophe which followed.

On the fall of Mr. Ramsay MacDonald's government in October 1924 Birkenhead was ready to be reconciled to his friends and to accept office as secretary of state

for India. His main work there was to prepare for the examination of the constitution granted to that country by the Government of India Act (1919), which had been foreshadowed in the preamble to that Act. He induced Sir John Simon to undertake the task of presiding over the commission which was to investigate the matter. Before that commission had reported Birkenhead had left office. He was not in sympathy with any attempt to anticipate the findings of the commission, and before he had ceased to be secretary of state signs were apparent that his mind was not moving upon the same lines as that of Lord Irwin, whose appointment to the viceroyalty in November 1925 he had approved. It is impossible to tell what view he would have taken upon the proceedings of the successive Round Table Conferences and of the Government of India Bill (1935).

Early in his lord chancellorship, Lord Birkenhead showed signs that his health was beginning to suffer from the excessive strain which he put upon it. He had for long been burning the candle at both ends. With prodigious labours both within and without his office he combined every form of physical activity. Meanwhile he had taken little care of his financial position. During his absence from office and after his return to it he had made money as a writer for the press and of books having a popular appeal. While he was secretary of state for India, public opinion in the Commons was adverse to these activities. He found himself under the necessity of increasing his income, and in 1928 he resigned and took up work in the City. By now even his magnificent powers were failing. His last speeches in the House of Lords sounded forced and hollow. In the spring of 1930 he fell seriously ill. He died in London 30 September, aged fifty-eight.

Birkenhead was advanced to a viscountcy in June 1921, and on the fall of Mr. Lloyd George's government in 1922 he was, in November, created Earl of Birkenhead and Viscount Furneaux, taking his second title from his wife's maiden name. He was created G.C.S.I. on leaving office in 1928, and he held the grand cordon of the order of Leopold, conferred upon him by Albert, King of the Belgians. In 1922 he received the honorary degree of D.C.L. from the university of Oxford, of which he was appointed high steward the same year. He was lord rector of Glasgow University (1922) and lord rector of Aberdeen University (1926).

Lord Birkenhead had one son, Frederick Winston Furneaux (born 1907), who succeeded him as second earl, and two daughters.

Birkenhead was often painted. His most famous, and on the whole most satisfactory portrait, is that by Glyn Philpot, which hangs in Gray's Inn hall. The cartoon by 'Spy' (*Vanity Fair*, 10 January 1907), reproduced in colour as the frontispiece to Vol. i of his son's *Life*, gives a faithful representation of him as he was when he was emerging into fame. Another, anonymous, cartoon also appeared in *Vanity Fair* 9 August 1911.

[*Frederick Edwin, Earl of Birkenhead, by his son* (the Earl of Birkenhead), 2 vols., 1930-1935; personal knowledge.] C. SCHUSTER.

SMITH, Sir HENRY BABINGTON (1863-1923), civil servant and financier, was born 20 January 1863 at Riverbank, Putney, the London house of his father, Archibald Smith [q.v.], mathematician, of Jordanhill, Renfrewshire. This branch of Smiths was long settled at Craigend in Stirlingshire as farmers and armourers. In 1800, a younger son, Archibald Smith, having succeeded as a West India merchant, bought the estate of Jordanhill, then a country place, but now a suburb of Glasgow. He was the father of James Smith [q.v.], geologist and man of letters, and grandfather of Archibald Smith, Henry's father. Henry Smith's mother was Susan Emma, daughter of Vice-Chancellor Sir James Parker [q.v.], and granddaughter of Thomas Babington, of Rothley Temple, Leicestershire. He was thus related to Babingtons and Macaulays, since Thomas Babington married Jean, sister of Zachary Macaulay [q.v.].

Smith was the fifth son in a family of six sons and two daughters, of whom all the sons obtained distinction, his eldest brother, James Parker Smith, sometime M.P. for Partick, Lanarkshire, being the best known.

After attending a private school (Dr. Spyers's) at Weybridge, Henry Smith was elected king's scholar at Eton in 1875, third on the list. He won the Tomlin mathematical prize in 1880, was Newcastle medallist in 1882, and obtained a minor scholarship at Trinity College, Cambridge, in the same year. As captain of the school he delivered to Queen Victoria an address from the Eton boys after the attempt on her life at Windsor in 1882. He was very competent at football and in the boats. Already he had a reputation for quiet

efficiency and sober sanity of judgement, a calmness of mind and a sweetness of temper which inspired confidence; and these qualities remained with him through life. Eton also had its effect on him, for he valued few of his honours more than his election, in later life, as a fellow of Eton, in which capacity he proved invaluable to the college in educational and financial business. At Cambridge, where he was a member of the 'Apostles', he gained a first class in both parts of the classical tripos, was second chancellor's medallist, obtained the Browne medal three times, and finally (1889) was elected a fellow of his college.

Already in 1887 Smith had entered the Education Office as an examiner. His inclination, however, was rather to administration and finance than to educational subjects. His chance came when, in 1891, Mr. Goschen, then chancellor of the Exchequer, appointed him his private secretary. In 1892 he was transferred to the Treasury establishment. Here he had his first taste of international finance, in which he was to play so large a part, as secretary to the British delegates at the Brussels Silver Conference in that year. But he was not allowed to develop under the Treasury routine. In 1894 he was chosen by Lord Elgin, the new viceroy of India, as his private secretary. On his return from India, at the beginning of the South African War, he was diverted to inquire into the finances of Natal, which were feeling the strain of the War. Another appointment followed when he was made British representative on the council of administration of the Ottoman Public Debt in 1900, and president in 1901. In 1903 he returned to home service as secretary to the Post Office, where he remained until 1909, administering that department with success, and representing it at various international congresses with dignity and efficiency. He received the C.S.I. in 1897, the C.B. in 1905, and in 1908 was created K.C.B.

Smith's conspicuous ability in finance had attracted the attention of Sir Ernest Cassel [q.v.]. Largely through the latter's influence he was, in 1909, appointed administrateur directeur-général of the National Bank of Turkey and consequently left the civil service. Other directorships followed. As chairman of the Pacific Cable Board (1913) he was still closely in touch with government work, and during the European War his wide financial experience was freely called upon.

He went twice to the United States—with the Anglo-French Commission in 1915, and as assistant high commissioner under Lord Reading in 1918. He helped to found the British Italian Corporation and the British Trade Corporation, and he served on many of the more important financial committees of that critical time. He was also chairman of the royal commission on the Civil Service in 1915, and after the War (1919) chairman of the Indian Currency and Finance Commission, and chairman of the Railways Amalgamation Tribunal (1921-1923). He was made a director of the Bank of England in 1920. He died at Vineyards, Suffron Walden, 29 September 1923, and was buried at Eton.

Smith married in 1898 Lady Elizabeth Mary, eldest daughter of Victor Alexander Bruce, ninth Earl of Elgin [q.v.], and had four sons and five daughters.

[*The Times*, 1 October 1923; family records; private information.] M. P. HEADLAM.

SMITH, Sir ROSS MACPHERSON (1892-1922), airman, was born at Adelaide, South Australia, 4 December 1892, the second son of Andrew Smith, pastoralist, of that city (a native of Dumfries, Scotland), by his wife, Jessie Macpherson. He was educated at Warriston School, Moffat, Scotland, and at Queen's School, Adelaide. In 1910 he made a tour round the world with a party of Australian mounted cadets, who were received by King George V. While he was in England, Ross Smith visited Lord Roberts, who showed the young man his medals, and impressed him with the danger of Great Britain becoming involved in a European war and of her reliance upon Australia's support.

Ross Smith was one of three brothers, all of whom were expected in due time to join the business, an estate of three million acres, of which their father was managing director. Meanwhile they each sought experience in other employment. Keith, the eldest (afterwards Sir Keith Smith), joined a firm of wool brokers; Colin, the youngest (who died of wounds received at Passchendaele in 1917), went into a bank; and Ross entered a firm of hardware merchants.

On the outbreak of the European War in August 1914, Ross Smith enlisted as a trooper in the 3rd Australian Light Horse. He sailed with the first Australian expeditionary force, and landed in Egypt in December 1914. After four months'

service on the Gallipoli Peninsula in 1915, he received a commission, but was shortly afterwards invalided to England. He rejoined his regiment in March 1916 and took part in August in the battle of Romani during the last attack made by the Turks on the Suez Canal.

In October 1916 Ross Smith was transferred to the Royal Flying Corps, and joined No. 67 (Australian) Squadron as an observer. He served with the squadron in Palestine, and gained valuable knowledge of the country. In July 1917 he qualified as a pilot at the training schools in Egypt, and rejoined his squadron in Southern Palestine. He was one of the most successful pilots of the squadron, engaged in many combats with German aeroplanes, and took a leading part in the bombing attack, 19 September 1918, on the Turkish central telephone exchange at 'Affule, the successful prelude to the offensive which put an end to Turkey's part in the War.

Ross Smith served in his squadron until the end of the War. On the conclusion of peace he at once began a series of long-distance flights which made his name famous. At the end of November 1918 he piloted Brigadier-General A. E. Borton on the first flight made from Cairo to Calcutta, for which he received the Air Force cross. He subsequently accompanied Borton on a series of reconnaissances for suitable aerodrome sites in Burma, Siam, the Malay States, and the Dutch East Indies. In 1919 Ross Smith undertook the first flight from England to Australia. The Commonwealth government had offered a prize of £10,000 for a flight from Great Britain to Australia to be performed in 720 consecutive hours by an Australian airman. The prize was won by Ross Smith and his brother Keith who, with Sergeants W. H. Shiers and J. M. Bennett, left Hounslow on 12 November and reached Port Darwin on 10 December after a journey of 11,294 miles. Their aeroplane was a Vickers Vimy machine fitted with Rolls Royce engines, and the journey was handicapped by bad weather and inadequate aerodrome facilities. The flight was continued to Melbourne and, at its conclusion, the Smith brothers were each created K.B.E.

In 1922 Sir Ross Smith arranged to make a flight round the world in a Vickers Vimy amphibian. He was making a first trial flight at Brooklands on 13 April, when the amphibian spun out of control and the pilot with his sole passenger, Lieutenant J. M. Bennett, was killed. Sir Keith Smith, who was to have accompanied them on the

trial flight, had been delayed by fog in reaching Brooklands in time to join them.

Ross Smith was a rugged, determined character. He was very level-headed and took no foolish risks. The plans for his long flights were made only after the most exhaustive study of every aspect of the journey. Although he will be chiefly remembered for his pioneer flight from England to Australia, his service record earned great distinction for the Australian Flying Corps.

Ross Smith received the M.C. and bar, the D.F.C. and two bars, and the order of El Nahda, fourth class, conferred upon him by the King of the Hejaz. He was unmarried.

[F. M. Cutlack, *The Australian Flying Corps*, 1923; private information; personal knowledge.]
H. A. JONES.

SMITH, WILLIAM FREDERICK DANVERS, second **VISCOUNT HAMBLEDEN** (1868-1928), philanthropist, was born at Fily, Yorkshire, 12 August 1868. He was the younger and only surviving son of William Henry Smith [q.v.], the well-known statesman, by his wife, Emily, daughter of Frederick Dawes Danvers, of Bushey, Hertfordshire, clerk of the council of the duchy of Lancaster. On the death of W. H. Smith in 1891, his widow was raised to the peerage as Viscountess Hambleden, in recognition of her husband's public services. Frederick Smith, as he was usually called, succeeded to his father's business and estate, and to his mother's title on her death in 1913.

Smith entered Dr. Warre's house at Eton in 1882, and went up to New College, Oxford, in the autumn of 1887. A good oarsman, he was in the Eton College eight, and stroked the New College boat, but under medical orders was obliged to abandon the attempt to secure a place in the university crew. Always a man of many friends, he later became, at his Henley home, the popular host of generations of university oarsmen. He left Oxford with a third class in modern history in 1890. In the following year his father's death placed him at the head of the newspaper-distributing business of W. H. Smith and Son. At the same time he was invited to succeed his father as conservative member of parliament for the Strand division of Westminster, and was returned by a substantial majority in October 1891. He held the seat until the general election of January 1910, when he resigned. Neither in the House of Com-

mons nor in the House of Lords, which he entered three years later, did he make much figure as a politician. The chief interests of his useful life lay elsewhere.

Smith devoted constant attention to the business of W. H. Smith and Son, which his grandfather had founded and his father had developed. He was proud of the traditions of the firm, and showed himself devoted in many ways to the welfare of its employees. One of his first acts was the establishment of a benefit society for his workpeople, and his sympathetic outlook earned him the regard of all who served with him or under him. When in 1905 a crisis occurred in reference to the firm's book-stall contracts with the railway companies, and two of the most important of these contracts were given up, Smith was prepared to risk all his resources in organizing a book-shop branch, and by 1 January 1906, two hundred new shops of this kind had been opened. The new departure was in the end fully justified, and under his able management the business generally increased and prospered.

The other chief interest of Lord Hambleden lay in philanthropic work, and especially in the administration of voluntary hospitals. He was closely connected with King's College Hospital, of which for many years he was chairman. He was the prime mover in the transfer of that institution from the neighbourhood of Clare market to its new site on Denmark Hill. His experience gave him a wide knowledge of the problems of hospital management, and he was chairman of the London regional committee of the British Hospitals Association as well as treasurer of the association itself. He was the founder (1922) and first chairman of the Hospital Savings Association, and also chairman of the King Edward's fund pay beds committee.

Coming as a young man into great wealth, Smith regarded his riches as a trust to be administered for the benefit of others. He was a sincere churchman, and there was no good cause which he was not ready to assist with wise generosity, and sometimes, as in the case of the hospitals, with valuable personal service as well.

During the European War Lord Hambleden served in Gallipoli and in Egypt (1915-1916) with the Royal first Devon Yeomanry, of which he was lieutenant-colonel.

Lord Hambleden married in 1894 Lady Esther, third daughter of Arthur Gore,

fifth Earl of Arran, and had three sons and two daughters. He died at Henley-on-Thames 16 June 1928, and was succeeded as third viscount by his eldest son, William Henry (born 1903).

[*The Times*, 18 June 1928; private information.] A. COCHRANE.

SMITH-DORRIEN, Sir HORACE LOCKWOOD (1858-1930), general, the sixth son of Colonel Robert Algernon Smith-Dorrien, J.P., of Haresfoot, Hertfordshire, by his wife, Mary Anne, daughter of Thomas Driver, M.D., was born at Haresfoot 20 May 1858. After passing through Harrow School and the Royal Military College, Sandhurst, he was gazetted as lieutenant in the 95th Foot in January 1877.

Smith-Dorrien's first experience of active service was in the Zulu War of 1879, where he was one of the five officers who escaped from the disaster at Isandhlwani (22 January). On 4 July he saw the final defeat of the Zulus at Ulundi. In 1882 he went with his regiment to Egypt, at the time of Arabi Pasha's rebellion, and took part in some skirmishes outside Alexandria. The regiment then went on to Lucknow, where Smith-Dorrien won the first of his many successes on the race-course and polo-field. But during a shooting expedition he wrenched his knee so badly that he had to be invalided home. In January 1884 he joined the newly raised Egyptian army under the sirdar, Sir Evelyn Wood. But the trouble with his knee broke out again, and he remained at the base, unable to take active part in Lord Wolseley's attempt to relieve General Gordon at Khartoum. He recovered in time, however, to command the Egyptian cavalry at the battle of Ginniss on 30 December 1885.

After passing through the Staff College—where he chiefly distinguished himself as master of the draghounds—Smith-Dorrien returned to his regiment in India, and served there for nearly ten years (1889-1898). He kept a large stud for polo and racing, and was greatly delighted when his horse 'Shannon' won the army cup; it was ridden by Captain (afterwards General Sir) Hubert Gough. He held staff appointments at Lucknow and Umballa, and spent five months (1897-1898) on the Tirah expedition against the unruly tribes of the North-West Frontier.

While Smith-Dorrien was on leave at home in June 1898, the sirdar, Sir H. H. Kitchener, telegraphed for him to come

to Egypt. He hastened out in time to take command of the 13th Sudanese battalion at the battle of Omdurman (2 September). Immediately afterwards he was selected to command the troops which accompanied Kitchener to Fashoda to meet the column under Major Marchand. The appearance of the French expedition in territory which was held to be under British control gave rise to an extraordinary outburst of feeling in the press. But although the trip was full of interest, Smith-Dorrien declared that he had little knowledge of what was going on, as Kitchener did not confide his intentions to subordinates.

On the outbreak of war with the Boer republics in 1899, Smith-Dorrien went to South Africa with his regiment and was at once given command of the 10th brigade. With this he distinguished himself at the battle of Paardeberg (18 February 1900), and in the advance to Pretoria. Another year was spent with the columns hunting Generals Botha and De Wet. But before peace was declared he had been promoted major-general, and Lord Roberts, who was then commander-in-chief at the War Office, insisted on sending him to India as adjutant-general (November 1901).

In those days the post of adjutant-general was regarded as the most important staff appointment in the whole army. Smith-Dorrien found it far from easy. Between the viceroy, Lord Curzon [q.v.], and army head-quarters there arose serious differences, which became so acute that the adjutant-general found his position intolerable. He asked to be allowed to resign. At that moment, however, Lord Kitchener arrived in India as commander-in-chief (December 1902), and insisted that Smith-Dorrien should remain in office for a few months; after this he was transferred to the 4th division at Quetta. This was his first important command, and he thoroughly enjoyed every day of the five years which he spent in it. With the commander-in-chief he made extended tours along the North-West Frontier; they studied the various problems connected with possible operations in Afghanistan, and the best system of training for war.

Kitchener gave Smith-Dorrien a very free hand in instituting many reforms on which the young general had set his heart. Chief among these were contrivances for promoting the health and comfort of his troops; soldiers' clubs and recreation

grounds were provided in every station. As was his custom he entered zealously into every form of sport, and at one race meeting he won two steeplechases and a hurdle race on his own horses. In 1902 he had married Olive Crofton, daughter of Colonel John Schneider, of Oak Lee, Furness Abbey, and she acted as hostess in entertaining many distinguished guests, including the Prince and Princess of Wales. In every way Smith-Dorrien's tenure of the appointment was a success, and perhaps it did even more than his previous services in the field to enhance his reputation. The 4th division became known as a happy one in which to serve, for although the commander occasionally gave vent to an outburst of wrath, it never fell on innocent shoulders. His popularity arose from his close interest in the personality of his officers; it was commonly said that he knew by sight every subaltern in the division, and every subaltern's pony.

In December 1907 Smith-Dorrien went on to the command at Aldershot, and, after four years there, to the Southern command at Salisbury (1912). Here for the first time he found himself in touch with the Territorial forces, and formed a very high estimate of their value. Being convinced of the probability of a European war, he studied the problem of increasing the strength of the British army; more than once he came into conflict with Cabinet ministers by suggesting some system of universal training. He drew up a scheme for expansion on the basis of the Territorial associations which were already in existence, and in August 1914 he submitted it to Lord Kitchener when the latter went to the War Office as secretary of state. Kitchener, however, had determined to make his new armies independent of any existing organization, and Smith-Dorrien's proposals were rejected.

The dispatch of the British Expeditionary Force to France in August 1914 marks the beginning of the outstanding period of Smith-Dorrien's career, when, after the sudden death of Sir J. M. Grierson [q.v.] on the 17th of the month, he succeeded to the command of the II Corps. He later commanded the Second Army in France. Controversy has been aroused by the events which in the end led to his resignation.

After bearing the brunt of the fighting at Mons, the II Corps retired, on 25 August, to a selected position at Le Cateau. Then the commander-in-chief, Sir John French (afterwards Earl of Ypres,

q.v.), found that the French Fifth Army on his right was continuing the retreat; he therefore decided to conform to its movement, and issued orders for another march southward on the following day. Smith-Dorrien had every intention of complying with these orders, but during the course of the night he became aware that the difficulties were increasing. The few roads were hopelessly blocked by country carts of fugitives; a heavy thunderstorm made some of the steeper gradients impassable; in the darkness the scene was one of unavoidable confusion. Half the troops had been delayed by a rearguard action, and many of them were wandering about until dawn next morning. Throughout the night the commander of the II Corps was engaged in consultation with his generals, and in trying to collect reports from his scattered units. At 2 a.m. Major-General Allenby came in to say that the German cavalry had pressed up to within two miles of the British position, and would be on the top of the II Corps unless it could march before dawn. Major-General Hubert Hamilton was then consulted, and he stated definitely that the 3rd division, on the left of the II Corps, would not be ready to move before 9 a.m. As the commander-in-chief and his staff had gone on to St. Quentin, 26 miles to the south, Smith-Dorrien was forced to take responsibility on his own shoulders. He issued orders to stand fast and await the German attack. This led to the battle of Le Cateau (26 August). By 2 p.m. the block on the roads had been cleared, and Smith-Dorrien determined to resume the retreat. It is evident that he chose the right moment, for the enemy had suffered too much to make any attempt at pursuit. The official *History* says: 'In fact, the whole of Smith-Dorrien's troops had done what was thought to be impossible. With both flanks more or less in the air, they had turned upon an enemy of at least twice their strength; had struck him hard, and had withdrawn, except on the right front of the 5th division, practically without interference, with neither flank enveloped, having suffered losses certainly severe, but, considering the circumstances, by no means extravagant' [*Military Operations, France and Belgium, 1914, 1922*, pp. 181-182]. The total casualties amounted to 7,812 men and 88 guns.

Sir John French's first dispatches on the battle were full of praise. Later on, however, he changed his opinion and took a very gloomy view of what he called 'the

shattered condition of the Second Corps'. His book *1914* passes adverse comment on Smith-Dorrien's decision. But the generals on the spot believed that that decision saved the day; for unless the troops had been ordered to stand and fight an extremely dangerous situation would have ensued. Practically all military historians have now accepted this view. Far from being shattered, the II Corps went on to win fresh laurels on the Marne, the Aisne, and in the first terrible battles near Ypres.

By the end of the year (1914) the trench line stretched from the North Sea to the Alps, and the deadlock which followed gave rise to wide divergences of opinion regarding strategy. The French, with their system of compulsory service, had already mobilized all available men; they had little faith in the value of Kitchener's new armies; they were naturally impatient to drive the invaders out of their country, and they believed that it could be done by vigorous offensive action. Sir John French shared this belief. Smith-Dorrien, on the other hand, put a high value on the new armies, and, although fully convinced that the struggle would end in victory for the Allies, was content to await the time when British resources, in men and munitions, would be more fully developed. In the meanwhile he wanted to husband the few regulars who still remained.

During the first months of 1915 Smith-Dorrien gradually became aware of the differences of opinion between himself and general head-quarters. The British forces had been reorganized into two armies, of which he commanded the second. In April this Second Army relieved French troops in the southern half of the big salient round Ypres. German guns from north, east, and south made the position dangerous and very uncomfortable; every day showed a heavy roll of casualties; transport and fatigue parties, carrying ammunition and rations to the front line, suffered terribly from concentrated fire. Smith-Dorrien was in favour of withdrawing to a position some two miles back which would be less exposed and could be prepared beforehand. French refused to allow any voluntary surrender of ground, since that to his mind would be a confession of weakness.

On 22 April the matter was brought to a head by the first German gas attack. This burst in full force on the northern half of the salient, which was held by an Algerian division and some second line French territorials. They were swept back

in confusion, evacuating the whole of their sector. This retreat exposed the left flank of the Royal Canadians, who, less affected by the gas, were still holding the apex. Orders were issued for immediate counter-attacks to retake the former French position, but although they were continued throughout the next five days, the only result was heavy loss, especially to British and Indian troops. The French were unable to afford any material assistance; they had lost nearly all their guns in the salient, and reinforcements were slow in arriving.

On 27 April Smith-Dorrien wrote a long and important letter to head-quarters; he said that unless the French could render more help, further attacks by the British would only cause useless loss of life; although he was not pessimistic, he thought that a scheme should be prepared for a withdrawal to a line nearer Ypres. The same afternoon a telegram came from head-quarters directing him to hand over command of all troops in the salient to General Sir Herbert (afterwards Lord) Plumer. This drove Smith-Dorrien to the conclusion that the relations between himself and the commander-in-chief were so much strained that they constituted a weak link in the chain of responsibility. On 1 May he sent a message asking for an interview, and, as no answer was received, he followed it up on 6 May by a second letter offering to resign. The same evening he was handed a telegram ordering him to return to England. The official *History* says: 'No reason or explanation was vouchsafed.' After his departure steps were taken to carry out the withdrawal which he had recommended. This was the end of Smith-Dorrien's active service in the field.

Lord Kitchener wished to make Smith-Dorrien inspector-general of all troops in the United Kingdom, but the prime minister, Mr. Asquith, insisted on keeping this appointment open for French, who came back from France a few months later. Smith-Dorrien was given command of the First Army for home defence, and he held this post for six months (June-November 1915).

In December 1915 Smith-Dorrien was selected for command of an expedition in German East Africa, but an attack of pneumonia, which necessitated three serious operations, caused him to be invalided home from Cape Town. The War was over before he had fully recovered his health.

In September 1918 Smith-Dorrien went to Gibraltar as governor, and spent five years there, after which he retired. He devoted much time to work for his old regiment (originally the 45th and 95th Foot, now the Sherwood Foresters), of which he was colonel for over twenty-five years.

On 11 August 1930 Smith-Dorrien was terribly injured in a motor accident on the Bath Road, and he died the next day in Chippenham hospital without recovering consciousness. His wife and three sons survived him.

Smith-Dorrien's autobiography, *Memoirs of Forty-Eight Years' Service* (1925), gives a full and lively account of his early experiences, but he always refused to discuss questions connected with his resignation.

Smith-Dorrien had a total of nineteen military decorations, of which ten were war medals; the others included the K.C.B. (1907), G.C.B. (1913), G.C.M.G. (1915), D.S.O. (1880), and the Legion of Honour (1915).

Smith-Dorrien was of medium height and build, with a very active figure which he kept in hard condition by constant exercise. A square chin gave a look of determination which was emphasized by a clear and decided manner of speaking.

A cartoon of Smith-Dorrien by 'Spy' appeared in *Vanity Fair* 5 December 1901.

C. R. BALLARD.

SOLOMON, SOLOMON JOSEPH (1860-1927), painter, was born in the Borough, London, 16 September 1860, the fourth son of Joseph Solomon, leather merchant, by his wife, Helena Lichtenstadt, of Prague. He was educated at Thomas Whitford's South London School, Great Dover Street, and received instruction in Hebrew and German from the Rev. Simon Singer, minister of the Borough synagogue. Having shown an artistic bent, Solomon was sent at the age of sixteen to Heatherley's art school in Newman Street, where Samuel Butler [q.v.], then a man of mature years, was a fellow-student: after a year's study there he proceeded to the Royal Academy schools, where (Lord) Leighton, (Sir) J. E.

Millais, and (Sir) Lawrence Alma Tadema were among his teachers. A short period at the École des Beaux Arts, Paris, under Alexandre Cabanel, made a great impression on him; but the Munich Academy, where he continued his studies, did not attract him, and he stayed only some three months.

After a journey to Spain, Italy, and Morocco with his friend, the painter Arthur Hacker [q.v.], in 1880, Solomon settled in London, where he gradually made a name as a painter of portraits and classical and biblical scenes. His first exhibit at Burlington House was a portrait in 1881, but his first outstanding success was 'Samson' (1887), a dramatic representation of strong emotion and violent action, which now hangs in the Walker Art Gallery, Liverpool. 'Niobe' (1888) and 'Echo and Narcissus' (1895) are notable exercises in flesh-painting, and 'Your Health' (1893) is a genre painting in which problems of lighting are the main technical preoccupation. 'The Birth of Love' (1896), although an allegory, shows a movement towards a more formal decorative quality than had been evident in Solomon's earlier works. In portraiture, he did his best work when he was genuinely interested in the personality of the sitter: thus 'Israel Zangwill' (1894) is one of his most successful portraits, although 'Mrs. Patrick Campbell as the Second Mrs. Tanqueray' (1894) also shows incisive reading of character and real decorative skill.

Solomon was elected A.R.A. in 1896 and R.A. ten years later (1906). In the latter year he took a house at Birchington-on-Sea, Kent, which thenceforward became his home. His later work includes portraits of Mr. Asquith (1909) and of Mr. Ramsay MacDonald (1912). In 1910 he published a book on *The Practice of Oil Painting*. He was elected president of the Royal Society of British Artists in 1918.

Shortly after the outbreak of the European War in 1914 Solomon was impressed by the need for the use of 'camouflage'—the masking of trenches and other military objectives in such a way as to reduce their visibility to enemy aircraft. He communicated his views on the subject to the War Office, and in January 1916 was sent to France, with the rank of lieutenant-colonel in the Royal Engineers, in order to help to organize this work. In 1920 he published a book entitled *Strategic Camouflage*. He died at his home at Birchington 27 July 1927.

In an age of technical innovation in painting Solomon remained faithful to traditional methods. He was a good average portrait-painter and an exceedingly conscientious craftsman; and the critic who is not contemptuous of all emotional content in painting finds considerable poetic power in his subject pictures. He was keenly interested in Jewish social and religious life, and was one of the founders in 1891 of the Macca-beans Society, of which he was a vice-president.

Solomon married in 1897 Ella, daughter of Hyman Montagu, F.S.A., solicitor and numismatist, sometime lord-lieutenant of the City of London; they had one son and two daughters.

SONNIENSCHN, EDWARD ADOLF (1851-1920), classical scholar and writer on comparative grammar and metre, was born in Holloway, London, 20 November 1851, the eldest son of Adolf Sonnenschein, an Austrian supporter of the Hungarian patriot, Louis Kossuth, who settled in England and became well known as a teacher and writer of school-books, by his wife, Sarah Robinson, daughter of the Rev. Edward Stallybrass, who was for many years a missionary in Siberia. A younger son was William Swan Sonnenschein, founder of the publishing house of that name.

Sonnenschein was educated at University College School and at University College, London, whence he proceeded as a scholar to University College, Oxford, where he obtained first classes in classical moderations (1873) and *literae humaniores* (1875). On the recommendation of the master of his college, G. G. Bradley, he became assistant (1877-1881) to G. G. Ramsay, professor of humanity at Glasgow. After two years as headmaster of Kelvinside Academy, Glasgow, he was appointed in 1883 professor of Greek and Latin at the newly founded Mason College, Birmingham (afterwards Birmingham University), where he spent the rest of his active teaching life. In 1884 he married Edith Annesley, daughter of Ogden Bolton, barrister-at-law, of Liverpool, who survived him with two of their three sons.

Sonnenschein had long been interested in Plautus, and as early as 1870 had published an edition of the *Captivi*, based on the German edition of Julius Brix, and notable for an account of Richard Bentley's emendations on all the plays, which he discovered in the British Museum, in the margin of Bentley's copy of Pareus's edition of the works of Plautus. This account Sonnenschein afterwards elaborated into a volume of the *Anecdota Oxoniensia* (1883). A more independent edition was his *Mostellaria* of Plautus (1884), containing contributions from his former London teacher, Robinson Ellis [q.v.], who became a lifelong friend. This book led to his long friendship with Oskar Seyffert, of Berlin, who spoke of Sonnenschein as his 'literary heir'. Seyffert's influence is seen in the edition of the *Rudens* of Plautus (1891), up to that date the best English edition of any of the plays, and perhaps the best Plautine text in any country. In Sonnenschein's later years Plautine criticism was thrust into the background by more urgent calls, but he never slackened in his study, and wrote many articles in journals, besides contributing the article on Plautus to the eleventh and later editions of the *Encyclopaedia Britannica*.

Meanwhile Sonnenschein had been developing his ideas on the reform of the prevalent chaotic and unscientific manner of teaching of grammar by treating all Indo-European languages on the same plan, with a common terminology. His efforts gave rise to the 'Parallel Grammar' series, of which he was editor and his brother publisher. The series was welcomed with acclamation not only in Great Britain, but on the Continent, where nothing like it was to be found. Sonnenschein's own contributions marked an advance on previous grammars, not only in their logical and scientific accuracy and happy expression (e.g., 'prospective subjunctive'), but in external presentation, to which he gave much thought, being probably the first editor to use marginal lines in order to indicate essentials, as he was among the first to interleave a school-text (the *editio minor* of the *Rudens*, 1901). Other pioneer work in teaching Latin is to be found in his two Latin stories for schools, *Ora Maritima* (1902) and *Pro Patria* (1903), with their ingenious Latin equivalents for modern appliances.

Sonnenschein's interest in the teaching of the classics led him to join John Percival Postgate [q.v.] in forming the

Classical Association (1903), to which he devoted much time and enthusiasm, ever insisting on the claims of the classics and the reform of their teaching. As chairman (1904-1909) of the Curricula Committee he issued four reports (1908-1909), and as chairman (1909-1911) of the Joint Committee on grammatical terminology, representing eight associations, two further reports (1909-1910), which have in substance been adopted by all bodies concerned with language teaching, including the Board of Education. His views appear in the Joint Committee's pamphlet of 1911, and are exemplified in *A New Latin Grammar* (1912), *A New French Grammar* (1912), and *A New English Grammar* (1916).

Besides his contributions to periodicals, for many years Sonnenschein wrote the chapter on 'Grammar, Lexicography and Metric' for *The Year's Work in Classical Studies* (founded in 1906). He was much interested in the evidence for Shakespeare's classical reading (which he was perhaps inclined to overstrain), and the later influence of Stoicism, on which he wrote in the *Hibbert Journal* (1907) and the *Contemporary Review* (1923). Much of his grammatical research was summed up in *The Unity of the Latin Subjunctive* (1910) and *The Soul of Grammar* (1927), the latter being a readable exposition, by the comparative method, of the unity in framework of the Aryan languages, intended, in his own words, to 'demolish the arch-enemy, Jespersen' (Otto Jespersen, of Copenhagen), and widely accepted by competent judges as having done so. His projected *magnum opus* on Plautine metre never saw the light, but the results of his wider metrical studies appeared in *What is Rhythm?* (1925).

Sonnenschein's brilliance as a grammarian tended to obscure in popular estimation his other qualities, and the inevitable references to Browning's Grammarian at his retirement and after his death, however apposite, tended to fix this one-sided view. He was in demand at college functions for his social qualities, and was a good talker with a fund of humour, which, as it never appeared on public occasions, never received due recognition. In Birmingham he lived in a house said to have belonged to David Cox, the painter, where he bestowed much hospitality of a quiet and intimate kind. He showed a growing interest in philosophy, and both at Birmingham and at Lansdown, Bath, where he lived from his

retirement in 1918 to his death, which took place there 2 September 1929, he formed 'Socratic' societies for the discussion of philosophical and other problems.

One of Sonnenschein's foremost claims to remembrance has been strangely passed over. He had always insisted upon the humanities taking their proper place in the modern university. Before the university of Birmingham received its charter in March 1900 (largely through the activities of Joseph Chamberlain), Sonnenschein, both in the press and in interviews with Chamberlain and others, had urged that liberal policy which was adopted by Birmingham, and following Birmingham's lead, by the other modern universities which date from the decision of the Privy Council of 10 February 1903. In the teeth of strong opposition he secured a much improved organization of the faculties, each being represented by its dean on the governing body along with the lay members, with complete autonomy for professors, security of tenure, and the recognition of research as an essential part of their functions.

During the European War, besides being, with his wife, prominent among those who organized relief for Belgian refugees, Sonnenschein was the first to call attention to the manifesto of the German professors on war-guilt, which led to the publication of a rejoinder by representative English scholars, circulated both in English and German. He also wrote two of the Oxford war pamphlets, *Through German Eyes* (1914) and *Idols of Peace and War* (1915), and numerous letters in the press on the question of war-guilt.

In scholarship, as in other things, Sonnenschein prided himself on being 'a conservative of the right sort'. He was minutely accurate, and averse to loose quotations and incorrect innovations in language; for instance, he objected to the expression 'post-graduate'. He was a loyal friend, but uncompromising in condemning anything which fell short of his own exacting standards. As a correspondent, he was most conscientious in answering questions or discussing difficulties, and never spared himself in promoting the cause of good scholarship or helping fellow students. A certain absent-mindedness in society and indifference to correctness in dress only served to endear him the more to several generations of pupils. There is a small portrait

by Charles Gere in the possession of the family.

[*The Times*, 3 and 7 September 1929; *Classical Review*, November 1929; private information. For Sonnenschein's share in fixing the constitution of the modern university, see his letters to the *Birmingham Daily Post*, 20 April, 1 and 8 May 1899, his correction of the statement in Lord Haldane's *Autobiography* (p. 146), *The Times*, 28 June 1920, and particularly a pamphlet by E. J. Somersct, *The Birth of a University*, 1934.]

W. B. SEDGWICK.

SPENCER, SIR WALTER BALDWIN (1860-1920), biologist and ethnographer, was born 23 June 1860 at Stretford, Lancashire. He was the second son in the family of thirteen of Reuben Spencer, himself one of twelve, a Derbyshire lad who had worked his way up to be head of Rylands and Sons, Ltd., a Manchester firm of textile merchants. His mother's name was Martha Circuit. He was sent as a day-boy to Old Trafford School, where his inherited vigour showed itself alike in examinations and in athletic sports. Thence he went for a year to the Manchester School of Art, where he acquired a graphic touch which later on adorned and vivified his demonstrations in the lecture-room as well as the copious records of his studies in the field. To study good pictures and, within his means, to collect them, ever remained the chief of his hobbies. Spencer's true vocation was discovered when he entered Owens College, Manchester; there, under the able tuition of Professor Arthur Milnes Marshall [q.v.], who later described him as 'the best student I ever had', he became fired with an enthusiasm for biology. In 1881 he won an open scholarship in that subject at Exeter College, Oxford. There two of the fellows, Henry Nottidge Moseley and Edwin Ray Lankester, were eminently qualified not only to train him in research but to secure the recognition of his talents. After gaining a first class in natural science in 1884, Spencer became assistant to Moseley in April 1885, and was elected a fellow of Lincoln College in January 1886. At Moseley's suggestion, he assisted Edward Burnett Tylor, then reader in anthropology at Oxford, to arrange the ethnological material presented to the university in 1883 by General Pitt-Rivers [q.v.]—an experience which inspired Spencer with a second interest, whence so much of his future reputation was to come.

In June 1886 Spencer read a paper before the Royal Society on the median, or

pinial, eye in lizards—a palaeontological mystery to which he provided the evolutionary key. The paper won him instant recognition. Within six months he was elected to the chair of biology in the university of Melbourne. Accompanied by his wife, Mary Elizabeth, the daughter of Richard Bowman, whom he married in January 1887, Spencer sailed immediately afterwards to the Antipodes, of all possible regions the richest in forms of arrested life.

Spencer held his professorship at Melbourne for thirty-two years. He proved an admirable and energetic teacher and organizer, and was rewarded with many honours. He was elected a fellow of the Royal Society in 1900, and an honorary fellow of Exeter College in 1906, and of Lincoln College in 1916. He received the C.M.G. in 1904, and was created K.C.M.G. in 1916.

But it is what Spencer did for uncivilized rather than for civilized Australia that demands special mention, for, as Sir James Frazer has well said, 'the record of Central Australian savagery, which we owe primarily to the genius of Baldwin Spencer, is likely to remain for all time the standard by reference to which, more than to any other documents, future inquirers will attempt to estimate the comparative antiquity of forms of society and to trace them to their origin in times which lie far beyond the reach of history' [Preface to *Spencer's Last Journey*, p. 8].

Attached as zoologist to the expedition organized in 1894 by W. A. Horn to carry out scientific investigation in Central Australia, Spencer, at Alice Springs, near the very centre of the continent, fell in with Francis James Gillen, who was stationed there as telegraphist among absolutely primitive natives. With these natives Gillen, a genial Irishman, had become so friendly as to be regarded by them as one of the tribe and a party to its most intimate secrets. Grasping the anthropological possibilities of a unique situation, Spencer brought his trained method to the aid of Gillen's experience; and as a result of this collaboration, of repeated explorations on Spencer's part, and of a subsequent journey undertaken by them both right across the continent to the gulf of Carpentaria (1901-1902), a quite unknown world of authentic stone-age folk was brought to light and vividly described. Under their joint names there appeared *Native Tribes of Central Australia* (1889), and *Northern Tribes of Central*

Australia (1904), each of them anthropological classics. After Gillen's death in 1912, Spencer more than once revisited the regions explored by them and published in 1927 under their joint authorship (a pious fiction) *The Arunta, a study of a Stone Age People*; this was meant to be a final effort to verify their findings, and it proved feasible with a minimum of substantial modification. Readable as they are, these digests of severely controlled evidence are meant for the expert. Covering the same ground, however, two other works, more popular in character, *Across Australia* (1912) and *Wanderings in Wild Australia* (1928), the first written by the partners, the second by the survivor, reveal the personal side of a close contact with what almost amounts to another order of humanity.

In 1911-1912 Spencer, who held the position of special commissioner for the Commonwealth government and chief protector of aborigines in the Northern Territory, explored wide spaces of the Northern Territory, partly on his own account and partly at the instance of the government. Here he amassed much fresh material with the insight and thoroughness that mark all his field observations, and in 1914 was published *Native Tribes of the Northern Territory of Australia*. He resigned his chair at Melbourne University in 1919, retaining the title as professor emeritus.

It had always been one of Spencer's dreams to follow up Darwin's study of the Fuegians, another derelict race. Accordingly in 1929, at the age of sixty-nine, with the threat of *angina* upon him, he braved a winter at Cape Horn; but he died suddenly on 14 July of that year in a snow-bound hut at Hoste Island, off Tierra del Fuego. His venture was not in vain, since he left behind him valuable notes which are incorporated in *Spencer's Last Journey* (1931). His grave is at Magellanes. He had one daughter.

There are two portraits of Spencer by W. B. McInnes, an Australian artist, one in the possession of the university of Melbourne, the other hanging in the hall of Exeter College, where his name appears also in a memorial window.

[R. R. Marett and T. K. Penniman, *Spencer's Last Journey*, with memoir and bibliography, 1931. *Spencer's Scientific Correspondence*, 1933, by the same editors, throws light on his intellectual friendships, and especially on his constant literary intercourse with Sir J. G. Frazer.] R. R. MARETT.

SPOFFORTH, FREDERICK ROBERT (1853-1926), Australian cricketer, was born at Balmain, Sydney, 9 September 1853, the fourth child and second son of Edward Spofforth, a Yorkshireman who had emigrated to Australia in 1828, by his wife, Anna McDonnell. Spofforth was educated at Eglinton College, Sydney, where he learned his cricket. On 31 March 1877 he formed one of the Australian eleven at Melbourne against the team of English professionals captained by James Lillywhite [q.v.]. This fixture, in which Spofforth took 4 wickets for 115 runs, is usually counted the second in the series of test matches between England and Australia. Spofforth came to England in 1878 with the first Australian team which visited this country. Though the batting of the Australians was weak, the strength and variety of the bowling came as a revelation to English cricketers. At Lord's on 27 May a good Marylebone Cricket Club eleven, which included William Gilbert Grace [q.v.], was dismissed for 33 and 19. Owing to rain, the ground was difficult, but Spofforth's performance of taking 11 wickets for 20 runs was amazing. Throughout the tour he was successful, and in the first-class matches took 107 wickets at a cost of 11 runs each. When he came again to England in 1880, his bowling seemed as good as ever, but an injury kept him out of the only test match that was arranged. It was on his third visit to England, in 1882, that Spofforth accomplished the most famous feat of his career: this was at the Oval on 28 and 29 August when the Australians won their first victory in international cricket on English soil. England, with 80 runs to win, was put out, chiefly by Spofforth, for 72, and lost by 7 runs. Although the conditions were against the batting side, it was generally admitted that more formidable bowling had never been seen, and the public gave Spofforth the name of the 'demon bowler'. He paid two more visits to England, in 1884 and 1886, but found no opportunity in test matches of repeating his sensational achievement. Early in the 1886 tour, when he was bowling very well, his hand was hurt by a ball driven back at him, and he himself fancied that he lost something of his skill owing to this injury.

Spofforth was a tall, lean man, with long arms, and he delivered the ball at his full height. In his younger days he was a fast bowler, but afterwards he owed most of his success to clever variations of length and pace, and his best ball was of medium

pace with a break from the off. His name will always be associated not only with the development of Australian cricket, but also with a marked advance in the art of bowling.

In 1886 Spofforth settled in England. Thereafter he was a member of the Derbyshire county eleven on several occasions, and played in a few other first-class fixtures. In Australia he had been a bank-manager, but in England he entered a tea-merchant's business, which he directed with energy and success. He married in 1886 Phyllis Marsh, daughter of Joseph Cadman, of Breadsall, Derbyshire, and had two sons and two daughters. He died at Ditton Hill Lodge, Surrey, 4 June 1926.

[*The Times*, 5 June 1926; private information.] A. COCHRANE.

SPoonER, WILLIAM ARCHIBALD (1844-1930), warden of New College, Oxford, the eldest son of William Spooner, barrister, county court judge for North Staffordshire, of Walton Lodge, Stafford, by his wife, Jane Lydia, daughter of John Wilson, of Seacroft Hall, Leeds, was born 22 July 1844 at 17 Chapel Street, Grosvenor Place, London. Archibald Campbell Tait [q.v.], afterwards archbishop of Canterbury, who had married his father's sister, Catherine Spooner, was his godfather. Though robust in general, he suffered as an albino from defects of eyesight and taste, but triumphed over them by sheer force of character. Educated at Oswestry School, he won an open scholarship at New College, Oxford, in 1862, being the first scholar elected from outside Winchester College.

From this time onward Spooner's life was bound up with New College as successively scholar, fellow, and warden, and after his retirement as honorary fellow, in a period which saw its conspicuous growth in numbers, buildings, and importance. In this process of expansion the leading spirits were Edward Charles Wickham [q.v.], to whose tuition Spooner owed much, and Alfred Robinson, who came from University College in 1865. Spooner helped to carry out their policy. As a freshman, he was welcomed by the small Wykehamist society for his alert and cheerful spirit and for his connexions, through his family and friends, with other colleges. He had many noteworthy contemporaries: in college, W. A. Fearon, John Wordsworth, W. J. Courthope, Edgar Jacob, and R. C. Moberly, and among those outside, R. W. Raper, F. H.

Jeune, W. R. Anson, E. S. Talbot, Mandell Creighton, J. L. Strachan-Davidson, Evelyn Abbott, and W. G. F. Phillimore. He showed independence by going to Henry Wall's logic lectures at Balliol College, and getting some tuition from Benjamin Jowett. After obtaining first classes in classical moderations (1864) and *literae humaniores* (1866), Spooner was elected fellow of his college in 1867, lecturer in 1868, and tutor in 1869, and for thirteen years (1870-1889) held the office of dean. He lectured on ancient history, philosophy, especially on Aristotle's *Ethics*, and divinity; and many generations of undergraduates were grateful for his tuition. He was ordained deacon in 1872 and priest in 1875, and the college became his lifelong parish. He was examining chaplain to Edward Carr Glyn, bishop of Peterborough, from 1902 to 1916, and was made honorary canon of Christ Church by Bishop Stubbs in 1899. He took his D.D. degree in 1903. His sermons, good in substance, suffered from his difficulty in reading. His fine eloquence found expression in his *extempore* speeches at the college Gaudy, which went to the hearts of his hearers by their mingled wisdom, humour, and love of the college.

On the death in 1903 of James Edwards Sewell [q.v.], who had been warden of New College since 1860, Spooner was unanimously elected warden, and entered on the happiest period of his life. The Lodgings, long neglected, were reconstructed with his generous assistance, and became a hospitable centre where he discharged with zest every duty of his office, making himself the friend of all, high or low, connected with the college: in this he had the gracious co-operation of his wife. No duty came amiss to him, but he excelled on such human occasions as a Gaudy or a Choir School prize-giving. He had an extensive knowledge of his undergraduates, who could count on his interest and good-will, but if they presumed on his good nature, were surprised by some pungent phrase which they never forgot. Considerate to his colleagues, he took them into his confidence and won their affection. He loved the ties with Winchester, and enjoyed his visits there as *ex-officio* fellow. He did not take a very active part in university affairs; he was a pro-vice-chancellor, but declined the vice-chancellorship and entered the Hebdomadal Council too late to make a mark. But he did valuable service as a first-rate examiner in 'Greats', and his judgement

as an awarding examiner in Scripture knowledge for the Oxford and Cambridge Joint Board was highly esteemed, and his opinion on university affairs carried weight. He supported the promotion of natural science studies, and welcomed the foundation in 1901 of the Wykeham chair of physics at New College. He was also chairman of the council of Lady Margaret Hall, Oxford (1901-1907) and of that of the Oxford House in Bethnal Green (1908-1920), and for many years was a poor law guardian, an active member of the Charity Organisation Society in Oxford, and chairman of the council of the Warneford Hospital. He was an ardent member of the Political Economy Club and for many years its secretary. He retired from the wardenship at the end of 1924, but continued to live in Oxford until his death, which took place there 20 August 1930.

Spooner's weak eyesight limited both his reading and his studies, but he published in 1891 an edition of *The Histories of Tacitus* which was widely used, and small volumes on *Bishop Butler* (1901) and *William of Wykeham* (1900). His letters to *The Times* on public affairs were distinguished by clarity and sound sense. In politics and churchmanship he belonged to the centre, and disliked extremes; his inner life was one of simple piety, undisturbed by outside storms. A tendency to lapse of speech led to the association of his name with one form of slip which gave a new word, 'Spoonerism', to the English language ('Kinquering kongs their titles take' is the best-known example); but this had no relation to his general conversation, which was fluent, vigorous, often witty, and was enjoyed by all who shared it. His death left Oxford a duller place: for nearly seventy years, except for a dangerous illness in 1915-1916, he was a familiar figure in its streets, and had become a 'character' respected for great personal qualities, and for long and loyal service to the university. As he wrote himself of William of Wykeham, 'he accomplished more than many able and more masterful men'.

Spooner married in 1878 Frances Wycliffe, third daughter of Harvey Goodwin [q.v.], bishop of Carlisle, and had two sons and five daughters.

Spooner's grave is at Grasmere, where his wife's house, How Foot, had for many years been a beloved holiday home. His portrait by Hugh Riviere in New College hall is an excellent likeness. There is also a cartoon by 'Spy' in *Vanity Fair* (21

April 1898), the original of which is at New College.

P. E. MATHESON.

SPY (pseudonym) (1851-1922), cartoonist. [See WARD, SIR LESLIE.]

SQUIRE, WILLIAM BARCLAY (1855-1927), musical antiquary, was born in London 16 October 1855. He was the only son of William Squire, of Feltham Hill, Middlesex, merchant of the City of London, by his wife, Elizabeth Ogden. He was educated privately, at Frankfurt-am-Main, and at Pembroke College, Cambridge, where he graduated B.A. in 1879, having obtained a third class in the historical tripos. He practised as a solicitor in London from 1883 to 1885, and in the latter year was appointed an assistant in the department of printed books in the British Museum, and in 1912 was made an assistant keeper, with special charge of the printed music. Although Squire retired from this office under the age limit in 1920, he was in 1924 appointed honorary curator of the King's music library which is permanently on loan to the Museum, and this bore valuable fruit in the publication of a catalogue of this collection. Part I, dealing with the Handel MSS., appeared in 1927; Part III, the printed music and musical literature, in 1929. The second portion had not been begun by Squire when he died, and is the work of Miss Hilda Andrews.

From 1890 to 1904 Squire acted as music critic for the *Saturday Review*, *Westminster Gazette*, *Globe*, and *Pilot* in succession. He wrote the libretto of (Sir) C. V. Stanford's opera, *The Veiled Prophet of Khorassan* (1881) and of (Sir) F. Bridge's cantata, 'Callirrhoe' (1888). Squire contributed many articles to all three editions of Grove's *Dictionary of Music*, and in the third edition, which is illustrated, his special interest in portraits of musicians proved of great service. He was also a contributor to the *Encyclopædia Britannica*, to this *Dictionary*, and to other publications. He compiled catalogues of old printed music in the British Museum (2 vols., 1912), of the music in the chapter library of Westminster Abbey (*Monatshefte* for 1903), and of the printed music in the Royal College of Music (1909), of which he had been librarian since 1885. He also collaborated with Helen, Countess

of Radnor in the *Catalogue of the Pictures in the Collection of the Earl of Radnor* (1909).

Squire did much valuable editorial work on English madrigals and old keyboard music, the most important of which, the *Fitzwilliam Virginal Book*, was done in co-operation with his brother-in-law, J. A. Fuller-Maitland, and was published in 1894-1899. He edited a reprint of the words of Robert Jones's *Muses' Garden for Delights* (1901), and for the Purcell Society, of which he was honorary secretary, he edited Purcell's harpsichord music (4 vols., 1918).

During the European War, Squire worked for the Intelligence Department of the Admiralty (1916-1918), and from 1918 to 1920 he served in the historical section of the Foreign Office. His report on the *Tribes of Tunisia* (1910) was officially adopted by the French government. He died, unmarried, in London 13 January 1927.

Squire became a fellow of the Society of Antiquaries in 1888 and of the Royal Geographical Society in 1894. He was elected an honorary fellow of Pembroke College, Cambridge, in 1925. In 1918 he became a knight of grace of the order of St. John of Jerusalem, and in 1926 received the C.V.O.

As an historian and archaeologist Squire's habitual care and accuracy made him regarded as a sound authority, and his readiness to place his great knowledge, not only of music, but of matters artistic and genealogical, at the disposal of all genuine applicants for information, will not be readily forgotten by students in the British Museum Library and elsewhere.

H. THOMPSON.

STACK, SIR LEE OLIVER FITZMAURICE (1868-1924), soldier and administrator, was born at Darjeeling, India, 15 May 1868, the only son of Oliver Stokes Stack, inspector-general of police, Bengal, by his wife, Emily Dickson. Educated at Clifton College and the Royal Military College, Sandhurst, he was commissioned to the Border Regiment in 1888, promoted captain in 1896, and appointed staff officer to the British commissioner and commander in Crete in 1899.

Eager for experience, Stack turned his eyes to the Sudan, at that time administered by British officers attached to the Egyptian army. He joined that army in 1899, served in the adjutant-general's

department, and in 1902 commanded the Shambé field force operating in the Shambé district of the Bahr el Ghazal, being awarded the medal and clasp. His discreet handling of this mission attracted the notice of the authorities, and Stack was chosen for service with the Sudan government. He was appointed private secretary to the governor-general in 1904, and Sudan agent and director of military intelligence in Cairo in 1908. Two years later he retired from the British army, and threw in his lot permanently with the Sudan service.

Following the transfer from the Sudan of the governor-general, Sir Reginald Wingate, to be high commissioner in Egypt in 1917, Stack, who had become civil secretary to the Sudan government in 1914, was gazetted (1917) acting sirdar of the Egyptian army and governor-general of the Sudan. It was an obvious choice: his military credentials were ample, his acquaintance with the Sudan was intimate. He succeeded to an inheritance unhampered by embarrassing legacies. The Sudan was tranquil, trade was reviving, revenue expanding. Fortified by this knowledge, Stack urged the expediency of carrying out proposals, already approved in principle by the Treasury, to develop cotton production in the area lying between the Blue and White Niles. But the business proved more protracted than he had anticipated; erroneous estimates and technical disputes so delayed making a beginning with the enterprise that Stack did not live to witness its completion.

Meanwhile his appointments had been confirmed (1919), and sensible of wider responsibility, Stack began a cautious experiment in decentralization. Up till then, the post-War fever of disruptive nationalism had not penetrated the Sudan, but, too shrewd to expect such immunity to last, Stack hoped to forestall the menace by providing existing tribal organizations with a definite place in the government of the state. He sanctioned and extended the judicial and administrative powers exercised hitherto unofficially by sheikhs, and he encouraged the admission of young Sudanese into the executive. In these and other ways he laid the foundations of a wholesome national consciousness.

Stack was present at the Anglo-Egyptian negotiations in London in 1924 in order to watch the interests of the Sudan, and when negotiations broke down,

returned to Cairo. The situation was disquieting. Mutiny was afoot in the Sudan, murder being hatched in Egypt. Tragedy drew near. On 19 November 1924 Stack was waylaid in the streets of Cairo and shot through the body. He died the following day.

Stack was an attractive personality: sympathetic and unaffected, inclining to advise rather than to command, finding reward in the simple performance of duty. No conspicuous achievement stands to his credit, but his administration was always constructive, his judgement cool and balanced. He piloted the Sudan without mishaps through seven difficult years, and he laboured unceasingly for the welfare of its people.

Stack married in 1902 Flora Center, daughter of Edwin Ramsay Moodie, commodore captain of the Cunard Company, and had one daughter.

Stack was a temporary major-general of the British army (1917) and a ferik of the Egyptian army. He was created C.M.G. (1914), K.B.E. (1918), and G.B.E. (1923). He was also in possession of the fourth class Osmanie (1902), third class Medjidie (1910), grand cordon of the Nile (1917), and first class El Nahda of the Hejaz (1920).

P. G. ELGOOD.

STANFORD, Sir CHARLES VILLIERS (1852-1924), composer, conductor, and teacher of music, was born in Dublin 30 September 1852, the only child of John Stanford, of Dublin, examiner in the court of Chancery and clerk of the crown, co. Meath, by his wife, Mary, daughter of William Henn, of Dublin, master in Chancery. He was educated at Henry Tilney Bassett's school in Dublin. His early Dublin life was spent in a favourable intellectual atmosphere. His father was an enthusiastic amateur vocalist and violoncellist. His music teachers, Arthur O'Leary (under whom he studied in London), Michael Quarry, and Sir Robert Prescott Stewart [q.v.], were all of them able musicians and all of them Irishmen. Quarry, in particular, exercised a great influence upon Stanford by instilling into him a love for the music of Bach, Schumann, and Brahms, little of which had, in those days, penetrated to Ireland. These early influences never lost their spell and can be traced in Stanford's works up to the last.

Stanford did not definitely decide to adopt music as a profession until 1870, when he was eighteen years of age. His father, in accepting the situation, insisted upon a general university education first and a specifically musical study abroad afterwards. This plan was carried out, but not without some difficulty. Stanford went up to Queens' College, Cambridge, as choral scholar in 1870, but he achieved such distinction in the musical life of Cambridge as an undergraduate that in 1873 he was appointed organist of Trinity College, and his university activities prevented any prolonged musical study abroad. Nevertheless, from 1874—the year in which he took his degree with a third class in the classical tripos—to 1870 he was given leave of absence for considerable periods in order to visit Germany for musical instruction. He studied first with Carl H. C. Reinecke in Leipzig and afterwards with Friedrich Kiel in Berlin. Stanford's reputation as a composer soon extended beyond Cambridge. As early as 1876 he attracted attention in London by his music to Tennyson's *Queen Mary*, written, at the poet's suggestion, for the Lyceum production, and by a symphony which gained a prize in a competition organized by the Alexandra Palace authorities. In 1877 his name figured in the Gloucester Festival programme with an overture. In 1882 a second symphony appeared, and his orchestral serenade was produced at the Birmingham Festival. His music to the *Eumenides* of Aeschylus (1885) took Cambridge by storm, and had much to do with consolidating his position as a musician of distinction.

It is surprising that with his manifold and varied activities, which increased when he settled in London in 1892, Stanford's output as a composer was so continuous. Whatever else claimed his attention—and he touched nothing timidly or half-heartedly—the time reserved for creative work was seldom allowed to be disturbed. He was a rapid worker. He scarcely ever made a sketch. Even complicated works were written straight into score, in ink, without previous preparation. Stanford was certainly the most versatile British composer of the latter half of the nineteenth century. There was no department of music in which he did not seek to challenge comparison with the foremost composers of his age, and there were few departments in which he failed to achieve some measure of distinction.

Stanford's efforts in the cause of English

opera deserve special mention. If he gained only temporary successes with his stage works his fate in this respect must in part be attributed to the difficult conditions which beset operatic production in England. His first opera, *The Veiled Prophet of Khorassan* (1881), enjoyed only two performances, one in Hanover, and one in London. *Savonarola* (1884), *The Canterbury Pilgrims* (1884), *Much Ado about Nothing* (1901), and *The Critic* (1915), in which Sheridan's 'tragedy rehearsed' became an 'opera rehearsed', fared little better. His last opera, *The Travelling Companion*, published by the Carnegie Trust in 1919, has not up to the present time (1934) received an adequate professional presentation. The nearest approach to a popular success which Stanford secured on the stage was with his *Shamus O'Brien*, a romantic light opera, which had a run of several weeks at the old Opera Comique Theatre, London, in 1896.

Stanford's large-scale choral works, although many of them are forgotten, were highly esteemed in their day, and certainly left their influence upon the work of later writers. 'The Three Holy Children' (1885) and 'Eden' (1891) have not been heard in recent years, but his 'Requiem' (1897) and especially his 'Stabat Mater' (1907) created a more lasting impression, and may be regarded as representing his finest work for chorus and orchestra. On a smaller scale, in the form of secular ballads, his 'The Revenge' (1886), 'Phauidrig Crohoore' (1896), and 'The Last Post' (1900) remain conspicuous examples of the best type of British choral writing, and have won both professional and popular acceptance.

For orchestra alone Stanford completed seven symphonies, the best-known of which are No. 3, 'The Irish' (1887), and No. 5, 'L'Allegro ed il Penseroso', inspired by Milton's poems (1895). His six 'Irish Rhapsodies' are, however, more representative of his genius, and their national character, combined with the imperishable poetic beauty of the native melodies from which the main themes are derived, give them a place of special significance in modern music. No. 1 (1902) is the most obstinately popular, but No. 2 (1903) is a finer work, and No. 4, 'The Fisherman of Lough Neagh' (1913), is probably the most satisfying example of Stanford's orchestral writing which exists.

Stanford was also a prolific writer of chamber music—skilfully wrought, but

mostly of a severely classical type which seldom reflected his personality attractively. There are eight string quartets; two string quintets; a pianoforte quintet and quartet; several trios and duet sonatas for various combinations, &c. None of these are publicly performed with any regularity, although many of them are in the repertoires of amateur players.

Stanford's church music, on the other hand, has established itself firmly in the services of all English cathedrals and important churches. His settings of the canticles are healthy, vigorous, and far superior in quality to those of most of his contemporaries. No religious music is better loved in Great Britain than 'Stanford in B flat' (1879), whilst his four later services, and several anthems, have almost equal claims upon the affection of church musicians. Medievalists have taken exception to some of his methods, and complained that this music is not always devout in style, but Stanford took a liberal view of the Church's needs for various occasions.

The mastery of design and fluency which distinguish Stanford's services and anthems are features also in his secular part-songs, notably the 'Elizabethan Pastorals', of which there are three sets; in the infinitely charming vocal pieces for children; in the much-esteemed compositions for organ, as well as in his smaller instrumental solos, too numerous to mention in detail. Fleeting trifles many of them are, but sometimes they reveal his individuality with greater clearness than more elaborate works.

It is, however, as a writer of solo songs that Stanford's reputation appears to be most securely established. Through the art of his friend, Plunket Greene, he won especial fame for his settings for baritone voice with choral and orchestral accompaniment. Early and brilliant examples are the 'Three Cavalier Songs', settings of Browning's poems, with male chorus (1882), but his 'Songs of the Sea' (1905) and 'Songs of the Fleet' (1910) are his finest essays in a form which he made peculiarly his own. They strike a note of romantic patriotism at once stirring and dignified. In writing for solo voice with pianoforte he excelled in settings of modern Irish poems, several collections of which won wide acceptance. The high-water mark in this type of song is reached with 'An Irish Idyll' (1901), but the succeeding collections, 'Cushendall' (1910), 'A Fire of Turf' (1913), and 'Songs from Leinster' (1914), all maintain an excellent

standard and contain many of his happiest thoughts.

As a conductor Stanford gained extensive experience with the Cambridge University Musical Society (1872-1893), but he will chiefly be remembered as director of the Bach Choir, London (1885-1902), and of the Leeds Festival, where he succeeded Sir Arthur Sullivan and officiated from 1901 to 1910. He also had chief charge of the Royal College of Music orchestra during the period of his professorship at that institution. It has been well said by one of his pupils, George Dyson, that 'Stanford was never a virtuoso conductor. Virtuosity of every kind was alien to his temperament. Contrasted with the more exuberant, his methods appeared to be sound rather than inspired. But he could handle large masses with a command and a dignity which revealed the nobility of masterpieces.'

Stanford was appointed professor of composition and orchestral playing at the Royal College of Music on its opening in 1883, and professor of music at Cambridge in 1887, holding both appointments until the year of his death. He earned the reputation of being the most successful composition teacher of his time in England. Many of his pupils were destined to become distinguished musicians. Amongst these were Walford Davies, Coleridge Taylor, Vaughan Williams, Gustav Holst, John Ireland, Frank Bridge, Rutland Boughton, Eugène Goossens, Arthur Bliss, and Herbert Howells. This list alone will serve as testimony to the soundness of his training and the catholicity of his sympathies. In 1911 he published his treatise on *Musical Composition*, a little volume which was the fruit of long experience and presented an admirable epitome of his methods, set forth without didactic heaviness or pedantry.

Stanford's other contributions to literature are not numerous, and may be regarded mainly as diversions in the course of a busy life. His chapters in *A History of Music* (1916), written in collaboration with Cecil Forsyth, are terse in style and exhibit sound critical judgements. Mention should also be made of his *Studies and Memories* (1908) and *Interludes* (1922).

Stanford was the recipient of many academic distinctions, including the honorary degrees of Mus.D. of Oxford (1883) and Cambridge (1888), D.C.L. of Durham (1894), and LL.D. of Leeds (1904). He was knighted in 1902.

Stanford married in 1878 Jane Anna

Maria, daughter of Henry Champion Wetton, of Joldwynds, Shere, near Guildford. They had one son and one daughter. Stanford died in London 20 March 1924 and his ashes are buried in Westminster Abbey.

Stanford's personality was very striking. He was tall in stature, and his countenance, somewhat grim in repose, assumed, in conversation, immense earnestness and animation. He was easily led by his fiery temperament into indiscretions of utterance. He delighted to triumph over enemies, but seldom bore malice. He could stab with sarcasm and heal the wound with affectionate good-humour. None could question his intense loyalty to his art, to his friends, to those who served him, and to those whom he delighted to honour.

An excellent portrait of Stanford, painted by Sir William Orpen, hangs in the hall of Trinity College, Cambridge. A cartoon of him by 'Spy' appeared in *Vanity Fair* 2 February 1905.

[Sir George Grove, *Dictionary of Music and Musicians*, 3rd ed., 1928; Sir C. V. Stanford, *Pages from an Unwritten Diary*, 1914; *Proceedings of the Musical Association*, 1926-1927; private information; personal knowledge.]

T. F. DUNHILL.

STANLEY, EDWARD LYULPH, fourth BARON SHEFFIELD, of Rosecommon, in the peerage of Ireland, and fourth BARON STANLEY OF ALDERLEY, in the peerage of the United Kingdom (1839-1925), was born in London 10 May 1839. He was the third son of Edward John, second Baron Stanley of Alderley [q.v.], by his wife, Henrietta Maria [q.v.], eldest daughter of Henry Augustus Lee-Dillon, thirteenth Viscount Dillon. He succeeded his eldest brother, Henry Edward John, third Baron Stanley of Alderley [q.v.], in 1903, and, by special remainder, succeeded to the barony of Sheffield on the death in 1909 of his kinsman, Henry North Holroyd, third Earl of Sheffield and third Baron Sheffield [q.v.].

Stanley was educated at Eton and at Balliol College, Oxford, where he obtained a second class in classical moderations (1859) and a first class in *literae humaniores* (1861). He was elected a fellow of Balliol in 1862, and held his fellowship until 1869. He was called to the bar by the Inner Temple in 1865, became an assistant commissioner under the Friendly Societies Commission in 1872, and in 1876 a member of the London School Board, on which he served, with one interruption (1885-1888),

until its abolition in 1904. After two unsuccessful attempts, Stanley was elected member of parliament for Oldham in the liberal interest in 1880, and retained his seat until 1885. In 1884 he was appointed a member of the royal commission on the housing of the poor, and in 1886 a member of the royal commission (the Cross commission) 'to inquire into the working of the Elementary Education Acts'; when the latter commission reported in 1888 he was the first signatory of a strong minority report, in which his characteristic style is conspicuous.

In 1880 Stanley took a leading part, as chairman of the executive committee and treasurer, in the formation of the National Education Association, which may be regarded as the descendant of the National Education League, an organization very prominent in the controversies connected with the Education Bill of 1870.

In 1897 Stanley became vice-chairman of the London School Board (which then reverted to the practice of appointing an outside chairman—Lord Reay), and he held that office until 1904. On the abolition of the School Board, the London County Council omitted, somewhat ungraciously as it appeared to him, to find an opening for a continuance of his services. His long and valuable work in the development and administration of education in London therefore came to an end. Subsequently, however, he did good service in the same cause in Anglesey, where he was a landowner.

Stanley was always active with his pen. He wrote a small book called *Our National System*, published in 1909, and between 1895 and 1917 expressed his views forcibly in many articles contributed to the *Nineteenth Century*, and the *Fortnightly*, *English*, and *Contemporary Reviews*. He supported the Education Bill of 1918, and in 1923, at the age of eighty-four, he delivered an address to the National Education Association vigorously criticizing two proposals, put forward respectively by the archbishop of Wales and Mr. H. A. L. Fisher, for a 'concordat' solution of the denominational controversy.

In the controversies which the organization and administration of public education have always excited in England, Stanley took an active part. He was a strong advocate of public control, and although he accepted the settlement or compromise of 1870, he held that the development of a public system of education was the business of public authorities

(preferably of *ad hoc* authorities), and he offered stout resistance to all proposals which tended to enlarge the influence or strengthen the position of voluntary or denominational bodies in that system. Thus he strongly criticized a circular issued by the London School Board in 1894 relating to religious instruction in Board schools, as giving a new opening to denominational influences in those schools. The controversy was ended by the victory of the Progressive party in 1897, and Stanley for the next seven years exercised a dominant authority on the Board.

The result of another controversy was less happy for Stanley, and indeed it led to the dramatic collapse of the scheme of higher education which he had been instrumental in devising, and to the defeat of his cherished hope that the School Board would become the public authority responsible for all grades and branches of public education. The London School Board had, with the concurrence and aid of the Science and Art Department, developed a large system of 'higher grade schools', 'evening continuation schools', &c., in which free instruction far above the standard of ordinary elementary schools was given to pupils of an age much above the ordinary elementary school age. In discussing with Sir John Eldon Gorst [q.v.] in 1899 the powers of the School Board to provide higher education, Stanley put its claims so high that the Education Department (shortly afterwards merged in the new Board of Education) felt it necessary to obtain a legal decision. Voluntary schools and institutions were also at that time feeling the competition of rate-aided Board schools and institutions, which charged no fees, very severely. Certain items of the London School Board's expenditure on higher education were accordingly challenged before Mr. Cockerton, the auditor, and his disallowance of them was upheld by the Court of Queen's Bench and the Court of Appeal. The courts in effect decided that the power of school boards to provide education out of the rates was limited to elementary instruction, given to children, and not to adults, within the scope of the Elementary School Code as distinguished from the Directory of the Science and Art Department. It was indeed a *cause célèbre*, and in the result led directly to the comprehensive reform of the English system of public education effected by the Act of 1902.

But though Lord Sheffield was an active and determined controversialist, his real

achievement lay in the field of detailed and laborious, but nevertheless imaginative and constructive, administration to which he devoted himself for many years. His actual accomplishment, not only in running the machine but in working out big and new ideas, and by a combination of enthusiasm and practical judgement securing their successful application, was great both in volume and quality. He was a pioneer in many branches of education and its organization, and made the London School Board a leading influence in the development of national education. He anticipated many lines of advance which have now become familiar, but he never neglected the humbler conditions on which successful advance depends. He gave constant and personal attention to the provision and improvement of school accommodation in pursuit of his ideal of 'a school place for every child and every child in its place, and that a good place'. But for his previous efforts, the London County Council would have had great difficulty in dealing with the huge problem which it was called on to face in 1904; and in preparing the way for the change from *ad hoc* School Board administration to municipal administration, Sheffield unwittingly contributed to the defeat of one of his own cherished projects.

Lord Sheffield's industry was unflagging; he drove himself and others with extraordinary energy. He was severely critical and caustic in speech, but a genuine kindness and generosity underlay his antagonisms, and he never bore ill-will. He was not an easy man to deal with, but his disinterested devotion to his chosen task and his capacity for getting things done compelled respect.

Lord Sheffield married in 1873 Mary Katharine, daughter of Sir Isaac Lowthian Bell [q.v.], first baronet, of Washington Hall, co. Durham, and had three sons and five daughters. He was succeeded as fifth Baron Stanley of Alderley and fifth Baron Sheffield by his eldest son, Arthur Lyulph (born 1875). He died at Alderley Park, Cheshire, 18 March 1925.

There is a portrait of Lord Sheffield by P. A. de László at Alderley Park (1904), and others are in the possession of Colonel Oliver Stanley at Plas Llanfawr, Holyhead, and of the Hon. Lyulph Stanley at Penrhos, Holyhead.

L. A. SELBY BIGGE.

STARLING, ERNEST HENRY (1806-1927), physiologist, was born 17 April 1806 in Barnsbury Square, North London, the eldest son of Matthew Henry Starling, clerk of the crown, Bombay, by his wife, Ellen Mathilda, daughter of Henry George Watkins, artist and engraver, of Islington. He was educated at King's College School, London, and at Guy's Hospital, which he entered in 1882. As a student he won numerous distinctions, became demonstrator in physiology at Guy's in 1889, and later on head of the physiology department at that hospital. His tenure of office was marked by a complete reconstruction of the building available for physiology, with the result that, instead of being poorly equipped, Guy's came to have the best physiological laboratory in London. In 1890 Starling was elected to the Jodrell chair of physiology at University College, a position which he filled until 1923. In 1922 he was appointed to the Foulerton research professorship of the Royal Society, of which he was the first holder. He was elected a fellow of the Royal Society in 1899, was awarded the Society's royal medal in 1913, and the Baly medal of the Royal College of Physicians in 1907. He received honorary doctorates from Trinity College, Dublin, and from the universities of Sheffield, Cambridge, Breslau, Strasbourg, and Heidelberg. He was created C.M.G. in 1917.

Starling married in 1801 Florence Amelia, daughter of Sir Edward Henry Sieveking [q.v.], the physician, and widow of Leonard Charles Wooldridge, a distinguished physiologist. They had one son and three daughters. His wife assisted him indefatigably in his work. Starling died on board a steamer as it was entering Kingston harbour, Jamaica, 2 May 1927, while he was travelling for his health.

Starling wrote several books, outstanding among which was his *Principles of Human Physiology* (1912, 4th ed. 1925), the classical English physiological textbook of its time; but it is as an original investigator that he has the greatest claim to be remembered. So meagre at that time was the equipment at Guy's Hospital, that for purposes of research Starling was driven in 1890 to University College, which then contained a brilliant group of workers under the leadership of (Sir) E. A. (Sharpey-) Schäfer, the Jodrell professor. This group included (Sir) William Maddock Bayliss [q.v.], who in 1893 married Starling's sister Gertrude. Starling formed with Bayliss a lifelong intellectual alliance

of the most fruitful character. Starling's investigations covered an unusually wide field, but three subjects stand out pre-eminently: (1) the secretion of lymph and other body fluids, (2) the discovery of secretin, (3) the laws which govern the activity of the heart.

In 1892 Starling went to Breslau in order to work with R. Heidenhain on the subject of lymph formation. Heidenhain at that time was the protagonist of the 'vital' theory of the secretion of serous fluids, which regarded the cells of the capillary wall as having secretory powers similar to those of the salivary or pancreatic cells. This theory was supported by certain experiments on the ligature of vessels, but principally perhaps by the alleged action of the so-called lymphagogues. It is said, and the saying is approximately correct, that Starling verified all Heidenhain's experiments and disproved all the conclusions; but the advance was made by supplementing the work of the master by other and crucial experiments of his own. Starling showed, in fact, that most of the phenomena which govern the flow of lymph could be explained, if proper account were taken of the factors which govern the hydrostatic pressure of blood in the capillaries together with the osmotic properties of the fluids concerned. In this connexion special stress was laid on the osmotic pressure of the colloid constituents of those fluids. The work, although undertaken with special reference to lymph flow, soon extended to the secretion and absorption of other fluids, such as urine and serous fluids generally. It so completely superseded previous work in this field as to put Starling, in his early thirties, into the first rank of experimental physiologists.

Starling's second achievement, and probably his greatest, was his discovery in 1902 in collaboration with Bayliss of secretin, a performance so noteworthy as to require no comment except that as time has passed that achievement appears to rank more and more as one of the most important discoveries of physiology. The conception of an internal secretion was not new, for Schäfer had established that by his discovery of adrenaline in 1894; moreover, although thyroxine had not then been isolated, its main physiological reactions were known. But the idea of a chemical stimulus from one part of the body producing a specific response elsewhere, such as the secretion of pancreatic juice, was new. The degree of importance

to which humoral secretions have now attained is merely evidence of the fundamental nature of the discovery of secretin.

The years immediately preceding the European War of 1914-1918 were devoted by Starling to the study of the heart, which, indeed, was the subject of perhaps his earliest research. The 'heart-lung preparation' had been used by Henry Newell Martin (1848-1896), of Johns Hopkins University, and others, but Starling converted it into a technical method of the first importance by the introduction of a suitable and variable resistance on the arterial side. On the 'heart-lung preparation' he studied, *seriatim*, the effect of varying the numerous factors which influence the beat of that organ, e.g. arterial pressure, venous inflow, temperature, the chemical composition of the blood, and so forth; finally, he expounded the generalization known as 'Starling's law of the heart', namely, that 'the energy of contraction is a function of the length of the muscle-fibres'. Then came the War, and Starling never carried out his full programme, which was to apply all the knowledge acquired on the 'heart-lung preparation' to the innervated organ. Apart from his activities in the War, Starling worked at many other subjects, such as the movement of the gut and renal secretion.

On the outbreak of war Starling at once obtained a commission in the Royal Army Medical Corps, and at first served as a medical officer at the Herbert Hospital at Woolwich; later he performed important work in the gas warfare department at home. In 1917 he was sent on a commission to the Italian army in order to convince the military authorities of the advantages of equipping their soldiers with a more perfect respirator. The sequel was that in the first three months of 1918 Great Britain made about one million respirators for the Italian army of such efficiency as to render quite innocuous an offensive launched against it by the Austrians on a great scale, an offensive which, had it been successful, might have proved decisive.

No account of Starling's work would be complete without some reference to his magnetic personality. Of not more than middle height, and with a penetrating but sympathetic eye, he gave the impression of personified alertness. His energy, mental and physical, appeared inexhaustible, his reactions and judgements were rapid, and if, as was inevitable, they occasionally

proved wrong he was not prevented by any misplaced feeling for consistency from revising and correcting them. Yet his searching intellect was coupled with a heart of great generosity; to help younger workers was his supreme pleasure, and no one more fully enjoyed the companionship of his fellows. His outlook on life he once voiced in the words 'An objective life is a happy one'.

J. BARCROFT.

STEEL, FLORA ANNIE (1847-1929), novelist, was born at Sudbury Priory, Harrow-on-the-Hill, 2 April 1847, the sixth child and second daughter of George Webster, sheriff-clerk of Forfarshire, by his wife, Isabella, daughter and heiress of Alexander Macallum, sugar planter, of Cousins Cove, Jamaica. Until she was nine years old she lived at Harrow and at her father's London house in Palace Yard, Westminster, where Thackeray and George Cruikshank were among his friends. Her parents moved in 1857 to Burnside, Forfar, and she quickly developed a deep love of the Highlands. News of the Indian Mutiny impressed her childish imagination: she was even then a creature of energetic action, and she burned and hanged the Nana Sahib in effigy many times. She was educated by governesses and at a private school in Brussels where the headmistress described her as 'diligente mais point gracieuse'. During 1866 she lived with her parents in Heriot Row, Edinburgh, and 'dressed on twenty pounds a year'. At the end of 1867 she married Henry William Steel, of the Indian civil service, the son of the Rev. Thomas Henry Steel, vicar of St. Ippolyts with Great Wymondley, Hertfordshire. Although she claimed in her autobiography, *The Garden of Fidelity*, that she was never in love, the marriage was a happy one, and her husband thought her 'the one entirely right thing in this world'.

Mrs. Steel landed in Madras in 1868 and travelled to Delhi. From there she continued the journey by road to Lahore and thence to Ludhiana, where she was the only European woman. Her husband was soon transferred to Dalhousie. There her first child was born dead, but her only other child, a daughter born in 1870, survived. She was a devoted mother, a studious reader, and a keen conversationalist; she also sang, acted in theatricals,

and painted with infinite gusto and satisfaction to herself. In 1870 she joined her husband in Kasur, a subdivision of the Lahore district, and made it her business to acquire a special knowledge of India.

Mrs. Steel, alone of the Englishwomen then married to officials in India, flung herself heart and soul into the lives of Indians, and she wrote memorable fiction inspired by the insight which she acquired. Thrown upon her own resources—for there were no other Europeans in Kasur—she interested herself at first in municipal administration and in entertaining local magnates. When riding with her husband through the district, escorted by petty officials and farmers, she became familiar with the life of the country-side and the customs of the people. Later, she penetrated behind the purdah to the secluded women, and thus gained information not available to men. There was that in her Highland blood which was sympathetic to legend, pilgrimage, and religious disputation. She was impatient of the superstitions of others, yet she seems 'with her mind's eye' to have believed in the reality of the Indian railway guard who asserted that his name was Nathaniel James Craddock and who told her the story which she published in 1897 called *In the Permanent Way*.

Over Indian women Mrs. Steel exercised remarkable influence. The need for social reform was clear to her, but at that time there was no revolutionary party in India capable of emancipating women in a nationalist cause. She took a long view of the situation and attacked the deeply rooted social system by strongly advocating the education of Indian women. In this matter she was a pioneer, and her great ability was recognized, although her enthusiasms occasionally brought her into conflict with the constituted authorities. She started a school for little girls at Kasur in 1874, and when she roundly told the government that it ought to appoint inspectresses of girls' schools, it made her the first one (1884). She was a member of the Provincial Educational Board from 1885 to 1888, and served on it with John Lockwood Kipling, the artist, father of Rudyard Kipling. When Mr. Steel retired in 1889, she left India with regret and almost immediately began her literary career in earnest.

Mrs. Steel's first book, *Wide Awake Stories* (1884), had been followed by *The Complete Indian Cook and Housekeeper* (1887), written in collaboration with a friend, Mrs. Grace Gardiner. Neither lady

was regarded as an ideal housekeeper, but the book was appreciated by hundreds of Englishwomen in India and is a valuable record of contemporary prices, wages, remedies, conditions, and customs. In 1896 her great novel of the Indian Mutiny, *On the Face of the Waters*, was published and won for its author instant recognition. No future novelist who may write of the Indian Mutiny will possess Mrs. Steel's knowledge of that tragedy. The Northern India which she knew so well had changed but little in custom and sentiment since 1857, and she had listened to many a tale told by an old Moslem servant and other Punjabis. Colonel Reynell George Taylor [q.v.] and Sir George Stuart White [q.v.], who served through the Mutiny, were her friends. The novel was long astir in her mind, and during 1894 she returned to India, going back to live in Kasur, a predominantly Moslem district. From there she went to Delhi and spent much time with the descendants of the old Mogul dynasty. This weaving together of scenes and talks was a method in which she delighted, and her books give a remarkable tapestry of Indian life, sometimes blurred, often confusing, but never false. *On the Face of the Waters* is written with faithful accuracy and complete impartiality. She visited India only once more, during the winter of 1897, and left it finally in May 1898. *The Potter's Thumb* (1894), *In the Permanent Way* (1897), and *Hosts of the Lord* (1900) are convincing in their sincerity and are without rivals as contemporary pictures of life in the cantonments and villages of Northern India. Her series of Indian historical romances is more sentimental, but she never wrote of India without re-creating the Indian scene.

Mrs. Steel lived to be old, energetic to the end. From 1900 until 1913 she lived at Talgarth, near Machynlleth, North Wales, where she enjoyed her garden, and then moved to Court o' Hill, Tenbury. She supported the movement for women's suffrage, but was not a leader nor militant. In 1928 she wrote her autobiography, but died before it was published. It is a self-revealing book. After her husband's death in 1928 she lived with her daughter and son-in-law at Springfield, Minclunhampton, Gloucestershire, where she died 12 April 1929.

E. M. BELL.

STERNDALE, BARON (1848-1923), judge. [See PICKFORD, WILLIAM.]

STEVENSON, JAMES, BARON STEVENSON, of Holmbury (1873-1920), administrator, was born at Kilmarnock, Ayrshire, 2 April 1873, the elder son of Archibald Stewart Stevenson, of Carriden, Kilmarnock, by his wife, Elizabeth, daughter of James Morrison. He was educated at Kilmarnock Academy, but while still a very young man went into business as a travelling salesman. He became connected with the firm of John Walker and Sons, distillers, of Kilmarnock, and worked his way up to be managing director. With the help of extensive advertising, the sales of the company's whisky were much increased, and the concern prospered under Stevenson's management.

When the European War broke out in 1914 Stevenson offered his services gratuitously to the government in any capacity in which they could be used. On the formation, in the following year, of the Ministry of Munitions under Mr. Lloyd George, he was made director of area organization, an office which he held until 1917. He was then appointed vice-chairman of the Ministry of Munitions advisory committee, and in 1918 a member of the Munitions Council for ordnance. The value of his services in the provision of supplies of war was undoubted. He brought to bear on whatever work he undertook great industry and power of concentration.

After the War Stevenson was appointed chairman of the Munitions Council committee on demobilization and reconstruction, and from 1919 to 1921 he was surveyor-general of supply to the War Office. He was also a member of the Army Council (1910-1921) and of the Air Council (1910-1921), and vice-chairman of the advisory committee on civil aviation (1919-1920). In 1921 he was appointed personal adviser on commercial affairs to the secretary-of-state for the Colonies, a post which he held until 1923. It was while acting in this capacity that he was chosen to be chairman of the Rubber Investigation Committee, which produced the scheme, known as the Stevenson plan, for the restriction of the output of rubber. Those who support this scheme claim that it saved the planters of Malaya and Ceylon from conditions which, when the plan was put into effect (in 1922), were threatening the existence of the rubber industry.

The most striking example of Stevenson's powers of organization was his

management of the British Empire Exhibition, held at Wembley in 1924, and reopened the following summer. When it was decided to hold this great display, the biggest effort of the kind hitherto attempted in Great Britain, Stevenson was chosen to be the chairman of the Exhibition board. Exhibits from every part of the British Empire were collected, and there was hardly any industry or art which was not represented. Wide interest was, of course, aroused, and the exhibition proved, as was expected, the event of the summer. The control of this vast enterprise, with all its various sections, was in the hands of Stevenson. Great exertions were required to ensure the opening of the exhibition for its first season on the appointed date. Partly owing to delays caused by unfavourable weather, the work of erecting the buildings and arranging the exhibits in order had been much hindered, and a week before the day fixed for the opening ceremony the scene was one of almost hopeless confusion. Yet thanks to the efforts of the chairman of the board, the opening was made possible at the proper time. Furthermore, Stevenson's initiative and support ensured the successful reopening of the exhibition for a second year, whereby added stimulus was given to the growing sentiment of trading within the Empire.

Stevenson took no share in political controversy, and never declared himself an adherent of any particular party, but worked with and for all governments alike with the same impartial energy. Nor would he have considered himself a public man, yet his record of public service over a period of ten years is notable.

Stevenson was created a baronet in 1917 and G.C.M.G. in 1922. In 1924 he was raised to the peerage as Baron Stevenson, of Holmbury, Surrey. He was twice married: first, in 1897 to Jessie Baird (died 1917), daughter of James Hogarth, of Ardrossan, Ayrshire; and secondly, in 1918 to Stella, fifth daughter of William John Fraser, of Herne, Kent, and widow of Edward Johnstone. Lord Stevenson died at Holmbury St. Mary 10 June 1926, and, as he left no children, the barony became extinct.

[*The Times*, 11 June 1926. Portrait, *Royal Academy Pictures*, 1923.] A. COCHRANE.

STEVENSON, WILLIAM HENRY (1858-1924), historian and philologist, was born at Nottingham 7 September 1858, the elder son of William Stevenson, timber merchant and antiquary, by his wife, Mary

Ann, daughter of John and Rosina Lennon, of Banbridge, co. Down. The family moved in 1869 to Hull, where Stevenson was educated at the grammar school (now Hymers College). After leaving school he worked for a short time in his father's office on the Queen's dock, and, through the business connexion with Scandinavia, he became interested in Scandinavian languages. He learned Norwegian from a Norwegian sailor. But he never took to the timber trade, and in 1878 he returned to Nottingham, where he was engaged by the town council to edit the records of the borough (4 vols., 1882-1889). At this time Stevenson made the acquaintance of Lord Middleton, whose collection of manuscripts at Wollaton Hall he later catalogued for the Historical Manuscripts Commission (1911).

Stevenson's connexion with Oxford was due to Professor E. A. Freeman, with whom he had corresponded and whom he visited at Oxford in 1880. From 1887 he became a regular contributor to the recently founded *English Historical Review*, which contains much of his original work. In 1888, on the recommendation of Freeman, Stevenson was engaged to catalogue the muniments of Merton College. He was given rooms in the college and soon became known to many Oxford scholars, including Professor A. S. Napier, with whom he collaborated in editing the important Crawford collection of early charters now in the Bodleian Library (1895). While at Merton he entertained the idea of reading for a degree, but was dissuaded by the warden, G. C. Brodrick, who considered his work on the college muniments incompatible with other studies. He never, in fact, took a degree by the passing of university examinations; but he received the M.A. degree by decree of convocation in 1890, after his election to a research fellowship at Exeter College in the preceding year.

After completing his work at Merton, Stevenson was employed on the records of Gloucester, and edited a *Rental of all the Houses in Gloucester, A.D. 1455* (1890), a *Report on the Records of the Dean and Chapter and of the Corporation* (Historical MSS. Commission, 12th Report, 1891), and a *Calendar of the Records of the Corporation* (1893). In 1890 he was invited by Sir Henry Maxwell-Lyte, then deputy-keeper, to undertake regular work at the Public Record Office. Between 1892 and 1908 he produced eleven volumes of the *Calendars of Close Rolls*, comprising the reigns of Edward I and Edward II, and

the first six years of Edward III. He found the work, however, both irksome and a strain on his eyesight; moreover, since his election to a fellowship at Exeter College, he was spending more and more of his time at Oxford. In his later years Stevenson was responsible for but one volume of the Record Office publications, a volume of *Liberate Rolls of Henry III* (1916), which interested him on account of the linguistic difficulties which it presented. In 1904 he published his edition of *Asser's Life of King Alfred* with elaborate introduction and notes, which is perhaps his best work. He was appointed Sanders reader in the university of Cambridge in 1898, and gave a course of lectures on the Anglo-Saxon chancery to a small but distinguished audience which included Professor F. W. Maitland and Mary Bateson. In 1904, shortly after the expiration of his fellowship at Exeter College, he was elected at St. John's, where he spent the remainder of his life, as fellow and librarian, devoting much time to amassing material for the history of the college.

In spite of his interest in, and remarkable knowledge of, topography Stevenson cared little for travel, and, except for a visit which he paid with Maitland to the Canary Islands, he never left England. Both in term and vacation he made his home at Oxford, where the natural simplicity of his character, his kindness, and sympathy endeared him to a wide circle of friends, and enabled him to enter easily into the lives and interests of undergraduates although he had never been one himself. He died at Oxford 22 October 1924. He was unmarried.

Stevenson's qualifications for historical work were exceptional. He had an exact knowledge of all the languages requisite for the study of early English history, and no professed philologist could compare with him in extent of historical learning and knowledge of diplomatic. It was this remarkable combination that made him the first authority of his time on English place-names. He compiled in the course of his work a vast index of place and personal names, which has since been in part used by the editors of the *English Place-Name Society* in their publications. His philological work is scattered through his editions, reports, and articles, and he left in the press an edition of *Early Scholastic Colloquies* (published 1929).

[*Oxford Magazine*, 6 November 1924; private information; personal knowledge.]

A. L. POOLE.

STOKES, ADRIAN (1887-1927), pathologist, born at Lausanne 9 February 1887, was the youngest son of Henry John Stokes, Indian civil service, of Howth, co. Dublin, by his wife, Mary Anne, daughter of William MacDougall. He was great-grandson of Whitley Stokes [q.v.], sometime regius professor of medicine at Trinity College, Dublin, and grandson of William Stokes [q.v.], the well-known clinician. Sir William Stokes [q.v.], surgeon, and Margaret McNair Stokes [q.v.], Irish archaeologist, were his uncle and aunt. He was educated at St. Stephen's Green School and at Trinity College, Dublin, where he obtained honours in anatomy, and graduated M.B. in 1910 and M.D. in 1911. In 1910-1911 he was working at St. Mary's Hospital, and was house-surgeon at the Royal Sussex County Hospital, Brighton. In the latter year he was awarded the medical travelling prize and the Banks medal by Trinity College. After spending six months with his travelling prize at the Rockefeller Institute for medical research in New York, he was appointed assistant to the professor of pathology in Dublin, a position which he retained until the outbreak of the European War. Stokes went out to France in September 1914 as a lieutenant in the Royal Army Medical Corps, and was appalled by the great number of men who reached the base in the agonies of tetanus. He packed the sidecar of his old motor-bicycle with anti-tetanic serum and set off by himself to visit the field dressing-stations, saving lives at every halting place. In this way the first mobile laboratory of the British Expeditionary Force was established. Stokes invented the method of giving oxygen continuously through a nasal catheter to victims of gassing, a method which has extended since to civilian practice and has saved countless lives. He did invaluable work on typhoid and cerebro-spinal fever, gas-gangrene, trench nephritis, dysentery, and wound infections. In 1916, when an epidemic of jaundice appeared in the Ypres salient, he proved by animal experiment that the disease was spirochaetal in origin and identical with that described by Japanese investigators in 1914. He showed that it was conveyed by rats which infested the trenches, and he helped to locate the infected areas with the result that the epidemic was stamped out. For his war services he received the D.S.O. in 1918 and the O.B.E. in 1919.

In 1919 Stokes returned to Dublin as

professor of bacteriology and preventive medicine at Trinity College. His investigations on epidemic jaundice led to a request in 1920 from the Rockefeller Yellow Fever Commission that he should go to Lagos, but as no cases were available for investigation, the expedition proved fruitless. In 1922 Stokes was appointed Sir William Dunn professor of pathology in London University, working at the pathological department of Guy's Hospital. There he quickly made a unique position for himself. Members of the staff, house-officers, and students constantly sought his help, and they rarely failed to profit from his wide knowledge and great experience. Many important contributions to scientific literature, generally published in the hospital *Reports*, came from his laboratory.

In 1927 the Rockefeller Commission again sought Stokes's assistance. Its investigations had led to no definite results, and it was hoped that his clear judgement and genius for research would help to unravel the problems of yellow fever. Stokes proceeded to Lagos in June of that year, and carried out some decisive experiments. He showed that yellow fever could be transmitted to monkeys, and thus ensured further progress by animal experiment. On 15 September he developed yellow fever and died at Lagos on the 19th at the early age of forty. During the few days of his illness he insisted that mosquitoes should be fed on him, that his blood should be taken for inoculation into monkeys, and that an autopsy should be performed if he died. The mosquitoes were subsequently allowed to bite a monkey which developed yellow fever, the first time that the disease had been thus transmitted; the inoculated monkeys developed the disease, and his own autopsy showed the characteristic changes of yellow fever.

Stokes was a keen sportsman, and especially delighted in fishing, shooting, and cricket. He was extremely popular, and in his short life he exerted an enormous influence for good on all those with whom he came in contact at Trinity College, Dublin, in the Royal Army Medical Corps, and at Guy's Hospital. He was unmarried.

[*Adrian Stokes* by A. F. H. and J. A. R. in *Guy's Hospital Reports*, vol. lxxviii, 1928; personal knowledge.] A. F. HURST.

STOKES, SIR FREDERICK WILFRID SCOTT (1860-1927), civil engineer and inventor, born 9 April 1860, was the

fifth and youngest son of Scott Nasmyth Stokes, barrister, and inspector of schools, a friend of Matthew Arnold, by his wife, Emma Louisa, youngest daughter of Benjamin Walsh, of Worcestershire. An elder brother was the artist Adrian Stokes, R.A. (1854-1935). He was educated at St. Francis Xavier's College, Liverpool, the Kensington Catholic public school, and the Catholic University College in Kensington. At the age of eighteen he was articled to Lancaster Owen, civil engineer, of the Great Western Railway Company. From 1881 to 1885 he was engaged, under Sir William Shelford [q.v.], in designing bridges and other steelwork construction for the old Hull and Barnsley Railway.

On the termination of this employment Stokes began his lifelong connexion with the firm of Messrs. Ransomes & Rapier of Ipswich, by becoming assistant to Richard Christopher Rapier, the managing director. In 1896 when the firm was converted into a limited company, Stokes was appointed engineer and managing director of the London office. On Rapier's death in 1897 he succeeded him as managing director, and in 1907 became chairman of the company, both of which offices he held until his death.

From 1886 to 1888 Stokes took out patents for rotary kilns for cement-making, which were a distinct advance on the Ransome kiln of 1885. His improvements were widely adopted by cement-makers in the United States, and from that country the rotary kiln was later reintroduced into Great Britain in a modified form. He also improved Ransomes & Rapier's break-down crane and invented a shallow traverser for railway carriage and wagon stock. Subsequent to 1880 Ransomes & Rapier acquired the patent rights of the sluices invented by Francis Gould Morony Stoney in 1874 and 1880 [*Proceedings of the Institution of Civil Engineers*, vol. cxxx, pp. 317-18, 1896-1897]. Stokes superintended the erection of these sluices on the Manchester ship canal, and while so engaged he greatly improved their design, notably by arrangements for protecting the rollers from scour when the sluice is open, and by devices for ensuring complete watertightness, and for preventing vibration of the rollers. These sluices were subsequently employed for the Assuan dam on the Nile and for the Sennar dam on the Blue Nile. Stokes visited the Assuan dam in May 1898 and in January 1899, and represented his firm

at the opening of the first sluice in December 1901. He was also present at the opening of the Sennar dam in January 1926. For his services in connexion with the Assuan dam he received from the khedive the decorations of the order of the Osmanie (second class) and the Medjidie (second class). These sluices have also been employed in the Argentine, in India, New Zealand, China, and elsewhere.

The original design of the Stokes gun, the invention for which he is most widely known, was rejected by the War Office in December 1914, but the gun was subsequently used in the trenches at the battle of Loos in September 1915, firing smoke shells. It was a trench mortar consisting of a smooth-bored tube of iron or steel, three or four inches in diameter. The projectile carried its own propelling charge and igniter, and when it was dropped down the tube ignition occurred automatically by contact with a striker. Although the gun was not at first very popular in the trenches, it came to be much employed later, when it had been improved. At that time two sizes were used, a smaller for firing high explosive bombs, and a larger for gas, smoke, and incendiary shells. It was employed not only on land, but in naval operations such as the attack on the Zeebrugge mole on 23 April 1918.

Stokes was elected an associate of the Institution of Civil Engineers in 1885, and became a member in 1903. He was president of the British Engineers' Association from 1915 to 1917. He was a member of four committees of the Inventions Department of the Ministry of Munitions, and president of the Industrial Reconstruction Council in 1918. In 1917 he was created K.B.E. He contributed a paper on 'Sluices and Lock-gates of the Nile Reservoir, Assuan', to the *Proceedings* of the Institution of Civil Engineers, vol. clii, p. 108, 1902-1903. He died 7 February 1927 at Ruthin, and was buried at Mortlake.

Stokes married in 1900 Irene, daughter of Luke Ionides, and niece of the donor of the Ionides collection to the South Kensington Museum, Constantine Alexander Ionides [q.v.]. There were no children of the marriage.

[*The Times*, 8 February 1927; *Engineering*, 11 February 1927. See also *Proceedings* of the Institution of Civil Engineers, vol. cxxii, p. 107, 1925-1926; *Engineering*, vol. cv, p. 710, 1918; vol. cxxi, p. 104, 1920.]

E. I. CARLYLE.

STOPFORD, SIR FREDERICK WILLIAM (1854-1929), general, was born in Dublin 22 February 1854, the second son of James Thomas Stopford, fourth Earl of Courtown, by his second wife, Dora, daughter of Edward Pennefather [q.v.], chief-justice of the Queen's Bench, Ireland. He was educated at Eton, and while there became a page of honour to Queen Victoria. In October 1871 he was commissioned as ensign and lieutenant in the Grenadier Guards. From 1877 to 1881 he was adjutant of the regiment, and in August 1882 he was appointed aide-de-camp to General Sir John Miller Adye [q.v.], chief of the staff of the Egyptian Expeditionary Force. Stopford was present at the battle of Tel-el-Kebir (13 September), was mentioned in dispatches, and received the medal and clasp, the bronze star, and the order of the Medjidie (fifth class). In May 1884 he was promoted captain, and in the same year was appointed aide-de-camp to the commander of the British troops in Egypt. In February 1885, on the formation of the Suakin Expeditionary Force, Stopford was appointed aide-de-camp to Major-General Fremantle, commander of the Guards brigade in that expedition, and soon after was made brigade-major of the brigade. He was mentioned in dispatches and received the clasp for Suakin and the brevet of major. From 1886 to 1889 he was brigade-major at Aldershot, and in July 1890 he was promoted substantive-major in the Grenadier Guards.

After serving as deputy-assistant-adjutant-general at the War Office and at Aldershot, Stopford was chosen to command a composite half battalion in the Ashanti expedition of 1895. He was again mentioned in dispatches and received the star for the expedition. In March 1896 he was gazetted as brevet-colonel. In that year he was appointed assistant-adjutant-general at the War Office and was holding that post on the outbreak of the South African War in 1899. Stopford was then appointed military secretary to Sir Redvers Buller. He was present at the battle of Colenso (15 December) and at the actions of Spion Kop (24 January 1900), Vaal Krantz (5 February), Tugela Heights (18 February), Pieter's Hill (27 February), the relief of Ladysmith (28 February), and Laing's Nek (9 June). Later he took part in the operations in the Eastern Transvaal, and was present at the actions of Belfast (20-27 August) and Lydenberg (6 September). He received a number

of mentions in dispatches, was awarded the Queen's medal with six clasps, and was created K.C.M.G. in 1900. On his return home Stopford was appointed in 1902 chief of the staff of the I Army Corps, and while holding that position he was, in February 1904, promoted major-general and appointed director of military training at the War Office. He held this position until 1909, when he was appointed to the command of the London district. In that position he took an active part in the organization and development of the Naval and Military Tournament, which had recently been moved from the Agricultural Hall to Olympia, and devoted much of his spare time to service charities, becoming chairman of the Soldiers' and Sailors' Families Association and vice-president of the Royal Patriotic Fund. In 1909 he was created K.C.V.O., and promoted lieutenant-general, and in 1912 he was appointed lieutenant of the Tower of London, which position he was holding on the outbreak of the European War in August 1914.

Soon after that event, Stopford was appointed to the command of the First Home Defence Army, and thus was actively concerned both in the training of troops and in the organization of home defence. When, in June 1915, Sir Ian Hamilton called for reinforcements for the Dardanelles, Stopford was chosen to command the IX Corps of the New or 'Kitchener' Army troops destined for that theatre of war. Although in his sixty-first year, and not in good health, his service in the trying climate of tropical Africa having left its mark on him, Stopford eagerly accepted the offer of an active command, and, preceding his troops, he reached the Eastern Aegean in the middle of July. Here he was for a short time appointed to the command of the VIII Corps on the Krithia front in order to gain local experience. While there he learned from Sir Ian Hamilton that he was to command the IX Corps in a surprise landing at Suvla Bay. He, at first, expressed his entire agreement with Hamilton's plan; but later, on examining it more closely, he informed the commander-in-chief that he had grave doubts whether the amount of artillery support for the landing was sufficient. The landing was begun on the night of 6-7 August, and was at first successful. The Turks were surprised and had but small forces on the spot. The success of the enterprise depended on seizing promptly the Tekke

Teke ridge about five miles from the landing-place; but a landing on a beach is one of the most difficult operations of war, the troops were inexperienced and had been trained mainly for trench warfare in France, while the commanders with their experience of France in their minds, were loth to advance without adequate artillery support, and the naval arrangements for the landing of guns and of water were defective. Owing to the delays thus caused and to the personal and timely intervention of Kemal Pasha on the Turkish front, the opportunity of securing the vital ridge was lost and the landing ended in a dead-lock on the Suvla Plain.

On 16 August Stopford was relieved of his command and came home. A committee of general officers appointed by Lord Kitchener investigated Stopford's conduct of the operations, and this committee, while refusing to blame him, found grounds for criticizing general headquarters. It is possible that a younger man in better health might have been able to inspire his troops by personal example with the necessary enterprise, but it is also possible that more active assistance given to the corps commander by general headquarters on 7 August would have had a like result.

Stopford returned to his post as lieutenant of the Tower, which he held until 1917. He retired from the army in 1920, when he was created K.C.B. He died in London 4 May 1929 at the age of seventy-five. He never married.

[*The Times*, 6 May 1929; Sir J. F. Maurice and M. H. Grant, (Official) *History of the War in South Africa, 1899-1902, 1900-1910*; C. F. Aspinall-Oglander, *History of the Great War. Military Operations. Gallipoli*, vol. ii, 1932.]
F. MAURICE.

STOUT, Sir ROBERT (1844-1930), prime minister and chief justice of New Zealand, was born at Lerwick, in the Shetland Islands, 28 September 1844, the son of Thomas Stout, merchant and landed proprietor, of Lerwick. He was educated at the parish school, Lerwick, where he became a pupil teacher at the age of thirteen. In 1863 he went out to New Zealand, and was appointed an assistant master first at Dunedin grammar school and subsequently at North Dunedin district high school. In 1867 Stout began to study law, and in 1871 he gained first place at Otago University in the mental and moral science and political economy examinations. In the same year he was

admitted to practise as a solicitor and barrister. In 1872 he was elected to the Otago provincial council and remained a member until the abolition of the provinces in 1870; and from May 1874 to May 1875 he was provincial solicitor. From 1873 to 1875 he was law lecturer at Otago University. In August 1875 he was elected to the house of representatives, at a by-election, for Caversham, as an opponent of the Abolition of Provinces Bill then before the house. At the following general election, in 1876, he became one of the members for Dunedin; and he played a part in the transformation of the provincialist party, whose *raison d'être* had disappeared in 1876, into a new liberal party. Two years later, in 1878, he was appointed attorney-general and minister for lands and immigration in the ministry of Sir George Grey [q.v.].

Finding that politics interfered with his profession, Stout resigned his official posts in 1879, but returned to parliament in 1884 as a member for Dunedin East. In the same year he joined Sir Julius Vogel [q.v.] in the formation of the Stout-Vogel ministry, he himself becoming premier, attorney-general, and minister of education. He was considered chiefly responsible for the important Hospitals and Charitable Institutions Act of 1885. This coalition ministry was defeated in 1887, criticism being chiefly directed against its financial policy, and Stout withdrew from politics for six years. In June 1893 he was returned, at a by-election, for Inangahua. John Ballance [q.v.], who had died in April, is said to have regarded Stout as his natural successor. But Richard John Seddon [q.v.] succeeded to the premiership. For some time afterwards Stout remained somewhat aloof and critical of the Seddon administration. He represented the city of Wellington in parliament from 1893 to 1898, when he resigned, and was appointed in 1899 chief justice of New Zealand, a position which he held until 1920.

Throughout his life Stout kept in close touch with educational matters, though his educational views were regarded as conservative in his later years. He was a member of the senate of the New Zealand University for forty-six years (1884-1930), of the council of Otago University from 1891 to 1898, and of the council of Victoria College for many years. He was chancellor of the New Zealand University from 1903 to 1923. He received honorary degrees from the universities of Oxford, Edin-

burgh, and Manchester. He was created K.C.M.G. in 1886, was admitted a privy councillor in 1921, and was a member of the Judicial Committee of the Privy Council. When he resigned from the chief justiceship in 1920 he was appointed to the legislative council of New Zealand. This appointment he retained until his death, which occurred at Wellington 19 July 1930 in his eighty-sixth year. Stout married in 1876 Anna Paterson, daughter of John Logan, of Dunedin, clerk to the superintendent of the province of Otago, and had four sons and two daughters.

Stout was one of the greatest advocates the New Zealand bar has ever known; of striking appearance, with a voice of great flexibility and charm, he was a man of outstanding ability, and a formidable antagonist—especially before a jury. He was a courageous upholder of freethinking opinions in religion. He was one of the strongest advocates of prohibition in the country. He was largely responsible for placing the first measure of local option upon the New Zealand statute book, and helped to pass a bill for the introduction of women's suffrage.

As chief justice, Stout, the kindest of men, endeared himself greatly to the legal profession. He took a leading part in helping to frame the First Offenders' Probation Act (1886), and when as judge he administered the provisions of that Act he was fond of calling attention to its good results. His legal opinions were not always shared by his colleagues on the bench. But his was one of the ablest minds ever devoted to public affairs in New Zealand.

[*The Times*, 21 July 1930; New Zealand Parliamentary Record, 1840-1925; T. M. Hocken, *Contributions to the Early History of New Zealand* (Settlement of Otago), 1898; J. B. Condliffe, *New Zealand in the Making*, 1930.] T. M. WILFORD.

STRACHEY, JOHN ST. LOE (1860-1927), journalist, was born at Clifton 9 February 1860, the second son of Sir Edward Strachey, third baronet [q.v.], of Sutton Court, Somerset, by his second wife, Mary Isabella, second daughter of John Addington Symonds, M.D. [q.v.], and sister of the author John Addington Symonds [q.v.]. He was the great-grandson of Sir Henry Strachey, first baronet [q.v.], politician, and nephew of Sir John Strachey [q.v.], Anglo-Indian administrator, and Sir Richard Strachey [q.v.], lieutenant-general. He was educated

privately, mainly by his father at home and at Cannes, until he went to live with his uncle by marriage, Thomas Hill Green [q.v.], at Oxford in order to work for responsibilities. He entered Balliol College in 1878 and read history. He was already widely read, and wrote verse, but he lacked the conventional school education and discipline, and he did not make a favourable impression on the master of Balliol, Jowett, and the dons, nor did he appreciate their merits. However, he obtained a first class in the honour school of modern history in 1882. His quality was proved by the lasting friendships which he made with the best of his Balliol contemporaries, such as (Sir) Herbert Warren, afterwards president of Magdalen College, H. C. Beeching, afterwards dean of Norwich, and (Sir) Bernard Mallet, and with W. T. Arnold, of University College.

In 1884 Strachey settled in London intending to read for the bar, to which he was called by the Inner Temple in 1885, but he plunged eagerly into journalism. He was soon contributing to the *Saturday Review*, the *Pall Mall Gazette*, the *Economist*, the *Manchester Guardian*, and, regularly, to the *Standard*, which accepted him in spite of the whiggism which he had inherited and the liberalism which he professed. For the liberal-unionist party, which he joined in 1880, he edited with C. L. Graves the *Liberal Unionist*, and he then began to write for the *Spectator*, edited by his father's friends Richard Holt Hutton [q.v.] and Meredith White Townsend [q.v.]. In 1896 he was appointed editor of the *Cornhill Magazine*, but in 1898 Townsend handed the *Spectator* over to him, and Strachey became editor and proprietor, a position which he retained until December 1925. The paper lost nothing in vigour as its interests expanded. The circulation increased throughout the English-speaking world, and for years it was the most influential unionist weekly paper. It strengthened Imperial and Anglo-American friendship, and the interest in Indian affairs, which Townsend had made prominent, was not diminished by an editor whose family had sent to India distinguished administrators since the days of Henry Strachey, secretary to Lord Clive.

Strachey married in 1887 Henrietta Mary Amy, daughter of Charles Turner Simpson, and granddaughter of the economist Nassau Senior [q.v.]. This connexion confirmed his individualistic views on social questions. He opposed

state-socialism as contrary to the freedom of contract and exchange. Similarly, he opposed the tariff reform movement at the beginning of the twentieth century and became an active and influential unionist free-trader. At the general election of 1906 he unsuccessfully contested the seat for Edinburgh and St. Andrews Universities. He had built a house for himself at Newlands Corner in Surrey, and became enthusiastic over new materials and methods of building. In 1905 he organized the Cheap Cottages Exhibition at Letchworth in order to stimulate progress in cottage-building. In a practical matter like building he had the same naively eager love of experiment as he showed in literature, politics, and travel.

Strachey felt it to be his duty to warn Great Britain of the inevitability of the European War, which he foresaw. In his paper and personally in Surrey he took up rifle-shooting as advocated by Lord Roberts, Red Cross Voluntary Aid, and the registration of 'Surrey Veterans', ex-soldiers, and trained men. This led to his greatest contribution to the country's forces, for his scheme was copied beyond Surrey, and in 1914 the War Office had ready a register of 250,000 trained men upon whom there would have been no other means of calling. Strachey was high sheriff of Surrey in 1914 and threw himself into recruiting and other work with a feverish vigour which brought on a serious illness in 1916. A valuable piece of work done in London was the gathering of American and other journalists week by week at his house in Queen Anne's Gate in order to meet Cabinet ministers and others and to discuss the War with them. After the War he recovered his health sufficiently to visit Canada and the United States and to lecture there in 1926, but he died in London 20 August 1927. His elder son predeceased him; his younger son and his only daughter survived him.

Strachey's published works include *The Great Bread Riots* (1885, reissued 1908); *Industrial and Social Life and the Empire* (1895) (*The Citizen and the State*, Part ii); *From Grave to Gay* (essays and studies, 1897); *The Problems and Perils of Socialism* (1908); *The Practical Wisdom of the Bible* (1908); *A New Way of Life* (articles reprinted from the *Spectator*, 1909); *The Adventure of Living, a subjective autobiography* (1922); *The River of Life* (diaries, 1924); *The Madonna of the Barricades* (a novel, 1925); *American Soundings* (1920).

A portrait sketch of Strachey made in 1922 by Sir William Rothenstein is in the possession of Mrs. Strachey.

STRATHCLYDE, BARON (1853-1928), lawyer and politician. [See URE, ALEXANDER.]

STRUTHERS, Sir JOHN (1857-1925), educationist and civil servant, was born in Adelphi Street, Glasgow, 19 January 1857, the eldest son of Robert Struthers, described as a provision-merchant, by his wife, Agnes Muir. He was one of a numerous family, and was practically adopted and brought up by his father's sister, who was well married in Renfrewshire and was childless. Struthers was educated at the parish school at Mearns, Renfrewshire, where he served for five years as a pupil-teacher. Thence he went to the Church of Scotland Training College, Glasgow, and, combining his course at the college with a university course, he took his degree at Glasgow University with first-class honours in mental philosophy and a second class in classics. In 1881 he won an exhibition at Worcester College, Oxford, where he obtained a second class in classical moderations (1883) and a first class in *literae humaniores* (1885). In 1886 he was appointed an inspector of schools in Scotland; in 1898 he was taken on to the administrative staff of the Scottish Education Department as senior examiner; in 1900 he became assistant secretary, and in 1904 succeeded Sir Henry Craik [q.v.] as secretary; that post he held until his retirement under the age limit in 1922.

In the department Struthers's intimate knowledge of Scottish life and educational questions, his untiring industry, his consistency of purpose, and the sanity of his personal outlook were of the greatest value to Scottish education. Between 1898 and 1904 the framework of Scottish education was reshaped in every part and formed into a complete structure by means of a series of departmental minutes and circulars. The rationalization of the grant system was completed; post-primary education was re-classified and developed in new directions by the institution of 'higher grade schools' and 'supplementary courses'; continuation classes were regulated in a single system and grouped round 'central institutions'; the training of teachers was reorganized. It is not too

much to say that the initiation of these reforms was the work of Struthers, and their consolidation was the most characteristic part of what he accomplished as secretary. To some extent they hinged upon the Scottish Education Act of 1901, which raised the school-leaving age effectually to fourteen.

The ensuing Acts of 1908, 1913, and 1918, which, among other reforms, substituted county education authorities for small school boards, settled the voluntary school question, greatly improved the condition of the teaching profession, instituted a general system of medical inspection, with medical treatment and the provision of food and clothing in necessitous cases, and extended the facilities provided by the existing bursary system, were largely due to Struthers's initiative.

While an examiner Struthers had been a member (1898) of the royal commission on manual and practical instruction in Ireland; and (as head of his department) of the committee on local and imperial taxation (1912), and other committees. He was an active trustee of the Carnegie Library Trust and a member of the executive committee of the Central Library for Students.

Struthers married in 1912 Gertrude, daughter of Julian Hill, of Dean's Yard, Westminster, nephew of Sir Rowland Hill; they had no children. He was created C.B. in 1902, K.C.B. in 1910, and given the honorary degree of LL.D. by Aberdeen University in 1905. His portrait by Maurice Greiffenhagen, remarkable both as a likeness and a work of art, was presented to him on his retirement. He died at his house in Chelsea 25 October 1925.

[*The Times*, 26 October 1925; *Glasgow Herald*, 26 and 29 October 1925; private information.] M. F. HEADLAM.

STRUTT, EDWARD GERALD (1854-1930), agriculturist, the fifth son of John James Strutt, second Baron Rayleigh, by his wife, Clara Elizabeth La Touche, eldest daughter of Captain Richard Vicars, R.E., and sister of Hedley Shafto Johnstone Vicars [q.v.], was born at his father's country seat, Terling Place, Essex, 10 April 1854. He was educated at Winchester and at Trinity College, Cambridge. He then became a pupil of Messrs. Rawlence and Squarey, land agents, of Salisbury. In 1876 he was called upon by his eldest brother, John William Strutt, third Baron Rayleigh [q.v.], to undertake

the management of the latter's Essex estates. The farms were then for the most part in the hands of tenants, and he was able to do what was required while completing his training.

In 1877 Strutt went into partnership with Charles Parker, a friend of his boyhood, and the London firm of Strutt & Parker, land agents and surveyors, was founded, primarily in order to undertake the office of receiver (land agent) for the Lincolnshire and Essex estates of Guy's Hospital. A few years of Strutt's administration nearly doubled the income of the hospital from the estates, mainly by means of raising the rents. He ultimately (1919) negotiated the sale of the Lincolnshire estates to the Board of Agriculture, which desired control for the establishment of small holdings. A perpetual rent-charge was accepted in preference to a cash payment, and the hospital gained £5,000 per annum by the transaction.

In the meantime, the tenants on the Rayleigh estates had for the most part left, owing to the bad harvests and disastrous fall of wheat prices from 1878 onwards. They could not be replaced, and it became necessary to take the land in hand. Strutt looked round for some alternative farming policy, and he found it in the development of large-scale arable dairy farming, lucerne and other rotational grasses being used to supplement the limited amount of pasture. His system depended above everything on carefully kept records of milk yield. These were initiated in 1883. By weeding out the cows, the yield per head was progressively increased to more than double what it had been at first. From 1890 the use of the tuberculin test was progressively extended, and the reacting cows, which were at first found to be at least 50 per cent. of the whole number, were got rid of. The old cow houses were replaced by new ones of hygienic construction, and other exacting standards of cleanliness introduced. At the time that these improvements were made, they had a large measure of originality. In 1928, towards the end of Strutt's career, there was on the Rayleigh estate a herd of 850 cows which won the championship for clean milk herds in England.

Concurrently with these developments, a retail selling organization was formed in London, with a number of centres, incorporated as Lord Rayleigh's Dairies, Ltd. The farms on which the dairy herd was developed were and are preponder-

antly arable, and this aspect was not neglected. Here, too, a system of records was instituted much in advance of current practice. The computed profit or loss on each field was shown, and these figures, when added up, were found to give a good approximation to the actual profit. From these records, which were in full operation from about 1894, the average profit or loss on each crop could be determined. In the published records from 1894 to 1911 profit was always shown on corn crops. On other crops there was usually, but not invariably, a profit. The financial result for cows, cattle, pigs, sheep, and poultry were separately shown. A system of profit-sharing was instituted, and the employees were encouraged to invest their savings in the concern, on special terms.

These facts are taken for the most part from Strutt's presidential address to the Surveyors' Institution, delivered on 11 November 1912. This was the chief occasion on which he gave a public exposition of his views on agricultural policy. He emphasized the national importance of maintaining the agricultural population, and discussed with moderation and restraint what could be done to this end. His suggestions were: (1) an increase of arable land; (2) extension of small holdings; (3) agricultural education and research; (4) light railways; (5) government assistance in building rural cottages; and (6) no adverse legislation against capital invested in the soil. In the concluding part of his address he cited facts and figures to show that if the capital which had been expended on improving agricultural land were deducted, little or nothing remained which could be reckoned as the 'site value' postulated by radical politicians.

During the European War of 1914-1918, Strutt's help was largely relied on by the government in framing its agricultural policy. In 1915 the submarine menace became serious and it was vital to increase to the utmost the home production of food, in order to set overseas transport free for other purposes, and, in the last resort, to avert the threat of starvation. Strutt sat on Lord Milner's food production committee of 1915, and on Lord Selborne's committee of 1916 on post-War agricultural policy. In the meantime Mr. R. E. Prothero (afterwards Lord Ernle) had been appointed minister of agriculture, and Strutt was attached to the ministry as 'agricultural adviser'. He was consulted on most matters of real difficulty,

and it was largely in reliance on his advice that compulsion was applied to secure the ploughing up of additional grasslands. He judged that most British farmers would loyally accept such a policy, if prices were guaranteed. The Corn Production Act of 1917 was the result: it proved that Strutt had correctly anticipated the attitude of the British farmers, who from reasons of discretion could not be fully informed of the necessities of the case. For his war services, he was made a Companion of Honour, on the institution of the order in 1917.

Strutt advised his friends not to oppose the minimum wage for agricultural labourers, but as a compensation to the farmer he tried, without ultimate success, to get the guarantee of corn prices continued. After the harvest of 1922-1923 this was abandoned.

Both before and after the War Strutt's agricultural enterprises steadily increased. The firm of Strutt & Parker (Farms) Ltd. was incorporated just before the War. In 1876 he had begun farming 1,000 acres, and at the time of his death this had increased to 25,000 acres. During the post-War period Strutt gave much of his energies to the development of the sugar-beet industry. He served on the royal commission on Oxford and Cambridge Universities (1920-1922), and also on the royal commission on tariffs (1923) under Lord Milner.

Strutt married in 1878 Maria Louisa, daughter of John Jolliffe Tufnell, of Langleys, Essex. They had five sons (two of whom died in infancy) and three daughters. His home was at Whitelands, Hatfield Peverel, on the Rayleigh property, and there he died 8 March 1930.

As an agriculturist, Strutt was essentially practical, and his farming was wholly directed to financial results. He was not by temperament a student, and he sought his information more from men than from books. He had a keen eye to avail himself of the resources of science, but valued it mainly for results. He had, however, the same capacity as his eldest brother for attending to essentials, and for closely adjusting means to ends. There was also some personal resemblance. He was of medium height, with fair complexion and somewhat rugged features. Up to about his fiftieth year he was fond of hunting, but otherwise his work was his chief interest and pleasure. In his personal relationships a strong human sympathy was his most marked quality. Inefficiency

or slackness moved him to anger, but his anger left no permanent sting. His death was mourned by a whole country-side, as was very evident at his funeral.

A portrait of Strutt by Fiddes Watt is in possession of the family.

[Lord Ernle in *The Nineteenth Century and After*, April 1931; H. Rider Haggard, *Rural England*, vol. i, pp. 462-470, 1902; *Essex Weekly News*, 14 March 1930; personal knowledge.]
RAYLEIGH.

STURDEE, Sir FREDERICK CHARLES DOVETON, first baronet (1859-1925), admiral of the fleet, was born at Charlton, Kent, 9 June 1859, the eldest son of Captain Frederick Rennie Sturdee, R.N., by his wife, Anna Frances, daughter of Colonel Charles Hodson, of Oakbank, St. Helena. He was sent to the Royal Naval School at New Cross, and entered the *Britannia* as a naval cadet in July 1871. He passed first out of the training ship and went to sea as a midshipman in July 1873, serving until 1878 in the Channel squadron and on the East Indies station. After promotion to sub-lieutenant in June 1878, Sturdee was for nearly two years at Portsmouth in the gunnery school ship *Excellent* for courses and examinations which he passed with great distinction. He was promoted lieutenant in May 1880. From February 1881 to September 1882 he was in the *Hecla* on the Mediterranean station and took part in the operations at Alexandria in 1882, for his services in which he received the medal and bronze star.

From September 1882 to December 1885 Sturdee was in the *Vernon* torpedo school, and made his mark as a brilliant torpedo officer. For the next three and a half years he served as torpedo lieutenant in the *Bellerophon*, Lord Clanwilliam's flagship on the North American and West Indies station. From 1889 to 1893 he was on the staff of the *Vernon* and was continuously in command of torpedo boats: he gained more experience of these craft than any other lieutenant in the service. He was promoted commander in June 1893, and then served at the Admiralty for four years in the naval ordnance department as a torpedo specialist. He was awarded the gold medal of the Royal United Service Institution in 1894, having won it previously as a lieutenant. In November 1897 he went for two years in command of the *Porpoise* on the Australian station, and took command of the British force in Samoa in the summer of 1899 at

the time of the trouble between Germany and the United States. For his services in handling a delicate international situation Sturdee was awarded the C.M.G. and promoted captain. He then returned to the Admiralty as assistant director of naval intelligence until October 1902, when he again went to sea and commanded successive cruisers in home waters until, in May 1905, he became chief of staff to Lord Charles Beresford, commander-in-chief of the Mediterranean fleet. Sturdee continued with Beresford on the latter's transfer to the command of the Channel fleet in 1907; he had received the C.V.O. in 1906. His last year, before promotion to flag rank in September 1908, was spent in command of the *New Zealand* battleship in the Channel fleet. In 1910 he commanded the first battle squadron for a year, and after presiding over the submarine committee at the Admiralty in 1911, was again employed afloat in command of cruiser squadrons, being the senior cruiser admiral in the home fleet, until his promotion to vice-admiral in December 1913. He had been created K.C.B. in the previous June.

In July 1914, immediately before the outbreak of the European War, Sturdee relieved Admiral Sir Henry Jackson as chief of the war staff under Prince Louis of Battenberg, first sea lord. The destruction of the cruiser squadron under Sir Christopher Cradock [q.v.] at Coronel on 1 November 1914 made it urgently necessary to deal with Admiral von Spee's German cruisers; and, on Lord Fisher succeeding Prince Louis as first sea lord, it was decided that Sturdee should be appointed commander-in-chief in the South Atlantic and South Pacific for this purpose. He reached Port Stanley in the Falkland Islands in the evening of 7 December 1914, and von Spee's squadron was sighted the next morning. The decisive victory of the Falkland Islands followed, in which Sturdee with two battle cruisers, five cruisers, and one armed merchant cruiser annihilated the German squadron of two armoured cruisers, three light cruisers, and two colliers, one light cruiser alone escaping. Sturdee's services in this action were rewarded by a baronetcy in January 1916.

Early in 1915 Sturdee hoisted his flag in the *Benbow* in command of the fourth battle squadron, which he commanded at the battle of Jutland on 31 May 1916. In the honours awarded after that battle he was promoted K.C.M.G., and he remained

in command of the fourth battle squadron until February 1918, being promoted admiral in May 1917. During his period in the grand fleet he devoted much time and thought to fleet tactics and to tactical and strategical games. He then became commander-in-chief at the Nore until 1921, when he was promoted admiral of the fleet and G.C.B. At the end of the War he received the thanks of parliament and a grant of £10,000. Soon after ceasing active service he succeeded Lord Milford Haven (Prince Louis of Battenberg) as president of the Society for Nautical Research, and applied himself with whole-hearted devotion and energy to the scheme for preserving Nelson's flagship *Victory* and restoring her to her original Trafalgar rig and condition. He had successfully achieved this object before he died at his residence, Wargrave House, Camberley, 7 May 1925.

Sturdee was a really able naval officer, and an indefatigable student of his profession, who made his way to the highest rank entirely by his own merits, hard work, and devotion to the Service.

Sturdee married in 1882 Marion Adela, daughter of William John Andrews, of Fortis Green, Middlesex. They had two children, Lionel Arthur Doveton (born 1884), who succeeded to the baronetcy, and Margaret Adela, who married Vice-Admiral Cecil Minet Staveley.

V. W. BADDELEY.

STURT, GEORGE (1863-1927), author, who wrote under the pseudonym of GEORGE BOURNE, the younger son of Francis Sturt, by his wife, Ellen, daughter of William Smith, was born at Farnham, Surrey, 18 June 1863. His paternal ancestors had worked at East Street, Farnham, in a firm of wheelwrights which had existed since 1706. His grandfather had bought the business in 1810; his father became head of it in 1865, and died in 1884. Of his early life George Sturt has left a vivid account in *A Small Boy in the Sixties* (1927). He was educated at Farnham grammar school, where he was a teacher from 1878 until 1885, when he entered the family business. He had learned, under the influence of Ruskin, to set handwork above the labour of the desk; and while acting as manager of the shop he took his share in all the branches of the craft. In the early 'nineties he took a partner, William Goatcher, and himself went to live at Vine Cottage in the village of The

Bourne, near Farnham, where he found leisure for writing.

In 1901 Sturt published, under the name 'George Bourne', *The Bettesworth Book*, a study of an old labourer who worked in his garden. It has humour and sympathy, but the stories told by the old labourer, Frederick Bettesworth, are apt to be prolix and somewhat pointless, and the author as interlocutor has rather too large a part in the scene. This book was followed in 1907 by *Memoirs of a Surrey Labourer*, a continuation of Bettesworth's history up to his death. Sturt's subsequent work included *The Ascending Effort* (1910), *Change in the Village* (1912), *Lucy Bettesworth* (1913), *William Smith, Potter and Farmer* (1920), and *A Farmer's Life* (1922). The last two are collected memories of his mother's ancestors in the corner of Surrey round about Frimley and Farnborough. William Smith was Sturt's maternal grandfather; John Smith, of *A Farmer's Life*, his uncle; both were men of the old school, of fine character and strong personality. The background to their histories is the life of the country in days when Aldershot was open heath, and the labours and humours of the people—small tradesmen, farmers, and squatters. Everywhere the author, whose writing is generally lucid and graceful, displays a deep appreciation of the mental vigour and sound sense of the older generation, and of the distinctive character of the landscape.

In 1923 appeared Sturt's best book, *The Wheelwright's Shop*, a chronicle of the family business at Farnham during the author's management of it from 1885 to 1920. This book reveals not only the spirit of the wheelwright's craft before the coming of the machine age, but also the traditional methods and manual skill of the workers. In their hands the English farm-wagon, for instance, is shown to be a thing of beauty in the ordering of its lines and the perfect adaptation of its parts to the work it had to do. Every detail of the craft is explained, the characters of the workers are portrayed, and, unconsciously, a striking self-portrait of the author is furnished.

Sturt's last book, *A Small Boy in the Sixties* (1927), and *The Wheelwright's Shop* appeared under his own name. He died 4 February 1927 at Vine Cottage, The Bourne. He was unmarried.

[*The Times Literary Supplement*, 31 May 1928; J. Conrad, *Notes on Life and Letters*, 1921; Sturt's own works; private information.] G. F. SCOTT.

SUTHERLAND, SIR THOMAS (1834-1922), chairman of the Peninsular and Oriental Steamship Company from 1881 to 1914, was born at Aberdeen 16 August 1834, the eldest son of Robert Sutherland, a house-painter, of Aberdeen, by his wife, Christian, daughter of Thomas Webster. Thomas Sutherland, while still a child, lost his father, and he and his widowed mother went to live with her parents, the Websters. The earliest influence in his life was the sober and self-respecting atmosphere of his grandparents' house. He was educated at the grammar school and university of Aberdeen, and at the age of nineteen came to London in order to enter as a junior clerk the office of the Peninsular and Oriental Steamship Company, to the service of which he devoted almost the whole of his business life.

In 1854 Sutherland was sent out to Bombay, and had his first experience of Eastern travel. This was six years before the railway from Alexandria to Suez was built, and the overland journey between these two ports occupied three or four days. After a short stay in Bombay, Sutherland was transferred to Hong Kong, where he gave such proof of his ability that by the time he was twenty-six he was appointed superintendent of the company's Japan and China agencies. He was one of the founders of the Hong Kong docks, as well as of the Hong Kong and Shanghai Banking Corporation, of which he became the first vice-chairman. His services to the mercantile community were recognized by his being appointed by the governor, Sir Hercules Robinson, a member of the legislative council of Hong Kong.

After twelve years' work in the East, Sutherland returned in 1867 to London, and was promoted to be inspector, and then assistant manager, of the Peninsular and Oriental Steamship Company. About this time the completion of the Suez canal threatened to rob the company of its monopoly of the Eastern carrying trade, and Sutherland was the moving spirit in the necessary reconstruction of the Peninsular and Oriental fleet. Continuing to show administrative capacity, he was advanced to the position of a managing director in 1873, and eventually in 1881 he was elected chairman of the board.

The most important as well as the most interesting business which Sutherland undertook on behalf of his company was the conduct of the negotiations for an arrangement between British shipowners

and the Suez Canal Company. An agreement to obviate delays in working traffic through the canal had been reached in the spring of 1883 by the liberal government of the day, represented by Mr. Gladstone and Lord Granville. But this agreement had been considered so unsuitable that it was never submitted to the House of Commons, and the shipowners, acting on a hint from the government, took the matter in hand themselves. In October of the same year negotiations with M. Ferdinand de Lesseps and his son, M. Charles de Lesseps, were opened by a visit paid by the latter to the London offices of the Peninsular and Oriental Steamship Company. Sutherland explained the requirements of the shipowners, and the result was the agreement of November 1883 known as the 'Programme de Londres'. By this instrument British shipowners were admitted to a share in the management of the canal, with a right to appoint seven directors, and it was also agreed that after the Canal Company had received a fair dividend, the balance of profit should be applied to the reduction of dues. This settlement was of much more advantage to Great Britain than the agreement previously negotiated by the government, under which a substantial loan was to be made to the Canal Company; for under Sutherland's settlement the Canal Company itself was to provide funds for widening the canal. The arrangements at the time gave general satisfaction. The tolls began to be reduced in 1884, and, in addition, a considerable sum was saved annually by the shipowners in pilotage dues. Sutherland himself became one of the directors of the Canal Company, and at the time of his death was senior vice-president. The services rendered by him in this affair were appreciated so highly by his own company that the shareholders presented him with the money necessary to qualify him as a director of the Canal Company.

Sutherland resigned the chairmanship of the Peninsular and Oriental Steamship Company in 1914, after being connected with that undertaking for sixty years, for the last thirty-three of which he had been chairman. His successor in office, paying a tribute to his memory, said that Sutherland had done much to maintain the supremacy of British shipping and the high regard in which British shipowners and their methods are held among foreign competitors.

Sutherland entered the House of Commons as member for Greenock in 1884,

and sat for that constituency, first as a liberal, and then as a liberal unionist, until 1900. He was a member of the Load Line commission (1882), and also a member of the royal commission on the financial relations between Great Britain and Ireland (1893). He was one of His Majesty's lieutenants for the City of London and was created K.C.M.G. in 1891 and advanced to G.C.M.G. in 1897.

Sutherland married in 1880 Alice (died 1920), daughter of the Rev. John Macnaught, vicar of St. Chrysostom's, Liverpool, and had two sons and one daughter. His sons were both killed in action, one in the South African War and one in the European War. Sutherland died at his London house in Buckingham Gate 1 January 1922.

[*The Times*, 2 and 9 January 1922; private information.] A. COCHANE.

SWINTON, ALAN ARCHIBALD CAMPBELL (1868-1980), electrical engineer, born at 9 Albyn Place, Edinburgh, 18 October 1868, was the third son of Archibald Campbell Swinton, D.L., of Kinnermore, Berwickshire, professor of civil law in the university of Edinburgh 1842-1862, by his wife, Georgiana Caroline, daughter of Sir George Sitwell, second baronet, of Renishaw, Derbyshire. As a child, Swinton showed a decided bent towards engineering, and developed considerable skill in photography, which remained a lifelong hobby. In 1878 he was sent to Fettes College, where his hatred of games and dislike of orthodox methods of instruction seem to have made life very difficult for him. At the age of fifteen, two years after the invention of the telephone, he made, at school, an excellently working installation connecting two houses. In 1881 he went to Havre to study French and mathematics, and visited the Paris exhibition, where he was deeply impressed by the electrical inventions which he saw.

In 1882 Swinton began a five years' apprenticeship in the engineering works of Sir W. G. (afterwards Lord) Armstrong at Elswick-on-Tyne. In 1883 his book *The Principles and Practice of Electric Lighting* was published by Messrs. Longman, and thereafter he became chiefly interested in the electrical side of Armstrong's business. He was the first to employ lead-covered wires and cables for electric wiring in ships, in place of the cumbersome methods then employed to prevent the penetration of moisture.

In 1887 Swinton went to London to work up an independent practice as electrical contractor and consulting engineer. He carried out electric lighting installations in many country houses, and was connected with several of the earliest electric supply companies, notably those which were the first to employ steam turbines—for example, the Scarborough Electric Supply Co. and the Cambridge Electric Supply Co., of which latter he became managing director. He was also connected with Messrs. Crompton & Co. and was consultant to Sir William Armstrong. He gave up the contracting side of his business in 1904.

His ability to estimate rapidly the value of new discoveries marked out Swinton as a pioneer in the application of electricity in this country. The first photograph produced by X-rays in England was taken by him and published in *Nature* (23 January 1896) within a month of the announcement of Röntgen's discovery. By 1897 doctors and surgeons were bringing him their patients for examination with the aid of X-rays, so that Swinton must have been one of the first radiographers employed by the medical profession. From this date onwards Swinton read many papers of fundamental importance before the Royal Society and other learned societies, dealing with his observations on X-rays and cathode rays. His writings were, in general, of a descriptive nature, his great skill as an experimenter and his extraordinarily wide scientific knowledge being his greatest assets. His discovery of the high temperatures obtainable by the focusing of cathode rays led to a study of the luminosity of rare earths and was demonstrated by the conversion of a diamond into coke.

In association with Sir Charles Parsons, Swinton was intimately connected with the early development of the steam turbine and with the construction of the turbine ship *Turbinia*, a torpedo-boat destroyer which at the naval review of 1897 attained the then astonishing speed of 33½ knots.

Swinton, who lived in London in Chester Square, met nearly all the eminent men of science of his day, and received much encouragement in his work from Lord Kelvin, Lord Armstrong, and Sir William Crookes. In 1896 he introduced Guglielmo Marconi to (Sir) William Preece, who was then engineer-in-chief to the Post Office; and rapid developments in radio-tele-

graphy ensued. Swinton was also responsible for investigating the papers left by the inventor, David Edward Hughes [q.v.], and proved that Hughes had made successful experiments in wireless telegraphy over short distances in 1879, some years before Hertz's discovery.

Swinton was a member of the Institutions of Civil, Mechanical, and Electrical Engineers, and was for four years vice-president of the last. In 1911 he was president of the Röntgen Society, and in 1913 of the Radio Society. For several years he was chairman of the Royal Society of Arts, and in 1915 was elected a fellow of the Royal Society. He gave his services freely to many scientific societies, which owe much to his philanthropy. He died at his house, 40 Chester Square, 19 February 1930. He was unmarried.

[*Nature*, 8 March 1930; *Proceedings of the Royal Society*, vol. cxxx, A, 1931; Alan A. Campbell Swinton, *Autobiographical and other writings*, 1930.] S. E. A. LANDALE.

TAYLOR, HENRY MARTYN (1842-1927), mathematician, was born at Bristol 6 June 1842, the second son of the Rev. James Taylor, who afterwards became headmaster of Wakefield grammar school, by his wife, Eliza Johnson. He was educated at Wakefield and at Trinity College, Cambridge, which he entered as a minor scholar in 1861. He graduated as third wrangler in 1865, and was awarded the second Smith's prize.

Taylor cherished for a time the intention of going to the bar, and was in fact called by Lincoln's Inn, but soon relinquished the design. After holding the post of vice-principal of the School of Naval Architecture and Marine Engineering at Kensington (1865-1869), he returned to Cambridge in 1869 as assistant tutor on the mathematical staff of Trinity College. He had been elected a fellow, under the old competitive system, in 1866. Thenceforward his life was spent in the service of his college and university until his retirement in 1894. He became tutor of the college in 1874, and held the position for the usual period of ten years.

Taylor's mathematical leanings were mainly towards geometry, in its intuitive aspect, as is indicated by the papers which he contributed to the London Mathematical Society (of which he was one of the earliest members), to the *Philosophical Transactions*, and the *Cambridge Transactions*. Special reference may be made to his papers on *Inversion*, on *Plane Curves*,

and on *Solid Geometry*. He had a rigid standard of verbal and logical accuracy, and was often consulted by friends, including Lord Rayleigh, on stylistic and other matters, where his judgement was valued.

When released from tutorial duties at the early age of fifty-two, Taylor might reasonably have looked forward to some years of useful mathematical work, but these expectations were defeated by the severe calamity which soon befell him. An attack of influenza was followed by partial, and later by complete, blindness. He met this disaster with admirable courage. He continued for a time to interest himself in mathematical questions, with something like enthusiasm, and indeed his two most original papers, requiring a high degree of constructive imagination, were those which he contributed, after his blindness, to the *Philosophical Transactions* and to the volume commemorating the jubilee of Sir G. Gabriel Stokes (1900).

Taylor's most notable work, however, was yet to come, and lay in a somewhat different direction. His own affliction had led him to consider how, with his own special training and acquirements, he could most usefully help those in like case. He found that although a certain amount of literature was accessible to the blind through the medium of the Braille script, there was no provision of a scientific kind. Taylor made it his duty to try to throw open to them in some degree this province also. He soon made himself expert on the Braille typing machine, and with his own hands transcribed a series of elementary books on mathematics and various branches of natural science. He was here faced with the problem that the Braille system had no provision for mathematical notation, whilst diagrams were, of course, a special difficulty. Taylor accordingly gave much thought to the invention of suitable symbols and contrivances. The question of expense was a further difficulty; the reproduction and multiplication of the bulky volumes was costly. In order to meet this, Taylor, with the assistance of his friends, started an Embossed Scientific Book Fund, which was, to his great satisfaction, accepted as a trust by the Royal Society, and is now administered by a special committee of the fellows. Taylor had himself been elected a fellow in 1898.

In addition to his scientific and educational interests, Taylor had a strong practical sense which found an outlet in

the administrative business of his college, and also, later, in municipal affairs. He was one of the university representatives on the Cambridge town council and was in due course elected alderman, and finally mayor in 1904.

Taylor was a singularly modest man, and devoid of personal ambition. He was a loyal and generous friend, and a scrupulously fair opponent. Before his blindness, he had shared in the usual recreations of his time, 'real' tennis, cricket, shooting, fishing, and billiards, in all of which he was competent. He had also been fond of travel, and of mountain excursions. His last few years were clouded by increasing infirmity. He died at Cambridge 16 October 1927. He never married.

[*Proceedings of the Royal Society*, vol. cxvii, A, 1928 (portrait); personal knowledge.]
H. LAMB.

TEALE, THOMAS PRIDGIN (1831-1923), surgeon, the eldest son of Thomas Pridgin Teale, by his wife, Frances Ann, daughter of the Rev. Charles Isherwood, curate-in-charge of Brotherton, Yorkshire, was born at Leeds 28 June 1831. He was the son, grandson, and nephew of Leeds surgeons. His father was a distinguished F.R.S., the inventor of the 'long anterior flap' method of amputation of the leg, and author of the standard work of his day on hernia. The name Pridgin, a corruption of Prujean, is an indication of Teale's Huguenot descent through his paternal grandmother.

Thomas Pridgin Teale the younger was educated first at Leeds grammar school, and from the age of thirteen to eighteen at Winchester College under the headmastership of Dr. George Moberly. Thence he proceeded to Brasenose College, Oxford, where he read mathematics. He received his medical training at King's College, London, of which he was later elected an honorary fellow. After a short period of continental travel and study, he began practice in Leeds in 1856. He was elected surgeon to the Leeds General Infirmary in 1864 and served for twenty years, being afterwards appointed to the consulting staff. In collaboration with his eminent colleague (Sir) Thomas Clifford Allbutt [q.v.] Teale was a pioneer in 'team work' in medicine and in the surgical treatment of scrofulous neck. At the instigation of Allbutt, Teale undertook the experiment of removing enlarged tuberculous glands before suppuration

had occurred; his example was soon generally followed. Teale, like his father, was expert in the treatment of vesical calculus, and their joint experiences at the Leeds General Infirmary in this branch of surgery covered a period of almost eighty years. He favoured the crushing of stones by the delicate operation of lithotrity, provided the surgeon was trained in the use of an instrument requiring special skill. In the days when the *Lancet* expressed the view that a surgeon who lost a patient after the operation of ovariectomy should be indicted for manslaughter, Teale advocated and employed this method, and his success did much to rescue it from disrepute. His contributions to literature were not numerous; but he wrote important papers on tracheotomy, on ruptured perinaeum, and on dilatation of the anal sphincter. In his ophthalmic practice Teale designed a suction curette for the extraction of soft cataract; he invented an operation for symblepharon; he showed the value of atropine in the treatment of iritis; and he described two cases of cysticercus in the eye, discovered by the ophthalmoscope. He lectured on the abandonment of iridectomy in the extraction of hard cataract. All his writings were expressed with modesty which won for them a most favourable reception.

Perhaps one of the greatest services rendered by Teale to the cause of surgery was his early recognition and enforcement of the truth of the teaching of Lord Lister [q.v.]. At the Leeds General Infirmary, when senior colleagues were hesitant or scoffing, he practised antiseptic surgery, and was one of the most successful apostles in spreading the new gospel. He was an advocate of ether anaesthesia, as opposed to all other methods, and chloroform was vigorously excluded from his practice. As lecturer and teacher by the bedside, Teale, denied the gift of oratory, made a strong and almost unforgettable impression by his earnestness, directness, simplicity, contagious enthusiasm, and sturdy reliance upon personal experience.

Teale's interests extended to sanitation. He invented new fireplaces and new smokers; he taught the virtues of ventilation; he was an eager and exacting authority upon sewers. On domestic hygiene he lectured to the Royal Institution in 1880, and in this important matter no man had so quick and vivid an influence upon his generation. He wrote *Dangers to Health; a pictorial guide to domestic sanitary defects*, which passed through four editions (1870

(two), 1881, and 1883) and was translated into French, Spanish, and Italian, and into German by Princess Helena (Princess Christian of Schleswig-Holstein). In 1888 Teale was elected F.R.S. He was for many years examiner in surgery at the university of Oxford, and from 1876 to 1901 he was a member of the General Medical Council.

Teale added much to the science of surgery, and practised the craft with hands which, for deftness, gentleness, exquisite delicacy of touch, and effective movement, were unsurpassed in his day. Those two great advances, anaesthesia and antiseptic surgery, were advocated and practised by Teale when the minds of other men were unprepared fully to understand their significance. The advocacy of such a man at that time was a great asset, for he was known to be averse from wild adventures. His vision was acute and penetrating; his judgement grave, sane, and cautious; but when convinced of the right way he was joyous and eager in its pursuit and practice.

Teale married twice: first, in 1862 his cousin Alice (died 1891), daughter of the Rev. William Henry Teale, rector of Devizes, and had four sons and four daughters; secondly, in 1899 Mary Jane Elizabeth, second daughter of Daniel Charles Jones, of Tamworth, and had no issue. Teale died at Leeds 13 November 1923.

[*Proceedings of the Royal Society*, vol. xevi, B, 1924 (portrait).] MOYNIHAN.

TEALL, SIR JETHRO JUSTINIAN HARRIS (1849-1924), geologist, born at Northleach, Gloucestershire, 5 January 1849, was the only and posthumous son of Jethro Teall, landowner, of Sandwich, Kent, by his wife, Mary, daughter of Justinian Hathaway, of Northleach. He received his early education at Northleach grammar school, and later was sent to Berkeley Villa school, Cheltenham, where he developed a taste for natural history and the sciences, especially chemistry, botany, and geology. Having obtained a sound mathematical training, he proceeded to St. John's College, Cambridge, in 1869, with the intention of reading for the mathematical tripos, but falling under the inspiring influence of his college tutor, (Professor) Thomas George Bonney [q.v.], he forsook mathematics and devoted himself wholly to natural science. He was privileged to attend the last course of lectures delivered by Adam Sedgwick

[q.v.], the Woodwardian professor of geology, obtained a first class in the natural sciences tripos of 1872, graduated B.A. the following year, and M.A. in 1876.

In 1874 Teall was the first recipient of the Sedgwick prize for geology, endowed in memory of the late Woodwardian professor. The following year (1875) he was elected to a fellowship at his college, and he held it until his marriage, four years later (1879), with Harriet, daughter of George Roberts Cowen, of Nottingham. After taking his degree he devoted himself to lecturing under the university extension scheme and to petrographical research. Teall's earlier contributions to petrology include outstanding papers on the 'Cheviot Lavas' (1883), 'The North of England Dykes' (1884), 'The Whin Sill' (1884), 'The Metamorphosis of Dolerite into Hornblendschist' (1885), and the 'Origin of Banded Gneisses' (1887); most of these appeared either in the *Quarterly Journal* of the Geological Society or in the *Geological Magazine*. His concurrent mineralogical studies on such subjects as 'Andalusite from the Cheesewring, Cornwall' (1887), 'Rutile-needles in Clays' (1887), 'Minerals from the Lizard' (1888) found ready publication in the *Mineralogical Magazine*. He was one of the first geologists to draw attention to mineralogical changes induced by stress within the earth's crust, and to deal scientifically with the natural history and genesis of many important minerals of metamorphic origin.

Teall's extensive study of British igneous rocks inspired him with the idea of publishing in parts a monograph on *British Petrography*, of which subject his mineralogical and geological knowledge and his intimacy with current petrographical literature made him the best possible exponent. He began the publication of this valuable and beautifully illustrated work in 1886, but owing to the failure of his original publishers its completion was delayed until 1888. This work remains a monument to his scientific ability, his broad outlook, and clear, unbiased interpretation of geological observations.

At the invitation of (Sir) Archibald Geikie [q.v.], Teall joined the Geological Survey of Great Britain in 1888, and at once undertook petrographical work connected with the detailed survey in progress in Scotland and south-west England. This led him to publish in official memoirs the results of many important petrographical investigations, mainly connected

with the Lewisian Gneisses, the Torridon Sandstone, and the post-Cambrian igneous rocks. Extra-official publications of exceptional scientific value were those on the *Plutonic Rocks of Garabal Hill* (with J. R. Dakyns, 1892), on *Barolinite* (with J. Horne, 1893), and several papers on the rocks of the Lizard, Cornwall (with Howard Fox, 1891, 1893). Teall succeeded Geikie as director of the Geological Survey of Great Britain in 1901. His able administration, which terminated on his retirement in 1914, left a lasting impression upon that institution: the scope of its activities was enlarged, its scientific status studiously upheld, and its general utility and educational value still further increased.

Teall was elected a fellow of the Geological Society in 1873 and of the Royal Society in 1890; of the former he was secretary (1893-1897) and president (1900-1902). He received from the Geological Society first the Bigsby medal (1889), and later (1905) its highest award, the Wollaston medal; the Académie des Sciences of Paris awarded him the Delesse prize in 1907. He also held doctorates of the universities of Oxford, Cambridge, Dublin, and St. Andrews. He was knighted in 1916. He died at his home at Dulwich 2 July 1924. His wife and two sons survived him.

Teall was a true scientist with the widest scientific sympathies. He was never rash in his conclusions, always free from the tyranny of theories, and always regardful of any piece of evidence however small. Thus his published works hold to-day an important and honoured place in geological literature, and many of them, such as his presidential addresses to the Geological Society and the Geologists' Association, influenced greatly the trend of modern petrographical thought.

[*'Eminent Living Geologists'* in the *Geological Magazine*, vol. vi, 1900 (portrait); *Proceedings* of the Royal Society, vol. xcvii, B, 1925; *Quarterly Journal* of the Geological Society, vol. lxxxi, 1925.] H. H. THOMAS.

TERRY, DAME (ALICE) ELLEN (1847-1928), actress, was born in Smithford Street, Coventry, 27 February 1847, the third daughter and third of the eleven children of Benjamin Terry, actor, by his wife, Sarah Ballard, actress, daughter of a Scottish minister at Portsmouth. Benjamin Terry's father was H. B. Terry, an innkeeper at Portsmouth. Three of Ellen Terry's sisters, Kate, Marion, and

Florence, and a brother, Fred, also went on the stage. Ellen's first appearance on the stage was as the boy Mamillius in Charles Kean's production of *The Winter's Tale* at the Princess's Theatre, London, 28 April 1856. With Kean she also acted Puck in *A Midsummer-Night's Dream* (1856), Arthur in *King John* (1858), and Fleance in *Macbeth* (1859), besides a fairy in a pantomime and many other parts.

Ellen Terry's childhood was full of work, and in 1862 she went to the Theatre Royal, Bristol, to the company of J. H. Chute, for whom she appeared as Titania at the opening of the Theatre Royal, Bath, in March 1863. Her dress for that part was designed by the architect Edward William Godwin [q.v.], whose acquaintance she first made at Bristol. In the spring of 1863 she joined the company of John Baldwin Buckstone [q.v.] at the Haymarket Theatre. Her parts there included Hero, Desdemona, Nerissa, Lady Touchwood in *The Belle's Stratagem*, Flora in *The Duke's Motto*, Julia in *The Rivals*, and Mary Meredith in *Our American Cousin* by Tom Taylor [q.v.], in which Edward Askew Sotherton [q.v.] was giving his celebrated performance of Lord Dundreary. But Ellen Terry regarded her season at the Haymarket as a lost opportunity. She was restless and not happy, and the theatre had come to seem to her less interesting than the studio. Tom Taylor had introduced her to the painter George Frederic Watts [q.v.], who was enchanted with her beauty; and on 20 February 1864 she was married to him at St. Barnabas church, Kensington. Watts was then nearly forty-seven years old. He and his circle treated his wife like a child—not without some provocation from her playful high spirits. Against her will a separation was arranged in June 1865. She went back to the stage, and in October 1867 joined Alfred Sydney Wigan [q.v.] at the New Queen's Theatre, Long Acre, to play Mrs. Mildmay in Tom Taylor's *Still Waters Run Deep* and other parts, among them Katharine in *Katharine and Petruchio* (Garriek's version of *The Taming of the Shrew*), in which, in December 1867, she acted for the first time with (Sir) Henry Irving [q.v.]. She was still neither happy nor successful on the stage, and in 1868 she left it and set up house in Hertfordshire with her friend Godwin. The theatre saw her no more for six years, during which time she gave birth to her daughter Edith Craig, and her son Edward Gordon Craig.

Anxiety for her children's future induced Ellen Terry to accept an offer from Charles Reade [q.v.]. On 28 February 1874 she took up the part of Philippa in Reade's *The Wandering Heir* at the New Queen's Theatre, and in the summer toured with Reade, from whom she learned much of the art of acting. On 17 April 1875, at the age of twenty-eight, she reached the turning-point of her career, when she appeared as Portia in the production of *The Merchant of Venice* at the old Prince of Wales's Theatre staged by (Sir) Squire Bancroft [q.v.] and his wife. The play ran for only three weeks, but Ellen Terry, in looks and in acting, was the high point of beauty in a beautiful production. Her personal success led to further work with the Bancrofts.

In November 1876 Ellen Terry went for eighteen months to the Court Theatre, where (Sir) John Mare [q.v.] gave her her second great opportunity, namely the part of Olivia in the adaptation by W. G. Wills [q.v.] of Goldsmith's *Vicar of Wakefield* (28 March 1878). In that part, which remained in her repertory until 1900, she proved her power of reducing her audience to tears. Godwin and she had parted company, but not friendship, in 1875; and on 21 November 1877 (Watts having divorced her in that year) she married Charles Clavering Wardell, who acted under the name of Charles Kelly. In 1881 they were judicially separated.

In 1878 Henry Irving, having become sole lessee of the Lyceum Theatre, engaged Ellen Terry to play Ophelia in his forthcoming production of *Hamlet*, and she appeared in that part on the opening night of his management (30 December). Thus began an association which lasted unimpaired until 1896 and unbroken until 1902. Up till 1896 Ellen Terry played the leading female parts in all Irving's productions. The list (excluding revivals and single performances for charity) is as follows: 1878, Ophelia. 1879, Pauline in *The Lady of Lyons*; Ruth in *Eugene Aram*; Henrietta Maria in *Charles I*; Portia. 1880, Iolanthe in a play of that name by Wills. 1881, Camma in *The Cup*; Letitia Hardy in *The Belle's Stratagem*; Desdemona. 1882, Juliet; Bentrice. 1883, Jeannette in *The Lyons Mail*; Clementine in *Robert Macaire*. 1884, Viola. 1885, Olivia in *Olivia*; Marguerite in *Faust*. 1886, Peggy in James Kenney's farce *Raising the Wind*. 1887, Ellaline in *The Amber Heart*. 1888, Lady Macbeth. 1889, Catherine Duval in *The Dead Heart*. 1890,

Luey Ashton in *Ravenswood* by H. C. Merivale. 1891, Nance Oldfield in the play of that name by Charles Reade. 1892, Queen Katharine in *King Henry VIII*; Cordelia. 1893, Rosamund in *Becket*. 1894, Guinevere in *King Arthur* by Joseph Comyns Carr. 1896, Imogen. 1897, Catharine in *Madame Sans-Gêne*. 1898, Catherine in *Peter the Great* by Laurence Irving; Sylvia Wynford in *The Medicine Man* by Robert Hichens and H. D. Traill. 1899, *Clarice* in *Robespierre*, an adaptation by Laurence Irving from the French. 1901, Volumnia. She took part in Irving's eight American tours between 1888 and 1901. In the summer of 1902 she was acting at the Lyceum only twice a week, in matinées of *Charles I* and *The Merchant of Venice*. Her last appearance at that theatre was as Portia, 19 July 1902. She decided not to go to America with Irving to act a part in *Dante*; and in the autumn of that year, neither at her suggestion nor by her desire, they finally parted.

Egoist though he was, Irving had too much sense to stint his theatre of the genius of Ellen Terry at her best. Certain plays he chose rather for her sake than for his own. And Ellen Terry made the most of her chances. In face, dress, and movement she was so beautiful, her voice was so thrilling, her personal charm so inextinguishable, and, above all, her vitality so exuberant that these qualities won much of the credit due to histrionic power dependent upon nothing but her intelligence, sympathy, and hard work. As Luey Ashton she showed that she could conquer her besetting temptation to restlessness. In *Madame Sans-Gêne* and Volumnia, parts out of line with her personality, she showed her accomplishment and power of impersonation. When her natural attractions (which she had perfectly at command) chimed with her skill, she was a great actress. There was nothing insipid about her. In the young women of Shakespeare, Desdemona or Ophelia, she found character; as Lady Macbeth she was an exquisite woman aflame with ambitious imagination; in Queen Katharine her majesty proved her patience to be no weakness. But she was at her best when her sense of fun and her high spirits could join forces with her strength, her intensity, and her grace. Her Beatrice, surpassing even her Portia, was as near perfection as acting can go. With every sign of complete spontaneity, it was a work of precisely calculated art.

In April 1902, while Irving was acting

Faust with Cissie Loftus as Marguerite, Ellen Terry went to Stratford-upon-Avon in order to play Queen Katharine with (Sir) Frank Benson's company. In June she appeared with great success at His Majesty's Theatre as Mrs. Page in *The Merry Wives of Windsor* produced by (Sir) Herbert Beerbohm Tree [q.v.]. In 1903 she ventured into management. The theatre was the Imperial, in Westminster; and there in April she produced *The Vikings*, an English version by William Archer of Ibsen's *The Vikings at Helgeland*, herself taking the part of Hjordis. The staging was by Gordon Craig, and was the first example of his art on a large scale. It won golden opinions, but the cost was very heavy and the public rather shy. The play was soon withdrawn. The same ill-success attended her production, also staged by Gordon Craig, of *Much Ado about Nothing*; and in June she closed the theatre. In July 1903 at a charity performance at Drury Lane Theatre Ellen Terry played Portia and acted for the last time in her life with Henry Irving. The next two years saw her well established in modern prose drama. She showed her own faith in it by producing Christopher St. John's (Miss Christabel Marshall's) version of *The Good Hope* by Hermann Heijermans, in which for the first time she played the part of an old woman. On 5 April 1905 she created the part of Alice Grey in (Sir) J. M. Barrie's *Alice Sit-by-the-Fire* at the Duke of York's Theatre; and on 20 March 1906 at the Court Theatre she played Lady Cecily Waynflete in G. Bernard Shaw's *Captain Brassbound's Conversion*.

That month saw the fiftieth anniversary of Ellen Terry's first appearance on the stage; and the occasion was taken to pay public tribute to her. On 12 June a 'jubilee' matinée was held at Drury Lane, in the course of which she played Beatrice in the first act of *Much Ado about Nothing*, with scenery designed by her son and with twenty-two other members of her family in the cast. Foreigners as well as English people joined in the expression of admiration and affection; and nearly £10,000 was subscribed as a gift to her. In September 1906 at His Majesty's Theatre she played Hermione in *The Winter's Tale*. In the early part of 1907 she took *Captain Brassbound's Conversion* and *The Good Hope* on tour in the United States; and on 22 March of that year she was married at Pittsburg, Pennsylvania, to James Usselman, a young American acting in

Florence, and a brother, Fred, also went on the stage. Ellen's first appearance on the stage was as the boy Mamillius in Charles Kean's production of *The Winter's Tale* at the Princess's Theatre, London, 28 April 1850. With Kean she also acted Puck in *A Midsummer-Night's Dream* (1850), Arthur in *King John* (1858), and Fleance in *Macbeth* (1859), besides a fairy in a pantomime and many other parts.

Ellen Terry's childhood was full of work, and in 1862 she went to the Theatre Royal, Bristol, to the company of J. H. Chute, for whom she appeared as Titania at the opening of the Theatre Royal, Bath, in March 1863. Her dress for that part was designed by the architect Edward William Godwin [q.v.], whose acquaintance she first made at Bristol. In the spring of 1863 she joined the company of John Baldwin Buckstone [q.v.] at the Haymarket Theatre. Her parts there included Hero, Desdemona, Nerissa, Lady Touchwood in *The Belle's Stratagem*, Flora in *The Duke's Motto*, Julia in *The Rivals*, and Mary Meredith in *Our American Cousin* by Tom Taylor [q.v.], in which Edward Askew Sotherton [q.v.] was giving his celebrated performance of Lord Dundreary. But Ellen Terry regarded her season at the Haymarket as a lost opportunity. She was restless and not happy, and the theatre had come to seem to her less interesting than the studio. Tom Taylor had introduced her to the painter George Frederic Watts [q.v.], who was enchanted with her beauty; and on 20 February 1864 she was married to him at St. Barnabas church, Kensington. Watts was then nearly forty-seven years old. He and his circle treated his wife like a child—not without some provocation from her playful high spirits. Against her will a separation was arranged in June 1865. She went back to the stage, and in October 1867 joined Alfred Sydney Wigan [q.v.] at the New Queen's Theatre, Long Acre, to play Mrs. Mildmay in Tom Taylor's *Still Waters Run Deep* and other parts, among them Katharine in *Katharine and Petruchio* (Garriek's version of *The Taming of the Shrew*), in which, in December 1867, she acted for the first time with (Sir) Henry Irving [q.v.]. She was still neither happy nor successful on the stage, and in 1868 she left it and set up house in Hertfordshire with her friend Godwin. The theatre saw her no more for six years, during which time she gave birth to her daughter Edith Craig, and her son Edward Gordon Craig.

Anxiety for her children's future induced Ellen Terry to accept an offer from Charles Reade [q.v.]. On 28 February 1874 she took up the part of Philippa in Reade's *The Wandering Heir* at the New Queen's Theatre, and in the summer toured with Reade, from whom she learned much of the art of acting. On 17 April 1875, at the age of twenty-eight, she reached the turning-point of her career, when she appeared as Portia in the production of *The Merchant of Venice* at the old Prince of Wales's Theatre staged by (Sir) Squire Bancroft [q.v.] and his wife. The play ran for only three weeks, but Ellen Terry, in looks and in acting, was the high point of beauty in a beautiful production. Her personal success led to further work with the Bancrofts.

In November 1876 Ellen Terry went for eighteen months to the Court Theatre, where (Sir) John Hare [q.v.] gave her her second great opportunity, namely the part of Olivia in the adaptation by W. G. Wills [q.v.] of Goldsmith's *Vicar of Wakefield* (28 March 1878). In that part, which remained in her repertory until 1900, she proved her power of reducing her audience to tears. Godwin and she had parted company, but not friendship, in 1875; and on 21 November 1877 (Watts having divorced her in that year) she married Charles Clavering Wardell, who acted under the name of Charles Kelly. In 1881 they were judicially separated.

In 1878 Henry Irving, having become sole lessee of the Lyceum Theatre, engaged Ellen Terry to play Ophelia in his forthcoming production of *Hamlet*, and she appeared in that part on the opening night of his management (30 December). Thus began an association which lasted unimpaired until 1896 and unbroken until 1902. Up till 1896 Ellen Terry played the leading female parts in all Irving's productions. The list (excluding revivals and single performances for charity) is as follows: 1878, Ophelia. 1879, Pauline in *The Lady of Lyons*; Ruth in *Eugene Aram*; Henrietta Maria in *Charles I*; Portia. 1880, Iolanthe in a play of that name by Wills. 1881, Cumma in *The Cup*; Letitia Hardy in *The Belle's Stratagem*; Desdemona. 1882, Juliet; Beatrice. 1883, Jeannette in *The Lyons Mail*; Clementine in *Robert Macaire*. 1884, Viola. 1885, Olivia in *Olivia*; Marguerite in *Faust*. 1886, Peggy in James Kenney's farce *Raising the Wind*. 1887, Ellaline in *The Amber Heart*. 1888, Lady Macbeth. 1889, Catherine Duval in *The Dead Heart*. 1890,

Lucy Ashton in *Ravenswood* by H. C. Merivale. 1891, Nance Oldfield in the play of that name by Charles Reade. 1892, Queen Katharine in *King Henry VIII*; Cordelia. 1893, Rosamund in *Becket*. 1894, Guinevere in *King Arthur* by Joseph Comyns Carr. 1896, Imogen. 1897, Catharine in *Madame Sans-Gêne*. 1898, Catherine in *Peter the Great* by Laurence Irving; Sylvia Wynford in *The Medicine Man* by Robert Hichens and H. D. Traill. 1899, Clarice in *Robespierre*, an adaptation by Laurence Irving from the French. 1901, Volumnia. She took part in Irving's eight American tours between 1883 and 1901. In the summer of 1902 she was acting at the Lyceum only twice a week, in matinées of *Charles I* and *The Merchant of Venice*. Her last appearance at that theatre was as Portia, 19 July 1902. She decided not to go to America with Irving to act a part in *Dante*; and in the autumn of that year, neither at her suggestion nor by her desire, they finally parted.

Egoist though he was, Irving had too much sense to stint his theatre of the genius of Ellen Terry at her best. Certain plays he chose rather for her sake than for his own. And Ellen Terry made the most of her chances. In face, dress, and movement she was so beautiful, her voice was so thrilling, her personal charm so inextinguishable, and, above all, her vitality so exuberant that these qualities won much of the credit due to histrionic power dependent upon nothing but her intelligence, sympathy, and hard work. As Lucy Ashton she showed that she could conquer her besetting temptation to restlessness. In *Madame Sans-Gêne* and *Volumnia*, parts out of line with her personality, she showed her accomplishment and power of impersonation. When her natural attractions (which she had perfectly at command) chimed with her skill, she was a great actress. There was nothing insipid about her. In the young women of Shakespeare, Desdemona or Ophelia, she found character; as Lady Macbeth she was an exquisite woman aflame with ambitious imagination; in Queen Katharine her majesty proved her patience to be no weakness. But she was at her best when her sense of fun and her high spirits could join forces with her strength, her intensity, and her grace. Her Beatrice, surpassing even her Portia, was as near perfection as acting can go. With every sign of complete spontaneity, it was a work of precisely calculated art.

In April 1902, while Irving was acting

Faust with Cissie Loftus as Marguerite, Ellen Terry went to Stratford-upon-Avon in order to play Queen Katharine with (Sir) Frank Benson's company. In June she appeared with great success at His Majesty's Theatre as Mrs. Page in *The Merry Wives of Windsor* produced by (Sir) Herbert Beerbohm Tree [q.v.]. In 1903 she ventured into management. The theatre was the Imperial, in Westminster; and there in April she produced *The Vikings*, an English version by William Archer of Ibsen's *The Vikings at Helgeland*, herself taking the part of Hiordis. The staging was by Gordon Craig, and was the first example of his art on a large scale. It won golden opinions, but the cost was very heavy and the public rather shy. The play was soon withdrawn. The same ill-success attended her production, also staged by Gordon Craig, of *Much Ado about Nothing*; and in June she closed the theatre. In July 1903 at a charity performance at Drury Lane Theatre Ellen Terry played Portia and acted for the last time in her life with Henry Irving. The next two years saw her well established in modern prose drama. She showed her own faith in it by producing Christopher St. John's (Miss Christabel Marshall's) version of *The Good Hope* by Hermann Heijermans, in which for the first time she played the part of an old woman. On 5 April 1905 she created the part of Alice Grey in (Sir) J. M. Barrie's *Alice Sit-by-the-Fire* at the Duke of York's Theatre; and on 20 March 1906 at the Court Theatre she played Lady Cecily Waynflete in G. Bernard Shaw's *Captain Brassbound's Conversion*.

That month saw the fiftieth anniversary of Ellen Terry's first appearance on the stage; and the occasion was taken to pay public tribute to her. On 12 June a 'jubilee' matinée was held at Drury Lane, in the course of which she played Beatrice in the first act of *Much Ado about Nothing*, with scenery designed by her son and with twenty-two other members of her family in the cast. Foreigners as well as English people joined in the expression of admiration and affection; and nearly £10,000 was subscribed as a gift to her. In September 1906 at His Majesty's Theatre she played Hermione in *The Winter's Tale*. In the early part of 1907 she took *Captain Brassbound's Conversion* and *The Good Hope* on tour in the United States; and on 22 March of that year she was married at Pittsburg, Pennsylvania, to James Usselman, a young American acting in

her company under the name of James Carew, with whom she lived until 1910.

Failure of memory now made it difficult for Ellen Terry to take up new parts; but she appeared not infrequently in special performances. On 10 December 1908 at His Majesty's Theatre she created the part of a sweet old lady, Aunt Imogen, in Walford Graham Robertson's *Pinkie and the Fairies*; in 1917 and 1918 she acted the trial scene from *The Merchant of Venice* and scenes from *The Merry Wives of Windsor* at the Coliseum, and on 12 April 1919 at the Lyric Theatre she took the part of the Nurse in Doris Keane's production of *Romeo and Juliet*. Her last appearance on the stage was at the Lyric Theatre, Hammersmith, in Walter de la Mare's *Crossings* on 19 November 1925. Meanwhile in 1922 and 1923 she had taken part in four productions for the cinematograph. But she had found a wider outlet for her genius.

In 1903 Ellen Terry had composed, with the help of Christopher St. John, and delivered a lecture on 'The Letters in Shakespeare's Plays'. A few years later, with the same assistance, she composed two lectures on Shakespeare's heroines and one on the children in Shakespeare. That she had a talent for verbal expression, and much to say by that means, is proved by her memoirs and by her published letters to Bernard Shaw; and these lectures, with illustrations recited by the lecturer, proved her to be a fine critic and provided a delightful entertainment. In 1910-1911 she delivered the lectures on tour in America; in 1911 and 1912 she gave them in England, and in May 1914 she began a tour of Australia and the United States which lasted until the spring of 1915.

Ellen Terry's eyesight had long been troubling her and sometimes causing her acute pain; and in February 1915 she underwent an operation for cataract in New York. From 1921 onwards her health was failing, and her too lavish generosity had much reduced her means. She seldom went into public, but she was not forgotten. In 1922 the university of St. Andrews conferred upon her the honorary degree of LL.D.; and at the New Year, 1925, she was created G.B.E. She died 21 July 1928 at her house at Small Hythe, Tenterden, Kent. Her ashes were placed in a casket on the wall of St. Paul's church, Covent Garden. Her house at Small Hythe was bought by public subscription and converted into an Ellen Terry museum.

Portraits of Ellen Terry are very many, the most important being as follows. In the Tate Gallery hangs a well-known oil-painting by J. S. Sargent of Ellen Terry as Lady Macbeth. In the National Portrait Gallery are a profile head of her at the age of seventeen by G. F. Watts, and an oil-sketch in black and white of her as Lady Macbeth coming out to meet Duncan, made by J. S. Sargent for reproduction in the *Souvenir* of her jubilee. The Watts Gallery at Compton, Surrey, possesses Watts's portrait of Ellen Terry as Ophelia. Lord Somers owns 'Ellen Terry and her Sister' (Kate) by Watts, and Mr. Kerrison Preston the portrait by Watts entitled 'Choosing'. Mr. W. Graham Robertson retains in his collection his pastel head of Ellen Terry, which Irving used to call 'Ellen in Heaven', his large oil-portrait, and a portrait which he painted in 1923. Miss Edith Craig owns an oil-portrait painted in 1926 by Clare Atwood; and in the Memorial Museum at Small Hythe there is a replica in oils by W. Graham Robertson of his pastel head, besides many other portraits. At His Majesty's Theatre Ellen Terry is seen as Mistress Page, with Madge Kendal as Mrs. Ford and Tree as Falstaff, in a picture by the Hon. John Collier.

H. Cunliffe.

THISLTON-DYER, Sir WILLIAM TURNER (1843-1928), botanist, was born in Westminster 28 July 1843, the elder son of William George Thiselton Dyer (1812-1868), physician, of Westminster, by his wife, Catherine Jane, daughter of Thomas Firminger, assistant astronomer royal at Greenwich Observatory, and sister of T. A. C. Firminger, author of the standard *Manual of Gardening for Bengal and Upper India* (1864). Thiselton-Dyer's paternal grandparents were William Matthew Thiselton (1783-1842), printer and barrister, who assumed the additional surname of Dyer by royal licence in 1840, and his wife, Louisa

Merzeau, who came of a Huguenot family settled in Spitalfields. He was sent to King's College School, London, where he formed a friendship with Henry Trimen [q.v.], and began with him the botanical rambles which ultimately led to the publication of their *Flora of Middlesex* (1869). In 1861 he entered King's College, London, as a student of medicine, and there met (Sir) Charles James Lyall [q.v.], with whom he was still exchanging notes on Indian botany and on Sanskrit and Arabic plant-names fifty years later. Thiselton-Dyer proceeded to Christ Church, Oxford, in 1863, read mathematics under the tuition of Henry J. S. Smith, Savilian professor of geometry, and obtained a second class in mathematical moderations (1865). He had thought of going out to India with Lyall, but changing his mind, under the influence of his lifelong friends Henry Nottidge Moseley and (Sir) Edwin Ray Lankester, he turned to the study of natural science and obtained a first class in the final school in 1867.

In the following year Thiselton-Dyer was appointed professor of natural history at the Royal Agricultural College, Cirencester, where, with his colleague, A. H. Church, the professor of chemistry, he edited in 1869 S. W. Johnson's *How Crops Grow*, a famous book in its day. He was professor of botany in the Royal College of Science, Dublin, from 1870 to 1872, and at the Royal Horticultural Society at South Kensington and Chiswick from 1872 to 1875; this latter post brought him into touch with the Royal Botanic Gardens at Kew, and introduced him to the scientific world of London. Sir Joseph Dalton Hooker [q.v.] found him work at Kew on the recently begun *Flora of British India*, and for it, in addition to editorial work, Thiselton-Dyer described the Indian species of six families of flowering plants. In 1872 also he became one of T. H. Huxley's demonstrators at the Royal School of Mines, South Kensington, and in 1873 he organized and conducted the botanical side of the famous course of elementary biology. Long afterwards, on the occasion of Huxley's centenary, he wrote an account for *Nature* (1925) of these early days. In 1875 he edited A. W. Bennett's translation of Julius von Sachs's *Text-book of Botany*, which marked an epoch in the teaching of botany in England.

Colonial planters, and the Colonial Office on their behalf, were now turning to Kew for guidance, and Hooker, having persuaded the government to revive the

office of assistant-director, appointed Thiselton-Dyer to that post in 1875, to deal chiefly with colonial business. The new assistant-director made a great and immediate success of his office. In his first year he sent out to Ceylon some young Hevea plants from South America, which presently grew into the rubber-plantations of the East. In 1880 he dispatched to Henry Trimen, then director of the botanical gardens at Peradeniya, certain varieties of cacao from Trinidad, which flourished and are still under cultivation in Ceylon. In 1887 Thiselton-Dyer founded the *Kew Bulletin*, for the exchange of information among the many colonial institutions associated with Kew, and very soon this journal became indispensable to planters, agriculturists, and botanists throughout the British Empire. Mr. Joseph Chamberlain and Thiselton-Dyer were close friends, and when Chamberlain was at the Colonial Office (1895-1903) the two worked together for the development of economic botany and colonial agriculture. India, Ceylon, the West Indies, and West Africa were all materially helped and benefited by Kew. The rubber export from the Gold Coast grew from nothing in 1882 to half a million of money in 1898, all owing to the identification of a rubber plant at Kew; and the export of cocoa rose from £4 in 1892 to over £200,000 twelve years later, under the guidance of an officer trained at and sent out by Kew. In 1902 Thiselton-Dyer was formally appointed botanical adviser to the secretary of state for the colonies and held that office until 1906.

On Hooker's retirement in 1885 Thiselton-Dyer was appointed director of Kew Gardens. The Gardens, which had become world-famous under the direction of Hooker and his father Sir William Jackson Hooker [q.v.], more than maintained their reputation under Thiselton-Dyer. From the first his powers of organization showed themselves on every side. He vastly improved and beautified the garden, enlarged the library and the herbarium building, initiated a forestry museum, and made the Jodrell laboratory (the munificent gift of a friend) 'the best botanical laboratory in Europe'. As the herbarium had long been a great centre of systematic botany under Sir William and Sir Joseph Hooker, George Bentham [q.v.], Daniel Oliver, and J. G. Baker, so the laboratory became famous under Thiselton-Dyer and D. H. Scott, and was used by I. Bailey Balfour, F. O. Bower, Marshall Ward,

F. W. Oliver—in short by many who became the botanical teachers of the next generation, and by others, such as Horace T. Brown and F. Escombe in their work on the diffusion of gases and liquids in relation to the assimilation of carbon in plants.

Thiselton-Dyer was president of Section D of the British Association at Bath in 1888, and president at Ipswich in 1895 of the new Botanical Section (K), of which he was virtually the founder. He was a sound and accomplished systematic botanist. He edited with the utmost care the *Flora Capensis* begun by William Henry Harvey [q.v.] in 1859 (1896-1925), the *Flora of Tropical Africa* (1897-1913), the *Icones Plantarum* (1896-1906), and the *Botanical Magazine* (1905-1906). He made a special study of the Cyads, and went far towards compiling a monograph of that extensive order, but other work stood in the way; the account was published, by other hands, as a supplement to Volume v of the *Flora Capensis* (1933), and the preface to this supplementary volume records 'Thiselton-Dyer's share in the work. A good example of Thiselton-Dyer's style, scientific and literary, may be found in an admirable article on the 'Geographical Distribution of Plants', written from the Darwinian standpoint and published in A. S. Seward's *Darwin and Modern Science* (1900).

As director of Kew Gardens, as a great administrator, as an adviser of botanical students, in touch both with the old learning and with the new, Thiselton-Dyer was the acknowledged leader of English botanists, and his appearance, manner, and conversation marked and justified his unquestioned supremacy. He was, withal, at heart a modest man, constantly at work, doing nothing for publicity, caring only for the work to be done. He was elected F.R.S. in 1880, created C.M.G. in 1882, C.I.E. in 1892, and K.C.M.G. in 1899. In 1905 he retired, and went to live at Witcombe in Gloucestershire. From 1908 to 1916 he represented the university of Oxford on the Gloucestershire education committee, and he was a member of the court of the university of Bristol from 1909. Withdrawing from his old associates, even from the Royal Society, he lived the life of a country gentleman, served as a justice of the peace, and, returning to the favourite lessons of his boyhood, became a student, *facile princeps*, of ancient botany. Classical scholarship was not the least of Thiselton-Dyer's accomplishments. *The Georgicks*

of John Martyn [q.v.] had been his favourite school-book, and to identify the plants of Virgil, Pliny, Theophrastus, Galen, and Dioscorides became the occupation of his later years. He revised the whole vocabulary of Greek plant-names for the ninth edition of Liddell and Scott's *Greek-English Lexicon*; helped Sir Arthur Hort in his edition of the *De Historia Plantarum* of Theophrastus (2 vols., 1916); contributed the botanical chapters to *A Companion to Greek Studies* (edited by Leonard Whibley, 1905) and *A Companion to Latin Studies* (edited by Sir J. E. Sandys, 1910); and wrote three articles, dealing with some thirty 'Ancient Plant-Names', all more or less obscure and difficult, for the *Journal of Philology* (edited by Ingram Bywater and Henry Jackson).

Thiselton-Dyer's scholarship was sound, his reading wide, his knowledge of old books prodigious. His notes on Cassia, Colocasia, Anonum, Cardamom, &c. in the *Journal of Philology* are models of care, patience, and erudition. His life-work at Kew dealt with botany on its most practical side, but as part and parcel of the humanities it employed his learning and occupied his old age. He died at Witcombe 23 December 1928.

Thiselton-Dyer married in 1877 Harriet Ann, eldest daughter of Sir Joseph Dalton Hooker. They had one son and one daughter.

D'ARCY W. THOMPSON.

THOMAS, GEORGE HOLT (1869-1929), pioneer in aircraft manufacture, was born at Brixton Hill, London, 31 March 1869, the seventh son of William Luson Thomas, newspaper proprietor, by his wife, Annie Carmichael. He was educated privately and at Queen's College, Oxford (1888-1890), and entered his father's business, joining in 1899 the staff of the *Graphic* weekly illustrated newspaper, of which, together with the *Daily Graphic*, his father was the founder. In due course Holt Thomas became a director of the business, which he extended by founding the *Bystander* illustrated weekly and the *Empire Illustrated* magazine. After acting for some years as general manager of a group of these papers, he retired from an active share in the business in 1906.

At the time when Holt Thomas gave

up newspaper management, the art of flying was in its infancy, but was being actively developed. On 17 November 1906 the *Daily Mail* had announced its offer of a prize of £10,000 for the first successful flight from London to Manchester, and on 21 November Holt Thomas was prompted, through the medium of his newspapers, to offer £1,000 for a successful flight of one mile. He had social position, money, energy, and imagination, and it was not long before he was devoting his substance and his qualities to stimulating public interest in aviation. What convinced him was a talk which he had in Paris, probably about the end of 1906, with the French aircraft pioneer, Henri Farman, who made it clear that immediately a suitable engine was produced successful flying would be achieved. Holt Thomas followed the subsequent progress of Farman with eager interest; and when, in 1907, Farman succeeded in making short flights in France, Holt Thomas, through his own and other newspapers, pointed out the danger to which Great Britain would become exposed if she neglected to keep abreast of, and develop, the new art of aviation. He urged the War Office to form a military air service.

It cannot be said that Holt Thomas received much encouragement either from officials or from the public; but his convictions were strong, and he continued his propaganda with unabated zeal. In July 1909 he spent his time between Dover and Calais, watching the details of the preparation for the first cross-Channel flight, and after Louis Blériot had made his successful crossing (25 July 1909), Holt Thomas went on to Rheims for a flying-meeting which took place there in August. At Rheims he was much impressed by the skilful piloting of Louis Paulhan, and by the efficiency of the rotary Gnome engine with which Paulhan's Voisin aeroplane was fitted.

When Holt Thomas returned home from Rheims, he organized a flying-meeting for the Blackpool corporation, at which the pilot, Hubert Latham, gave a remarkable display of flying, in a wind of forty miles an hour. Holt Thomas thereupon decided to organize an air display for London, and he persuaded the authorities at Brooklands to clear an area for the purpose. There, in October 1909, Louis Paulhan gave a series of exhibition flights, and as a result of the success of the display a regular aerodrome was laid out at Brook-

lands, where, later on, many of the earliest pilots in this country were trained. In April 1910, at the instigation of Holt Thomas, Paulhan made a successful flight from London to Manchester, thereby gaining the *Daily Mail* prize. He used as a starting-place a field at Hendon, which later became the well-known Hendon aerodrome.

In September 1910 Holt Thomas attended the military manœuvres in France, where for the first time aeroplanes were employed for reconnaissance. He then went on to Salisbury Plain for the British army manœuvres, and as the result of his experience became an outspoken critic of the backward state of British military aviation. In 1911 the government formed an air battalion of the Royal Engineers, the beginnings of the national air service.

Holt Thomas now turned his attention to the manufacture of aeroplanes. Finding that British engineers and financiers were unwilling to take the initiative, he himself took up the Farman rights and with his own money founded the Aircraft Manufacturing Company. He also acquired the English rights to manufacture Gnome and Le Rhone engines, which were almost exclusively used in British aircraft in the early days of the European War. Farman aircraft were also extensively used by the Royal Flying Corps until British-designed aircraft became available. Just before the outbreak of war in 1914 he acquired the services as chief designer of Geoffrey de Havilland, an engineer who had been designing official types of aeroplane for the Royal Aircraft Factory at Farnborough. Hereafter the Aircraft Manufacturing Company produced at their Hendon works the well-known 'D.H.' series of aeroplanes which proved of great value during the European War. So great did the demand for them become—particularly for the two-seater day-bomber, the D.H. 4—that the factory at Hendon was continuously expanded, subsidiary companies in Gloucester, Wycombe, and other parts of the country were acquired, and these works and others building to D.H. designs, produced thirty per cent. of the aircraft used by the Allied forces. Holt Thomas, without seeking it, made a fortune. During the War one of Holt Thomas's companies manufactured flying-boats, for the production of which works were set up at Hythe, on Southampton Water, and another was engaged in the manufacture of airships, which Lord Fisher demanded for submarine patrol work.

After the War Holt Thomas took up the question of air transport. He founded a new company, Air Travel and Transport, Ltd., in which he was joined by Sir Sefton Brancker [q.v.]. He spent money lavishly in the organization of the first commercial air line to Paris, which opened its services to the public in August 1919, the operating aeroplanes being chiefly converted D.H. 9 bombers. He next formed an alliance with the Birmingham Small Arms group of companies; but when the post-War industrial slump came in 1920, the manufacture of aeroplanes at Hendon ceased. After undergoing reorganization and a change of name, the Air Transport company was eventually merged in Imperial Airways, Ltd., but the Aircraft Manufacturing Company closed down (October 1922) and de Havilland, with a few of his former associates, and with financial backing by Holt Thomas, founded the de Havilland Aircraft Company. Thenceforth Holt Thomas ceased to take active interest in the aircraft industry, and devoted his energies to highly successful dairy-farming.

Holt Thomas received no official recognition of the great services which he rendered his country during a critical period of its history; but if he felt resentment at this neglect he never showed it. Tall and bearded, with strongly marked features, he was a dominant and impressive figure. It was impossible to be long in his company without being aware of his inward fires. There can be little doubt that by his foresight and energy in aircraft manufacture and development, he made possible for England that victory in air-fighting which her airmen gained for her in the European War.

Holt Thomas married in 1894 Gertrude, youngest daughter of Thomas Oliver, F.R.I.B.A., of Newcastle-upon-Tyne, and had no children. He died at Cimiez, France, 1 January 1929.

H. A. JONES.

THOMAS, SIR HUGH EVAN- (1862-1928), admiral. [See EVAN-THOMAS.]

THOMPSON, SIR EDWARD MAUNDE (1840-1929), palaeographer and director of the British Museum, was born at Clarendon, Jamaica, 4 May 1840, the eldest son of Edward Thompson, who held the office of *custos* of Clarendon. His family had been connected with the

island for several generations. His mother was Elizabeth Hayhurst, daughter of Samuel Poole, also of Clarendon, and subsequently of Twyford, Buckinghamshire. He was sent to England for education, and proceeded in 1859 from Rugby to University College, Oxford. Owing, however, to a change in his father's financial circumstances, he had to leave the university without taking a degree.

In 1861 Thompson entered the British Museum as an assistant, at first in the principal librarian's office, from which he was soon transferred to the department of manuscripts, then under the direction of Sir Frederic Madden [q.v.]. At first he had doubts as to his wishing to continue in the Museum, and in 1863 he entered at the Middle Temple, and was called to the bar in 1867; but by this time he had settled down to his work, and he never practised at the bar. His industry and ability soon made themselves manifest, and when (Sir) Edward Augustus Bond [q.v.] succeeded Madden as keeper of the department in 1866, Thompson became his principal associate. For several years Thompson's main work was in connexion with the preparation of the 'Class Catalogue' of all the manuscripts in the department, which gave him an acquaintance with a large proportion of the collections, especially in the sections concerned with history and illuminated manuscripts. This laid the foundations for a thorough knowledge of medieval chronicles, of palaeography, and of illumination, with which subjects most of his published work was concerned. In 1871 he was promoted to be assistant-keeper, in succession to William Wright [q.v.].

The next fifteen years were a period of great productiveness for Thompson, in respect both of official and of unofficial work, the latter, although done out of Museum hours, being directly based on his knowledge of manuscripts. On the completion of the 'Class Catalogue', the main departmental duty was the clearing up of arrears in the cataloguing of recent accessions, which was accomplished by two stout volumes (covering the period 1854-1875) published in 1875 and 1877, with an enormous index (1880); in this Thompson had a large part. Meanwhile, he had, in 1873, joined Bond in founding the Palaeographical Society, the successive publications of which for the first time provided students with specimen photographic facsimiles of the most important classical and medieval manuscripts, and

thereby laid the foundations of the modern science of palaeography. The society produced two series (comprising 420 plates) during the years 1873-1895, and its work was carried on by the New Palaeographical Society from 1903 to 1930. Both series emanated from the department of manuscripts of the Museum, and Thompson was an editor of both from first to last. Other official publications were the two volumes of the *Catalogue of Ancient Manuscripts in the British Museum* (Greek 1881, Latin 1884), of which his friend and colleague (Sir) George Frederic Warner was joint author with him. Unofficially, he contributed an admirable article on 'English Chronicles' to the *English Encyclopædia* (Arts and Sciences Supplement) in 1878, and an article on 'Palaeography' to the *Encyclopædia Britannica* (9th edition, 1885). The latter of these articles was subsequently enlarged into a *Handbook of Greek and Latin Palaeography* (1893), which is still the best short introduction to the subject. He also supervised and contributed introductions to facsimiles of three important manuscripts, the Utrecht Psalter (1874), the Codex Alexandrinus (1879-1883), and (with Sir Richard Claverhouse Jebb, q.v.) the Laurentian manuscript of Sophocles (1885).

Thompson was also active in editing chronicles and other documents for various societies. These included the *Chronicon Angliæ, 1328-1388* (the anonymous chronicle of St. Albans, Rolls Series, 1874), the *Letters of Humphrey Prideaux to John Ellis, 1674-1722* (Camden Society, 1875), the *Chronicon Adæ de Usk, 1377-1421* (Royal Society of Literature, 1876; second edition, embodying the recently discovered conclusion 1904), the *Correspondence of the Family of Hatton, 1601-1704* (Camden Society, 1878), the *Diary of Richard Cocks, 1615-1622* (Hakluyt Society, 1883), the *Adæ Murimuth Continuatio Chronicorum, 1303-1347*, and *Robertus de Avesbury, De Gestis Mirabilibus regis Edwardi tertii* (Rolls Series, 1889). As a separate work he edited the *Chronicon Galfridi Le Baker de Swynebroke, 1303-1356* (1889); and this was regarded by both himself and others as his most important contribution to medieval history. His catalogue of the manuscripts in Salisbury Cathedral library appeared in 1880. As a palaeographer he had a first-rate eye and a sound judgement, based upon an extensive knowledge of classical and medieval manuscripts over their entire range. As an editor of texts, al-

though he was not a professional historian, he was so accurate in reading and transcribing that his work formed an entirely trustworthy basis for the studies of others.

In 1878 Thompson had become keeper of the department of manuscripts in succession to Bond; and in 1888 he again succeeded Bond as principal librarian (to which the title of director was prefixed in 1898). This practically put an end to his output of published work for the next twenty-one years, during which time almost the whole of his energy was devoted to the duties of administration. The only exceptions were the production of his *Handbook of Greek and Latin Palaeography* (1893), already mentioned; a series of articles on illuminated manuscripts in the periodical *Bibliographica* (1895-1897), the first three of which were reprinted in book form under the title *English Illuminated Manuscripts* (1895); and an edition of the *Customary of the Benedictine Monasteries of St. Augustine, Canterbury, and St. Peter, Westminster* for the Henry Bradshaw Society (1902).

As director of the British Museum Thompson was a masterful administrator, wholly devoted to the interests of the institution, intolerant of anything that he regarded as superficial or prompted by motives of self-seeking, but unflinching in support of those in whom he had confidence. He was urgent in promoting the production of catalogues of the contents of the Museum, which is one of the first duties of a curatorial staff; but perhaps the chief note of his administration was the development of the educational and popular side of the Museum. Objects were better exhibited and better labelled, and he vastly increased, if he did not wholly originate, the production of departmental guide-books, which were in fact cheap and amply illustrated handbooks to their respective subjects. He also encouraged excavations abroad, in order to add to the collections in the Museum, and was responsible for expeditions to Mesopotamia, Egypt, Cyprus, Ephesus, and Carchemish, and for assistance to Sir Aurel Stein's second expedition to Central Asia in 1906-1908. He carried through reorganizations, with improvements of pay, of the whole Museum staff, and in his latter years was much occupied in planning and supervising the new wing on the north side of the Museum, now known as the King Edward VII galleries.

In the winter of 1908-1909 Thompson's

health, which had hitherto been vigorous, began to give way, and in August 1909 he retired. He lived thenceforward out of London, successively at Mayfield in Sussex, Wells, Worthing, Tunbridge Wells, and finally at Mayfield again, where he built himself a house. His health was never fully re-established, and he was liable to heart trouble, but his mind remained vigorous. He enlarged his *Handbook* into a full-sized, copiously illustrated *Introduction to Greek and Roman Palaeography* (1912); he contributed a chapter to *Shakespeare's England*, which was enlarged into a separate volume entitled *Shakespeare's Handwriting* (1916), and he wrote a chapter on the same subject in his friend A. W. Pollard's *Shakespeare's Hand in the play of Sir Thomas More* (1923).

Thompson took an active part in the foundation of the British Academy, and presided at the meeting at which it was established in June 1901. He was one of the original fellows, and held the office of president from 1907 to 1909. He was made C.B. in 1893, and created K.C.B. in 1895, and G.C.B. on his retirement in 1909. He received honorary degrees from the universities of Oxford, Durham, St. Andrews, and Manchester, and was a corresponding member of the Institut de France and of the Royal Prussian Academy of Sciences, and an honorary fellow of University College, Oxford. He was Sanders reader in bibliography at Cambridge University in 1895-1896 and 1905-1906.

Thompson married in 1864 Georgina (died 1917), daughter of George Mackenzie, of Frankfield, Jamaica, and had three sons and one daughter. He died at Mayfield 14 September 1929 in his ninetyeth year, and is buried in Brookwood cemetery.

A good portrait of Thompson by Sir Edward Poynter, painted in 1909, is in the board room of the British Museum, and has been reproduced in photogravure.

[Sir F. G. Kenyon, *Sir Edward Maunde Thompson, 1840-1929*, in *Proceedings* of the British Academy, vol. xv, 1929; private information; personal knowledge.]

F. G. KENYON.

THOMPSON, HENRY YATES (1838-1928), book-collector, was born at Dingle Cottage, near Liverpool, 15 December 1838, the eldest son of Samuel Henry Thompson, of Thingwall Hall, Lancashire, a partner in the local banking firm of Arthur Heywood, Sons & Co. His mother was the eldest daughter of Joseph Brooks

Yates [q.v.], merchant and antiquary, from whom he inherited a number of books and manuscripts. He was educated at Harrow, where he became head of the school, and at Trinity College, Cambridge. Here he won the Porson prize for Greek verse in 1860, and graduated as sixteenth classic in 1862. The university of Cambridge appointed him Sanders reader in bibliography in 1901 and 1904. Thompson was called to the bar by Lincoln's Inn in 1867, but never practised. He unsuccessfully contested three different Lancashire constituencies in the liberal interest in 1865, 1868, and again in 1881. From 1868 to 1873 he was private secretary to the fifth Earl Spencer, viceroy of Ireland. During the years between 1862 and 1875 he travelled widely in Europe, Asia, Egypt, and the United States of America. In 1878 Thompson married Elizabeth, eldest daughter of George Smith, the founder and publisher of this Dictionary [see the memoir now prefixed to the first volume of the Dictionary]. In 1880 Smith made over to him the *Pall Mall Gazette*, which Thompson, after temporarily converting it into a liberal paper, sold in 1892 to Mr. William Waldorf (afterwards Viscount) Astor.

By this time Thompson had begun to form the famous collection of illuminated manuscripts with which his name will always be associated. He ensured its high quality from the first by limiting its number to one hundred, and by gradually discarding manuscripts in order to make room for finer examples. His largest accession was the purchase *en bloc* in 1897 of the portion of Lord Ashburnham's library known as the Appendix, of which he retained the most important manuscripts only. His catalogue, with descriptions by M. R. James, (Sir) S. C. Cockerell, (Sir) G. F. Warner, and others, was privately printed in four volumes in 1898, 1902, 1907, and 1912 respectively, and was supplemented by seven larger volumes of illustrations, issued between 1907 and 1918; these and a few other privately printed volumes remain the chief memorial of an unrivalled collection. The manuscripts were partly dispersed at three sales at Sotheby's in 1919, 1920, and 1921—one manuscript, the 'Hours' of Jeanne de Navarre, fetching at the first sale the record auction price at that date for an illuminated manuscript (£11,800). Thompson had previously given two of his finest manuscripts, the St. Omer Psalter and the Metz Pontifical, to the British Museum

and the Fitzwilliam Museum respectively. In 1906 he presented the second volume of the famous 'Anciennetés des Juifs' of Josephus, illuminated by Jean Fouquet, to King Edward VII, in order that it might be presented to the French nation, for preservation with the first volume in the Bibliothèque Nationale, after the insertion of ten of its missing miniatures which had been discovered in the Royal Library at Windsor Castle; for this action he received the legion of honour from the French government.

Thompson's various benefactions included two fine winter gardens in the Liverpool parks, for which he was given the freedom of the city of Liverpool in 1901; hospitals at Crewe and at Horwich railway works of the Lancashire and Yorkshire Railway, of which he was for many years a director; an art school to Harrow; a library to Newnham College, Cambridge; and three additional rooms to the Dulwich Picture Gallery. He died at his London house 8 July 1928, leaving no children.

[*The Times*, 10 July 1928; Seymour de Ricci, 'Les Manuscrits de la Collection Henry Yates Thompson', in *Bulletin de la Société Française de Reproductions de MSS. à Peintures*, 1926; Seymour de Ricci, *English Collectors of Books and Manuscripts*, 1930; private information; personal knowledge.]

E. G. MILLAR.

THOMSON, CHRISTOPHER BIRDWOOD, **BARON THOMSON**, of Cardington (1875-1930), soldier and politician, was born at Nasik in India 13 April 1875, the third son of David Thomson, major-general, Royal Engineers, by his wife, Emily, daughter of General Christopher Birdwood, and sister of Sir G. C. M. Birdwood [q.v.] and H. M. Birdwood [q.v.]. He was educated at Cheltenham College, where he distinguished himself in modern languages, and at the Royal Military Academy, Woolwich, whence he entered the Royal Engineers in 1894. After spending some time studying submarine mining at Plymouth, Thomson took part in the operations in Mashonaland under Sir Frederick Carrington [q.v.] in 1896 and received the medal. Thence he went to Mauritius, where he spent three years, and from 1899 to 1902 served through the South African War. He took part in the advance on Kimberley and was commended by Lord Kitchener for the manner in which he cleared a block on the railway (February 1900): in the operations in the

Transvaal he was present at the actions of Elands River (4-16 August 1900) and Lydenberg (6 September 1900), and in the operations in the Orange River Colony he was present at the actions of Lindley (1 June 1900) and Rhenoster River (29 November 1900). He distinguished himself in command of a field company section and received a brevet majority, the two war medals, and was mentioned in dispatches.

After the War Thomson served first as an instructor at the Engineering School at Chatham and then at Sierra Leone. He became a captain and brevet-major in 1904, and in 1909 joined the Staff College, Camberley, where Sir Henry Hughes Wilson [q.v.] was then commandant. After leaving the Staff College in 1911 he went to the War Office, where he served under Wilson, who had become director of military operations. In 1912 Thomson was appointed military attaché with the Serbian army, serving throughout the Turkish and subsequent Bulgarian campaigns, and returning to the War Office in 1913.

On the outbreak of war in 1914 Thomson served first as *liaison* officer with the Belgian army and then with the British I Corps, proceeding in February 1915 as military attaché to Bucharest, where he spent two years. He regarded the entry of Rumania into the War as ill timed, and protested that her value was greater as a neutral than as one of the Allies, since the Rumanian supplies of corn and oil would thenceforth be at Germany's mercy. After being present at the inter-allied conference at Petrograd in 1917, Thomson joined the 60th division in Palestine as C.R.E. He took part in the advance on Jerusalem and temporarily commanded a brigade at the capture of Jericho, receiving the D.S.O. in 1918. In the same year he was promoted brigadier-general on the staff of the Supreme War Council at Versailles, whence he was sent to Mudros as bearer of the terms of the British armistice with the Turks. He received the C.B.E. at the end of the War in 1919.

After serving on the British delegation to the Peace Conference in Paris, Thomson left the army in 1919 with the rank of honorary brigadier-general in order to enter politics, and stood for parliament as socialist candidate at Bristol. He was defeated in 1919 and in 1922 and again at St. Albans in 1923, so that he never sat in the House of Commons. In 1920 he went to Ireland as a member of the socialist

committee of investigation into the rebellion then in progress and the measures taken to combat it. In 1921 he served on an international Red Cross committee which inquired into the condition of refugees in Russia and the Near East, and in 1923 he took part in the socialist deputation to the Ruhr. At this time he also devoted himself to writing, and published *Old Europe's Suicide* (1919), an account of events from 1912 to 1919, and *Victors and Vanquished* (1924).

In 1924 Thomson was appointed secretary of state for air in the first labour government, sworn a privy councillor, and raised to the peerage as Baron Thomson of Cardington, taking his title from the place in Bedfordshire where the government airship works were situated. He set to work to master the technicalities of the air service and visited Egypt and Palestine on an air inspection tour. Thomson was largely responsible for the government's decision on a three years' scheme of airship development, which involved the construction of two airships and experiments with them in flight overseas. These airships were the R.100 and R.101. Thomson also encouraged the study of the problem of the replacement of petrol by heavy oil, for he had a great belief in the future of lighter-than-air craft.

After the fall of the labour government in 1924, Thomson was one of the most indefatigable of the small number of socialist peers in opposition. He was a clear and vigorous speaker, and his cheerfulness and good temper gained him many friends in the House; indeed, he seemed marked out as the future leader of the socialist party in the House of Lords. In opposition he still maintained his interest in the air, and associated himself with the Royal Aero Club, of which he was chairman, and with the Aeronautical Society and the Air League. He undertook a lecturing tour in the United States in 1926, and in 1928 represented the government at an international air conference in New York. He also contributed to the press, and in 1927 published a collection of articles and lectures on aviation entitled *Air Facts and Problems* in which he emphasized his belief in the future of airships.

In 1929, on the formation of the second labour government, Thomson returned to the Air Ministry more than ever convinced that the Royal Air Force had become the first line of home defence. In the House of Lords the defence of the

government in important debates was largely entrusted to him, and he spoke on many leading questions of the day, such as the resumption of relations with Russia (4 December 1929), British policy in Egypt (9 December 1929), the Singapore dock question (18 December 1929); and he conducted the Coal Miners Bill through committee in 1930. He was also actively concerned in representing the government at the Naval Conference in London in 1930 and defended the Naval Treaty, which was its outcome, in parliament.

When Thomson came to the Air Ministry for the second time he found that the development of lighter-than-air craft had progressed, and on 28 July 1930 the airship R.100 left Cardington for Canada, reaching Montreal in 79 hours. She returned on 16 August after a flight of 57 hours. The R.100 had petrol burning engines, so that when a flight was contemplated to India the task necessarily fell upon the airship R.101, which used heavy oil, a fuel which could be safely carried and burnt in the tropics. The flight was at first designed to coincide with the Imperial Conference, and there seems no doubt that the later decision to start as early as 4 October was influenced by considerations of public policy and by the strong desire of the secretary of state that a start should be made in time to enable him to take the flight himself and return for the Imperial Conference. But the subsequent commission of inquiry expressly exonerated both Thomson and his advisers from deciding to take an unjustifiable risk. The R.101 left Cardington on 4 October 1930 at 6.36 p.m. Sir William Sefton Brancker [q.v.], director of civil aviation, and ten other passengers and officials accompanied Thomson, and the crew numbered forty-two. The voyage proved uneventful until 2 a.m. on 5 October when the R.101 was over Beauvais, the weather being exceedingly bad with a strong south-west wind blowing in fierce gusts. The ship was rolling badly and failing to keep height, although she was 1,000 feet above the ground. At 2 a.m. the watch changed and a new height coxswain took the helm. Although no blame is attached to officers or crew it is known that in bumpy weather there is difficulty in a new hand getting the 'feel' of a ship and therefore in judging the extent of elevator action needed to counteract a dive. A dive occurred shortly after 2 a.m., but the ship was brought to a level keel after losing some hundreds of feet. A

second dive, however, occurred almost immediately which brought the R.101 nose first to the ground, and she immediately burst into flames. There were only eight survivors, two of whom died shortly after at Beauvais. Thomson was killed, and was buried with the other members of the expedition at Cardington. Subsequently, an inquiry into the disaster was held under the chairmanship of Sir John Simon.

Thomson was a man of varied tastes. He was widely, if not deeply, read in several languages, and was accustomed to memorize his favourite passages, so that he had an abundant fund of quotations. He was devoted to music and interested in painting and sculpture. Besides the works mentioned above, he was the author of *Smaranda* (1926), a book of war memories and tales of the Near East, in which he manifested his love of Rumania. He was fond of sport and rode well to hounds. Thomson was unmarried, and the barony became extinct on his death.

[Lord Thomson, *Old Europe's Suicide*, 1910, *Victors and Vanquished*, 1924, *Smaranda* (with an introduction by J. Ramsay MacDonald), 1926, *Air Facts and Problems*, 1927; War Office Records; Hansard, *Parliamentary Debates*; *Journal of the Royal Engineers*, March 1931; *Report of the R.101 Inquiry*, March 1931; private information; personal knowledge.]

ONSLow.

THOMSON, JOHN (1856-1926), physician and writer on diseases of children, was born in Edinburgh 23 November 1856, the second of three children and only son of Thomas Thomson, writer to the signet, by his wife, Elizabeth, daughter of Alexander Cleghorn. Educated at the Edinburgh Academy, he graduated in medicine at Edinburgh University in 1881, and after holding resident posts at the Royal Infirmary, spent seven months in Vienna and Berlin. In Berlin he came under the influence of E. H. Henschel, the famous German paediatrist. On returning to England in 1884 he was appointed resident medical officer at the Hospital for Sick Children, Great Ormond Street, London, where he worked under Walter Butler Cheadle [q.v.] and (Sir) Thomas Barlow. He next became physician to the New Town Dispensary, Edinburgh, and established there a clinic for diseases of children; in this post he accumulated much of that wealth of observation which formed the basis of his writings. In 1888 he published a translation of Henschel's *Vorlesungen über Kinderkrankheiten*.

In 1889 Thomson was appointed extra physician to the Royal Hospital for Sick Children, Edinburgh, and with this hospital he was actively associated for the rest of his life. From this time onwards he contributed to journals and text-books articles upon diseases of childhood, which were characterized by accurate and detailed observation: congenital pyloric stenosis, acute pyelitis in infants, and mongolism were some of the affections which, although previously described, had attracted little notice until his descriptions drew attention to them. In 1898 appeared his *Guide to the Clinical Study and Treatment of Sick Children*, based on his own records and so of particular value. He gave, however, generous recognition to the work of others, and was the better able to do so, since he had extensive knowledge of the literature of paediatrics in other countries.

When, on the expiry of his period of office as physician at the Children's Hospital in 1918, he was appointed consulting physician, Thomson retained a clinic for mentally defective children, in whom he took great interest. For the parents of these he wrote a booklet, *Opening Doors*, in the simplest language, giving valuable hints for training.

Thomson's writings were widely appreciated. In the United States and Canada he was made an honorary member of many paediatric societies; his own university in 1922 conferred on him the honorary degree of LL.D., and the Royal College of Physicians, London, in recognition of his valuable work, elected him a fellow in 1926.

Thomson died in Edinburgh 2 July 1926, and was buried in the Dean cemetery, Edinburgh. He married in 1887 Isobel Finlayson, daughter of the Rev. John S. McPhail, of the United Free Church, Benbecula, and had four sons and two daughters.

[*Edinburgh Medical Journal*, August 1926 (portrait); private information; personal knowledge.]

G. F. SMILL.

THORNYCROFT, Sir JOHN ISAAC (1843-1928), naval architect, born in Rome 1 February 1843, was the elder son of Thomas Thornycroft [q.v.] by his wife, Mary Thornycroft [q.v.], daughter of John Francis [q.v.]. His father, his mother, and her father were all sculptors, as was his younger brother, Sir William Hamo Thornycroft [q.v.]. His father was also an amateur engineer, and his studio a workshop furnished with model engines

and railways. John's career began in this workshop, where after making smaller craft he constructed the *Nautilus*, a steam launch which was the first that was able to keep pace with the crews in the university boat race of 1862. Shortly after this success his father sent him to work as a draughtsman with Palmer's Shipbuilding Company at Jarrow-on-Tyne and thence to Glasgow University, where he studied natural philosophy and engineering under Sir William Thomson (afterwards Lord Kelvin) and Professor MacQuorn Rankine and obtained a certificate in engineering science. He then worked for some time in the drawing office of Messrs. Randolph, Elder & Co. at Fairfield, Govan, near Glasgow (afterwards the well-known Fairfield Shipbuilding Company). At that time the firm was engaged in the construction of the Popofga circular ships for the Russian government, and in 1869 Thornycroft wrote for the Institution of Naval Architects a paper dealing with the work that he had carried out in calculating the resistance of these vessels.

In 1866 his father assisted Thornycroft to establish at Chiswick the shipyard which later became noted for the production of high-speed launches and torpedo craft. Between 1866 and 1870 he also studied at the South Kensington School of Naval Architecture, where he was a contemporary of (Sir) Philip Watts [q.v.]. In 1872 John Donaldson, who had been engineer in the Public Works Department of India and who married Thornycroft's sister, Frances Sarah, in that year, became his partner in the shipyard, Thornycroft devoting most of his attention to design, and his partner to administration. In 1870 the torpedo invented by Robert Whitehead [q.v.] was adopted in the royal navy, and it was realized that to make it effective a fast launch was needed to carry it. In 1871 Thornycroft built the first small high-speed boat of which there is any record, the *Miranda*, a launch with a hull of light steel and an engine of 58 horsepower, which attained a speed of 16.4 knots. In 1873 a somewhat larger boat, the *Gitana*, constructed for the Norwegian government, is said to have reached 20.8 knots with engines of 458 h.p. This boat, being fitted with a spar torpedo, was in fact the first torpedo boat. She had also a closed stokehold system of forced draught, and served as a model for the first torpedo boat of the English navy, the *Lightning*, built by Thornycroft in 1877, which, however, was furnished with a

revolving torpedo tube. In the succeeding years he turned out large numbers of torpedo boats, and when in 1892 torpedo-boat destroyers were introduced he was commissioned to build the *Daring* and the *Decoy*, two of the first four vessels of this class [*Transactions of the Institution of Naval Architects*, vol. liii, part ii, pp. 325-330, 1911].

During this period Thornycroft's vessels showed rapid improvement, owing to his continual experiments with hull form and propeller design. He introduced the flat, wide, form of stern at the water-line to prevent 'squatting', with the propeller shaft at downward inclination (a feature of his first juvenile launch), and wing-rudders on each side of the stern. He was the first to carry out experiments with screw propellers, measuring simultaneously the thrust, power transmitted, and speed. He took out patents for improvements in turbine screw propellers and for the tunnel form of stern for high-speed vessels navigating shallow rivers—devices which were successfully employed in 1875 in a twin-screw launch built for Sir John Fowler [q.v.] to navigate the Nile, and in five river gunboats which he was commissioned to build in 1885 for the Gordon relief expedition.

Thornycroft also improved the type of boiler employed in torpedo craft. He soon recognized that the locomotive type would not stand the high rate of forcing to which it was subjected in these vessels, and turned his attention to boilers of the water-tube type. The *Ariete*, a torpedo boat which he built for Spain in 1887, held the record for speed at the time, developing over 26 knots. In 1893, in spite of difficulties, he induced the British Admiralty to fit the *Speedy*, a torpedo gunboat, with water-tube boilers of his own design, and they proved entirely successful. His boats the *Daring* and the *Decoy* (already mentioned) were also fitted with this type of boiler. Ultimately he evolved a light, fast-running reciprocating engine of the triple expansion type, which was adopted in a large number of torpedo craft, but eventually was superseded by the Parsons turbine. Thornycroft was one of the civilian members of the famous Admiralty committee of design, appointed at the instance of Lord Fisher [q.v.] in December 1904, which recommended the adoption of the Parsons turbine for the *Dreadnought* class of battleship and for new destroyers.

The increased size of destroyers and torpedo boats was the principal reason for

the removal of the Chiswick shipyard to Woolston, Southampton, in 1906. Even then, however, Thornycroft was bringing to fruition work which led to a partial return to the small torpedo craft of earlier days. Already in 1877 he had patented a special form of hull designed to skim over the water rather than to cut through it, but no light engine then existed powerful enough to generate the speed required for skimming. With the development of the light internal-combustion engine he saw the possibility of success, and after experimenting for several years with aluminium models in a testing tank at Bembridge, Isle of Wight, close to his home, he patented a 'single-step' form of hull which was generally adopted, not only for racing-boats, but also for sea-planes. In the first year of the European War Thornycroft's patent was seen to have great possibilities, and in 1916 the Admiralty placed with his firm an order for a dozen torpedo boats of high speed and of such shallow draught that they could pass safely over mine-fields. These were built with the greatest secrecy on an island in the Thames at Hampton, and subsequently over a hundred more were constructed. These were the coastal motor-boats, known familiarly as 'scooters', which were successfully used in the attacks on Zeebrugge, Ostend, and elsewhere. A vessel of the type, built for the French government after the War, attained a speed of 41.6 knots over the measured mile. Towards the end of the War Thornycroft designed a decoy-ship of shallow draught, 240 feet long by 35 feet beam, which was able to pass over mine-fields and torpedoes. This vessel was given priority over all others under construction, and was completed in three months. In much of his experimenting during the War Thornycroft was assisted by his daughter Blanche, an associate of the Institution of Naval Architects.

Other problems engaged Thornycroft's attention at various times. He was early in the field with the use of oil for raising steam; this he adopted in a life-boat in 1892, and about the same time he fitted a 300-ton yacht with an anti-rolling device. In 1898 he established at Basingstoke works for the manufacture of motor vehicles, chiefly lorries and buses; and in later years he invented improvements in sugar-making machinery.

Thornycroft was elected a fellow of the Royal Society in 1893, and received the honorary degree of LL.D. from Glasgow

University in 1901. He was knighted in 1902. He served on the council of the Institution of Naval Architects from 1881 and on the council of the Institution of Civil Engineers from 1899 to 1908. He was a pioneer in naval architecture. The advances which he made in the hull design and machinery of small, high-speed craft served to show what could be done in much larger vessels. Of his early boats he designed every detail himself. He was a remarkably neat draughtsman and his line drawings were works of art. To the end of his life he was able to make free-hand sketches of complicated details of mechanism which would fit together directly without an assembly drawing.

Thornycroft died at Bembridge 28 June 1928, and was buried there. He married in 1870 Blanche, daughter of Frederick Coules, of Gloucester, and by her he had two sons and five daughters. His elder son, Sir John Edward Thornycroft, succeeded his father as head of the firm.

A cartoon of Thornycroft by 'Spy' appeared in *Vanity Fair* 19 January 1905.

[*The Times*, 20 June 1928; *Transactions of the Institution of Naval Architects*, vol. lxx, 1928 (with portrait); *Proceedings of the Royal Society*, vol. cxxi, A, 1928; *Proceedings of the Institution of Civil Engineers*, vols. cxl, 1899-1900, cccxvii, 1928-1929; Miss E. Thornycroft, *Bronze and Steel*, 1932; Sir P. Watts in *Encyclopædia Britannica*, 11th edition, vol. xxiv, pp. 915-916. Portrait, *Royal Academy Pictures*, 1919.] E. I. CARTLEY.

THORNYCROFT, Sir (WILLIAM) HAMO (1850-1925), sculptor, was born in London 9 March 1850, the younger son of the sculptor Thomas Thornycroft [q.v.] by his wife, Mary Thornycroft [q.v.], daughter of the sculptor John Francis [q.v.], and herself a sculptor; his elder brother was Sir John Isaac Thornycroft [q.v.], the naval architect. Hanno Thornycroft was educated at Macclesfield grammar school and at University College School, then in Gower Street, London; about 1868 he began to study sculpture, first under his father and subsequently at the Royal Academy Schools. In 1871 he exhibited for the first time at the Academy, his contribution being a portrait-bust of Professor William Sharpey (now at University College, London); soon afterwards he visited Italy, devoting much study to the works of Michelangelo. On his return he assisted his father in the execution of the 'Poets' Fountain' in Park Lane, the figures of Shakespeare, Comedy, and Fame

being by the son. The fountain was unveiled in 1875, in which year Thornycroft was awarded the gold medal of the Royal Academy for his group 'A Warrior bearing a Wounded Youth'. Much attention was attracted by his statue 'Lot's Wife', exhibited in 1878; but he achieved his most signal success when in 1880 he exhibited his 'Artemis'. This was commissioned from him in marble by the Duke of Westminster, the marble version being now at Eaton Hall. The following year he exhibited his bronze 'Teucer', which was bought by the Chantrey trustees for £1,000 and is now in the Tate Gallery; in the same year (1881) Thornycroft, now well to the fore among the younger English sculptors of the day, was elected A.R.A.

In his work up to this time, Thornycroft had, as regards subject, kept more or less within the convention of the antique, although in vitality of form and treatment he had advanced well beyond the formula of neo-classicism. Thenceforward he brought within the range of his art the subjects affected by contemporary realism in painting, exhibiting in 1884 'The Mower' (now in the Walker Art Gallery, Liverpool) and in 1886 'A Sower', both probably the result of impulses received from the paintings of Jean François Millet, and displaying a type of subject and treatment which very shortly afterwards was to be exploited quite independently by the Belgian sculptor Constantin Meunier.

Much noticed though these 'realistic' sculptures were, and although he occasionally reverted later on to this type of rendering, these figures nevertheless represent only an episode in Thornycroft's work; his energies were mainly absorbed by the steadily increasing flow of orders for public or semi-public statues, portrait busts, &c., which came to him. Among his best-known public monuments in London are the statues of General Gordon in Trafalgar Square (1888) and Oliver Cromwell in Old Palace Yard (1899), which latter won the *médaille d'honneur* at the Paris world exhibition of 1900; the group of Dean Colet and two kneeling scholars at St. Paul's School, West Kensington (1902); the national memorial to Gladstone in East Aldwych (1905); and the circular bas-relief in stone of Richard Norman Shaw in New Scotland Yard (1914). There is also by Thornycroft a statue of Queen Victoria in the Royal Exchange, and a bronze effigy of Mandell Creighton, bishop of London, in St. Paul's Cathedral. Of his works to be found out-

side London, mention should be made of the statue of King Alfred at Winchester (1901); the monument of Bishop Harvey Goodwin in Carlisle Cathedral; the Lord Armstrong memorial at Newcastle-upon-Tyne; the memorial of the viceroyalty of Lord Curzon, set up in Calcutta in 1912; the King Edward VII memorial at Karachi (1915); the war memorial at Luton (1923); and the statue of Bishop H. W. Yeatman-Biggs in Coventry Cathedral (1925). A large equestrian statue of Edward I, intended for Blackfriars Bridge, London, was never set up, although several models for it were shown in successive Academy exhibitions between 1885 and 1894. Realism remained to the end the key-note of Thornycroft's style: in one of his later works, the marble group 'The Kiss' (1916, purchased by the Chantrey trustees and now in the Tate Gallery), there is even something like a half-hearted approximation to the manner of Auguste Rodin.

Thornycroft was elected R.A. in 1888, his diploma work being 'The Mirror', a marble relief exhibited in 1890; he was knighted in 1917. In 1923 he received the gold medal of the Royal Society of British Sculptors for his distinguished services to sculpture. He died at Oxford 18 December 1925. He married in 1884 Agatha, second daughter of Homersham Cox, of Tonbridge, and had one son and three daughters. A retrospective selection of his works was shown at the Burlington House Winter Exhibition in 1927.

[*The Times*, 21 December 1925; Algernon Graves, *The Royal Academy of Arts, a complete dictionary of contributors and their works*, vol. vii, 1905; subsequent Royal Academy Exhibition Catalogues including that of the Memorial Exhibition, 1927.] T. BORENIUS.

THORPE, Sir THOMAS EDWARD (1845-1925), chemist, was born at Barnes Green, Harpurhey, near Manchester, 8 December 1845, the eldest son of George Thorpe, cotton merchant, of Trafford Bank, near Manchester, by his wife, Mary Wilde. From Hulme grammar school, where he received his early education, he passed in 1863 to the chemistry department of Owens College, Manchester, then under the direction of Professor (Sir) Henry Enfield Roscoe [q.v.]. Here Thorpe was initiated into the methods of chemical research, and in association with Roscoe made the first of his many notable contributions to scientific knowledge.

In 1867, fortified with a letter of intro-

duction to the famous R. W. von Bunsen, Thorpe proceeded to the university of Heidelberg, where two years later he graduated Ph.D. Subsequently, he worked for a time in the laboratory of Friedrich August Kekulé at Bonn, and after his return to England in 1870 was appointed to the chair of chemistry in the Andersonian College, Glasgow. An active period of four years in this institution was ended by Thorpe's removal to the Yorkshire College of Science at Leeds, where, besides spending much time and energy in the development of this new enterprise, he maintained a steady output of scientific work.

A further migration brought Thorpe to London, where for two periods, 1885-1894 and 1909-1912, he occupied the chair of chemistry at the Royal College of Science, South Kensington. For the fifteen years between these two periods he occupied the responsible position of government chemist, in which capacity he conducted numerous investigations bearing on industrial and public welfare. The detection of arsenic in beer, the elimination of lead from pottery glazes and of white phosphorus from matches, may be cited as examples of the problems which were tackled successfully in the government laboratories under Thorpe's supervision.

The more academic investigations with which Thorpe was concerned lay mainly in the field of inorganic chemistry. In his early years he shared in Roscoe's pioneer work on vanadium, and this led on to an intensive study of certain phosphorus compounds, notably the fluorides and oxides: his discovery of the pentafluoride provided conclusive evidence for the higher valency of phosphorus. The relation of the molecular weights of substances to their specific gravities in the liquid state was another line of investigation to which Thorpe devoted much attention and the results of which were largely responsible for the award to him of the Longstaff medal of the Chemical Society in 1881. With the assistance of his pupils, Thorpe did valuable work in the accurate determination of the atomic weights of titanium, silicon, gold, strontium, and radium. The results of these and other scientific investigations are recorded in numerous memoirs, published for the most part in the *Journal* of the Chemical Society.

It was not only chemical investigation which claimed Thorpe's active interest. He took part in four eclipse expeditions, and in collaboration with Sir Arthur

Rüchker he made, in 1884-1888, an extensive magnetic survey of the British Isles, the earlier results of which formed the subject of a joint Bakerian lecture before the Royal Society in 1889.

Besides originality as an investigator Thorpe possessed marked literary talent, as is shown by his *Essays in Historical Chemistry* (first edition, 1894), *Joseph Priestley* (1906), and other biographies, while the well-known *Dictionary of Applied Chemistry* (first edition, 3 vols., 1893, third edition, 7 vols., 1921) is a monument to his energy and ability as an editor. Two books on his favourite recreation of yachting, *A Yachtsman's Guide to the Dutch Waterways* (1905) and *The Seine from Havre to Paris* (1913), bear witness to his exploration of the waterways of Holland and France.

In the activities of British scientific bodies Thorpe took a prominent part. Elected a fellow of the Royal Society in 1876, he was awarded a royal medal in 1889, and acted as foreign secretary of the Society from 1890 to 1903. He was president of the Society of Chemical Industry in 1895, and of the Chemical Society 1899-1901. Finally, in 1921 he was president of the British Association at its Edinburgh meeting.

Thorpe married in 1870 Caroline Emma, daughter of Dr. John Watts, a prominent Manchester citizen and educationist. There were no children of the marriage. He died at his home at Salcombe, South Devon, 23 February 1925.

[*The Times*, 24 February 1925; *Proceedings of the Royal Society*, vol. cix, A, 1925; *Journal of the Chemical Society*, April 1926.]
J. C. PHILIP.

THURSFIELD, Sir JAMES (1840-1923), naval historian and journalist, was born at Kidderminster 10 November 1840, the younger son of Thomas Thursfield, M.R.C.S., by his wife, Sarah, daughter of Thomas Pardoe. On his father's death in 1855, his mother brought him to London, where he was educated at Merchant Taylors' School. In 1850 he proceeded with a scholarship to Corpus Christi College, Oxford, where he gained first classes in classical moderations (1861) and *literae humaniores* (1863). In 1864 he was elected to a fellowship at Jesus College, of which he eventually became a tutor. He was an examiner in the classical honour schools in 1873, and junior proctor for the year 1875. Among his closest friends at Oxford were Mandell Creighton, Walter

Pater, Mark Pattison, (Sir) Charles Dilke, and Mr. and Mrs. Humphry Ward. Resident fellowships were then held on condition of celibacy, and Thursfield had to relinquish his in 1881 subsequent to his marriage the previous year.

Returning to London, Thursfield joined the staff of *The Times* as leader-writer, and quickly gained recognition by his wide knowledge of public affairs. His political views were radical and not always consonant with the policy of the paper, more especially on the question of Home Rule. This was fully recognized by successive editors. Appreciating his service in other directions, they never asked him to write in support of any policy in which he did not believe. Of this earlier period of his career as a journalist, his *Peel*, contributed in 1891 to the popular series known as 'Twelve English Statesmen', is the landmark.

Perhaps as a result of acting as *The Times* correspondent at the naval manoeuvres of 1887, Thursfield began at this time to specialize in a new direction. Himself the most peace-loving of men, he devoted himself to a study of naval policy and, later, of naval history—a study which was thenceforth to be one of the main interests of his life. He attended successive manoeuvres and became acquainted with many of the leading naval officers of the day. He did not, however, cease to write on general topics, and from 1891 was for some years in charge of the 'Books of the Week' section of *The Times*. This, in 1902, developed into *The Times Literary Supplement*, of which Thursfield was the first editor, and to which he was a frequent contributor throughout his life.

Thursfield's interest in naval history was strengthened by the publication in 1890 of Captain A. T. Mahan's book, *The Influence of Sea Power upon History*. One of the first to grasp the importance of this work, it was he who directed public attention to it; the views which Mahan expressed being very largely those which Thursfield himself already held. In 1897 *The Navy and the Nation* was published, a collection of essays written by Thursfield and by Sir George Sydenham Clarke, afterwards Lord Sydenham of Combe. Thursfield's established reputation as a writer on naval affairs led to his being invited, in January 1900, to lecture at the Royal United Service Institution. He spoke on the training of seamen, and urged the need for full and impartial inquiry as a preliminary to reform. In 1903, an even more

important occasion, he lectured at the Staff College, Camberley, on 'The Higher Policy of Defence'. From 1902 to 1914 he advocated the need of naval development, and enjoyed the confidence of several first lords of the Admiralty, among them being Lord George Hamilton, Lord Selborne, Lord Cawdor, and Lord Tweedmouth. In 1909 his *Nelson and other Naval Studies* appeared, followed in 1913 by a smaller work on *Naval Warfare*.

Thursfield was made an honorary fellow of Jesus College in 1908, and was knighted in 1920 at the age of eighty. He died at his house at Golders Green 22 November 1923.

Thursfield married in 1880 Emily, eldest daughter of the Rev. Samuel Asher Herbert, rector of St. James's, Gateshead, and had one son and one daughter.

[*The Times*, 23 November 1923; private information.] G. A. R. CALLENDER.

TIZARD, THOMAS HENRY (1839-1924), oceanographer, hydrographic surveyor, and navigator, was born at Weymouth 13 March 1839, the third son of Joseph Tizard, shipowner and coal-merchant, by his wife, Sarah Parsons. He was educated at the Royal Hospital School, Greenwich—at that time noted for its sound mathematical training—and entered the royal navy by competitive examination as master's assistant in 1854. At the early age of fifteen he saw active service on H.M.S. *Dragon* with the Baltic fleet during the Russian War (1854-1856). Tizard next served on H.M.S. *Indus* on the West Indies station, and gained his first experience of surveying on the Newfoundland coast. He was promoted second master in 1860, and appointed to H.M. surveying vessel *Rifleman* on the China station. During his seven years' service in that ship he laid the foundation of his subsequent reputation as a surveyor. The survey of the reefs and shoals abounding in the South China sea necessitated the use of the schooner *Saracen* to act as tender to the *Rifleman*. Tizard was in command of the *Saracen* for three years after his promotion to the rank of master in 1864.

From 1868 to 1871 Tizard served as navigating lieutenant and senior assistant surveyor of H.M.S. *Neaport* in the Mediterranean and Red Sea, and was present at the official opening of the Suez Canal in 1869, when he led the long procession of ships. During this period he brought out the 'Table of Chords' which has proved

an inestimable boon to his brother surveyors. In 1871 the officers and crew of the *Nevoport* were transferred to the *Sheerwater*, and on the way out from England in the latter ship to continue the survey of the Gulf of Suez, Tizard was largely responsible for an important series of observations on the surface and undercurrents in the Straits of Gibraltar, which set at rest the vexed question of the movements of these waters.

Towards the end of 1872 the appointment of Captain (afterwards Sir) George Strong Nares [q.v.] to the command of the famous *Challenger* expedition led to Tizard's transference to the *Challenger*. He was by this time a man of strong personality and resourcefulness, an experienced navigator, and a master at handling a ship. The appointment opened out to him the great opportunity of his life in bringing him into contact with the leaders of the science of oceanography. The *Challenger* expedition resulted in a vast increase of knowledge of the physical condition of the oceans and of the distribution of marine life, and in the progressive improvement of apparatus and methods of research. As navigating officer Tizard's duties involved close collaboration with the leader of the expedition and the scientific staff. The influence which he exerted was increasingly apparent as time went on, and when Captain Nares left the ship in order to take command of the Arctic expedition of 1875, the prospect of taking Tizard with him could not be entertained. Tizard remained with the *Challenger* until she paid off in 1876, and spent the next three years at the Admiralty writing the narrative of the voyage in association with Sir John Murray [q.v.].

In 1870 Tizard, who had been promoted staff commander in 1874, resumed surveying duties afloat, and in the following year took charge of the Home survey. During the nine years that he held this command he wrote many papers of scientific value and interest. Among these may be mentioned a report on deep-sea exploration in the Faroe Channel (*Proceedings of the Royal Society*, vol. xxxv, 1883, and of the Royal Society of Edinburgh, vol. xi, 1882); lectures on *Marine Surveying and Hydrographic Surveying* (Professional Papers of the Corps of Royal Engineers, 1885 and 1890), and an article on the 'Thames Estuary' (*Nature*, April 1890) which is of great permanent value. He was promoted to staff captain in 1889, and in 1891 was appointed assistant

hydrographer of the navy, and was elected a fellow of the Royal Society. He was placed on the retired list with the rank of captain in 1890, but continued to serve at the Admiralty until the autumn of 1907. In 1890 he was awarded a civil C.B.

Tizard's last, and not least, public service was to assist the committee appointed by the Admiralty in 1912 'to examine and consider the evidence relating to the tactics employed by Nelson at the Battle of Trafalgar'. An exhaustive examination of ships' logs and journals enabled him to prepare 'the first and only plans representing any phase of the battle of Trafalgar which have been exactly drawn to scale'.

Tizard married in 1881 Mary Elizabeth, daughter of William Henry Churchward, civil engineer, and had one son and four daughters. He died at Kingston-on-Thames 17 February 1924.

[*Proceedings of the Royal Society*, vol. cv, A, 1924; *Geographical Journal*, May 1924; *Nature*, March 1924; private information; personal knowledge.] A. M. FIELD.

TOUT, THOMAS FREDERICK (1855-1929), historian and teacher, was born at Norwood 28 September 1855, the only child of Thomas Edward Tout, wine merchant—whose father, of a Somersetshire family, had settled in London—by his wife, Anne Charlotte Finch. Educated at St. Olave's grammar school, Southwark, he became head of the school, won the Brackenbury history scholarship at Balliol College, Oxford, in 1874, and went into residence in January 1875. Among his contemporaries at Balliol were (Sir) Charles Harding Firth, Reginald Lane Poole, John Horace Round, (Sir) Sidney Lee, (Sir) Richard Lodge, and Charles Edwyn Vaughan: all these became his lifelong friends. Tout obtained a first class in modern history in 1877 and a second class in *literae humaniores* in 1879. From the first his interests centred in medieval history, and the teacher to whom he owed most was William Stubbs [q.v.], whose place in English medieval studies he was later to fill.

In 1881 Tout was appointed professor of modern history at St. David's College, Lampeter, where he remained until his election, nine years later, to the chair of medieval and modern history at the Victoria University of Manchester. The years at Lampeter were the making of Tout, and most of the ideas with which he was later associated at Manchester

received trial there. He studied Welsh history; he took a large part in reconstituting and reviving the college, and to the abounding energy of his Oxford days was now added the self-confidence of the successful professor. In 1883 he was elected to a prize fellowship at Pembroke College, Oxford, and from 1889 to 1891 he was an examiner in the Oxford school of modern history.

Tout went to Manchester in 1890. There he remained until his retirement in 1925, and there his life's work was done in the triple capacity of administrator, teacher, and writer. As an administrator he took a prominent part in securing the severance in 1903 of the university of Manchester from the older federal body which included the universities of Liverpool and Leeds. To the task of building up the new university Tout brought tireless energy, vision, and a strength of will which was almost ruthless. His robust and practical sense made him an extremely useful counsellor, while his criticisms were always of the constructive kind, not sceptical and discouraging. He was a hard fighter, but he had a faith in his ideas which inspired respect, and in all personal relations a warm-hearted, human sympathy which rendered transient the animosities of debate. It was this almost paradoxical contrast which prompted the *bon mot*—*Tout comprendre c'est Tout pardonner*. Apart from the struggle for the new charter of 1903, Tout is best remembered as an administrator by his work in the building up of the faculty of arts, in the establishment of the undenominational faculty of theology, in the founding of the Manchester University Settlement, in insisting upon the same opportunities in the university for women as for men, and by his creation of the Manchester University Press. He also did invaluable and characteristic work in securing better conditions of pay and service for university lecturers and administrative officers, and as chairman of the Manchester high school for girls in establishing 'sabbatical' terms for the staff on full salary.

These tasks, on which Tout worked unsparingly, at no time overshadowed his main purpose, the development of the history school at Manchester. In this work he had the solid foundation of his predecessor, Sir Adolphus William Ward [q.v.], on which to build, and the whole-hearted co-operation of his colleague James Tait. It was Tout's conviction—and herein he was at variance with estab-

lished ideas—that the undergraduate training which should produce historians and researchers was also the best for the ordinary educated man. In the last year of the undergraduate course a real effort was made to give the student a grasp of the original sources of history. From the year 1907 this was done by means of a thesis which occupied a large part of the third year and was closely related to a short special period studied intensively with plenty of expert guidance. The essence of Tout's method lay in a nice adjustment between the 'broad outlines of general European History' and early but limited specialization: its success depended on Tout's splendid gifts as a teacher. He was a fine lecturer. He carried his subject in his head, speaking always without notes or even immediate preparation, but with illuminating digressions suggested by his own special studies or his travels. A bicyclist and a walker, he had a lifelong interest in medieval antiquities and archaeology. England and Wales he knew through and through, while there was no department in France, and few countries in Europe, which he had not visited.

Tout's highest gifts, however, lay in his personal relations with his students. Wholly without vanity, he met them on a footing of equality, not less interested in themselves and their future than in their work. Through the teacher the subject became alive to all, while his own energetic example and his faith in learning inspired some to choose the life of scholarship. His success as a teacher was made evident by the character of the graduates whom he produced. They were trained historians in a degree seldom found elsewhere; and many were stimulated to pursue their studies after graduation. From these beginnings there slowly grew up a post-graduate school, the work of which gained increasing recognition through the publications of the Manchester University Press. In 1920 Tout gave up most of his active teaching, and devoted himself to the organization of this post-graduate school.

Tout's writings fall into two well-marked groups, divided from each other by the year 1908. Before this year the easy adaptation to circumstances which marked his whole life was accurately reflected in his work. What his hand found to do he did with all his might. He wrote a number of successful text-books, including a standard *History of England* for schools (in conjunction with Professor

F. York Powell, Part III, 1890, Part II, 1898), and threw himself with enthusiasm into the great new venture of his time, the *Dictionary of National Biography*, of which the first volume appeared in 1885. Tout's contributions—spread out over more than forty volumes and together amounting to a whole volume [see *Dictionary of National Biography*, vol. lxiii, *A Statistical Account*, pp. xv, xviii *et seq.*—]ranged over the whole middle ages, but found a focus in the reign of Edward I and his relations with Wales. It was good work, conceived at first on the old-fashioned, optimistic lines and largely drawn from printed materials, but broadening and deepening with the years as it found a firmer basis in the manuscript sources. Apart from these articles, the research of this period bore fruit in three works of first-rate importance, viz. an article on 'The Welsh Shires' (*Y Cymroddor*, vol. ix, pp. 201-220, 1888); Volume III (1210-1377) in Longman's *Political History of England* (1905), and *State Trials of the Reign of Edward I, 1289-1293* (in conjunction with his sister-in-law, Miss Hilda Johnstone, Camden series of the Royal Historical Society's publications, 1906). The last of these brought Tout into immediate touch with the unexplored materials in the Public Record Office and foreshadowed the work of his second period.

Tout had always practised, as he had preached, historical research: henceforth he was absorbed by it. In 1912, in evidence before the royal commission on public records, he set forth in considerable detail certain conclusions to which work among archives had led him [First Report of Royal Commission on Public Records, vol. i, part iii, pp. 102-108]. The actual stimulus was supplied by Eugène Déprez' *Études de la diplomatie anglaise*, which Tout reviewed in the *English Historical Review* (1908). For the rest of his life he was concerned with administrative history, and his work in this subject is his peculiar contribution to medieval history. It was embodied in two books, *The Place of the Reign of Edward II in English History* (1914) and *Chapters in the Administrative History of Medieval England* (6 vols. 1920-1931). The first of these works grew out of his Ford lectures delivered at Oxford in 1913; of the *Chapters*, the last two volumes, although virtually finished before his death, were published posthumously. Hitherto Tout's originality had lain in his advanced conception of historical

teaching. He was now to give a permanent deflection to the study of institutional history such as had earlier been given by Stubbs, and to supply the first constructive criticism of his master's interpretation of the Middle Ages. The basic idea of these books is that, owing to the prevailing absorption in the history of parliament, English medieval history has been seen out of focus, since to contemporaries the administrative side of government bulked immensely larger. Tout's object was to supplement Stubbs's work 'by setting forth in detail the history of the great administrative departments and their offshoots'.

To a great extent Tout was applying to English institutional history ideas which had already been worked out with remarkable results by the historians of France, and one effect of his work was to emphasize the underlying similarity of French and English institutions. The meaning of this 'common heritage' he developed in his *France and England, Their Relations in the Middle Ages and Now* (1922), based mainly upon four lectures given at Rennes, at the invitation of the university of Rennes, in 1921. In this book and in a number of vigorous popular lectures given during the last fifteen years of his life he generalized the results of his special studies, to which they form an excellent introduction. To the end of his life, Tout was also closely connected with the *English Historical Review*, the *Scottish Historical Review*, and *History*. To each of these journals he contributed many valuable articles, notably that on 'Firearms in England in the Fourteenth Century' in the *English Historical Review*, (vol. xxvi, 1911), and for each of them he was an indefatigable reviewer. A careful list of all his writings to the year 1925, compiled by his wife, was included in the *Essays in Medieval History* presented to him by friends and pupils in that year. A note appended to Dr. A. G. Little's memoir in *History* (January 1930) carried the list down to Tout's death. A collection of his miscellaneous writings, historical articles, and public lectures was published posthumously as *The Collected Papers of Thomas Frederick Tout* (3 vols., 1932-1934).

Behind all these activities lay the force and charm of a remarkable personality. Tout was of middle height and thick set; an excellent talker and raconteur, with slow and emphatic utterance, delighting in pungent epithets. Warm-hearted and

kindly, he shared naturally the joys and troubles of his friends, and he had the understanding which won the devotion of all who worked with him or for him. The busiest of men, there was no limit to the time he could spare to help and counsel all who sought his advice. Therein he was assisted by the happy circumstances of his domestic life. In 1895 he had married Mary, daughter of Herbert Alison Johnstone, of Stockport. His wife shared his public work as well as his personal interest in his students, and their home became the centre of an ever-widening circle of friends.

Tout resigned his chair at Manchester in 1925. He returned to London, settling at Hampstead, where he had all but completed his *Administrative History* at the time of his death, which took place there 23 October 1929. In these years he maintained his public interests to the full. He was president of the Royal Historical Society from 1926; he directed the medieval publications of the British Academy, of which he had been elected a fellow in 1911 and which, as an active member of the council, he represented at the meetings of the Union Académique Internationale at Brussels in 1920 and 1921; he was elected a member of the Athenaeum Club under Rule IV; he was a member of the committee of the Institute of Historical Research and of the advisory committee of the British Broadcasting Company for national lectures. In 1928 he travelled in the United States of America, where he delivered the Messenger lectures at Cornell University, and in Canada. The last ten years of his life were marked by widening recognition of his pre-eminent position in medieval studies. Honorary degrees were conferred on him by the universities of Durham (1921), Liverpool and Edinburgh (1925), Oxford (1926), and Colorado (1928), he was made an honorary fellow of Pembroke College, Oxford, and a corresponding fellow of the Academy of Caen and of the Mediaeval Academy of America. These years were also marked by an ever-increasing interest in the *International Congress of Historical Studies*. He had much to do with its development from the beginning. At the International Congress held in London in 1919 he was president of the medieval section, and again at Brussels in 1923. He was an active member of its standing committee, president of the British National Committee, and was arranging for the annual meeting in England in 1930 at the time of his death.

Tout was survived by Mrs. Tout and by two sons and a daughter. The eldest son died in infancy.

Powicke, *Thomas Frederick Tout, 1855-1929* in *Proceedings of the British Academy*, vol. xv, 1929, reprinted in *Collected Papers*, vol. i; Henry Guppy in *Bulletin of the John Rylands Library*, January 1930; personal knowledge.]

V. H. GALBRAITH.

TOWNSHEND, SIR CHARLES VERE FERRIERS (1861-1924), major-general, was born 21 February 1861 in Southwark, the eldest son of Charles Thornton Townshend, by his wife, Louisa, daughter of John Graham, of Melbourne, Australia. His father was the eldest son of the Rev. Lord George Townshend, and a great-grandson of the first Marquess Townshend. Although he was for a time heir presumptive to the marquessate, the father lived in humble circumstances, earning his livelihood as a minor railway official. After his death in 1880 Charles Vere Townshend remained until 1916 heir presumptive to the sixth Marquess Townshend.

Townshend's home life was not happy; he was educated at Cranleigh School, Kent, until his relatives obtained a nomination for him to enter the royal navy. This, however, he did not accept, preferring to work for entrance into the Royal Military College, Sandhurst. Eventually, in February 1881 he was gazetted to the Royal Marine Light Infantry. In 1884 he proceeded to Suakin with a battalion of marines, which, shortly afterwards, was attached to the column with which Sir Herbert Stewart [q.v.] advanced up the Nile valley in an endeavour to relieve General Gordon, then besieged in Khartoum. Townshend was thus present at the fierce actions at Abu Klea and Gubat, and when the fall of Khartoum became known, participated in Stewart's retreat across the Bayuda desert. After being mentioned in dispatches for his work in the Sudan, he was transferred to the Indian army in January 1886.

On arrival in India Townshend was first posted to the seventh Madras Infantry, exchanging very soon into the third Sikh Infantry, and finally into the Central India Horse. The facility with which he changed regiments and sought appointments became a characteristic of Townshend's career. In 1891 he had the good fortune to be selected for service in the Himalayas, and was sent to Gilgit, where

he assumed command of the first, or Raga Pertab, battalion of the Imperial Kashmir Contingent. Not long afterwards the Hunza-Nagar expedition was organized at Gilgit, and Townshend thus came to take a prominent part in the capture of the hill forts of Nilt and Hunza. After obtaining another mention in dispatches and acting as military governor of Hunza, he returned to his regiment late in 1892, having been promoted to captain's rank earlier in that year. In 1893 he was once more sent to the Himalayas, being selected for the command of Fort Gupis, which stood midway between Gilgit and Chitral. A series of political murders and the subsequent disaffection of Sher Afzul, the usurping ruler of Chitral, led to the dispatch of the political agent, Sir George Scott Robertson [q.v.], to Chitral, escorted by Townshend and a detachment of troops from Gupis early in 1895. This little force reached Chitral, but was soon driven into the fortified palace of Chitral and there besieged, suffering severe privations during an investment of forty-six days (4 March-20 April). For Townshend, as commander of the garrison, the situation was difficult: the enemy displayed boldness; his own men were apathetic; and the presence of the political agent complicated his position as military commander. In April 1895 Chitral was relieved. For the skill and judgement displayed in its defence, Townshend received the thanks of the government of India, a brevet majority, and the C.B.—a remarkable reward for so young an officer.

On returning to England Townshend found himself a celebrity, and had little difficulty in obtaining a transfer to the Egyptian army. Accordingly in February 1896 he arrived in Cairo to assume command of the twelfth Sudanese battalion. A few weeks later he set out with (Lord) Kitchener's expedition for the reconquest of the Sudan. During that year he took part in the operations for the recovery of Dongola, obtaining another mention and a brevet lieutenant-colonelcy. Throughout 1897 he remained engaged in the Nile valley, and in 1898 commanded his battalion at the battles of the Atbara and of Khartoum, obtaining the D.S.O. for his services. After resigning his appointment in Egypt, Townshend returned to India in 1899, nominally to take up a staff appointment, but, on the outbreak of the war in South Africa, he made every endeavour to be sent to the Cape. This at length he effected, and he arrived at

Bloemfontein in March 1900, to act as assistant-adjutant-general on the staff of the military governor of the Orange Free State. The work and surroundings proved uncongenial and Townshend returned home in September 1900, to be reinstated in the British service as a major in the Royal Fusiliers. In spite of his record of service and of his proved military qualities Townshend now antagonized not a few high authorities. Many idiosyncrasies, regarded with amused tolerance in the young officer, proved less becoming in a soldier of standing and distinction. A passion for theatrical society, gifts as an excellent raconteur and entertainer, a constant flow of quips and quotations in French obscured some true merit. A remarkable knowledge of military history was warped by a lack of systematic training and by a self-confidence that often failed to impress. Townshend's abilities were thus, perhaps not unjustly, regarded as unbalanced, and he now went through a period of lean years. Until March 1903 he served at home, growing more dissatisfied with regimental duty. He then exchanged into the battalion of his regiment stationed in India. Promotion to brevet colonel came in January 1904. He returned home in December of that year, and in 1905 acted for a time as military attaché in Paris. But his restlessness was unabated until, in March 1906, he was transferred to the Shropshire Light Infantry and again went to India. There in August 1907 he became assistant-adjutant-general of the ninth division. In February 1908 he was promoted substantive colonel, while a year later he was appointed commander of the Orange River Colony District, a position carrying the rank of brigadier-general. Townshend remained in South Africa until promoted major-general in July 1911, when he returned to England. He had in the meantime become an ardent admirer of the French army and of the future Marshal Foch; so much so that this predilection even coloured the training of his troops. The command of the East Anglian division of the Territorial Force was next given him; but he preferred more active employment, and was gratified when in June 1913 he left for India to assume command of the Jhanzi brigade. A few months later he left this unit for the Rawal Pindi brigade, and he was at Pindi at the time of the outbreak of the European War.

Townshend's persistent efforts to obtain a command at the front were at length

satisfied in April 1915 by his appointment to the sixth (Indian) division, that being one of the two divisions operating in Mesopotamia, under the command of Sir John Eccles Nixon [q.v.]. In the ensuing campaign the brunt of the fighting fell upon Townshend's division. His first task was to drive the Turks northwards from Kurna on the Tigris, which was then in full flood. The water was so high that the fortified Turkish position stood out of the marshy flats almost like a string of islands. Townshend accordingly organized a fleet of ancient Tigris barges, known as *bellums*, on which he embarked two brigades, supported by three naval sloops and other odd craft. With this curious armada on 31 May he delivered a frontal attack on the enemy—a seemingly hazardous proceeding, since the Turkish position was guarded by mines and the depth of water was uncertain. Luckily the mines proved ineffective and most of the defenders fled. Emboldened by success Townshend pursued the Turks with a handful of men, embarked on a few naval craft, until he reached Amara (90 miles up the river from Kurna). There the bulk of the Turkish force surrendered before discovering the weakness of the pursuit. Townshend's audacity was thus amply rewarded.

Shortly afterwards Townshend fell ill and was sent to India for treatment. On resuming his command in September, he found his division distributed along the Tigris with the Turks entrenched astride the river in front of Kut el Amara (150 miles above Amara). Difficulties of transport and supply were already hampering the movements of the British troops, who were, moreover, sorely in need of reinforcement; the Turks on the other hand were growing in numbers and boldness. Nevertheless, an advance on Bagdad had been decided upon by higher authority, and Townshend was not unwilling to fall in with the plan. On 27 September he attacked the Turkish position. It was a bold move, involving a night march and a turning movement. Having divided his force Townshend cleverly feinted on the right bank of the river whilst driving home his main attack away from the left bank. The Turks were defeated and Kut was captured (29 September); but the victory could not be effectively followed up owing to the weakness and fatigue of the British forces. Retreating in good order, the Turks took up a fortified position at Ctesiphon, covering Bagdad. The Tigris now grew so shallow that Townshend,

depending largely on water transport, found his supply services still further hampered, so that he was compelled to halt at Azizieh (60 miles beyond Kut).

The final move on Bagdad was then ordered. Townshend raised objections to the proposed operations without the assistance of a second division, but deferred to the judgement of his commander-in-chief, Sir John Nixon. Difficulties were minimized by all authorities concerned in the campaign; and a successful preliminary attack on a Turkish advanced post at El Kutuniya encouraged optimism. But the Turks had in the meanwhile been reinforced, before Townshend, on 22 November, could attack their position. Once more he cleverly manoeuvred to turn the Turkish left while launching his main attack at a specially selected point in their main line of resistance. This point was taken after fierce fighting, but only at heavy cost. The Turks, now strengthened by some good troops from the Caucasus, counter-attacked the next day. Townshend's resources proved quite inadequate to the task in hand, and the situation, aggravated by the difficulty of navigating the low waters of the Tigris, grew critical.

After a week's fighting and retreating, holding at bay the enemy's greatly superior forces, Townshend led his men back into Kut on 3 December with 1,350 prisoners. It is more than doubtful whether he could have withdrawn farther. After one or two attempts to carry the place by assault the Turks invested it closely. Townshend expected to be relieved, but attempts by Lieutenant-General Aylmer and Major-General Gorringe in January and February proved unavailing. Townshend conducted the defence skilfully, although the fall of Kut had become inevitable when Aylmer failed to break through the Turkish lines in January. The garrison suffered severely, and men were actually dying of starvation when Townshend opened negotiations with the Turks. The surrender of Kut took place on 29 April 1916.

Townshend and his garrison became prisoners of war. The troops fared lamentably in captivity, but Townshend himself was well treated, being interned on Prinkipo Island, near Constantinople. In October 1917 he was created a K.C.B. A year later he was released by the Turks in order that he should plead on their behalf for the best possible terms of surrender. The armistice with Turkey was signed on

30 October 1918, when Townshend returned to England.

After the War Townshend failed to obtain any further military appointment; he therefore retired and took to political life, and was elected to parliament in November 1920, as an independent conservative for the Wrekin division of Shropshire. In the House he occasionally spoke on matters that concerned the East or the ex-service man, but on the whole he proved ineffective, and did not seek re-election. Subsequently, he sought opportunities of acting as negotiator between Great Britain and Turkey in the final settlement of questions arising out of the War; but his services were curtly declined by the government. Undeterred, he proceeded to Angora in June 1922, and was well received by Kemal Pasha, his pro-Turkish sympathies being thereby strengthened. On his return to London he strongly advocated the Turkish case, but failed to find support. He visited Angora again in 1923. His health, however, was failing, and he died in Paris 18 May 1924.

Townshend married in 1898 Alice, daughter of Count Louis Cahen d'Anvers. He left one daughter.

[*The Times*, 19 May 1924; E. Sherson, *Townshend of Chitral and Kul*, 1928; Sir C. V. F. Townshend, *My Campaign in Mesopotamia*, 1920; Army Lists. Portrait, *Royal Academy Pictures*, 1920.]

H. DE WATTEVILLE.

TRELOAR, SIR WILLIAM PURDIE, baronet (1843-1923), carpet manufacturer and philanthropist, the second son of Thomas Treloar, mat manufacturer, of Helston, Cornwall, by his wife, Elizabeth, daughter of John Robertson, of Pitlochry, Perthshire, was born in Southwark 13 January 1843. His family soon moved to Blackheath, and in 1854, at the age of eleven, Treloar was sent to King's College School, then situated in the Strand, travelling thither daily alone in a third-class carriage—the carriages being roofless, windowless, and without seats. He left school at the age of fifteen and entered his father's business. He passed through every department of the factory, beginning at the bottom as a workman, later acting as foreman, and eventually succeeding to the post of manager.

Treloar's civic career began in 1880, when he was elected to the Court of Common Council in the ward of Farringdon Without. Thenceforth he took an active part in the municipal affairs of the

City of London. In the annual elections of his ward he was always successful, and generally headed the poll. In 1891 he was elected chairman of the City commission of sewers, which, nominally a separate body, was managed by the City Corporation and afterwards absorbed by it by Act of Parliament. In 1892 he was unanimously elected alderman of the ward of Farringdon Without. In 1899-1900 he served as sheriff, and entered with great spirit into the raising of the City Imperial Volunteers for service in South Africa during the Boer War. He was knighted in 1900.

Amongst Treloar's civic activities certain matters of public interest deserve special mention. In 1886 he moved and carried a resolution that election to the Court of Common Council should be by ballot. In 1894, in the face of much bitter opposition, he moved and finally carried a resolution expressing the desirability of opening the Guildhall Art Gallery on Sunday afternoons. This decision did much to encourage the activities of the National Sunday League, of which Treloar was president.

In 1906 Treloar was elected lord mayor of London, and began a brilliant year of office, during which King Edward VII and Queen Alexandra opened the New Central Criminal Court, Old Bailey. Treloar himself, as lord mayor, paid an official visit to Berlin, on an occasion which called for unusually tactful exchanges. But his most enduring work as lord mayor was the launching of an appeal for the foundation of a home for crippled children. The scheme received royal approval and support. Treloar collected £60,000 and obtained for the home the Princess Louise Military Hospital, built at Alton, Hampshire, during the South African War, with the proceeds of the 'Absent-minded Beggar' appeal by the *Daily Mail*. To the interests of this institution, which was named the Lord Mayor 'Treloar Cripples' Hospital and College, Treloar devoted the greater part of his remaining life. Such an institution had never previously been conceived. Its objects, from the beginning, were the combined treatment and education of crippled children under the age of twelve years—priority being given to children suffering from surgical tuberculosis—and the training of crippled boys between the ages of fourteen and eighteen in trades suited to their limitations. The hospital met a very real need, and since its opening in September 1908 many

thousands of crippled children have been successfully treated, educated, and trained therein. In 1910 Treloar founded a sea-side branch of the hospital at Hayling Island. As a result of this pioneer work, other hospital schools were established in 1911 and are now numerous in the country.

Treloar possessed a most genial personality, and was a member of the Carlton, Junior Carlton, Authors, Savage, Press, and Whitefriars Clubs. He was author of *Ladgate Hill; Past and Present* (1881), *Prince of Palms* (1884), *With the Kaiser in the East*, 1898 (1915), *Wilkes and the City* (1917), and *A Lord Mayor's Diary* (1920).

Treloar married in 1865 Annie (died 1909), daughter of George Blake; they had no children. He adopted a nephew and a niece. He was created a baronet in 1907, but the title became extinct on his death, which took place at Grange Mount, Norwood, 6 September 1923.

A portrait of Treloar by P. Tennyson Cole hangs in the Guildhall Art Gallery, and a marble bust by Albert Toft was recently in the Mansion House.

[C. E. Lawrence, *William Purdie Treloar*, 1925; personal knowledge.] H. GAUVAIN.

TRENCH, FREDERIC HERBERT (1865-1923), poet and playwright, was born at Avoncorc, co. Cork, 26 November 1865, the son of W. W. Trench, of Ballater, Bournemouth. In 1880 he went to Haileybury College (Melville House), and from there in 1884, having won an open exhibition in modern history, to Keble College, Oxford. His university studies were at first hindered by ill-health, but he obtained a first class in modern history in 1888 and was elected a fellow of All Souls College in 1889. He had meanwhile travelled in southern Europe and the Near East. As an undergraduate Trench is described by a contemporary as of engaging manners and striking appearance, with fine eyes, straight black hair, a fresh complexion, and a heavy black moustache. His tutors found him an interesting but somewhat dreamy person, of obvious ability, and of a fine character, steadily developing through discipline. He was appointed a temporary examiner by the Board of Education in 1891, was placed on the permanent staff in 1892, and promoted to be a senior examiner in 1900. He retired in 1909. From then until 1911 he was 'artistic director' at the Haymarket Theatre. Shortly after this he went to live at Settignano, near Florence. He died in hospital at Boulogne-sur-Mer on 11 June

1923, having fallen ill on a journey to England. He had married in 1891 Lillian Isabel, daughter of Robert Fox, of Grove Hall, Falmouth, and Penjerriek, Cornwall. They had two sons and three daughters.

Trench was a man of letters who was temperamentally unsuited to administrative work. When the burden of routine at the Board of Education was much increased after the Education Act of 1902, it was probably with feelings of mutual relief that his retirement was arranged. But before this he had made his mark as a poet; first, in 1900 with *Deirdre Wed and other Poems* and, more definitely, in 1907 with the volume containing 'Apollo and the Seaman'. Later came poems, long and short, inspired by his life in Italy and by the European War, and various lyrics, notably a sequence, 'To Arolilia'. It was probably his short term of responsibility at the Haymarket Theatre (in itself notable for productions of *King Lear* and Maeterlinck's *The Blue Bird*) that turned him to play-writing. He completed a four-act play, *Napoleon*, which was produced by the Stage Society in 1919, and he was at work upon another, *Talleyrand*, when he died. He also published some *Fables in Prose*, which are not remarkable, and a translation (1901) of Merejowski's *Death of the Gods*.

Trench had a generous share of the attributes of a poet. He was sensitive and imaginative; he had an ear for the music of words and a scholarly taste in their use. His simpler poems are the most likely to survive, and those in which the emotion and the thought meet, as it were, upon equal terms. He is at his best when he is least self-conscious. Such a lyric as 'Come, let us make love deathless, thou and I...' is memorable, and there are others as good. Such poems as 'The Shepherd' and 'The Song of the Vine' have authentic beauty, and the swinging melodies of 'Apollo and the Seaman' promise life to a great theme. The vigorous

'Apollo through the woods came down
Furred like a merchant line,
And sate with a sailor at an inn
Sharing a jug of wine . . .'

is, for the opening of a 'philosophic ballad', hardly to be bettered; so, too, the sailor's

'I heard them calling in the streets
That the ship I serve upon—
The great ship Immortality—
Was gone down, like the sun . . .'

But the promise is only partly fulfilled; the method is incompatible with the portentous weight of matter. The weak-

ness of the more patently ambitious work lies, it is to be feared, in a certain pretentiousness. The poet is possessed, seemingly, by some transcendental idea. But he either cannot or will not forge it as a whole into clear thought and adequate expression. He is apt instead to elaborate its vagueness in fine words and images, which leave us at the poem's end conscious of having read some very noble lines but disposed to wonder what it is all about—and a little suspicious that Trench himself may have been left wondering too.

Napoleon is a play with an idea, a very good idea, and the dramatic medium itself invites clarity. Trench chose, moreover, to cast it in prose, save for one scene, and that not among the best. The stage-craft is efficient, even if the action is, now and then, needlessly crowded with incident. Some of the characters may lack autonomous life, but the result of the whole is often striking, occasionally moving, and never less than interesting. It is distinguished drama, and might well have led him to other and more complete achievement in this kind.

The following is a list of Trench's works: *Deirdre Wed and other Poems* (1900); *The Death of the Gods*, translated from Merejowski (1901); *New Poems* ('Apollo and the Seaman', 'The Questioners', &c., 1907); *Lyrics and Narrative Poems* (1911); *Ode from Italy in time of War* (1915); *Poems, with Fables in Prose* (1918); *Napoleon, a play* (1919). His *Collected Works* were published in three volumes in 1924.

[*Memor* by Harold Williams in *Collected Works*, 1924; private information.]

H. GRANVILLE-BARKER.

TREVELYAN, SIR GEORGE OTTO, second baronet (1838-1928), historian, man of letters, and statesman, was born at Rothley Temple, Leicestershire, 20 July 1838. He was the only son of Sir Charles Edward Trevelyan, first baronet [q.v.], governor of Madras, by his first wife, Hannah More, daughter of Zachary Macaulay [q.v.] and sister of Lord Macaulay [q.v.]. During the first twenty years of Trevelyan's life his father resided in England, occupying, as assistant secretary to the Treasury, a leading position in the English civil service, between two periods of his Indian career. At Clapham and afterwards in London the Trevelyans' house was almost a second home to the bachelor Macaulay. George Trevelyan was from the first a favourite companion of his uncle, and acquired in very early

years a picturesque and vivid realization of the past, and 'strong bookmindedness' in relation to classical and English literature, although he never had his uncle's easy familiarity with modern European languages. His elder sister Margaret, who afterwards married the first Viscount Knutsford [q.v.], and his younger sister Alice, afterwards Mrs. Stratford Dugdale, completed this affectionate and like-minded family group.

After a few years at a private school of no special note, Trevelyan went in 1851 to Hartow, then at the height of the scholarly eminence which it reached under Dr. Charles John Vaughan [q.v.]. Trevelyan was at The Grove, Mr. Steel's house; he became head of the school and Gregory prizeman, swept up the school honours, winning the English prize poem three years running, and distinguishing himself by an output of English verse on topical school subjects, some in imitation of Juvenal. In 1857 he went up to Trinity College, Cambridge, where he obtained an undergraduate reputation which long outlasted his residence there. This reputation was not based on Trevelyan's performance in scholarship, although he was placed second in the classical tripos (1861) in a period of very high competition; it rested principally on his intellectual high spirits, above all on his light verse and satires ('The Bear' and 'The Cambridge Dionysia', which made a butt of a pretentious university magazine, *The Lion*). This phase of his literary activity culminated in *Horace at the University of Athens*, first printed by Jonathan Palmer at Cambridge in 1861, a piece of not too recondite fun which long remained a favourite among Cambridge men of the old classical tradition. But, however popular among Trevelyan's contemporaries, it was less highly appreciated by some of the authorities; and William Whewell, as master of Trinity, considered the author lacking in deference.

In any case Trevelyan failed to obtain a fellowship at Trinity in October 1862, and as he had no very high opinion of the scholarship of some of the successful candidates (R. C. Jebb was also passed over that year), he decided not to sit the next year, as he might have done, but to go out to India as private secretary to his father, then financial member of the governor-general's council. His feeling for Trinity remained all his life akin to that of an Athenian for Athens, and one of the honours which he most appreciated in

later life was his election in 1885 to an honorary fellowship. His full-length portrait by Frank Holl now hangs in the Old Combination Room of the college, and is by far the best picture of him. His friends among his Trinity contemporaries remained the most intimate friends of his life—Henry and Arthur Sidgwick, Edward Bowen, Henry Jackson, Richard Jebb, Henry Yates Thompson, George Howard (afterwards ninth Earl of Carlisle), Sir George Young, and Henry Montagu Butler, who was a few years his senior.

In December 1859 Lord Macaulay died: in its main outlines Trevelyan's mind never lost the impress made upon it by his uncle's society. But during the following decade his mental equipment for life was completed by two fresh influences—the works of Carlyle, Ruskin, and Browning, which to some extent modernized his literary tastes in a manner which his uncle would not have approved, and in politics the new liberal movement of the 'sixties. Largely intellectual in origin, that movement was closely connected with the desire to reform the older universities and to open them to all, irrespective of religious beliefs. The movement enlisted the enthusiasm of all Trevelyan's Cambridge friends, such as the Sidgwicks and Henry Jackson, and of new Oxford friends in the early days of the 'Ad Eundem' dining club. The memory of his personal connexions with Oxford at this period made him take a particular pleasure as an old man in his election to an honorary fellowship at Oriel College in 1920.

While he was still at Cambridge and still a Palmerstonian whig, rather than a liberal, Trevelyan had been touched by the prevalent enthusiasm for the cause of Italian liberty; in 1862 he had written, in boyish high spirits, a poetic skit on the subject entitled *The Pope and his Patron*; and in 1867 he went out to be present at Garibaldi's attack on Rome, but arrived the day after the battle of Mentana, only in time to witness Garibaldi's arrest by the Italian royal troops. To the end of his life he was devoted to Italian travel and enjoyed it with a full mind.

The work which first brought Trevelyan to the notice of London as distinct from Cambridge society was *The Competition Wallah*, which originally appeared as letters in *Macmillan's Magazine*, and in 1864 in book form; it contained the observations made during his long visit to India in 1863. The work, favourably looked on by those who knew India well,

at once became popular in England. It remains the most vivid account of Anglo-Indian life in the decade after the Mutiny. He followed it up with *Caenpore* (1865), a striking piece of historical narrative.

In the parliament of 1865 to 1868 Trevelyan, although returned for Tyne-mouth as a Palmerstonian, became an enthusiastic supporter of John Bright. He often sat next to him in the House during the debates and vicissitudes of the struggle which ended in the second Reform Bill (1867). The dramatic events of the Reform Bill session of 1866 inspired him to write *Ludies in Parliament*, the last and not the least happy effort of his poetical and social muse. The Aristophanic chorus 'We much revere our sires' was the best thing of the kind that he wrote.

Trevelyan became at this time a prominent advocate of army reform, particularly of the abolition of the purchase system, in which controversy he was to no small degree inspired and coached by his father. This cause, unpopular with the court and the army chiefs but serviceable to the efficiency of the army, triumphed in 1870 owing to the energetic measures of Mr. Gladstone and (Viscount) Cardwell. In 1868 Gladstone formed his first ministry, and Trevelyan, who had been returned to parliament for the Border (Hawick) Burghs, became civil lord of the Admiralty. In 1870 he resigned office because he differed from the government's decision to increase the grant to the Church schools as part of the arrangements of W. E. Forster's famous Education Bill. This action permanently retarded Trevelyan's rise in the official hierarchy of the party, and throughout life his relations with Gladstone, although correct, were seldom cordial. During the 'seventies he remained in parliament, sitting for the Border Burghs, a centre of Scottish radicalism, until 1886. During the period of liberal opposition (1874-1880) he brought forward year after year a motion for the extension of the working-class franchise to the county divisions, a measure finally passed by Gladstone in 1884-1885, largely as a result of Trevelyan's efforts in bringing the question to the front.

If the 'seventies were a period of comparative obscurity for Trevelyan as a politician, they were the principal period of his literary achievement. In 1870 appeared his *Life and Letters of Lord Macaulay*, a work which has always been regarded as a model of that type of bio-

graphy, and by which his name is likely to survive longest on this side of the Atlantic. In 1880 he brought out his *Early History of Charles James Fox*, a biography of a totally different kind, giving satisfaction more as a brilliant picture of a state of society than as the portrait of a statesman of whom nothing is there recorded except the years of his irresponsible boyhood and youth. It is a work of historical art which has the effect of giving the reader the *entrée*, as an intimate member, to a bygone aristocratic society.

The death of Trevelyan's mother in 1872 and the marriages of his two sisters had now quite broken up the old family circle, but his own marriage in 1869 to Caroline, daughter of Robert Needham Philips, of Manchester, a leading Lancashire merchant and politician in the heyday of the Manchester School, opened for him fifty-nine years of unbroken domestic happiness. He always spoke of his marriage as the most fortunate event in a very fortunate life. There were three sons of the marriage: Charles Philips, sometime labour minister for education; Robert Calverley, the poet; and George Macaulay, regius professor of modern history in the university of Cambridge, author of this article. He had something of his uncle's power of interesting children in literature and history, especially military history, as much through familiar jokes and allusions as by direct instruction.

In 1880 Gladstone formed his second ministry and Trevelyan was left out of it. In 1881, however, he was appointed parliamentary secretary to the Admiralty, and in 1882 the murder of his friend, Lord Frederick Cavendish, in the Phoenix Park, Dublin, led to Trevelyan's appointment as his successor in the office of chief secretary for Ireland, under the fifth Earl Spencer as lord-lieutenant. The secretary had to face the organized Irish opposition in the Commons, as well as to share with Lord Spencer the difficulties in Ireland, including on one occasion a mutiny of the Dublin police. Trevelyan became warmly attached to Lord Spencer; they endeavoured to carry on the policy of conciliation which Lord Frederick had been sent over to initiate, though their difficulties were greatly increased by his assassination.

In October 1884 Trevelyan entered the Cabinet as chancellor of the duchy of Lancaster. In Gladstone's third ministry, formed after the election of 1885, Trevelyan

became secretary for Scotland and in 1886 introduced his Crofters' Bill, the principles of which, when subsequently put into law, did much to solve the crofter question in the highlands on the lines of previous Irish land legislation. But in the spring of 1886 Gladstone introduced Home Rule for Ireland, and Trevelyan resigned, being unable to accept Home Rule, especially in connexion with the accompanying land-purchase scheme. He stood as a liberal-unionist at the general election of 1886, an election which he always thought Gladstone ought to have avoided, as it led inevitably to the break-up of the liberal party. He was defeated by a Gladstonian at the Border Burghs, for which he had sat for twenty-eight years. But alliance with conservatives was not congenial to him; after the abortive Round Table Conference (January-February 1887), in which he took part, had failed to reunite the liberal chiefs, his liberalism overcame his objections to Home Rule. He was returned for the Bridgeton division of Glasgow as a Gladstonian liberal in 1887. This change naturally exposed Trevelyan to a good deal of censure at a time of intense political feeling.

If politics and London society were becoming less entirely congenial to Trevelyan than before, his country home at Wallington in Northumberland, which he inherited when he succeeded his father as second baronet in 1886, gave a happy background to his life. This combined with a love of letters to draw him out of public life in January 1897, after another period in the Cabinet as secretary for Scotland in the Home Rule parliament of 1892-1895. During his later years in politics he had formed friendships—personal and literary even more than political—with colleagues such as Lord Rosebery, (Lord) Bryce, (Lord) Morley, and Sir William Harcourt, and among younger men with Sir Edward (afterwards Viscount) Grey, a neighbour in Northumberland.

From his retirement in 1897 until his death in 1928, Trevelyan seldom spent more than three months a year in London, and in the last dozen years of his life never visited town. He lived during the summer at Wallington and during the winter at his wife's house at Welcombe, Stratford-on-Avon. He was fond of shooting, particularly blackcock and grouse on the moors; in pursuit of game he was an active walker until old age overtook him, when he became devoted to his garden and

woods. He was never too old to read the Greek, Latin, and English classics with an avidity rare even among scholars.

Until he became too old for regular work, Trevelyan was employed in writing his history of the American Revolution, which appeared in the following order: *The American Revolution*, Part I, 1766-1776 (1899), Part II (2 vols., 1903-1905), Part III (1907), and *George III and Charles Fox, the concluding part of the American Revolution* (2 vols., 1912 and 1914). This, his last work, completed on the very outbreak of the European War, retains many of the qualities of his earlier work. But, although not ill received, it was not generally popular in England, for the story of the loss of the American colonies can hardly be made an agreeable story to Englishmen, and part of the public regarded his point of view as too favourable to the Americans. On the other hand, the work had a great effect in the United States, where its chief sale has always been. It did much to help the movement over there for reconciliation to England, by emphasizing the strong element of opposition to the policy of George III that had existed in this country, by disposing of many anti-English myths, and by representing English life and people of that day in a pleasanter and more intimate light than any to which American readers were accustomed. The book brought him many American friendships, and put him into close personal and epistolary contact with Theodore Roosevelt, Cabot Lodge, J. H. Choate, the Adamses, the historians J. F. Rhodes and C. H. Van Tyne, and many more. His voluminous correspondence with Roosevelt (some of it published in J. B. Bishop's *Life of Roosevelt*, 1920), Cabot Lodge, and other influential Americans was continued during the European War in the interest of England's quarrel with Germany and the cause of Anglo-Saxon solidarity. He was too old to render his country any more active services between the years 1914 and 1918. He lived until the age of ninety, dying at his home at Wallington 17 August 1928, six months after his wife's death and nine years after their golden wedding. He was succeeded as third baronet by his eldest son (born 1870). In 1911 the Order of Merit had been conferred on him.

There is a portrait of Trevelyan by Francis Paul at Trinity College, Cambridge.

[G. M. Trevelyan, *Sir George Otto Trevelyan. A Memoir*, 1932.] G. M. TREVELYAN.

TREVES, SIR FREDERICK, baronet (1853-1923), surgeon, was born at Dorchester, Dorset, 15 February 1853, the youngest son of William Treves, upholsterer, of that town, by his wife, Jane, daughter of John Knight, of Honiton. His father's family had been settled in Dorset for many generations, most of its members being yeoman farmers. In 1860, at the age of seven, Treves was sent to the school in Dorchester kept by the Rev. William Barnes [q.v.], the Dorset poet, where he remained until 1864, when he entered Merchant Taylors' School, in the City of London. Here he spent seven years, leaving in 1871, at the age of eighteen, to enter upon the study of medicine. There is no record of his having shown special ability during his school-days. At Merchant Taylors' he became a member of the football XV.

The London Hospital, at which Treves obtained his medical education, although offering its students ample opportunities for clinical observation, did not then enjoy the highest reputation amongst the metropolitan medical schools. Yet on its staff were men of scientific distinction, such as John Hughlings Jackson and (Sir) Jonathan Hutchinson, and others, like (Sir) Andrew Clark, who were eminently practical. It was the practical rather than the scientific aspect of medicine which appealed to Treves. He proved to have excellent manipulative ability, an asset of great value to one destined to become eminent both as anatomist and surgeon.

In 1875, after four years of study, Treves passed the examinations which qualified him as a member of the Royal College of Surgeons of England; in the previous year he had become a licentiate of the Apothecaries Hall. After holding a house-surgeonship at the London Hospital, he became in 1876 resident medical officer at the Royal National Hospital for Scrofula (later it became the Royal Sea-Bathing Hospital) at Margate, to which his brother William (Frederick's senior by ten years) was honorary surgeon. Scrofula and tuberculosis became the subjects of his first research.

Meantime Treves became engaged to Anne Elizabeth, youngest daughter of Alfred Samuel Mason, of Dorchester, and went into practice in Derbyshire in order to provide a home for her. He married in 1877 at the age of twenty-four, but continued to study and passed the examinations for the fellowship of the Royal College of Surgeons of England in 1878.

In the following year he gave up practice in Derbyshire and returned to the London Hospital in order to fill the post of surgical registrar. He had scarcely entered on this office when a vacancy occurred on the surgical staff of the hospital; he was appointed assistant surgeon in September 1879, and became full surgeon in 1884, being then only thirty-one years of age.

Having obtained a place on the surgical staff of his hospital Treves, like other young surgeons in a similar position, had to find a means of livelihood until he had built up a consulting practice. He therefore became a 'demonstrator' of anatomy in the medical school attached to the London Hospital. His reputation as a demonstrator soon spread beyond the walls of the hospital; his clear, incisive style, his power of happy description, his racy humour, and the applicability of his teaching brought crowds of students to his daily demonstrations. His success as a writer, both of medical treatises and of books of travel, can be traced to his experience as a demonstrator of anatomy. He was in charge of the practical teaching of anatomy from 1881 to 1884, when he became lecturer on anatomy, a post which he held until 1893. This he gave up in order to teach operative surgery, which he did for only one year, becoming lecturer on surgery 1894-1897. Meanwhile, Treves was diligent in the wards of the hospital, building up a reputation as a leading surgeon. His consulting-room at No. 6 Wimpole Street became one of the best known in England.

During the period in which he held these teaching posts, Treves also produced a succession of successful text-books. In 1883 appeared *Surgical Applied Anatomy*; he edited *A Manual of Surgery* (3 vols., 1886), *A Manual of Operative Surgery* (1891), *The Student's Handbook of Surgical Operations* (1892), and *A System of Surgery* (2 vols., 1893). All these books are characterized by a lively, clear style and many practical observations.

In quite another category are the books which brought Treves fame as an investigator. His early experience with his brother at Margate led him to join in the search into the nature of the condition then known as scrofula. In 1882, at the age of twenty-nine, he published the results of his research in a book entitled *Scrofula and its Gland Diseases*. In the same year as this book appeared, Robert Koch, the German bacteriologist, demonstrated that the disorder which had so

greatly puzzled Treves and all previous investigators was due to the action of a bacillus.

Just at the time when Treves began his surgical career, the abdomen became a field of advance in surgery. The application of the discoveries of Louis Pasteur and of (Lord) Lister [q.v.] made this possible. Treves applied himself to this new field, making a survey of the anatomy of the abdomen, especially in so far as anatomical details could throw light upon the causes of obstruction. In 1883 the Royal College of Surgeons, of which he was one of the Hunterian professors of anatomy in 1885 and Erasmus Wilson lecturer in pathology in 1881, awarded him the Jacksonian prize for a dissertation on *The Pathology, Diagnosis and Treatment of Obstruction of the Intestine* (published 1884). In 1899 a new and revised edition of this work appeared under the title *Intestinal Obstruction, its Varieties, with their Pathology, Diagnosis and Treatment*. A final and much amended edition, almost a new work, appeared in 1902. In 1885 appeared his Hunterian lectures on *The Anatomy of the Intestinal Canal and Peritoneum*, a book which contains his best original work.

When Treves began the study of medicine the condition known as perityphlitis was still obscure. By 1886 R. H. Fitz, of Boston, Massachusetts, had examined 200 cases and observed that in 257 of them it was not the caecum but its appendix which was the site of the disease; hence he named the condition *appendicitis*. Treves operated on his first case of perityphlitis (he at first rejected the name appendicitis) in 1887; by 1890 he, too, was convinced that it was the appendix and not the caecum that was the site of the disease. He did great service to surgery in England by his advocacy of the operative treatment of appendicitis. It was he who first advised that in chronic cases operation should be delayed until a quiescent interval was reached.

So extensive did Treves's private practice become that he gave up his surgeonship at the London Hospital in 1898 at the age of forty-five. In 1899, on the outbreak of war in South Africa, he was called to serve as consulting surgeon to the forces then in the field. On his return to England, he was appointed surgeon extraordinary to Queen Victoria in 1900; he was made C.B. and created K.C.V.O. in 1901.

In the summer of 1902 Treves's fame became suddenly world-wide. On 24 June, two days before the date fixed for his

coronation, King Edward VII became acutely ill. His condition was diagnosed as perityphilitis. Treves had been called in by the physicians in attendance. After consultation with Lord Lister and (Sir) Thomas Smith [q.v.], he operated. The king made a good recovery and was crowned on 9 August. Treves was created a baronet in the same year.

In 1900 Treves published an account of his experiences of the South African War under the title *Tale of a Field Hospital*. This was the first of a series of books in which he applied to the description of countries and peoples the gifts which had made him famous as a teacher of anatomy and of surgery. *The Other Side of the Lantern* (1905) is based on a tour round the world; *Highways and Byways of Dorset* (1906) is a guide to his native county; a voyage to the West Indies gave him the materials for *The Cradle of the Deep* (1908); *Uganda for a Holiday* (1910) has a self-explanatory title. His impressions of Palestine are vividly reproduced in *The Land that is Desolate* (1912). Treves visited Italy in order to work out the topography of Robert Browning's *The Ring and the Book*. His inquiries provided the basis for *The Country of 'The Ring and the Book'* (1918).

After the European War of 1914-1918, during which he served at the War Office as president of the Head-quarters Medical Board, the state of Treves's health made it advisable for him to live abroad, first in the south of France, afterwards at Vevey on the shores of the Lake of Geneva. His experiences and impressions of these years are published in *The Riviera of the Corniche Road* (1921) and *The Lake of Geneva* (1922). His last book, entitled *The Elephant Man and other Reminiscences* (1923), is devoted to recollections of medical experiences.

Treves died after a few days' illness at his home at Vevey 7 December 1923. His ashes were buried in Dorchester cemetery, his friend Thomas Hardy being present at the ceremony. He had two daughters, the younger of whom predeceased her father, and the baronetcy became extinct on his death without male issue.

Many honours were conferred upon Treves in addition to those already mentioned: C.B. (1901), sergeant-surgeon to King Edward VII (1902) and to King George V (1910), and G.C.V.O. (1905). He received honorary degrees from several universities, and the students of the university of Aberdeen elected him to the rectorship of their university (1905-1908).

Treves loved the sea, holding a master's certificate. He was a strong swimmer and fond of bicycling. He avoided social entertainments, preferring to be in bed by ten o'clock so as to be fresh for work at six in the morning. His early morning hours he devoted to study and correspondence.

There is a portrait of Treves by Sir Luke Fildes at the London Hospital Medical College. A cartoon by 'Spy' appeared in *Vanity Fair* 19 July 1900.

[*The Times*, 10 December 1923; V. G. Plarr, *Lives of the Fellows of the Royal College of Surgeons of England*, 2 vols., revised by Sir D'A. Power and others, 1930; *British Medical Journal*, 1923, vol. ii, p. 1185 (portrait).]

A. KERR.

TROUBRIDGE, SIR ERNEST CHARLES THOMAS (1862-1926), admiral, was born 15 July 1862 at Hampstead. He belonged to a family which for several generations had been connected with the fighting services. Rear-Admiral Sir Thomas Troubridge, the first baronet [q.v.], who gained distinction at the battles of Cape St. Vincent and the Nile, was described by Nelson, his close friend, as 'the most meritorious sea officer of his standing in the service'. His only son, Sir Edward Thomas Troubridge, the second baronet [q.v.], was present at the battle of Copenhagen. Troubridge's father, Colonel Sir Thomas St. Vincent Hope Cochrane Troubridge, the third baronet [q.v.], fought in the Crimean War, losing his right leg and left foot at the battle of Inkermann. He married Louisa Jane, daughter of Daniel Gurney, of North Runcton, Norfolk, and Ernest Troubridge was their third son.

After a short time at Wellington College, Troubridge entered the *Britannia* as a naval cadet in 1875, and was promoted lieutenant out of the royal yacht *Victoria and Albert* in 1884. While serving in the *Sultan* in Suda Bay, Crete, four years later, he saved the life of a young signalman who fell overboard, in the darkness, from a torpedo boat which was going at full speed. He was awarded the silver medal of the Royal Humane Society. In 1895 he was promoted commander, and was appointed in the following year to the *Itchen*, flagship successively of Rear-Admirals Sir Robert Harris and Sir Gerard Noel, and thus came to take part in the international blockade of Crete, in 1897-1898, which was praised by Lord Salisbury in the House of Lords as an example of successful naval diplomacy.

After his promotion to captain in 1901, Troubridge acted successively as naval attaché to the courts of Vienna, Madrid, and Tokio. He was serving in Tokio when the Russo-Japanese War broke out early in 1904, and by special permission of the Japanese government was embarked in one of the Japanese warships. He was the only non-combatant European officer to witness the battle of Chemulpo (9 February 1904) and the actions off Port Arthur, but he subsequently denied that he had taken any part, as had been suggested, in the preparation of Admiral Togo's plans. He furnished the British Admiralty with reports which were of the highest value in the evolution of naval policy. Besides being decorated by the Emperor of Japan, he was created a C.M.G. (1904) and received the M.V.O. (1904) 'as a mark of his Majesty's personal appreciation of his services in the Far East'.

Soon after returning to England, Troubridge was attached to the suite of King Edward VII during the king's visit to Kiel in 1904. In March 1907 he was appointed to the battleship *Queen* as captain of the flagship and chief of the staff to the commander-in-chief, Admiral Sir Charles Drury, and as commodore was subsequently (1908-1910) in command of the Royal Naval Barracks at Chatham. In 1910 he was selected for the position of private secretary to the first lord of the Admiralty. He served both Mr. Reginald McKenna and Mr. Winston Churchill in that capacity, and on the formation of the Naval War Staff in January 1912 was chosen by the latter to organize and direct the new 'brain of the navy', and became chief of the War Staff. Whilst serving at the Admiralty he was promoted to rear-admiral (1911).

In January 1913 Troubridge was appointed, with his flag in the *Defence*, to command the cruiser squadron of the Mediterranean fleet, of which Admiral Sir Archibald Berkeley Milne was commander-in-chief. He was thus destined to play a leading part in one of the decisive incidents of the European War, the fruitless attempt, in the opening days of the War, to intercept the German cruisers *Goeben* and *Breslau* in the Mediterranean. For the failure to bring these two vessels to action, the former one of the fastest and most powerful battle-cruisers afloat, both the commander-in-chief and the rear-admiral of the cruiser squadron were blamed when it became known that the

two vessels had eluded the British forces south of Greece and escaped into the Dardanelles, on 10 August 1914, to the great satisfaction of the Turks. It was suggested that this German naval move was the decisive factor in causing the Turkish government to throw in its lot with the Central Powers. Upon his return to England in consequence of the Franco-British agreement under which the French assumed supreme command in the Mediterranean, Milne gave an explanation to the Admiralty of his action and he was exonerated. Subsequently, Troubridge appeared before a court-martial, being charged that 'from negligence or default he did on 7 August forbear to chase H.I.G.M.'s *Goeben*, being an enemy then flying'. The court decided that Troubridge had acted loyally in accordance with his instructions, that he was justified in regarding the enemy's forces as superior to his own, in daylight, and that although, if he had carried on the chase, he might have brought the *Goeben* to action in the Cervi channel, south of Greece, he would not have been justified, without further orders, in quitting the station allotted to him. The charge was held to have been not proved, and Troubridge was 'fully and honourably' acquitted in November 1914. In order that he might attend the court-martial he had been recalled from the blockade of the Dardanelles which he had assumed under the orders of the French commander-in-chief.

In January 1915 Troubridge went out to Serbia as head of the British naval mission, and organized the evacuation of the Serbian army and refugees. During the Serbian retreat Troubridge rendered conspicuous services. His 'influence with the Serbian generals was very great. From the moment when he arrived on the Danube he had won their affection and respect. Throughout the retreat his proud military bearing and the self-control of his officers had been noticed by everybody. The Serbian authorities were very bitter about the Allies; but their affection for the British admiral had never wavered, and when they arrived at the coast one of their first acts had been to give him authority over their own soldiers and fellow countrymen' [*Naval Operations*, vol. iv, p. 118].

Troubridge returned home early in 1916 and was subsequently, in September 1916, appointed on the personal staff of the Crown Prince of Serbia. He was given command of a naval contingent which was

successful in preventing Belgrade from being bombarded and the Serbian troops harassed. His association with the Serbian government continued until after peace was signed in June 1919. In June 1920 he was appointed British representative on the International Danube commission, and acted as its president till March 1924. This was his last active service. He had retired from the navy in 1921, having been promoted vice-admiral in June 1916 and admiral in January 1919.

Troubridge died suddenly from heart failure, at Biarritz, 28 January 1926. His attractive personality and genial manners made him one of the most popular naval officers of his day. He was twice married: first, in 1891 to Edith (died 1900), younger daughter of William Duffus, of Halifax, Nova Scotia, by whom he had one son and two daughters; secondly, in 1908 to Una Elena, daughter of Captain Henry Ashworth Taylor, M.V.O., and granddaughter of Sir Henry Taylor [q.v.]; by her he had one daughter.

A. HURD.

DUKE, HENRY SCOTT (1858-1920), painter, the younger son of Daniel Hack Tuke [q.v.], physician and governor of Bethlehem Hospital, by his wife, Esther Maria Stickney, of Ridgmont, Holderness, Yorkshire, was born at York 12 June 1858. He was great-great-grandson of William Tuke [q.v.], quaker philanthropist, great-grandson of Henry Tuke [q.v.], quaker writer, grandson of Samuel Tuke [q.v.], and nephew of James Hack Tuke [q.v.], both of whom were also quaker philanthropists. The family, which belonged to the quaker aristocracy, inherited traditions of culture. He showed a precocious talent for drawing, and entered the Slade School of Art in 1875. His first work was hung in the Royal Academy in 1879, and in the following year a portrait group of the Misses Santley attracted attention there. After passing the winter in Florence, he joined Arthur Lemon at Forte dei Marmi in the spring of 1881, and in this friend's company made his first studies of nude figures in the open air, and realized, as he afterwards put it, 'what one's calling in life was'. In the following autumn Tuke entered the studio of Jean Paul Laurens, and remained in

Paris until 1883. Besides working in the atelier he was very much alive to the influences of contemporary French art, visiting exhibitions and making useful acquaintances, particularly that of Bastien-Lepage, for whom he felt the profoundest admiration, and whose example, especially in relation to the degree of finish used to accentuate various parts of a picture, can be traced in Tuke's earlier works.

From childhood Tuke had known and loved Cornwall, and on returning to England he settled there, at first in the artistic colony at Newlyn. In June 1885 he discovered quarters in a cottage on the cliffs above Swanpool, a little west of Falmouth, with neighbouring coves and beaches where he could paint from a nude model undisturbed. He gradually added studios to the cottage, which remained his home until his death. The foundries in the town and the maritime population supplied him with a succession of young male models. At first his subjects included scenes on board ship, of which the large 'All Hands to the Pumps' exhibited at the Royal Academy in 1889, bought by the Chantrey trustees, and now in the Tate Gallery, is a typical example. These were gradually superseded by the studies of nude youths in a sunlit atmosphere, against backgrounds of sea or shore—his most characteristic works and his own favourites as well as those of his public. One of the earliest and the finest, 'August Blue', exhibited in the Academy of 1894, created a stir not only by its artistic qualities but by the contrast which it presented to the frigid, studio nudes un- easily tolerated by the prudery of the time. Its purchase by the Chantrey trustees has been generally applauded: it is now in the Tate Gallery.

Throughout his life Tuke was also employed in painting portraits, the best of which rank with all but the most accomplished works of their class and period. He was elected A.R.A. in 1900 and R.A. in 1914. He was also an associate (1904) and member (1911) of the Royal Society of Painters in Water Colours, and his water colours, especially those of harbour scenes and sailing ships, are distinguished by an ethereal, fairy-like charm.

Tuke more than once visited Marseilles, Venice, and the Italian Riviera, and in 1923, at the age of sixty-five, was tempted, unfortunately as it proved, to accompany some scientific friends on a five-months' excursion to the West Indies and Central America. He failed to find the inspiring

subjects he had hoped for; the climate made him ill; and the party had experiences which might have tried the strength of a younger man. He returned home unwell in April 1924, and never fully recovered his vigour, although he took up his work and social life with his old zest. By the end of 1927 his health was causing anxiety, and after long periods of illness he died at Swanpool 13 March 1929, and was buried in Falmouth cemetery. He never married.

Tuke was one of those highly individual painters who make the British school the delight of the English public and the despair of philosophic art critics. He had been thoroughly grounded as a draughtsman at the Slade School, but problems of form and design did not greatly interest him. With a single figure, or a pair, his composition was often felicitous, but he rarely combined a larger number without confusion. His technique as a painter, assimilated by an inquiring and receptive temperament in Parisian studios with traditional tendencies, and modified later by study of the French impressionists, was in general experimental, but usually skilful and apposite. As a colourist he was sure of succeeding with certain prescribed schemes. His pictures were never merely illustrations, indeed his few mythological subjects are wholly unconvincing. Allowing for complete dissimilarity of theme, his works may be compared not inaptly with those of George Morland: both appeal to a distinct class of admirers for reasons connected with their subjects apart from their art, and the best works of each claim respect for their art quite apart from their subjects.

Although an extremely industrious painter, Tuke successfully pursued sports and games—yacht-racing, deep-sea fishing, cricket, bicycling, and bridge; and to those not familiar with his habits he seemed almost as eager about them as in his profession. His sympathy with the young kept him youthful in spirit. His considerable reading filled the background of a serious and reflective mind. His views on political, religious, and moral questions were shared with a large circle of close friends, and his social attachments in all ranks of life were numberless.

An excellent self-portrait of Tuke belongs to Mr. Colin W. Kennedy.

[*The Times*, 14 March 1929; Maria Tuke Sainsbury, *Henry Scott Tuke. A Memoir*, 1933 (compiled by his sister with the aid of summary journals kept by him, with illustrations of his

works including the self-portrait, and containing three interesting letters from Samuel Butler); personal knowledge.] C. F. BELL.

TURNER, CUTHBERT HAMILTON (1860-1930), ecclesiastical historian and New Testament scholar, was born in Paddington 7 July 1860, the eldest son of Edwin Goldwin Turner, solicitor, by his wife, Catharine, daughter of Cuthbert Finch, M.D. In 1872 he was elected at the same time as (Sir) Charles Oman, his lifelong friend, and (Professor) D. S. Margoliouth, to a scholarship at Winchester. There he laid the foundations of his accurate scholarship, acquired a beautiful handwriting, discussed theology—he was even then an earnest high churchman—and maintained in debate the cause of Gladstonian liberalism.

In 1879 Turner proceeded, as a scholar, to New College, Oxford; and in Oxford the whole of his maturer life was spent. He did brilliantly in classical honour moderations, obtaining in 1881 one of the best first-classes of the year. With every aptitude for historical study, he was not born to be a philosopher, and it must have been a consolation that the second class in *literae humaniores* in 1883 included, besides his own, the names of F. J. Haverfield and T. B. Strong.

After taking his degree, Turner stayed on in Oxford, writing reviews for the *Guardian* and political articles for the *Oxford Review*; he hoped in vain for a fellowship and for the opportunity of teaching at his own college theology, which he was studying with keen interest and in which he obtained a first class in 1884; but no college work came his way until 1885, when he was appointed theological lecturer at St. John's College. In the following year he won the Denyer and Johnson scholarship; by that time he had acquired a deep knowledge of the methods and problems of chronology in their bearing on the history of the Early Church. This knowledge enabled him in 1887 to complete a first-rate piece of research, and to establish conclusively the correct date (Saturday, 22 February 156) of the martyrdom of St. Polycarp [*Studia Biblica*, vol. xi]. Turner had the knack of regarding all historical questions *sub specie temporis*, and it was characteristic of him that his earliest original work should have been a minute inquiry in that field.

In 1888 William Bright [q.v.], the regius professor of ecclesiastical history at Oxford, appointed Turner as his assistant-

lecturer, a recognition which Turner never forgot. He continued to work for Bright until the latter's death in 1901, after which he repaid his debt of gratitude by preparing for publication the professor's lectures on *The Age of the Fathers* (1903). In 1889 Turner became a fellow of Magdalen College. The prize fellowship to which he was then elected—after a close contest with F. E. Brightman and R. B. Rackham—was renewed as a research fellowship in 1896, and at regular intervals thereafter; so that for forty-one years he retained his place in the college which had adopted him.

As a fellow of Magdalen, Turner always took some share in the work of lecturing for the theological school, and in such tutorial work as came to him from the colleges (from New College in particular); but he was above all bent on making a substantial contribution to the study of Christian antiquity. It was not easy for him to choose one direct road of research. He wanted to write history; but he was keenly interested in textual criticism and alive to the importance of producing accurate texts. When he chose to concentrate primarily upon the textual material of early Western canon law, he had it in mind to work at the same time upon a book which would have been similar in scale to Duchesne's *Histoire de l'Église*. But he found himself drawn to follow by-roads of learning; his studies in canon law involved complex investigations into the history of manuscripts and manuscript tradition; he became increasingly interested in New Testament studies; and in the end he left behind him no such church history as he had planned to write, but one *magnum opus* carried a long way towards completion, and a large number of *opuscula* which ranged in subject over many fields of research.

Turner's position down to 1920 was that of a research fellow. He was also the first holder of the Speaker's lectureship in biblical studies from 1906 to 1910, and a university lecturer in early Christian history and literature from 1914 to 1920. During this period he was an active member of the board of the faculty of theology. In 1920, when Walter Lock succeeded William Sanday in the Lady Margaret chair of divinity, Turner succeeded Lock in Dean Ireland's professorship of exegesis, a position which he held for the remainder of his life.

Turner's main vocation as a scholar was to edit the successive *fasciculi* of his

great work, *Ecclesiae Occidentalis Monumenta Juris Antiquissima*. A general sketch of the development of early canon law, in a chapter contributed by Turner to the *Cambridge Medieval History*, vol. i (1911), on 'The Organization of the Church', and a course of Birkbeck lectures given at Trinity College, Cambridge, in 1921 and 1922 (but never published) were the only elucidations which he ever supplied of the documents published in his *Monumenta*. The nucleus of early Western canon law was formed by what was believed in the West to be Nicene material; but the word 'Nicene' did not cover the whole Nicene code and was allowed to include much that was not Nicene at all; other Eastern councils, such as those of Ancyra, Neo-Caesarea, Gangra, and Antioch, were appended to it, and the canons of Sardica were commonly joined without a break to those of Nicaea. In the early collections of canon law, its three elements—the 'Nicene', the Latin, and the papal decretals—were combined with bewildering diversity. Turner set himself to edit all these collections, beginning with the Latin versions of the Canons of the Apostles, going on to Nicaea and beyond that as far as Ephesus and Chalcedon, and including also the fourth- and fifth-century councils of Africa, Gaul, and Spain. Six sections of this work were published (tom. i, four parts, 1899, 1904, 1913, 1930; tom. ii, two parts, 1907, 1913); they contain the Canons of the Apostles, the Nicene Council, and those of Ancyra, Neo-Caesarea, Gangra, and Antioch; two *fasciculi* also include matter supplementary to Nicaea, a fine piece of work upon the Council of Sardica, and the *Gesta de nomine Apollonii*, the record of a crucial dispute between the Churches of Rome and Carthage. Two more sections, containing the first and second Councils of Arles, with that of Valence, and the Councils of Laodicea and Constantinople respectively, were all but finished at the time of Turner's death. The editing of this material involved the collation of a large number of manuscripts and many visits to foreign libraries. In his yearly journeys abroad for this purpose Turner, who never married, enjoyed, for twenty-two years, the companionship of his mother, whose aid and sympathy are acknowledged in the touching dedication prefixed to a section published in 1930.

Of Turner's minor works the best known is his article on the 'Chronology of the New Testament' in the first volume of

Hastings's *Dictionary of the Bible* (1898). He also contributed an essay on the 'Text of the New Testament' to *Murray's Illustrated Bible Dictionary* (1908), and an elaborate treatise on 'Greek Patristic Commentaries on the Pauline Epistles' to the supplementary volume of the larger work (1904). Each of these is masterly, but the 'Chronology', as Professor Burkitt said, 'took its place from the first as a classic'. Turner did the major part of the work needed to complete an enterprise begun by Sanday—the editing of the New Testament quotations in Irenaeus, a labour begun as early as 1884, and not completed until 1923, when the *Novum Testamentum S. Irenaei* appeared as No. VII in the series *Old Latin Biblical Texts*. For the dean and chapter of Worcester Cathedral he devoted great pains and palaeographical skill to the editing of early manuscript fragments preserved as guard-leaves to books in the chapter library; a stately volume of *Early Worcester MSS.* published by the Clarendon Press in 1916 is the fruit of this research. In 1912 Turner collected some of his earlier work into a volume of essays with the title *Studies in Early Church History*; this included a valuable paper on the 'Letters of St. Cyprian', but an essay on *The History and Use of Creeds and Anathemas in the Early Centuries of the Church*, which had been published for the Church Historical Society in 1906, was too long for inclusion.

From 1910 onwards Turner was greatly interested in the preparation of the volume planned by Henry Barclay Swete [q.v.], *Essays on the Early History of the Church and the Ministry* (1918), and after Swete's death in 1917 he took over the editorial supervision of the volume. His own contribution, an essay on 'Apostolic Succession', was a fully documented study of the word *διαδοχή* in the earliest centuries and of the problem of non-Catholic orders in the time of St. Augustine. Turner's exposition of 'succession language' in the early Fathers, and of the controversy about Donatist ordinations, attracted a considerable measure of attention; it has also been largely misunderstood, as implying that there was nothing in the early conception of ministerial continuity beyond the numerical following of one bishop by another. It is only just to Turner's memory to say that, as is clear from pp. 107 f. and 195 f. of this essay, he did in fact hold a diametrically opposite view.

Before he was elected professor, Turner undertook for Bishop Gore the revision

(1919) of the latter's work on *The Church and the Ministry*, a revision so thorough as to give the book, in its author's opinion, an entirely new value. As professor, he inaugurated his work with a lecture on *The Study of the New Testament, 1883 and 1920*, particularly valuable for its full and just estimate of Sanday's place in the history of scholarship. Another lecture, delivered and published in 1924, on *The Early Printed Editions of the Greek Testament*, had an interesting context, for it was based upon an all but complete collection of sixteenth-century Greek Testaments (including the Complutensian Polyglot) which he had made himself in order to give it to his old school. He was happy to be able to transfer the collection to Winchester in the summer before his death. As professor also, Turner made an intensive study of St. Mark's Gospel, and this study bore fruit both in the luminous exposition which he contributed to the one-volume *New Commentary on Holy Scripture* issued by the Society for Promoting Christian Knowledge in 1928, and in the 'Notes on Marcan Usage' referred to below.

Among the minor interests which absorbed so much of Turner's working time, mention should be made of the *Lexicon of Patristic Greek*, for which he schemed and planned harder than anyone, and above all, of the *Journal of Theological Studies*, of which he was first editor, 1899-1902. His work for the *Journal* ended only with a paper on the *Actus Petri* which appeared after his death. It was a continuous flood of articles, documents, notes, and reviews; there are studies in the textual history of St. Cyprian, and of his own *Monumenta*, texts of Niceta of Remesiana, a re-collation of Codex Bobiensis (*k*), and documents from the chapter library of Verona; and in vols. xxv-xxix there is a notable series of 'Notes on Marcan Usage' which no future editor of St. Mark can afford to neglect.

Part of the material for a second volume of papers was collected by Turner about 1926; this was put into shape in 1931 at the desire of his literary executors under the title of *Catholic and Apostolic*, with a memoir by his friend and former colleague, H. N. Bate (afterwards dean of York). Some of Turner's projects of work were carried so far by him as to justify their being completed after his death. A study of the St. Gall palimpsest fragments (St. Gall 1995) had been in type since 1909; it was finished and published in 1931, with the title *The Oldest Manuscript of the Vulgate Gospels*, by Professor Alexander

Souter, of Aberdeen University. It remains to complete Turner's text of the *Testimonia* and *Ad Fortunatum* of St. Cyprian, and of the Latin version of the *Shepherd of Hermas*.

Turner's journeys in pursuit of learning brought him into contact with many eminent scholars; he was a welcome guest at the great libraries in Rome, Milan, Paris, Verona, and elsewhere: he maintained a constant correspondence with Ehrle, Delisle, Omont, Mercati, Morin, Spagnolo, and interchanged letters with Pope Pius XI when he was prefect of the Ambrosian Library at Milan. He cherished an especial affection for Verona and its librarian, but the Belgian hagiographer, Père Delchaye, was perhaps his most intimate foreign friend.

With all these and many more Turner moved on terms of equality. He was happy everywhere on the Continent; but although his reverence for such German scholars as Ludwig Traube was very deep, he found French and Italian erudition more congenial than that of the Germans, whose language he never fully mastered. His own mind was of the Latin order: it was accurate, clear, logical, and not given to the pursuit of abstractions. It was at this point that he diverged from William Sanday [q.v.]; united with him in all his interests as a palaeographer, as a critic, as a student of documentary history, although more conservative in his adhesion to the verdicts of tradition, he was not able, like Sanday, to absorb and appraise the mass of German work in those fields. But he knew—and perhaps enjoyed—his own limitations. The history of doctrine and the systematizing of theology did not attract him; the study of texts, their origin, their critical history, was his *métier*, and in that arena his work was consistently first-rate. Sanday paid him a tribute which Turner would have valued above all others, in comparing his work with that of F. J. A. Hort. 'At the present time,' he wrote in 1910, 'and taking the whole world over, there is no one who occupies so nearly the position that Hort had in the last generation—with an added effectiveness and force to which Hort did not attain.'

Turner was never robust, though his alertness and vivacity made him seem stronger than he was, and led his friends to think him too minutely careful of his health. Some years after his mother's death in 1914 he moved out of college to a house in North Oxford, where he was always accessible to his old friends, to the

younger scholars who attended his seminar on St. Mark, and to a group of promising undergraduates from Eton and Winchester whose friendship gave him the keenest pleasure. He held his professorship for ten years, and seemed likely to hold it for many more. But in the autumn of 1930 he had a sudden seizure and died at Oxford 10 October. He was buried, as he had desired, in his mother's grave at Abingdon.

[Memoir by H. N. Bate prefixed to *Catholic and Apostolic*, 1931; personal knowledge.]

H. N. BATE.

TURNER, HERBERT HALL (1861-1930), astronomer, was born at Leeds 13 August 1861, the eldest son of John Turner, artist, of that town, by his wife, Isabella Hall, of Hexham. He was sent first to Leeds modern school and then to Clifton College, whence he proceeded with a scholarship to Trinity College, Cambridge, in 1879. He graduated as second wrangler in 1882, and was second Smith's prizeman in 1883. Turner was elected a fellow of Trinity in 1884, but left Cambridge that year in order to become chief assistant at the Royal Observatory, Greenwich. There he remained until 1893, when he was appointed to succeed Charles Pritchard [q.v.] as Savilian professor of astronomy at Oxford, with a fellowship at New College. He remained at Oxford for the rest of his life. He was elected F.R.S. in 1896, and was president of the Royal Astronomical Society 1903-1904. He received honorary degrees from various British and foreign universities, was a corresponding member of the Institut de France, and was awarded the Bruce gold medal of the Astronomical Society of the Pacific in 1927. Turner married in 1899 Agnes Margaret, eldest daughter of Robert Whyte, of Blackheath, who survived him with their only child, a daughter. He died of cerebral haemorrhage in Stockholm 20 August 1930 while presiding at a meeting of the International Commission on Seismology.

The first general work in which Turner took part, after going to Greenwich, was the co-ordination of the use of photography in astronomy. A congress was summoned in Paris in 1887, which resulted in the formulation of an international scheme for an astrophotographic chart and catalogue. The scheme was taken up enthusiastically at the time, although its course was diverted before it was fully under way in order to make photographic observations of the minor planet, Eros, from which the dimen-

sions of the solar system may most favourably be derived. The original scheme is still (1934) in large measure uncompleted. Turner devoted all his energies to the work, writing some papers which have become authoritative, and devising means for expediting progress. He continued at Oxford, and the Oxford University Observatory competed closely with Greenwich in being the first to complete and publish its share. From the beginning he realized the magnitude of the undertaking, and used all his energy to secure early and economical publication. In this he followed no more than his natural bent. Just as he was a convinced advocate of the use of photography in astronomy, so he always urged early publication and the full use of material in hand, a counsel which he did not fail to carry out by his own work. The material in question was necessarily statistical, and often rough, but Turner was very skilful in making simple, harmonic analyses of it. He was also a strong believer in the advantages of good personal relations between scientists, and this he constantly illustrated by his relations with other, especially American, astronomers. He was a vigorous personality, who seldom masked his feelings—a trait which in the eyes of those who valued him mattered little.

Astronomy, first of all the sciences, demands a widespread organization, since it is impossible to make all the necessary observations at a single spot. When international co-operation was re-established in 1919 after the end of the European War, the astrographic catalogue was included as one of the commissions of the International Astronomical Union, and Turner became its first president the same year. Here he used his energy and influence in order to spur the laggards into completing their undertakings. At the same time he was elected first president of the commission on seismology in the International Union for Geodesy and Geophysics. His connexion with seismology was in its origin no more than the expression of his friendship with John Milne [q.v.]. When Milne died in 1913, the world-wide organization which he had built up demanded some one to carry it on. It also needed some reasonable reforms. Partly because no one else was forthcoming, Turner took up the task, first partly at Slide in the Isle of Wight, and afterwards wholly at Oxford. Gradually he became more and more interested in the work, gathered more

strings into his hands, and developed it, with the help of some zealous co-workers. In much the same way he first became interested in variable stars, by editing a volume for the *Memoirs* of the Royal Astronomical Society in which are the accumulated observations of George Knott. He never lost that interest, and it was subsequently drawn upon when he edited in the same *Memoirs* the records of Sir Cuthbert Edgar Peck, second baronet [q.v.], and those of Peck's observer, Charles Grover.

Turner entered fully into his environment. When he became a fellow of New College he shared whole-heartedly in its life. In the same way, he took a full part in university affairs, including the inevitable quarrels. He was a frequent writer of letters to *The Times*, and a hearty supporter of many causes before they became popular, such as 'daylight saving'. Although a man of strong feelings, who played his various games in earnest, he was a good loser. He was an incessant worker, and, perhaps because of this, he always seemed free to discuss other people's affairs, and, in a remarkable degree, to help to forward them.

[*The Times*, 21 August 1930; personal knowledge.] R. A. SAMPSON.

URE, ALEXANDER, BARON STRATHCLYDE (1853-1928), lawyer and politician, the second son of John Ure, of Cairndhu, Helensburgh, merchant and in his day a distinguished lord provost of Glasgow, by his wife, Isabella, daughter of John Gibb, of Glasgow, was born in that city 24 February 1853. He was educated at Larchfield Academy, Helensburgh, and at the university of Glasgow, where he graduated M.A. in 1872, B.L. in 1874, and LL.B. in 1878, and from which he received the honorary degree of LL.D. in 1907. In 1878 he was admitted a member of the Faculty of Advocates and began his career at the Scottish bar. In the following year he married Margaret McDowall, daughter of Thomas Steven, iron merchant in Glasgow. They had one daughter, who died in 1918.

Success came early to Ure, and for him there was no weary waiting for briefs. His influential connexion with the West of Scotland, the source of most of the lucrative commercial litigations in the Parliament House, and a natural gift of robust and telling advocacy secured for him from the outset a steady flow of business. After only fourteen years of

junior practice he 'gave up writing', the step which then marked the transition of a Scottish advocate to senior rank, and on the institution of a roll of Queen's Counsel for Scotland in 1897 he was one of the first new Scottish silks. For ten years after his call to the bar (1878-1888) Ure held the lecturership of constitutional law and history in Glasgow University, but this appointment, which did not require him to reside in Glasgow, in no way interfered with his professional advancement. Like so many other ambitious young advocates he took to politics, and Gladstonian Home Rule found in him an ardent supporter. His first attempt to enter parliament as a candidate for West Perthshire in 1892 was unsuccessful. He also failed in 1893 to secure election for Linlithgowshire, but at the general election in 1895 he was returned in the liberal interest as member for that constituency, which he continued to represent until his elevation to the bench in 1913. From 1905 to 1909 he was solicitor-general for Scotland, and in the latter year he succeeded Lord Shaw (afterwards Lord Craigmyle) as lord advocate and was admitted a privy councillor.

Ure's activities during his tenure of the lord advocateship brought him into conspicuous prominence. It was a period of political high tension, and Mr. Lloyd George's budget for 1909-1910 was the storm-centre. Ure threw himself into the fray with characteristic energy and devoted himself especially to advocating the taxation of land values. His physical vigour, his ubiquity, and his powers of relentless rhetoric rendered him an invaluable party henchman. There were few towns of any importance in England or Scotland which did not resound with his fervid oratory. Unfortunately, there were occasions when his enthusiasm led him to outstep the generally accepted limits of political controversy, notably in his utterances regarding the unionist party's policy in the matter of old-age pensions. These brought upon him a severe rebuke by Mr. Arthur Balfour, who at a meeting in the Constitutional Club on 26 October 1909 charged him with having been guilty of a 'frigid and calculated lie'. The phrase, singularly inappropriate to Ure's sanguine temperament, passed into currency, and its imputation was not entirely dispelled by Ure's brilliant defence of himself in a speech in the House of Commons on 3 November 1909. It was in that year also that Ure conducted the prosecution in the

trial of Oscar Slater for murder and secured from the jury a verdict of guilty by a majority of nine to six. The death sentence was commuted, but the verdict gave rise to a prolonged agitation which a somewhat inconclusive departmental inquiry failed to satisfy, and which was not finally set at rest until, in July 1928, after Slater's liberation, his conviction was reviewed and quashed by the High Court of Justiciary under the Criminal Appeal Act [see DOYLE, Sir Arthur Conan].

In 1913 Ure succeeded Lord Duncedin as lord justice-general for Scotland and lord president of the Court of Session, and in 1914 was raised to the peerage under the title of Baron Strathelyde, of Sandyford, co. Lanark. The transition from party polemics to the dispassionate atmosphere of the judiciary was abrupt, but it was achieved with remarkable success, for the new lord president proved himself from the first an efficient and capable judge, courteous, attentive, and unusually alert. He always had an eye to the practical issue, and his judgments are models of clarity. But the easy certitude which stood him in such good stead in his political career was a less suitable endowment for a judge, and his reported opinions exhibit little of that balanced discussion of legal principles which best contributes to the elucidation and advancement of the law. Undoubtedly Ure was better as an advocate than as a judge, though in neither capacity was he learned in the technical sense. He particularly excelled in cross-examination, where his direct methods and his masterful style found full scope. He had a quite admirable gift, too, of lucid exposition, aided by a retentive memory, which enabled him to handle intricate matters with enviable facility. Sometimes, however, his invincible optimism led him to see both facts and law as he wished them to be rather than as they were.

Ure's mental vigour found its counterpart in his physical constitution, and he was an intrepid yachtsman and an untiring walker. On one occasion he tramped from Edinburgh to London, and on another from London to Land's End. During the European War he rendered valuable service in the promotion of the Scottish War Savings Association, in recognition of which he was created G.B.E. in 1917.

In 1920 Ure was compelled by ill-health to resign from the bench, and he then retired to Cairndhu, the family residence on the Clyde at Helensburgh. It was

characteristic of him that he gave up the pension to which he was entitled, but with which his private means enabled him to dispense. In 1921 he published a pleasantly written biographical study of Lord Fullerton, a learned senator of the College of Justice for whom he had a great admiration. He died at Helensburgh 2 October 1928, survived by his wife, and the peerage then became extinct.

MACMILLAN.

VAUGHAN, BERNARD JOHN (1847-1922), Jesuit priest, was born at Courtfield, Herefordshire, 20 September 1847, the sixth son in the family of thirteen children born to Colonel John Francis Vaughan and his first wife, Louisa Elizabeth, third daughter of John Rolis, of The Hendre, Monmouth, grandfather of the first Baron Llangattock. The family inherited an intensely Catholic tradition from pre-Reformation times; and through fines and double land-tax they had lost all but a fraction of the fifty thousand acres they once owned. Of Colonel Vaughan's children, four of the five daughters became nuns, and six sons became priests; the eldest being Herbert Alfred Vaughan [q.v.], cardinal archbishop of Westminster, and the second, Roger William Bede Vaughan [q.v.], archbishop of Sydney.

Bernard Vaughan was sent in 1859 to Stonyhurst College, which had been given to the Jesuits by his great-grandfather, Thomas Weld, father of Cardinal Thomas Weld [q.v.]; and he never faltered in his early desire to become a Jesuit. Undistinguished at school, although he had abundant vitality and enthusiasm, he became a Jesuit novice in 1866. Subsequently he filled minor teaching and other posts at Jesuit colleges, chiefly at Beaumont College, Windsor. In 1880 he was ordained priest, and in 1883 was sent to the church of the Holy Name in Manchester; his eldest brother, Herbert, the future cardinal, was then bishop of Salford. Vaughan developed his church rapidly, and became its superior in 1888. His unconventional methods as a preacher and organizer soon made him a local celebrity, especially when, in order to raise funds for building, he hired the St. James's Hall in October 1890 and converted it into a replica of St. Peter's Piazza, Rome, with all manner of entertainments and scientific

exhibits which attracted great crowds from Lancashire and Yorkshire. He revealed unsuspected powers as a popular preacher, with his distinguished bearing, fine voice and delivery, startling use of slang and of homely allusions, and peculiar aptitude for crude epigrams. A series of local controversies enhanced his popularity as a formidable debater, who never failed in good humour and quick repartee. But his wide following in Lancashire arose chiefly from his devoted work among the poorest classes, and his ceaseless agitation to improve the conditions of housing and of factory labour.

As Vaughan's reputation grew, he was invited to preach courses of sermons in Rome and on the Riviera; and in 1898 his preaching at Cannes attracted the notice of the Prince of Wales. A close personal friendship with the prince and other royal personages followed, and these connexions soon led to his being transferred, albeit reluctantly, from Manchester to the Jesuit house at Farm Street, Mayfair, in 1899. His crudely sensational methods seemed unlikely to succeed in London, but he became conspicuous when he brought an action for libel against a protestant paper, *The Rock*, and was awarded substantial damages (1902). His public reputation increased and culminated in 1906 when, during the London 'season', he preached in Farm Street church a series of sermons on the 'sins of society'—a vigorous denunciation of the selfishness and ostentatious vulgarity of the rich, the growing disregard of marriage ties, and the increase of birth restriction. In subsequent years he preached other courses of sermons with titles such as 'Is England Christian?', 'Is Religion Worth While?', 'The Gospel of Doing Good', and he was in constant demand as a preacher and public speaker.

Vaughan's sermons, when published, had a wide sale, but they were much less sensational than the selected passages which had been eagerly quoted in the press. He took great pains to be accurate in theology and history, and most of his sermons, even on topical questions, were carefully revised for him. His reputation was extended by a visit to Canada in 1910, when he was cathedral preacher at the Eucharistic Congress at Montreal, and subsequent tours in the United States of America (1911-1913), China and Japan (1913), and Africa (1922). During the European War his native patriotism and his enthusiasm for the British Empire

found full scope, and he worked ceaselessly to raise funds for war charities.

Vaughan had so deliberately courted publicity in order to obtain the widest audience that his real character was generally misunderstood. Profoundly humble and simple, he was unfailing in obedience to his Jesuit superiors, and for years he went to confession every day. The dominating interest of his life was his personal work among the poor, first in Manchester and later in the East end of London. For them he used all his success and influence, as when he persuaded Madame Adelina Patti to return to London in 1904 and 1908 for Albert Hall concerts which he organized in order to raise funds for a club-house and an orphanage in Whitechapel. He was no socialist, but for years his energies were mainly devoted to campaigns for social reform, and in the many great cities which he visited he always investigated the poorest districts himself, and denounced remorselessly whatever seemed unjust or disgraceful. His published works include several pamphlets issued by the Catholic Truth Society, notably *The Roman Claims* and *Faith and Reason*, *Socialism* (1910), *Socialism from the Christian Standpoint*, (1913), besides several volumes of sermons. A posthumous volume, *Loaves and Fishes*, compiled from his note-books, was issued in 1923. Years of insomnia and nervous strain undermined his strength, and he died at Manresa, the Jesuit novitiate at Roehampton, 31 October 1922.

A cartoon of Vaughan by 'Spy' appeared in *Vanity Fair* 30 January 1907.

D. GWYNN.

VEITCH, SIR HARRY JAMES (1840-1924), horticulturist, was born at Exeter 20 June 1840, the second of the three sons of James Veitch, junior (1815-1869), the foremost horticulturist of his day. He was grandson of James Veitch, the elder (1792-1863), who founded the Veitch nurseries at Exeter and purchased in 1853 the nurseries of Messrs. Knight & Perry at Chelsea, and uncle of James Herbert Veitch [q.v.]. He was educated at Exeter grammar school and continued his training at Altona, near Hamburg, and at Paris with the firm of Vilmorin-Andrieux. He joined his father's business in Chelsea (which was carried on separately from

the Exeter business after 1864) when he was eighteen, and was connected with the firm of James Veitch & Son during the long period when the nurseries at Chelsea and at Coombe Wood, Surrey, and Langley, Buckinghamshire, had a world-wide reputation.

Realizing the importance of introducing new plants to cultivation, the firm sent out travellers to various parts of the world, and to its enterprise in this respect are owed many excellent plants grown in English gardens to-day. Harry Veitch was keenly interested in this side of the work. Among the firm's plant-collectors may be mentioned Richard Pearce, who visited Chile, Peru, and Bolivia and introduced *Eucryphia pinnatifolia*, the begonias which are the parents of the large-flowered, tuberous begonias of the hot-house, and many other plants now in cultivation. To John Gould Veitch, Harry Veitch's elder brother, who was sent to Japan, is due the introduction of the well-known *Ampelopsis Veitchii*, and many trees, including the Japanese umbrella pine. Frederick William Burbidge [q.v.], afterwards the curator of the botanic gardens of Trinity College, Dublin, another of the firm's collectors, was sent to Borneo in 1877, and brought back the giant pitcher plant, *Nepenthes Rajah*, from Kina Balu, *N. bicalcarata*, and several orchids. Other collectors were sent to Central and South America, particularly in search of orchids, ferns, and stove plants. But the best-known of the Veitch travellers was Ernest Henry Wilson, afterwards of the Arnold arboretum, Boston, Massachusetts, whose introductions from China are to be found in many English gardens. The firm were pioneers in orchid hybridization and introduced many hybrid orchids and the hybrid *streptocarpus*, begonias, Javan rhododendrons, hippeastrums, and many other plants now commonly grown.

Veitch's active influence in the firm extended over almost the whole of his lifetime, for although he had retired in 1900 he had again to resume control in 1906 owing to the illness of his nephew James Herbert Veitch. He finally retired in 1914. As there was no successor in the family, the nursery at Coombe Wood was sold.

Veitch was closely connected for many years with the Royal Horticultural Society, of which he became treasurer in 1918 at the age of seventy-eight, and later was elected a vice-president. He was awarded the Victoria medal of honour by the Society in 1906 and received several

foreign distinctions. In 1912 he was knighted.

Veitch published *The Manual of Coniferae* (1881, second edition 1900) and *The Manual of Orchidaceous Plants* (1887-1894), both works containing much information about plants brought to England by the collectors of the firm. He died at East Burnham Park, Slough, 6 July 1924. Veitch married in 1867 Louisa Mary (died 1921), daughter of Frederick W. Johnston, of Stoke Newington. There were no children of the marriage. His portrait, painted in 1909 by H. G. Riviere, hangs in the council room of the Royal Horticultural Society, Vincent Square.

A. W. HILL.

VENN, JOHN (1834-1923), logician and man of letters, was born at Drypool, Hull, 4 August 1834, the elder son of the Rev. Henry Venn [q.v.], then rector of that parish, by his wife, Martha, daughter of Nicholas Sykes, of Swanland, near Hull. Descended from a Devonshire family of considerable intellectual distinction, his grandfather was the Rev. John Venn [q.v.], the leader of the Clapham Evangelicals, and his great-grandfather was Henry Venn [q.v.], sometime vicar of Huddersfield. Venn was educated first at Sir Roger Cholmley's School, Highgate (now Highgate School), to which place his father had removed upon becoming honorary secretary of the Church Missionary Society, and subsequently at Islington proprietary school. In October 1853 he entered Gonville and Caius College, Cambridge, representing the eighth generation of his family to be admitted to (and to graduate at) Cambridge, or the sister university, and beginning an association with Gonville and Caius College which lasted for seventy years. Elected mathematical scholar in the following year, he took his degree, as sixth wrangler, in January 1857, and was elected fellow of his college a few months later.

Rigidly brought up, as he had been, in the family tradition, it is not surprising that Venn should forthwith have prepared himself for holy orders. Ordained deacon at Ely in 1858, and priest in 1859, he held curacies successively at Cheshunt, Hertfordshire, and at Mortlake, Surrey. After this short experience of parochial work he returned to Cambridge in 1862, and was appointed to the newly created post of

college lecturer in moral science, acting for a few months simultaneously as curate at St. Edward's church. Since taking his degree, Venn's attention had been directed more and more to the works of philosophical and metaphysical writers, Augustus De Morgan's treatises, George Boole's *Laws of Thought*, John Austin's *Jurisprudence*, and, most of all, John Stuart Mill's *Logic* so affected him as to cause a revolution in his critical outlook which *Essays and Reviews* (1860) could not counter. Upon resuming academic life, moreover, he found himself in close contact with such men as Henry Sidgwick, J. R. Seeley, Isaac Todhunter, and John Westlake, while outside Cambridge he saw much of his cousins, E. J. S. and A. V. Dicey, and James and Leslie Stephen. It had long ceased to be regarded as an anomaly for a clergyman to preach the then circumscribed evangelical creed and at the same time, without the slightest insincerity, to devote himself actively to philosophical studies; yet, some years later (1883), finding himself still less in sympathy with the orthodox clerical outlook, Venn availed himself of the provisions of the Clerical Disabilities Act. Of a naturally speculative frame of mind, he was wont to say in after-life that, owing to subsequent change in accepted opinion regarding the Thirty-nine Articles, he could consistently have retained his orders; he remained, indeed, throughout his life a man of sincere religious conviction. As Hulsean lecturer in 1869 he published *Some Characteristics of Belief, Scientific and Religious*.

For the next thirty years Venn devoted himself to the study and teaching of logic, at the outset, owing to his mathematical training, paying particular attention to the theory of probability. His first published work was *The Logic of Chance* (1866), which owed its inception to H. T. Buckle's well-known discussion concerning the impossibility of checking the statistical regularity of human actions. Similarly, *Symbolic Logic* (1881) represented a successful attempt, hitherto neglected even by W. S. Jevons, to rationalize and interpret the mechanism of Boole's processes. Many years earlier Venn had adopted the diagrammatic method of illustrating propositions by inclusive and exclusive circles, and he now added the new device of shading the segments of the circles in order to represent the possibilities excluded by the propositions. The moral science tripos was then attracting a grow-

ing number of students, among whom were to be found men of such promise and ability as Arthur Balfour, William Cunningham, F. W. Maitland, James Ward, and F. W. H. Myers. As lecturer and examiner Venn played an important part in the development of this tripos, which was characterized by freedom from extraneous control and rested, as is essential with a new subject, upon a friendly intercourse between teachers and taught. In 1889 he completed his trilogy by issuing *The Principles of Empirical Logic*, which, in common with its predecessors, at once became a standard text-book. During this period of his life Venn gradually acquired what was probably the largest private collection of works upon logic ever brought together; this he presented to the University Library in 1888.

Thereafter, apart from lecturing and preparing fresh editions of his books and writing monographs upon statistical and anthropometrical subjects, Venn's activities were devoted to the hitherto neglected subject of university history. In this field his largest single-handed undertaking was represented by the three volumes of the *Biographical History of Gonville and Caius College* (1897), which involved a vast amount of painstaking and methodical search among university, episcopal, and other records. He also edited several volumes of the university archives, e.g., *Grace Book A* (1910) and, with his son, *Matriculations and Degrees, 1544-1659* (1913). *Venn Family Annals* appeared in 1904, and in 1913 he brought together, under the title of *Early Collegiate Life*, many of his own writings and speeches descriptive of Cambridge life and habits in bygone periods. In 1910 he produced *John Caius, a biographical sketch*. Finally, during his latter years, he collaborated with his son in the preparation of the monumental *Alumni Cantabrigienses*, the first two volumes of which (1922) he lived to see in print.

Venn took the Cambridge Sc.D. degree in 1883, and was elected F.R.S. the same year. He married in 1867 Susanna Carnegie, eldest daughter of the Rev. Charles Welland Edmonstone, and had one child, John Archibald, president of Queens' College, Cambridge, since 1932. Of spare build, he was throughout his life a fine walker and mountain climber, a keen botanist, and an excellent talker and linguist. He died at Cambridge 4 April 1923, and was buried at Trumpington. At the time of his death he had been a

fellow of his college for sixty-six years, and its president since 1903.

There is a portrait of Venn by C. E. Brock in the combination room of Gonville and Caius College.

[An autobiography (unpublished) written for his family; private information; personal knowledge.]
J. A. VENN.

VERNEY, MARGARET MARIA, LADY VERNEY (1844-1930), historical writer, was born in London 3 December 1844, the elder daughter and co-heiress of Sir John Hay Williams, second baronet, of Bodelwyddan, co. Flint, by his wife, Lady Sarah Elizabeth Pitt, only daughter of William, first Earl Amherst of Arracan [q.v.]. On Sir John Hay Williams's death in 1859, his family retired to Rhianva, a house which he had built for them on the Menai Straits.

Miss Hay Williams married in 1868 Captain Edmund Hope Verney, R.N., liberal member of parliament for North Buckinghamshire, 1885-1886 and 1889-1891, who succeeded his father, Sir Harry Verney, second baronet [q.v.], of Claydon House, Buckinghamshire, in 1894 and died in 1910. They had one son, Sir Harry Calvert Williams Verney (born 1881), fourth baronet, and three daughters. Lady Verney died at Rhianva 7 October 1930, and was buried at Llandegfan.

From 1868 Lady Verney's time and interests were divided between her two homes. Both in Anglesey and in Buckinghamshire she took an active interest in village life, especially in education and nursing. She served on the rural school boards, was co-opted to the Buckinghamshire county education committee, and originated the association for the loan of pictures to schools; later she started a similar scheme for Anglesey. In Wales her activities extended to higher education in connexion with the University College of North Wales at Bangor; she was an original member of the court of governors, and was prominent on the hostels committee. She was a member of the University of Wales court (afterwards the council) from 1894 to 1922, and she continued to represent that body on the court of the National Library of Wales and on the Bangor council. In 1919 she was appointed junior deputy chancellor of the university, and received the honorary degree of LL.D.

As a convinced liberal in politics, Lady Verney worked enthusiastically for her husband and son in election campaigns.

Throughout her life she showed indomitable industry and real breadth of view, well supported by unfailing courage, patience, and humour.

Lady Verney's principal achievement, however, lay in the literary work which she took up as an amateur and completed as an acknowledged authority. Between 1858 and 1890 Frances Parthenope (*née* Nightingale, the sister of Florence Nightingale), second wife of Sir Harry Verney, had discovered the historical value of the seventeenth and eighteenth century letters, diaries, and accounts preserved at Claydon House. Beginning with magazine articles, she gradually worked up a connected history of the Verney family down to 1650, which, finely illustrated by reproductions of portraits, was completed for the press by M. M. Verney as Volumes I and II of *Memoirs of the Verney Family* with a preface by Dr. S. R. Gardiner, in 1892. These were followed by Volume III (1650-1660) in 1894, and by Volume IV (1660-1696) in 1899, which were wholly the work of the younger lady. The Claydon manuscripts, including over 30,000 letters dated before 1700, with drafts and copies of answers, required elaborate arrangement and comparison. The original work attracted so much attention that a thoroughly revised re-issue in two volumes was called for in 1904, and a third edition in 1925.

In addition to contributions about the Verneys to magazines and to this *Dictionary*, Lady Verney published a short *Memoir of Sir Henry Cunningham* (1923), and a text-book of county history, *Bucks. Biographies* (1912), for use in elementary schools. Later on she returned to the family papers, and just before her death (1930) saw through the press two supplementary volumes, the first dealing with the correspondence of John Verney, Viscount Fermanagh (1696-1717), the second with that of the two Earls Verney (1717-1791). The material is of inferior interest, but the workmanship shows no sign of weakness. The prominence given in Lady Verney's works to domestic as well as public matters has done much to encourage similar research; and they form as a whole a serious contribution to English history.

A full-length portrait of Lady Verney as a bride, by Sir William Richmond, hangs at Claydon House. A memorial tablet was placed in Middle Claydon church in 1936.

[In *Memoriam*, M. M. Verney 1930, privately printed, with added bibliography, 1932; private information; personal knowledge.]

H. E. D. BLAKISTON.

VINOGRADOFF, SM PAUL GAVRILOVITCH (1854-1925), jurist and historian, was born at Kostroma, Russia, 1 December 1854, the eldest son (three sons having been born of a previous marriage) of Gavril (Gabriel) Kiprianovitch Vinogradoff by his second wife, Elena Pavlovna, daughter of General Kobeloff, who had fought in the war of 1812. Kiprianovitch was a schoolmaster of more than average attainments, and a year after Paul's birth he was transferred from Kostroma to a boys' school of high standing at Moscow. Here Vinogradoff was educated at a gymnasium and entered the university in the faculty of history and philosophy at the age of sixteen. On graduating (1875) he obtained a scholarship which enabled him to study at Berlin under Theodor Mommsen and Heinrich Brunner. Instruction under such masters dedicated him decisively to a career of learning. He was accustomed to say that the three greatest minds which he had encountered, and the three most powerful intellectual influences in his life, were the German Mommsen, the Russian Vasilii Kluevsky, and the Englishman Frederic William Maitland [q.v.].

Vinogradoff's first learned paper (1876), written in German, was the fruit of his Berlin training; and in the next few years he immersed himself in the study of a subject which was to prove a special pre-occupation throughout his life. His first book, *The Origin of Feudal Relations in Lombard Italy* (Russian, 1881), embodied researches which had been begun by him three years previously in Italy. He was next attracted by the feudal land system in England, and in 1883 came to London to investigate in the Public Record Office material which at that time had been insufficiently explored. During this visit he not only gained a sympathetic insight into English life, but came in contact with some of the most distinguished scholars of the day, such as Sir Henry Maine, Sir Frederick Pollock, and Frederic Seebohm [q.v.]. But the most pregnant friendship which he formed was with Frederic William Maitland, then a young man of brilliant gifts who had not yet devoted himself definitely to a life of scholarship. Vinogradoff's eloquent and enthusiastic discourse decided Maitland upon his vocation; and the influence was not only reciprocal, but led immediately to tangible results of the first importance to English legal history. In a letter to the *Athenaeum* (19 July 1884) Vinogradoff called attention

to a manuscript in the British Museum which had been forgotten since Sir Anthony Fitzherbert [q.v.] had used it for his *La Graunde Abridgement* (1514). This was the celebrated 'Note Book' of Henry de Bracton [q.v.], out of which grew the first-fruits of Maitland's genius—one of the richest contributions to modern legal scholarship in England.

The results of Vinogradoff's inquiry into English feudal institutions gained him the doctorate at Moscow in 1884, and were published in Russian in 1887 and in an English translation in 1892 as *Villainage in England*, which many critics still regard as his best and most lucid work. His reputation was now firmly established, and in 1887, after three years' probation as extraordinary professor, he was appointed full professor of history in the university of Moscow. His sympathies had always been liberal, though in no sense revolutionary; and his cosmopolitan training set him in opposition to the narrow and reactionary Slavophilism which at that time stunted education in Russia. He at once became both a teacher of galvanic influence and an indefatigable apostle of educational reform. According to his own account, he 'endeavoured not only to form a school of historians, trained in the methods of western scholarship, but also to influence the progress of general education in Russia'. He was elected councillor of the municipal Duma and became chairman of its educational committee. This gave him an opportunity to promote an extension of the network of elementary schools which made it possible for every child living in Moscow to go through a course of primary education. In 1896 he founded a paedagogic society in which teachers of all grades could meet to discuss problems and conditions of education. Not content with these arduous administrative labours, Vinogradoff wrote several elementary text-books of history, some of which still remain current. In many respects he succeeded in introducing permanent reforms; but a reactionary element in the government steadily gained the ascendant; free speech and free thought among the university students were repressed with increasing severity, until the university itself was closed in 1899. Vinogradoff's moderate and carefully elaborated plan for a *modus vivendi* was rejected. This he felt to be a test case, and, finding his position impossible, he resigned his professorship in 1901.

In 1897, while on a visit to Norway,

Vinogradoff had married Louise, daughter of Judge August Stang, of Arendal, Norway, whose wife was an Englishwoman, Isabel Mary Newbold. A daughter was born of this marriage in 1898 and a son in 1901. With his wife and children Vinogradoff came to England after his resignation, and in 1903 was elected to the Corpus Christi chair of jurisprudence at Oxford, in succession to Sir Frederick Pollock. This position he held until his death. He at once introduced into Oxford a hitherto unfamiliar method of seminar teaching, which gathered round him a group of enthusiastic students of history and law. Their versatile and meticulous researches are to be found in an edition of the *Survey of the Honour of Denbigh, 1334* (1914) and in the valuable series of *Oxford Studies in Social and Legal History* (1909-1927). Another direct outcome of the seminar was Vinogradoff's own *English Society in the Eleventh Century* (1908), which had been preceded in 1905 by *The Growth of the Manor*. His output was prolific during the whole period of his professorship; besides innumerable articles and reviews in learned periodicals all over the world, he contributed copiously to encyclopaedias and to the *Cambridge Medieval History*; and, before the monumental *Outlines of Historical Jurisprudence* (1920-1922) of his latest years, he produced a luminous short study of *Roman Law in Medieval Europe* (1909) and a less successful sketch of English jurisprudence, *Common Sense in Law* (1914). In addition, he served as a director of publications for both the British Academy and the Selden Society. He delivered special courses of lectures in many European countries, in the United States, and in India.

Vinogradoff did not lose touch with Russia, and for many years made annual visits. He was in St. Petersburg during the revolution of 1905, and might have accepted the portfolio of public instruction in the new liberal government but for his disapproval of anti-Semitic restriction in education. In 1908, 1909, and 1911 he lectured in Moscow; but the government was again pursuing an oppressive policy, and Vinogradoff resigned, in common with sixty other instructors, when he found police spies in his lecture-room. The outbreak of the European War found him in high hopes for the moral and social regeneration of Russia. He worked untiringly for the mutual understanding of Russia and England, using to the utmost, by pen and by tongue, his unrivalled knowledge of

both countries; and in 1917 he was knighted for these services. The disillusionment which awaited him dealt a mortal blow. In 1914 he had written: 'It is our firm conviction that the sad tale of reaction and oppression is at an end in Russia, and that our country will issue from this momentous crisis with the insight and strength required for the constructive and progressive statesmanship of which it stands in need.' The Russian débâcle, the 'Red Terror', and the triumph of Bolshevism shattered, one by one, Vinogradoff's lifelong patriotic aspirations, which were a part of his deepest nature. He never recovered from the wound, and a part of him died when he renounced his Russian nationality in 1918. To his spiritual suffering were added personal distresses: he was obliged to stand by helpless while friends and kindred endured untold miseries in Russia; his own material losses changed his circumstances from comfort to exiguity; and rapidly failing eyesight supplied a crowning affliction. Although in his last years he was extremely active in writing, travelling, and lecturing, nothing of the savour of life remained for him except his intellectual pursuits and his strong family ties. He died suddenly of pneumonia in Paris 19 December 1925, shortly after adding the doctorate of Paris University to his numerous honorary degrees.

In the preface to his earliest English work, *Villainage in England*, Vinogradoff wrote: 'Nobody will deny that historical study is extending more and more in the direction of what is now called anthropology and social science.' The words were prophetic of the future trend of his life-work. Although he remained primarily an historian, and a medieval historian, to the end, his mind moved constantly in the direction of embracing history and, indeed, all the many departments of his learning, in one comprehensive scheme of the structure, the elements, and the cohesive forces of human society. For him, therefore, history and jurisprudence were not only allied, but grew naturally into each other. His range of reading was prodigious, his linguistic equipment extraordinary, his memory apparently without limit; and to these attainments were added a capacity for seeing any portion of knowledge, however minute and detailed, in its relation to a grand perspective of knowledge. His general juristic position which has been described as 'neo-Kantian', was based on a strong individualism, not

oblivious, however, of the concessions demanded by the socialistic tendencies of modern states. It is to be regretted that the different elements of his immensely varied studies were never brought together and interrelated in any one published work, except in the Introduction to his *Historical Jurisprudence*, where they suffer not only from the limits of space which he had imposed upon himself, but also from a certain obscurity of expression which grew upon him in his later years. Although he could write eloquently upon a theme which stirred him, and although he had a command of English which few foreigners possess, he was never, in his more technical works, an entirely felicitous stylist.

Vinogradoff's catholicity and constructive power made him an extraordinarily stimulating teacher. His lectures were somewhat beyond the ordinary undergraduate, but for advanced and receptive students he revealed unsuspected worlds both of method and of knowledge. Endowed with a powerful constitution and himself capable of great feats of sustained labour—he would often work twelve hours a day for long periods—he expected and obtained a high standard of industry from his pupils, and would accept no excuse for second-best. Yet, while unrelenting in all matters of scholarship, he was far from being severe or unsympathetic in private relationships, and would not only go to infinite pains to help his pupils in their studies, but would advance their interests by many personal kindnesses.

Vinogradoff was not, like his first master, Mommsen, a man who lived solely in his work, although in his later, darkened years he tended more and more to seek refuge from an uncongenial world in things of the mind. In his prime, he had a lively and spontaneous variety of interests: he was fond of society, and shone in it by the range and adaptability of his conversation; he loved and followed all the arts, especially the theatre, but above all music, in which, as a young man, he had considerable skill as a pianist; and he took a healthy, temperate pleasure in the material amenities of life. His favourite relaxation was chess, which he played with more than average proficiency. Beneath his naturally magisterial manner there lay great amiability, shrewd worldly perception, and a quick, somewhat satirical, humour. The outstanding qualities of his massive personality—besides his intellect—were his sturdy courage, his power of decision, and his inflexible adherence to what he deemed

to be right and wise. This last quality made him not only a man of the highest intellectual rectitude, but a somewhat uncompromising controversialist.

Vinogradoff's most enduring works will be his contributions to medieval history. His theories of law and of the social order must be sought in a number of essays, many of which are assembled in his posthumous *Collected Papers* (1928). His *Historical Jurisprudence* was to be the crown and epitome of his many years of untiring research, but unfortunately he did not live to complete more than part of its grand, if somewhat arbitrary, design. Enough remains to show him a master, unequalled in England, of the social and legal institutions both of the ancient and the modern world.

A portrait of Vinogradoff by Henry Lamb was presented to him in June 1925 and hangs in the Maitland Library in the Examination Schools at Oxford.

[*The Times*, 21 December 1925; H. A. L. Fisher, *Memoir* prefixed to *Collected Papers of Paul Vinogradoff* (also printed separately, 1927); F. M. Powicke in *English Historical Review*, April 1926; Sir William Holdsworth, *Professor Sir Paul Vinogradoff, 1854-1925*, in *Proceedings of the British Academy*, vol. xi, 1924-1925; F. de Zulueta in *Law Quarterly Review*, April 1926; Sir Bernard Pares and Baron Alexander Meyendorff in *Slavonic Review*, March 1926; private information. A complete bibliography of Vinogradoff's writings is published as an appendix to the *Collected Papers*.] C. K. ALLEN.

VON HÜGEL, FRIEDRICH, Baron of the Holy Roman Empire (1852-1925), theologian, was born at Florence 8 May 1852, the elder son of Carl Alexander Anselm, Baron von Hügel (1795-1870), naturalist and traveller, who was Austrian minister successively to Tuscany and to Belgium, by his wife, Elizabeth, daughter of General Francis Farquharson, and niece of Sir James Outram [q.v.]. His mother was a convert from Presbyterianism to the Roman Catholic Church, and von Hügel was brought up as a Roman Catholic, first at Florence, later in Brussels (1860-1867), and, after his father's retirement in 1867, at Torquay. Taught in childhood by an Anglican governess, and for seven years the devoted pupil of a German Lutheran tutor, with the Catholic historian Alfred von Reumont as supervisor of his studies, he was early familiar with various environments, political and religious. In 1870 an attack of typhus permanently impaired his hearing and

general health. A religious and moral crisis followed; but he was 'regained to purity and to God' by the Dutch Dominican Raymond Hocking in Vienna. To Hocking and to the Abbé Huvelin in Paris, under whose influence von Hügel came in 1886 (for notes of Huvelin's advice and acute estimate of von Hügel's character see *Holland's Memoir*, pp. 58 ff.), he 'owed infinitely much'; and he acknowledged a similar debt to William George Ward [q.v.], while he once said to a friend 'with emphasis': 'Under God, I owe my salvation to the Jesuits, but don't you ever have anything to do with them' [*Holland, Memoir*, p. 6, n. 1].

In 1873 von Hügel married Mary Catherine, daughter of Sidney, first Lord Herbert of Lea [q.v.], and sister of the thirteenth Earl of Pembroke. His wife and two of their three daughters survived him; the eldest (married to Count Salomel), who of all his family most fully shared his interests, died in 1915. After his marriage his home was in England (from 1876 to 1903 at Hampstead, from 1903 to 1925 at 18 Vicarage Gate, Kensington), but until 1903 the winters were frequently spent abroad, most often in Rome. He studied natural science, philosophy, and religious history and literature, learning Hebrew, and adopting 'critical' views of the Old Testament. These views he defended before a Roman Catholic congress at Freiburg in 1897; while in a pamphlet published in 1906, in collaboration with the American Presbyterian scholar Charles Augustus Briggs, he contended that the report of a papal commission, in June of that year, in favour of the Mosiac authorship of the Pentateuch need not be interpreted as a final condemnation of the opposite view. His biblical studies brought him into contact with men like Duchesne, Loisy, Mignot, and Semeria, who were endeavouring, amid much discouragement from the authorities, to domesticate within their own communion the methods which elsewhere had revolutionized the study of scripture and of Christian antiquity. With Loisy, despite a profound dissimilarity in temperament and interests (revealed in Loisy's *Mémoires*), von Hügel maintained from 1893 until his death a constant and intimate correspondence; while George Tyrrell [q.v.], whose acquaintance he made in 1897, became his 'friend of friends'. Von Hügel's social standing and cosmopolitan connexions combined with his impressive and attractive personality to place him at the centre of the 'modern-

ist' group, of which Paul Sabatier described him as 'the lay bishop' and a less sympathetic observer, Salomon Reinach, as 'the pope'. He also cultivated friendly relations with protestant scholars abroad, especially with Rudolf Eucken and Ernst Troeltsch; the latter's death in 1923, on the eve of a visit to England arranged by von Hügel, was a serious blow. In 1896 he became an original member of the Synthetic Society with Arthur (afterwards Earl of) Balfour and others; and he himself founded in 1905 the London Society for the Study of Religion; the obituary notice of him in *The Times* gives a vivid description of him as he appeared at its meetings. In 1908 his *Mystical Element of Religion as studied in St. Catherine of Genoa and her friends* established his reputation as a religious thinker. *Eternal Life, a Study of its Implications and Applications*, followed in 1912, and in 1921 a volume of *Essays and Addresses on the Philosophy of Religion*; of the latter a second series appeared posthumously in 1926. His style, although difficult, and German rather than English in structure, is highly expressive of his individuality.

Although to the last 'impenitent' as regards biblical criticism—his *Encyclopædia Britannica* article on the fourth Gospel (in the 11th edition, 1910) was published three years after the papal condemnation of modernism in 1907—faithful to the principle of free scientific and historical investigation, loyal to friends suffering under ecclesiastical censures, supporting and contributing to the short-lived Italian modernist review *Il Rinascimento* (1907-1909) and keenly lamenting its enforced decease, von Hügel was yet increasingly repelled by the 'immanentism' of many modernists, as tending towards denial of 'the objective full reality of God' postulated by 'adoration', which he regarded as the essence of religion. Despite his sympathetic study of mysticism, he came to distrust 'all and every monism' as destructive of man's sense of his own 'creatureliness' and God's transcendence, and to value ecclesiastical institutions as the safeguard of a truly religious temper. Himself ever a humble and devout Roman Catholic, careful—for example, by regular use of the rosary—to worship as far as possible in unison with the majority of his fellow churchmen, and convinced that no Church afforded so favourable a soil for the highest type of religion as his own, he yet recognized in every historical religion, although by no means in equal

measure, a medium of divine revelation. He therefore 'would not cross the room' to make a convert, although he rejoiced when any one, after fully utilizing the opportunities afforded by his own communion, felt himself compelled to seek in Roman Catholicism a fuller scope for his Godward aspirations. He could conscientiously prepare a child for Anglican confirmation; and it was only after his death that a niece, his spiritual letters to whom were posthumously published, ventured on a step to which he had never encouraged her and became herself a Roman Catholic.

That von Hügel escaped ecclesiastical censure during the campaign against modernism was probably due to a greater extent than he realized to his social position. He never risked refusal by applying for the *imprimatur*; he did not court martyrdom, but there is no reason to suppose that he would have declined the palm, had the Church seen fit to condemn one for whom the deep reverence felt by many outsiders was an advantage to its cause.

In 1914 von Hügel threw in his lot with his country of domicile, and was naturalized as a British subject. To the literature of the European War he contributed an interesting study of *The German Soul in its attitude towards Ethics and Christianity, the State and War* (1916). In 1910 he was given the honorary degree of LL.D. of St. Andrews (to this, his first university, he bequeathed his library), and in 1920, when divinity degrees at Oxford were open to others than Anglican clergymen, he received the honorary D.D. of Oxford. In 1922 he was elected Gifford lecturer at Edinburgh. The lectures, which his health never permitted him to deliver, are represented by *The Reality of God*, edited by E. G. Gardner and posthumously published in 1931 along with part of a projected study of his friend Sir Alfred Lyall [q.v.], entitled *Religion and Agnosticism*.

Von Hügel's influence on recent religious thought, greater outside his own communion than within, is due to the impression conveyed by his writings of a richly endowed and cultured personality, profoundly Christian and catholic, inspired by a passion for communion with God, and sympathetic with all genuine religion wherever found. Of his characteristic ideas the most noteworthy are perhaps his insistence on the necessity of sensory stimulation in every human activity, not excluding the religious; his suggestion that

the scientific view of the world may discharge for Christianity the purifying function formerly performed by eschatology, and his defence of the doctrine of two levels in human life, natural and supernatural, each with a value of its own.

Von Hügel died at his house in Kensington 27 January 1925, and was buried near Downside Abbey at Stratton-on-the-Fosse, Somerset.

The personal appearance of von Hügel was singularly impressive. The intensely pale face, lined with marks of physical suffering, the eyes deep set under bushy eyebrows, the dark hair and beard, turning white as he grew older, set off alike the delightful freedom, the eager human interest, the humour and ripe wisdom of his intimate conversation—in general conversation his deafness disabled him from taking part—and the prophetic earnestness of his more public utterances, which were all the more effective for the quaint and striking phrases and illustrations with which they abounded. In both he gave characteristic expression to a religious experience, remarkable for its richness and depth, its intellectual and moral discipline, its balance and sanity, and peculiarly fitted to communicate to others that sense of the reality of God which was the centre of the speaker's own life. Dom Cuthbert Butler has described (*Tablet*, 14 February 1925, quoted by Holland, p. 49) how he would 'watch him sitting' in church, 'the great deep eyes fixed on the Tabernacle, the whole being wrapt in an absorption of prayer, devotion, contemplation', and adds: 'Those who have not seen him so know only half the man.'

[*The Times*, 28 January 1925; *The Times Literary Supplement*, 25 May 1922; *Baron Friedrich von Hügel. Loisy, *Mémoires*, 3 vols., 1930-1931; Maisie Ward, *The Wilfrid Wards and the Transition*, vol. i, 1934; personal knowledge.] C. C. J. WEBB.

WACE, HENRY (1836-1924), dean of Canterbury, was born at Islington 10 December 1836, the eldest son and second child in the family of twelve children of the Rev. Richard Henry Wace, by his wife, Enlielia, daughter of Charles Grey. His father was at one time curate of St. Sepulchre's church, Holborn, but the strain involved by his work during the cholera epidemic of 1848 and 1849 left him with a nervous hesitation of speech, and he was

obliged to resign his curacy. He took pupils, first at Goring, and afterwards at Hill House, Wadhurst, a property left to him by an uncle.

Henry Wace, after careful training and tuition at home, was sent to Marlborough College in February 1848. He was physically unequal to the rough disorder of that school, not yet under the capable rule of Dr. George Cotton, and it was thought well to remove him to Rugby, where he was in the School House under Edward Meyrick Goulburn [q.v.]. After staying less than the ordinary time at Rugby, he went to King's College, London, where he lived as a pupil with the Rev. Charles Hole, to whose influence and friendship he owed much. In May 1856 he entered Trinity College, Oxford, but winning a scholarship a few days later at Brasenose College, he migrated thither. He obtained a first class in mathematical moderations in 1858, and graduated in 1860 with second classes in *literæ humaniores* and mathematical 'Greats'.

After studying a year for holy orders, Wace was ordained deacon in 1861, and priest in 1862, by Dr. A. C. Tait, bishop of London. His first licence was the curacy of St. Luke's, Berwick Street, a daughter church of St. James's, Piccadilly, and in 1863 the Rev. John Edward Kempe, the rector of St. James's, invited Wace to become his curate, an offer which Wace accepted.

The same year Wace began to write regularly for *The Times*. He had contributed a letter protesting against the treatment of Bishop John William Colenso [q.v.], and this attracted the attention of John Thaddeus Delane [q.v.], the editor. Shortly afterwards Wace was invited to become a writer of leading articles. His terse and vigorous style of writing commended him to Delane, who acknowledged freely the value of his services, and himself gained the admiration of Wace by his masterly notes, which gave his assistants the line to take on any subject. Wace's official association with *The Times* lasted for more than twenty years.

After seven years' work at St. James's, Piccadilly, Wace left in 1870 for the lectureship of Grosvenor chapel. In 1872 he was appointed to the chaplaincy of Lincoln's Inn, and in 1880 he was made preacher of the Inn. When in 1896 he resigned that office, the Society made him an honorary member of its high table, a distinction which he valued greatly. In 1874 and 1875 Wace was chosen to deliver

the Boyle lectures in the Chapel Royal, Whitehall. These lectures he collected and published (1876) under the title of *Christianity and Morality*, a work which ran through several editions. He was also Bampton lecturer at Oxford in 1879, choosing as his subject 'The Foundations of Faith'. He resumed his connexion with King's College, London, in 1875 on his appointment to the professorship of ecclesiastical history. About the same time he collaborated with (Sir) William Smith [q.v.] in preparing and editing the *Dictionary of Christian Biography, Literature, Sects, and Doctrines, during the first Eight Centuries*. This work was issued in four volumes between 1877 and 1887. He was also responsible for the section of the *Speaker's Commentary* on the Bible which dealt with the Apocrypha.

In 1883, on the resignation of Dr. Alfred Barry [q.v.], Wace was appointed principal of King's College, a position which he held until 1897. He took a leading part in the struggle for uniting King's College, University College, and Gresham College into one university, a scheme which, owing to the opposition of the Victoria University of Manchester, was defeated in parliament. It was during his term of office as principal that the government grant was withdrawn from King's as being a denominational institution; Wace thereupon raised £15,000 by an appeal for subscriptions to meet the emergency.

In 1896 Wace was nominated by the Drapers' Company to the valuable benefice of St. Michael's, Cornhill. Although this preferment brought with it comparative ease, and enabled him to re-establish a strong constitution overstrained by hard work, his activities continued. Known already as a churchman of wide learning, a controversialist of decided views, and a stout champion of the Reformation settlement, he was able now in various directions to show a remarkable business capacity. The councils and committees on which he served, and over many of which he presided, are too numerous to give in detail. He made an admirable chairman, for, strong partisan as he was, his fairness and ability were generally recognized, and won the confidence of many whose opinions differed from his own.

Up to the age of sixty Wace had not received from the Church authorities any honour except a prebendal stall at St. Paul's Cathedral (1881). But in 1903 promotion came from the Crown, and he succeeded Dr. Frederic William Farrar as

dean of Canterbury. The choice of the prime minister, Mr. Balfour, met with general approval, and the work at Canterbury was congenial to Wace himself. He continued the task of repairing the fabric of the cathedral, especially the famous Angel steeple. He did great service at Canterbury in educational and hospital work, and his popularity was shown by the presentation to him in 1921, on the occasion of his eighty-fifth birthday, of the honorary freedom of the city.

As dean, Wace became for the first time a member of the Convocation of Canterbury, where his ability in debate soon gained him the ear of the house. To the end of his long life he took a determined stand upon the ancient ways, and he was the outspoken opponent of innovations which, in the view of other leaders of the Anglican Church, were advisable in order to meet modern conditions. He could not tolerate the methods of the 'higher criticism' of Holy Scripture, and the revision of the Prayer Book found in him a convinced antagonist. Although such an attitude involved the support of many losing causes, he defended his position with a logical keenness and a wealth of learning to which few of his opponents could aspire. In private life he was most attractive, witty, and stimulating in conversation, and considerate to those whose intellectual powers were far less than his own. As a host at the deanery he was ideal, and as a friend loyal and dependable.

Wace made a special study of the Reformation period, and he was deeply read in Lutheran literature. His writings, besides those already mentioned, include an edition of Luther's primary works (in collaboration with Dr. C. A. Buchheim, 1896), lectures on *The Gospel and its Witness* (1883), *Sermons on the Sacrifice of Christ* (1898), and *The Bible and Modern Investigations* (1903). His contributions to newspapers and magazines were numerous.

Wace married twice: first, in 1863 his second cousin, Elizabeth (died 1893), eldest daughter of Henry Arnett; secondly, in 1894 Cornelia Gertrude, daughter of Dr. Leonard Schmitz. His second wife, who had been vice-principal of the Ladies' Department of King's College, survived him by nearly a year. By his first wife he had four sons, one of whom died in infancy. He died at Canterbury 9 January 1924.

A portrait of Wace by William Logsdail (1903) hangs in the Deanery, Canterbury. [*The Times*, 10 January 1924; private information.] A. COCHRANE.

WALKER, Sir BYRON EDMUND (1848-1924), Canadian banker, the eldest son of Alfred Edmund Walker, by his wife, Fanny, daughter of William Murton, of East Stour, Kent, was born on a farm in Seneca township, co. Haldimand, Canada West, 14 October 1848. Both his parents were of English origin. He went to the central school in Hamilton, Ontario, at the early age of four, but left when only twelve on account of ill-health. In 1861, while still under thirteen years of age, he was taken into the exchange office of his uncle, J. W. Murton, in Hamilton, where he learnt to understand the various complicated currencies in use, and became a recognized expert in the detection of counterfeit money. In July 1868 he entered the Canadian Bank of Commerce in Hamilton as a discount clerk. In spite of offers from other institutions, Walker remained for the rest of his life in the Bank of Commerce, rapidly acquiring a thorough knowledge of banking by holding a variety of posts. In 1872 he became chief accountant in Toronto; in 1873 accountant in the New York agency; in 1875 manager in Windsor, Ontario; in 1878 manager in London, Ontario; in 1879 inspector at the head office; in 1880 manager in Hamilton; in 1881 joint agent in New York; in 1886 general manager; in 1906 director; and in 1907 president. Not only was the growth of the Bank of Commerce due in great part to Walker's skill and personality, but the Canadian banking system as a whole owes its present form largely to his efforts. Soon after the Bank Act of 1871 had been passed, attempts were made to change it in such a way as to make it possible for the development in Canada of a banking system similar to the American system. In 1880 and again in 1890 when the Act came up for revision, it was Walker who bore the brunt of defending it against such a change. Walker, indeed, was a lifelong advocate of the branch-banking system, and always strenuously opposed the system of local banks which prevails in the United States. This opposition was due not merely to his traditional sentiments, but to reasons of sound finance. The need of co-operation amongst the Canadian banks, thus demonstrated, led him and others to found in 1891 the Canadian Bankers' Association, of which he was successively vice-president and president.

Walker early became recognized as an authority on Canadian finance. In 1899 he was made chairman of a royal com-

mission appointed to report on the financial position of the province of Ontario; in 1900 he was elected vice-president of the American Bankers' Association; and in the last few years of his life he was consulted by the English authorities in reference to the public finance of England. In addition, as director on the boards of many companies, he made valuable contributions to the development of Canadian business and finance. Perhaps, however, the greatest tribute to his financial ability was the stability of Canadian finance during the European War of 1914-1918. Immediately on the outbreak of war, Walker was called to Ottawa in company with two or three other financiers, and within a few hours the plan of war-time finance for Canada was drawn up and approved.

Although Walker's genius lay pre-eminently in banking and finance, his interests were unusually wide. He himself had never received a university education, but he gave much time and thought to the affairs of the university of Toronto. His first official connexion was as one of the trustees (1892), which office he held until the reorganization of the university following the report of the royal commission of 1905, of which he himself was a prominent member. Thereafter he served as a governor of the university, and as chairman of the board from 1910 until 1923, when he became chancellor.

Walker was connected with a host of organizations, large and small, which had for their object promotion of the arts. Nor was he a mere figure-head in these enterprises; on the contrary, he took an active interest in them all, so far as time allowed. He was honorary president of the Mendelssohn choir of Toronto from 1900, and chairman of the governors of the Toronto conservatoire of music. The opening of the Royal Ontario Museum in 1914 was in no small degree due to his efforts; many of his interests were represented there, and he took an active interest in the acquisition as well as the management of the museum. In palaeontology he was something of an expert, and for years gave much time and money to the collection of specimens. In 1907 Walker was made one of three members of an advisory arts council (later known as the Board of Trustees of the National Gallery) appointed by the Dominion government. To this, as to all the other similar organizations, he was able to lend both his advice on finance and his skilled opinion on artistic

questions. He now turned to public purposes that knowledge of pictures which for many years previously had been sought for its own end. In addition he acquired one of the finest and largest collections of Japanese prints in the world.

Walker had a keen sense of public duty, and never shrank from public affairs. But he took little part in politics, and only once was moved to vigorous action in an election. This was at the general election of 1911, when he joined with other liberals of Toronto in opposing the Laurier government's policy of reciprocity with the United States, in which he and they saw serious political and economic harm to Canada.

Amongst Walker's more important writings are 'Canadian Banking' in Pargrave's *Dictionary of Political Economy* (1894-1908), *A History of Banking in Canada* (1896), and 'East and West' (J. O. Miller (ed.), *The New Era in Canada*, Toronto, 1917). He left behind him a remarkable and carefully arranged collection of private papers, which relate to Canadian life and international finance in all their important activities.

Walker married in 1874 Mary (died 1928), daughter of Alexander Alexander, of Hamilton, and had four sons and three daughters. He was knighted in 1910, and received honorary degrees from Trinity University, Toronto, and the university of Toronto (1906). There is a portrait by Sir John Lavery in the National Gallery at Ottawa. He died in Toronto 27 March 1924.

[Victor Ross, *History of the Canadian Bank of Commerce*, 2 vols., Toronto, 1922; letters and papers in possession of the family; personal knowledge.] W. P. M. KENNEDY.

WALKLEY, ARTHUR BINGHAM (1855-1926), dramatic and literary critic, was born at Bedminster, Bristol, 17 December 1855, the only child of Arthur Hickman Walkley, bookseller, of Bristol, by his wife, Caroline Charlotte, daughter of Joseph Bingham, bookseller, of Bristol. From Warminster School he gained an exhibition at Balliol College, Oxford, and matriculated there in October 1873. In January 1874 he was admitted a scholar of Corpus Christi College, Oxford. He obtained first classes in mathematical moderations (1875) and in the final school of mathematics (1877).

In June 1877 Walkley was appointed a third class clerk in the secretary's office of the General Post Office. In November

1882 he was promoted second class clerk, in January 1892 first class clerk, in November 1899 principal clerk, and in August 1911 assistant secretary (in charge of the telegraph branch). In 1897 he was secretary to the British delegation to the Washington Postal Congress, in 1898 secretary to the Imperial Penny Postage Conference, and in 1906 a delegate to the Rome Postal Congress. He was superannuated in June 1919.

Side by side with his career as civil servant ran Walkley's more brilliant career as writer. He began by reviewing books in the periodical press. Interested by the dramatic criticisms of his friend William Archer [q.v.] and especially by his book *English Dramatists of To-day* (1882), Walkley turned his attention to the theatre. When the *Star* evening newspaper was founded in January 1888 he was appointed its dramatic critic and held the post until 1900. As 'Spectator' he wrote for the *Star*, besides his notices of plays, a periodical contribution on theatrical affairs and the drama in general; this prepared his way as essayist. In the *Star* he wrote also, under his own name, a series of miscellaneous papers entitled 'Fly Leaves', some of which concerned a certain Pettifer, who was intended for a 'fantasticated, burlesqued, and belittled projection' of the writer. In November 1890 he became dramatic critic of the *Speaker*, a weekly paper, and held the post until the paper changed hands at the end of September 1899.

Dramatic criticisms which he had written for the *Speaker*, the *National Observer*, and other periodicals, Walkley collected into a volume, *Playhouse Impressions* (1892); and a selection from his miscellaneous papers in the *Speaker*, the *Star*, and other journals was published as *Frames of Mind* in 1899. In that year he began to contribute dramatic criticism to *The Times*, his first notice being a review in the issue of 21 September 1899 of (Sir) Herbert Beerbohm Tree's production of *King John*; and on 1 March 1900 he was formally engaged as dramatic critic. He contributed in 1900 and 1901 to *Literature*, a weekly paper published by *The Times*, and to *The Times Literary Supplement* after its foundation in January 1902. Some of these articles composed his volume *Drama and Life* (1907). In February 1903 he delivered three lectures at the Royal Institution, which he published as *Dramatic Criticism* (1903). After his retirement from the Post Office he began the series of

miscellaneous articles published in *The Times* on Wednesdays, some of which he collected into his three volumes, *Pastiche and Prejudice* (1921), *More Prejudice* (1923), and *Still More Prejudice* (1925).

Walkley's view of criticism may best be learned from his book, *Dramatic Criticism*. He professed himself an 'impressionist', one whose task was to estimate and analyse his own sensations in the presence of a work of art, not to judge it by rule. 'The primary aim of all art', he wrote, 'is to give pleasure. And this pleasure of art . . . is in the first instance . . . a pleasure of the senses.' In practice he was not entirely consistent, being inclined, as Archer told him, to let aesthetic and philosophical theory intrude between him and the work of art; but his idea of criticism enabled him to come unprejudiced and fresh to each new book or play. This, especially in his earlier years, was of great help to the English drama, which was then beginning a new period and breaking free from certain conventions of dramatic form and content. In particular Walkley's welcome of Ibsen, not as moralist or reformer, but as a great artist in play-making, did much to counteract both the foolish abuse and the genuine misunderstanding with which Ibsen's plays were at first received in London. Later in life Walkley's fastidious love of form, clarity, and finish gave him a distaste for the development, in plays by Bernard Shaw and others, of the very 'drama of ideas' which his admiration for the French drama of the period had led him to desire. He lost his love of Ibsen and came to prefer light comedy of the more conventional type. The theatrical profession found him too much of the essayist and too little of the reporter for its taste; and his fearless gaiety in attack led to his being turned away on 2 March 1903 from the doors of the Garrick Theatre, to which, as critic of *The Times*, he had been invited to see *Whitewashing Julia*, a new play by Henry Arthur Jones produced by Arthur Bouchier. The insult did nothing to prevent Jones and Walkley from later becoming firm friends.

Whatever his opinions, Walkley's criticisms were always in themselves works of art. He was widely read in French drama, fiction, and criticism (he liked to be as French as possible in appearance and in bearing), fairly well read in the classics and in English prose, and with some knowledge of Spanish and Italian. Alike in dramatic and literary criticism and in the short miscellaneous essay (a form in

which he was a master), his sensitiveness to impression, his accurate and retentive memory, his ease and grace of manner, and his playfulness and wit produced delightful results.

Next to criticism, Walkley was most interested in fruit-growing and rock-gardening, which he practised at his country home at Pound Hill, near Crawley in Sussex. In 1919 he left it for a house at Brightlingsea in Essex, where he died 8 October 1926. He married in 1881 Frances, daughter of Charles Eldridge, bookmaker's manager, and had one daughter.

[*The Times*, 9 October 1926; H. H. Child, 'Arthur Bingham Walkley' in *The Post-Victorians*, 1933; personal knowledge.]

H. H. CHILD.

WALSH, STEPHEN (1859-1929), trade union leader and politician, was born in Liverpool of parents in humble circumstances 26 August 1859. Further details of his parentage are not available. In infancy he was admitted as a foundling to the Kirkdale Industrial School and Orphanage, near Liverpool. There he received an elementary education, showing proficiency in mathematics, and acquired in childhood a love of books which enabled him in later years to display to the House of Commons considerable knowledge of English literature and social history. At the age of thirteen Walsh became a working miner at Ashton-in-Makerfield, near Wigan. His native intelligence and trustworthy character attracted the attention of his fellow workers, and in 1901 he was appointed agent of the Lancashire and Cheshire Miners' Federation; subsequently he became president of that federation, and in 1922 vice-president of the Miners' Federation of Great Britain. In 1906 he was invited by the Miners' Federation to contest the Ince division of Lancashire as a labour candidate. He won the seat, and retained it for the remainder of his life. He was also a J.P. and D.L. for the county of Lancaster.

In parliament Walsh spoke with effect on industrial questions, and he made valuable contributions to debates on the Mines Act 1911 and on the Minimum Wage Act 1912. He became expert in wage negotiations, having remarkable facility in dealing with intricate calculations, and from 1914 to 1920 he was chairman of the miners' section of the English Conciliation Board. He was elected a vice-chairman of the parliamentary labour party in 1922. During the European War Walsh devoted

himself to recruiting and to the question of man power; he was parliamentary secretary to the Ministry of National Service in 1917, and to the Local Government Board during 1917-1918. He was an advocate of compulsory military service, consistently maintaining during the War, as he had maintained during the coal-mining crisis in 1912, that the claims of citizenship are superior to those of trade unionism. In January 1924, on the formation of the first labour government, Walsh was appointed secretary of state for war and president of the Army Council; when the government resigned in November of the same year he was already recognized as a capable and popular minister. In November 1927 he was appointed a member of the (Simon) statutory commission set up under the provisions of the Government of India Act 1919, but owing to failing health he was unable to serve. He died at his home in Wigan 16 March 1929.

Walsh was a man of exceptionally small stature and homely presence: his personality was acceptable in a marked degree to members of all parties in the House of Commons and to the public. Without any hereditary or educational advantages, he was called to a great position in the public service, and he performed the duties of that position with generally acknowledged efficiency. His career affords an example of success in high administrative office of a man possessed of no obvious qualifications for such responsibilities save integrity, courage, and abundant common sense. Walsh married in 1885 Anne, daughter of John Adamson, a Lancashire miner. She survived him with three sons and five daughters. The eldest son, Arthur, a young man of scholarly attainments, was awarded the military cross and fell in action in 1918.

[*The Times*, 18 March 1929; private information.]
A. E. WATKIN.

WARD, SIR ADOLPHUS WILLIAM (1837-1924), historian, born at Hampstead 2 December 1837, was the second son of John Ward, diplomatist [q.v.], by his wife, Caroline, daughter of the Rev. John Bullock, rector of Radwinter, Essex. In 1841 John Ward was sent to Germany on the first of a series of missions and appointments which kept him there until his retirement in 1870. This transplantation exerted a profound influence on his son, whose schooling began at Leipzig, where his father was then consul-general, and whose

youthful interest in Germany never waned. At the age of sixteen he was removed to King Edward VI School, Bury St. Edmunds, of which John William Donaldson [q.v.] was then headmaster, and in 1855 he entered Peterhouse, Cambridge, as a pensioner. He graduated in 1859 with a first class in the classical tripos, and was elected a fellow of his college in 1861. He entered the Inner Temple in 1860, and was called to the bar in 1866, but never practised. After brief periods as classical lecturer at Peterhouse, examiner at the Education Office, and assistant to Sir George Ramsay [q.v.], professor of humanity in the university of Glasgow, he was appointed professor of history and English language and literature at Owens College, Manchester, in 1866.

For the next thirty-one years Ward laboured with unflagging zeal as a teacher and an administrator. His commanding presence and impressive lectures combined with his enthusiasm for letters and great range of knowledge to render him one of the leading teachers of his time. He was the founder of the history school which placed Manchester next to Oxford and Cambridge in that department of study. The appointment of T. N. Toller as professor of English philology in 1880 relieved him of part of his burden; but until he became principal in 1889 Ward remained responsible both for English literature and for the whole range of history, and he continued to lecture on history until he left Manchester in 1897.

No member of the staff played a more active part than Ward in raising the academic status of Owens College. In 1875, with three of his colleagues, he began to advocate its transformation into an independent university. Instead, the federal Victoria University was created in 1880, with its seat in Manchester, and Owens College as its first constituent member, to which the colleges of Liverpool and Leeds were added later. Ward was vice-chancellor of the new university from 1886 to 1890 and again from 1894 to 1896. In recognition of his services to the community 'Ward of Manchester', as he was often called, received the freedom of the city in 1897, the year in which he left Manchester. He remained in close touch with his old friends, and rejoiced at the establishment of an independent university of Manchester in 1903.

Ward's output during the Manchester years was mainly in the field of English literature, although his translation in five

volumes of the *History of Greece* by Ernst Curtius (1868-1873) revealed his interest in ancient history and his admiration for German scholarship. His *History of English Dramatic Literature to the Death of Queen Anne* (2 vols., 1875), the first systematic attempt to cover this immense field, won him a place in the front rank of British scholars. The revised and enlarged edition in three volumes (1899) remains an indispensable work of reference. His editions of works by Marlowe, Robert Greene, and Thomas Heywood, his article on the 'Drama' written for the ninth edition of the *Encyclopædia Britannica*, and his contributions to the *Manchester Guardian*, of which he was for many years dramatic critic, supply additional evidence of his interest in plays new and old. The volumes on *Chaucer* (1879) and *Dickens* (1882) in the 'English Men of Letters' series, his editions of the works of Pope, of John Byrom, the Manchester Jacobite, and, in later years, of Crabbe and of Mrs. Gaskell, proved that he maintained his interest in poetry and fiction. The only substantial historical work of the Manchester period was *The Counter-Reformation* (1880) in Longman's 'Epochs of Church History' series. He contributed some 300 articles, chiefly seventeenth-century lives, to this Dictionary, and he was one of the chief supporters of the *English Historical Review* from its foundation in 1886.

On leaving Manchester at the age of sixty, Ward settled in London. A little volume on *Sir Henry Wotton* (1898) was followed by the Ford lectures on *Great Britain and Hanover* (1899, German translation 1900); and he began to work at *The Electress Sophia and the Hanoverian Succession* for Goupil's illustrated monographs (1903, revised and enlarged without illustrations, 1909). In 1900 his old college recalled him as its master. His inspiring influence was quickly felt in Peterhouse, and he took his full share in the life of the university, of which he was vice-chancellor in 1901. He was an admirable chairman of the Press Syndicate from 1905 to 1919, and he was scarcely less active on the Library Syndicate.

The death of Lord Acton [q.v.] in 1902 deprived the editors of the *Cambridge Modern History* of his guiding hand. As editor-in-chief, with the aid of (Sir) George Walter Prothero [q.v.] and (Sir) Stanley Leathes, Ward carried through the immense undertaking in eleven years (1901-1912). Of his own contributions, appear-

ing in seven of the twelve volumes, the most important are the six chapters on the Thirty Years War, which reveal his unsurpassed knowledge of that period. The success of the enterprise encouraged him to suggest and the University Press to undertake the *Cambridge History of English Literature*, edited by Ward and Alfred Rayney Waller, and published 1907-1910, in which Ward's contributions, mainly on the dramatists and historians of the last three centuries, appear in nine of the fourteen volumes. These chapters are on the whole shorter and less impressive than those which he wrote for the *Cambridge Modern History*.

The outbreak of the European War in 1914 was a poignant grief to Ward, who was bound to Germany by numerous ties. His dislike of German militarism in no way disturbed the balance of his chief historical work, *Germany, 1815-1890* (1916-1918), written for the 'Cambridge Historical Series'. The first two volumes, bringing the narrative down to 1871, displayed his power unabated, and in describing the making of the German Empire he was able to draw on the experiences of his early manhood. The third volume, with an epilogue extending to 1907, is shorter and slighter, for the octogenarian was anxious not to leave an unfinished work.

Ward next wrote two little volumes of minor importance on *The Period of Congresses and Securities of Peace* (1919) in S.P.C.K. 'Helps for Students of History'. The publication of his *Collected Papers* (1921), at the suggestion of the Cambridge University Press, was a fitting tribute to his services. Two volumes were devoted to history, two to literature, one to travel and miscellanies. His selection was not impeccable; for some important material was omitted, and a few ephemeral reviews were included. Though now over eighty and rather deaf, Ward was still full of energy. The *Cambridge History of British Foreign Policy, 1783-1919*, edited by Ward and Dr. G. P. Gooch, appeared in three volumes in 1922-1923. His chapter on the Schleswig-Holstein question, for which he used the unpublished papers of his father, is more valuable than his lengthy introduction sketching the evolution of diplomacy up to 1783. A briefer survey of British policy in Greece and the Ionian Islands, 1832-1864, derive a personal interest from an early visit of his to Athens, where he had conversed in modern Greek with veterans of the War of Independence. After the completion of this, his last

editorial enterprise, Ward contented himself with articles and reviews. He died at Cambridge 19 June 1924.

Ward received many honours at home and abroad. He was knighted in 1913, the year in which he presided over the International Historical Congress in London, and he was created a knight of the Prussian order of the Crown in 1911. He received honorary degrees from the universities of Manchester, Glasgow, St. Andrews, and Leipzig. He was president of the British Academy (of which he was an original member), 1911-1913, of the Royal Historical Society, 1899-1901, of the English Goethe Society, 1912-1922, of the Chetham Society, 1901-1914, and of the Spenser Society, 1888-1894.

Ward's main strength as a historian lay in his unrivalled knowledge of the political evolution of Europe since the Middle Ages, and no British scholar was so intimately acquainted with the results of German scholarship in this field. He owed most to Leopold von Ranke, whose objective treatment he endeavoured to emulate. Like Ranke he was better fitted to describe the policy of states than to portray an individual or to recapture the atmosphere of an epoch. His lack of colour and his lengthly sentences limited his appeal, but on occasion he could rise to passages of restrained eloquence. He belonged to the category of political historians, for he was more interested in events and institutions than in economic factors or political and religious ideas.

Ward was fortunate in his home life. His marriage in 1879 to his cousin, Adelaide Laura, daughter of the Rev. Thomas Burne Lancaster, rector of Grittleton, Wiltshire, like himself a grandchild of the sister of Thomas Arnold of Rugby, brought him enduring happiness; and the marriage in 1916 of their only surviving child to Dr. E. W. Barnes, master of the Temple, afterwards bishop of Birmingham, added to the interest of his later years.

Ward was conspicuous in every gathering he attended, and his hospitality made him an ideal host. He took special pleasure in entertaining foreign scholars. Despite his stately courtesy he was fundamentally simple and human, and his kindness to students was inexhaustible. In national as in academic questions he was a liberal, and he disliked Imperialism both at home and abroad. He remained young in spirit, working to the last with untiring energy.

There is a portrait of Ward by Sir Hubert von Herkomer in the university of Man-

chester, and another by Hugh Riviere at Peterhouse, Cambridge.

[*The Times*, 20 June 1924; *Manchester Guardian*, 20 June 1924; A. T. Bartholomew, *A Bibliography of Sir A. W. Ward with a Memoir by T. F. Tout*, 1926; *In Memoriam A. W. Ward, Master of Peterhouse*, 1924; *Cambridge Historical Journal*, vol. 1, no. 2, 1924; personal knowledge.] G. P. GOOCH.

WARD, Sir EDWARD WILLIS DUNCAN, first baronet (1853-1928), soldier and military administrator, the only son of Captain John Ward, R.N., of Oban, by his wife, Mary Hope, daughter of John Bowie, was born there 17 December 1853. Privately educated, he entered in 1874 the commissariat branch of the Control Department, an organization of military officials outside the army, like the French *Intendance Militaire*. He was promoted assistant commissary-general for active service in the Sudan (1885), and when the Army Service Corps was instituted (1888) as part of the army he was commissioned in it as major and promoted lieutenant-colonel in 1890. Having been noticed by Lord Wolseley in the Sudan, and in Ireland, where he served from 1888 to 1892, Ward held staff appointments in Dublin (1892-1895), on the Ashanti expedition (1895-1896, when he was made C.B.), and in London (1895-1899), where, being given official charge of the (originally unofficial) Military Tournament at Islington, his energy and business ability prepared its later triumphs at Olympia and promoted its substantial contributions to service charities. He published (1897) a good practical *Handbook of Army Service Corps Duties in Peace and War*.

In 1899, war in South Africa being imminent, Ward was among the officers sent out in advance and, as chief supply officer in Natal, collected large stocks at Ladysmith, which was invested on 2 November. Commandeering all traders' supplies, he took responsibility for feeding both troops and inhabitants until relief came on 28 February 1900. He had only two and a half months' rations, eked out with horse-flesh; but they were administered so ably that Sir George Stuart White [q.v.] proclaimed Ward 'the best commissariat officer since Moses', forgetting that only miracles saved Israel in the desert from hunger and thirst and that the supreme feat in Egyptian commissariat was Joseph's. Three weeks after the relief Ward, now director of supplies to Lord Roberts, was at Bloemfontein preparing for the advance

to Pretoria. That phase of the War ended, he came home with his chief late in 1900, promoted full colonel and created K.C.B.

In April 1901 the secretary of state for war, Mr. Brodrick (afterwards Lord Middleton), who after nine years at the War Office desired to deal with the military heads of departments without a civilian interposed by official rule as permanent under-secretary of state, tried to turn the position by giving that post to Ward. But to those heads Ward's commissariat record, however brilliant, stamped him as more official than soldier; while to Mr. Arnold-Forster, who succeeded Brodrick in 1903, he was more soldier than official, lacking the civil servant's special knowledge and experience. In 1904 the War Office Reconstitution Committee under Viscount Esher [q.v.] established direct dealings between the secretary of state and soldiers as colleagues on the Army Council, while the permanent under-secretary, no longer interposed, shrank to the position of secretary of the Army Council, retaining the (civil) headship of the department. Loyal in disappointment, without troubling overmuch about theories of administration, Ward concentrated on making the new machinery work smoothly, with the devoted help of the civilian staff. Ill-yoked with Mr. (afterwards) Viscount Haldane [q.v.], he yet made a notable contribution to the 'New Model' as chairman of the committee which designed the Officers Training Corps. With his driving-power, knowledge of men, and tact, he was at his best in the chair of a committee with a definite task, other instances of such success being the substitution of ex-military clerks for civilians in the military departments of the War Office, the Brodrick reorganization of the Army Medical Department, and the compilation of the original War Book detailing War Office action on mobilization. By organizing the War Office Sports Club, comprising officers, private soldiers, and civilians, he gave the Office personnel a *camaraderie* formerly lacking. Devoted to the welfare of soldiers past and present, Ward interested himself in schemes for civil employment of discharged men and reservists, and took the lead in founding the Union Jack Club for soldiers and sailors passing through London—an immeasurable boon—of which, after presiding over the originating committee (1902), he was president for twenty-two years.

Ward was created K.C.V.O. in 1907 and a baronet on retiring from the civil

service in January 1914, when he became chairman and director of substantial companies. By the autumn he was again immersed in public duties: organizer and commandant-in-chief of the Metropolitan Special Constabulary, Lord Kitchener's deputy in superintending the personal welfare of all overseas troops, organizer of the War Camps Library, director-general of the voluntary organizations of helpers in war hospitals, munition workers' canteens, &c.—there seemed no limit to Ward's powers of leadership, with his genius for wise delegation to the right man. When peace returned he was created G.B.E. in 1919.

A strong but genial personality, welcoming responsibility, imperturbable, somewhat inarticulate, Ward's forte lay in execution rather than in counsel. He married in 1880 Florence Caroline, daughter of Henry Minchin Simons, merchant, of London and Singapore, and had two sons, the elder of whom, Edward Simons (born 1882), succeeded him as second baronet. Ward died 11 September 1928 in Paris, of ptomaine poisoning, and was buried at Brompton.

A cartoon of Ward by 'Spy' appeared in *Vanity Fair* 30 May 1901.

[Official records; private information; personal knowledge.] C. HAUNTS.

WARD, JAMES (1843-1925), philosopher and psychologist, was born at Hull 27 January 1843, the eldest of the nine children of James Ward, by his wife, Hannah Aston. His father was a clever, ambitious, but unsuccessful merchant in Liverpool, whose vicissitudes of fortune made the support of his large family a difficult problem. James Ward was educated for a short time at the Liverpool Institute and then, at the age of eleven, sent to a preparatory school at Parkgate on the Wirral peninsula, expecting thereafter to proceed to Rugby; but his school-days were cut short, when he was thirteen, by his father's failure in business, and for the remainder of his boyhood he was self-taught. The Wards settled in a small house at Waterloo, then a village, near Liverpool, and James was left free to roam the neighbouring sandhills. In this solitude his senses were quickened, and the town-boy became a lover of nature. As he said long afterwards, 'it was here that the optimism began, in those wild wastes absolutely untouched by the hand of man; . . . all was beautiful, all was good, and I was one with it all'. He

had some skill as a draughtsman also, and this led, before he was sixteen, to his apprenticeship to a firm of architects. There he made acquaintances, started a debating society, and began to study Greek and logic. He was also an ardent Sunday-school teacher; and, after four years' office-work, determined to become a minister.

Ward's family were Congregationalists, biblical and Calvinist in their theology, and he shared their creed. In 1863, after many difficulties, financial and scholastic, he entered Spring Hill College, near Birmingham (now absorbed in Mansfield College, Oxford). He remained there till 1869, taking the London B.A. degree, as well as completing his theological course. His time there was on the whole not unhappy, although he was harassed by bad health and insufficient means, and perhaps by the rise of doubts concerning the security of his theological beliefs. Before beginning practical work, Ward determined on further study, and a scholarship made a year in Germany possible for him. Living at the Dom Candidatenstift in Berlin and attending the lectures of Isaac August Dorner, he entered a new theological environment and became immersed in speculations on fundamental problems. In the spring of 1870 he moved to Göttingen in order to study under Rudolf Hermann Lotze, who exerted a permanent influence on his thought; he remained there until the university dispersed on the outbreak of the Franco-Prussian War. Unsettled and unsettling as his speculations were, Ward still looked upon them as a support of Christian belief. He was asked and agreed to preach for a month at Emmanuel Congregational chapel in Cambridge, accepted a call to be its minister in January 1871, and, although never ordained, remained in charge of the congregation until March 1872, when he finally demitted his office. His preaching made a powerful impression on the greater number of his hearers and the congregation tried to dissuade him from resignation; but there were some who resented the liberal tone of his sermons and the absence of familiar doctrines; at the same time a struggle was going on in his own mind which issued in the conviction that his teaching was out of place in the Christian pulpit. It was the most unhappy year of his life; and, in the midst of his own trials, he envied the studious life of the university.

A new period of Ward's career began at the age of twenty-nine. He entered Cam-

bridge University as a non-collegiate student, gained an open scholarship at Trinity College in 1873, was placed alone in the first class in the moral sciences tripos in 1874, and in 1875 was elected to a fellowship at his college which he held for the remainder of his life. The break with his former career was complete; for the future he held himself aloof from all institutional religion: but he did not tend towards secularism or even agnosticism; his early belief in spiritual values and his respect for all sincere religion never left him: 'he buried the past, he burned his boats; but he remained for all that a native of other shores'. His passion for nature also, which had not received much encouragement in a domestic circle whose chief interests were business and sermons, and which seemed to have died away in his years of theological study and struggle, revived; and one day, on a walk, 'the old feeling of the would-be naturalist of ten years ago rose up and confronted the self-excommunicated sceptic'. It is worth noting that the first publications of this new period were two short communications on 'Animal Locomotion' in *Nature* (1874).

At this time Ward was working hard at psychology and philosophy. His fellowship dissertation on 'The Relation of Physiology to Psychology' was printed but not published, although a portion of it, 'An Attempt to Interpret Fechner's Law,' appeared in the first volume of *Mind* (1876). After election to a fellowship, he worked for the greater part of a year in the physiological laboratory at Leipzig, and for some time, on his return to Cambridge, in the physiological laboratory there. The result was two considerable papers: 'Ueber die Auslösung von Reflexbewegungen durch eine Summe schwacher Reize' (*Archiv für Physiologie*, 1880), and 'The Physiology of the Nervous System of the Freshwater Crayfish' (*Journal of Physiology*, 1879; abstract in *Proceedings of the Royal Society*, 1879). But, attracted as he was, and always remained, to research in natural science, Ward was deliberately working up towards the domain of mind. In 1880 he contributed the article on Johann Friedrich Herbart to the ninth edition of the *Encyclopædia Britannica*, in 1880-1881 he printed (without publishing) four papers, on 'General Analysis of Mind' and other fundamental problems in psychology, and in 1883 began a series of articles in *Mind* on 'Psychological Principles'. These writings were obviously

prolegomena for a more extended treatise, and circumstances made this treatise take the form of the article 'Psychology' in the ninth edition of the *Encyclopædia Britannica*. It had an immediate and profound effect upon the study and teaching of psychology and, along with two other articles on the same subject in subsequent editions of the *Encyclopædia*, remained the standard expression of Ward's views until the publication of his comprehensive treatise, *Psychological Principles*, in 1918.

Meanwhile Ward's academic career followed a normal course, but rather slowly. He began lecturing for the moral sciences trips in 1878, became a college lecturer in 1881, and in 1897 was appointed to the newly founded professorship of mental philosophy and logic. In 1880 and for a few years afterwards he also lectured on education, and these lectures form the basis of his *Psychology applied to Education* (1926). He was Gifford lecturer at Aberdeen University, 1895-1898, and again at St. Andrews University, 1907-1910. In each case the twenty lectures required were spread over a longer period than the customary two years, and in each case the result was an important philosophical treatise—*Naturalism and Agnosticism* (1890) and *The Realm of Ends, or Pluralism and Theism* (1911). In 1912 he gave the Henry Sidgwick memorial lecture at Newnham College, Cambridge, on *Heredity and Memory* (published 1913). He received the honorary degree of LL.D. from Edinburgh University in 1889 and from his own university in 1920, was an original fellow of the British Academy, and was elected a *correspondent* of the Institut de France. He spent the summer and early autumn of 1904 in America, lecturing for a term at Berkeley in California, reading a paper at the Congress of Arts and Sciences held in connexion with the St. Louis exhibition, and visiting friends in several universities.

During the earlier part of his literary career, Ward's published work was almost entirely psychological, although he always looked to the philosophical bearings of his views and on occasion wrote philosophical papers; after about 1894 his work was mainly philosophical. The most controversial of his psychological doctrines concerned the standpoint of the science and what he called the 'general analysis' of mind. Neither the physiological approach nor the start with sensations or presentations as ultimate data could withstand his

criticism. 'The standpoint of psychology is individualistic; by whatever method, from whatever sources its facts are ascertained, they must—to have a psychological import—be regarded as having place in, or as being part of, *some one's consciousness*.' By 'consciousness', as the term is used here, he means that where and only where there is an object presented to a subject, are we in the domain of mind. The other sciences disregard this fact of presentation as irrelevant for their purposes; but it is fundamental for psychology, and psychology cannot transcend it. The 'subject', however, is not to be identified either with the 'soul' of rational psychology or with a nondescript 'mind-stuff'. It is not a mere passive recipient of presentations; it feels and it acts (or attends). The feeling and the activity characterize the 'subject' only. From this fundamental position a system of psychology was worked out which contained many points of novelty—as in the account of space and time, the clear distinction between the perception and the conception of each, the bold extension of the doctrine of secondary automatism, the emphasis on the importance of subjective as well as natural selection in mental development, and the stress laid on the function of inter-subjective intercourse in leading to knowledge of the external world and of self.

Ward's philosophy is worked out in his two sets of Gifford lectures, in both of which construction is preceded by an elaborate criticism. In the earlier book he begins by making clear the distinction between science and the philosophical theory to which it had been supposed to lead and with which it was often confused, and this opens the way for his refutation of naturalism with its satellite doctrines such as the mechanical theory of reality and psychophysical parallelism. Not all his points were new, but Ward's criticism gave the final blow to the competency of naturalism and to its alliance with agnosticism as promulgated by Herbert Spencer and other leaders of contemporary thought. 'Reality', says Ward, 'consists in the concrete things and events that science sets out from, and not in the network of relations which is its goal'; but science itself starts with the abstraction of things from the experience of them; in philosophy we must proceed from an experience which implies subject-object. In the argument which follows the subjective element is given a position of primacy, and the result

is a theory of 'spiritualistic monadism' which interprets the whole of reality from the side of the subject whose objects are themselves always monads or arrangements of monads. This view is elaborated in *The Realm of Ends*, after criticism of other forms of pluralism. Ward held, with Spinoza and Leibniz, that 'all individual things are animated, although in diverse degrees'. According to this form of pluralism reality consists of active subjects of experience interacting with an environment which consists of other spiritual monads; and these active beings have all a *nisus* towards goodness. It was chiefly this that led Ward to see the unity of the whole from the theistic standpoint. He did not think that theism could be proved, but he held that the idea of God alone enables us to co-ordinate our experience, and the concluding chapters of this book are a series of reflections on the cosmology of theism.

Ward's last book, *A Study of Kant* (1922), was published when he was seventy-nine, and several shorter writings appeared in the three years that followed. They were not marked by the novelty of much of his previous work, but in criticism and exposition they show that his mental powers were unimpaired.

Ward married in 1884 Mary, daughter of the Rev. Henry Martin, Congregationalist minister, herself a lecturer at Newnham College, Cambridge; they had one son and two daughters. He died at Cambridge 4 March 1925.

A portrait of Ward by Ambrose McEvoy was presented by subscribers to the university of Cambridge in 1914 and hangs in the Fitzwilliam Museum.

Dawes Hicks in *Mind*, July 1925; W. R. Sorley in *Proceedings of the British Academy*, vol. xii, 1926 (including, p. 310 n., some additions to the bibliography contained in *The Monist*); personal knowledge; private information.]

W. R. SORLEY.

WARD, SIR JOSEPH GEORGE, first baronet (1856-1930), prime minister of New Zealand, was born at Emerald Hill, Melbourne, Victoria, 26 April 1856, the son of William Thomas Ward, merchant. His parents soon removed to the Awarua district of Southland, where he attended the primary school at the Bluff. At the age of thirteen he entered the New Zealand post and telegraph department as a

telegraph messenger. Later he joined the railway department, and in 1877 he set up in business as an export merchant at Invercargill.

Ward took a prominent part in local affairs, and in 1887 was made a J.P. In the same year he was elected liberal member of the house of representatives for Awarua. In 1891, during the premiership of John Ballance [q.v.], he became postmaster-general, and established the San Francisco mail service contract for fortnightly services. He also opened a campaign to secure penny postage. In 1893, in the ministry of Richard John Seddon [q.v.], Ward was appointed colonial treasurer (i.e. minister of finance), and in 1894 had charge of the legislation for the state guarantee to the Bank of New Zealand. He devised and put through parliament the *Advances to Settlers Act* (1894)—a measure considered daringly experimental—raising £3,000,000 in London at 3 per cent., a record loan for Australasia. In 1894 he became the first minister of industries and commerce; he also had charge of the marine department. He resigned office in 1896 as his firm had been obliged to go into liquidation, but he retained his seat in parliament. In 1899 he rejoined the government as colonial secretary, postmaster-general, and minister of industries and commerce: shortly afterwards he became minister of public health, the first man in the world to hold this office. In 1901 he introduced inland penny postage, and in the same year he was created K.C.M.G. In 1902 he was acting prime minister during Seddon's attendance at the coronation of King Edward VII. The same year he introduced the first superannuation scheme for railway servants, and in 1903 he established state fire insurance for New Zealand. In 1906 he attended the Postal Union Conference held in Rome, and advocated the adoption of universal penny postage.

When Seddon died in June 1906, Ward succeeded him as prime minister after a short interval due to his absence from New Zealand. In 1907 he was sworn of the Privy Council. His first act as premier was to undertake tariff revision; he placed practically all the necessities of life on the free list. In 1907 he attended the Imperial Conference held in London, and secured the recognition of New Zealand as a Dominion. In 1908 he passed the Workers' Compensation Act, and in 1909 he offered the British government, on behalf of New Zealand, a battle-cruiser, or two if

necessary, for the British navy. The offer of one cruiser, H.M.S. *New Zealand*, was accepted. Ward attended the Imperial Defence Conference held in London in 1909, and then returned to New Zealand in order to inaugurate the first hydro-electric scheme for the Dominion. In 1910 he instituted compulsory military training. In 1911 he again went to London in order to attend the Imperial Conference, at which he advocated the creation of an Imperial Parliament of Defence and an Imperial Council, but he received no support and withdrew the motion. The same year he was created a baronet.

The elections of 1911 were inconclusive. Ward met the House, but finding he had not a working majority resigned in March 1912. (Sir) Thomas Mackenzie became prime minister, but he only held office from March to July 1912, when William Ferguson Massey [q.v.] formed a government. In 1915 a national government, composed of a coalition of the reform and liberal parties, was formed, and Ward became minister of finance and post-master-general. He and Massey represented New Zealand at the Imperial War Cabinet and Conferences held in London in 1917 and 1918, and at the Paris Peace Conference in 1919. In 1919 the coalition government was dissolved, owing to the withdrawal of the liberal party. In the ensuing general election the liberal party was defeated, and Ward lost the seat which he had held since 1887. He was out of parliament from 1919 until 1925, when he was returned as member for Invercargill. In 1928, at the invitation of the reorganized national (former liberal) party, he took office as prime minister. He successfully carried out difficult financial operations, but in May 1930 he resigned owing to ill-health, and he died at Wellington 7 July 1930.

Ward married in 1883 Theresa Dorothea (died 1927), daughter of Henry Joseph de Smidt, of New Zealand, and had four sons and one daughter. He was succeeded as second baronet by his eldest son, Cyril Rupert Joseph (born 1884). He received honorary degrees from the universities of Oxford, Cambridge, Edinburgh, Dublin, and Birmingham. He was created G.C.M.G. in 1930.

Ward was an Imperialist, and accomplished much for New Zealand, on the political history of which he left an indelible mark. He was often referred to in the press as a wizard of finance, and his extraordinary memory for figures, which he could

quote accurately without notes for lengthy periods, stood him in great stead in parliamentary controversies. A bold administrator, though no great orator, he possessed the gift of inspiring public confidence, and seemed in his last political campaign in 1928 to personify the whole history of the New Zealand liberal movement. He died with his political prestige at its height in his own country, and with many friends, whom his urbanity and generosity had made for him, all over the world.

[*The Times*, 8 July 1930; New Zealand Parliamentary Record, 1840-1925.]

T. M. WILKINSON.

WARD, SIR IESLIE (1851-1922), cartoonist, was born in Harewood Square, London, 21 November 1851, the eldest son of Edward Matthew Ward [q.v.], historical painter, by his wife, Henrietta Mary Ada Ward. The two families, although they had the same surname, were not related. Mrs. Ward (who died in 1924 at the age of ninety-two) was herself a painter; her father, George Raphael Ward [q.v.], was a mezzotint engraver and miniaturist; her grandfather, James Ward [q.v.], was an engraver and animal painter; and she was niece and great-niece respectively of John Jackson [q.v.], portrait-painter, and of George Morland [q.v.]. After preparatory instruction at Mr. Chase's school at Salt Hill, near Slough, Ward was sent to Eton. His home was visited by many famous artists; and both heredity and environment tended to foster in him precocious artistic development; he exhibited at the Royal Academy while still at school a bust of his brother and a painting (1867). After a brief period of architectural study under Sydney Smirke [q.v.], he joined the Royal Academy Schools in 1871. (Sir) John Everett Millais was much struck by his caricatures, and introduced him to Thomas Gibson Bowles [q.v.], the proprietor of *Vanity Fair*, who chanced to be in need of a new cartoonist.

From the year 1873 onwards Ward contributed regularly to *Vanity Fair*, under the pseudonym of 'Spy'; and for thirty-six years produced cartoons of large numbers of well-known people—politicians, hunting men, judges, jockeys, authors, musicians, bishops, generals—executed in colour and reproduced by lithography. These prints had a wide vogue, and were framed for the walls of innumerable clubs, common-rooms, restaurants, and other places of resort. Ward also did a certain

amount of serious portraiture and some architectural drawings. In 1915 he wrote a book of recollections, *Forty Years of 'Spy'*, a pleasant but feeble work. He was knighted in 1918. He died in London 15 May 1922.

Ward married in 1890 Judith Mary Topham-Watney, only daughter of Major Richard Topham, 4th Hussars and 16th Bengal Cavalry, and had one daughter.

Ward was a character-portraitist rather than a caricaturist in the strict sense of the word. He produced good likenesses of his subjects, dressed in their ordinary clothes; and neither presented them in dramatic or mythological guise nor used them to point a political or social moral. He was not a sensitive draughtsman, nor was he a decorator; and the *Vanity Fair* plates may best be described as very good pictorial journalism, largely dependent on topical appositeness for their appeal. His best work, in his own opinion, was done not from formal sittings, but when the model was unaware of his scrutiny.

WARLOCK, PETER (pseudonym), musical composer and writer on music. [See HESELTINE, PHILIP ARNOLD.]

WARREN, Sir CHARLES (1840-1927), general and archaeologist, was born at Bangor 7 February 1840, the second son of Major-General Sir Charles Warren [q.v.], by his first wife, Mary, daughter of William Hughes, of Dublin and Carlow. He was educated at Cheltenham College, Sandhurst, and Woolwich, and joined the Royal Engineers in 1857. From 1859 to 1865 he was employed on the Gibraltar survey, and in the latter year became assistant instructor in surveying at the school of military engineering at Chatham. In 1867 he was selected for special service in Palestine, where he made, for the Palestine Exploration Fund, a reconnaissance of Philistia, the Jordan valley, and Gilead, and also excavated extensively in Jerusalem. He published the results in three books—*The Recovery of Jerusalem* (with (Sir) Charles William Wilson, q.v., 1871), *Underground Jerusalem* (1874), and *The Temple or the Tomb* (1880).

Owing to ill-health, Warren was obliged to return to England in 1870. After serving at Dover from 1871 to 1872, he held an appointment at the school of gunnery at Shoeburyness from 1872 to 1876, where

he found himself against his will drifting into civil life. He was considering the acceptance of an appointment as engineer to harbour works in Australia when he was asked by the Colonial Office to act as special commissioner to delimit the Griqualand West and Orange Free State boundary. This he completed in 1877, when he received the C.M.G. for his services. He then travelled through the Transvaal to Delagoa Bay, but was sent back to Griqualand in order to investigate and settle the land question, a task which he successfully performed.

During the Kafir War of 1877-1878 Warren received the command of the Diamond Fields Horse. He took part in the actions of Perie Bush (in which he was severely wounded), Debickek, and Tankoon. For his services he was thrice mentioned in dispatches and received the medal and clasp and the brevet of lieutenant-colonel. On the conclusion of the war he was appointed special commissioner to investigate native questions in Bechuanaland, and in 1879 administrator and commander-in-chief of Griqualand West.

From 1880 to 1884 Warren was chief instructor in surveying at the school of military engineering at Chatham, but in the course of his service there he was detached for special duty under the Admiralty in Egypt. He was commissioned to lead a search party to discover the fate of the expedition of Professor Edward Henry Palmer [q.v.], which had left Suez on 8 August 1882. Warren discovered that Palmer and his companions had been robbed and murdered; he recovered their remains, and secured the punishment of the criminals. For this he received the K.C.M.G., medal, bronze star, and third class Medjidie, and in 1883 he was created a knight of justice of the Order of St. John of Jerusalem.

In 1884 difficulties arose in Bechuanaland between the natives and Boer immigrants from the Transvaal, and it became necessary to send a military expedition to Bechuanaland to restore order. Warren was sent out from England to take command. He arrived in December at the Cape, where he mobilized a force of 4,000 men and started for Bechuanaland. Here he met Cecil Rhodes [q.v.], who was acting as deputy-commissioner, and President Kruger. Warren was vested with full civil and military powers, and proceeded to administer the protectorate after forcing the two

republics of Stellaland and Goshen, which had been formed by Boer freebooters on territory stolen from the natives, to capitulate. The expedition was a complete success, the more so because it was carried out in the face of very considerable difficulties and entirely without bloodshed. Some friction arose between Warren and the Cape government, but the home government supported Warren. He was, however, recalled in September and his place was taken by Colonel (afterwards Sir) Frederick Carrington [q.v.] in command of a newly created police force. For his services Warren was created G.C.M.G.

After a few weeks spent in command of the troops at Suakin, Warren was appointed to succeed Sir Edmund Y. W. Henderson [q.v.] as chief-commissioner of the London metropolitan police in 1886. The office was one of great difficulty. Much dissatisfaction had been caused by the action of the police in the disturbances in Pall Mall and Oxford Street in the spring of that year, and in consequence Warren was called upon to reorganize the force. On the occasion of Queen Victoria's jubilee in June 1887, Warren was responsible for the police arrangements, which proved completely successful. In that year further disturbances took place in Trafalgar Square, and the police, in quelling them, were popularly accused of 'military high-handedness'. The case of Miss Cass (1887) opened afresh the question of the treatment of women by the police, and the 'Ripper' murders caused much public indignation. Relations between Warren and the home secretary, Henry Matthews (afterwards Viscount Llandaff, q.v.) became strained. Strong difference of opinion arose as to the right of the home secretary to issue orders to the police, and Warren resigned in consequence in 1888, receiving the K.C.B. for his services.

Warren was appointed in 1889 to the command at Singapore, a post which he held until 1894. He proceeded to organize a defence scheme, to frame mobilization regulations, and to reform infantry-training. He conducted experiments in communication and even attempted a wireless communication between two forts. During his time at Singapore he spent his periods of leave in travelling in India, Burma, Japan, and the Dutch East Indies, and on leaving the Straits Settlements he returned home through North America. He was appointed in 1895 to the command of the

Thames district. Here he devoted himself to the completion of the Thames defence schemes, but the routine work of the command scarcely gave scope to a man of Warren's restless energy. He was placed on the retired list for a year after completing the period of this command; but after the outbreak of the war in South Africa he was appointed, in November 1899, to the command of the 5th division, and sailed for the Cape.

Warren had been promoted lieutenant-general in 1897, and when he with the fifth division joined Sir Redvers Buller [q.v.] in Natal on 21 December 1899 he was the senior divisional commander. At the beginning of January 1900 Buller planned a further attempt to relieve Ladysmith. It was intended to turn the Boer position in front of Potgieter's Drift by crossing the Tugela near Trichardt's Drift and gaining the open plain north of Spion Kop. The conduct of the operations was placed directly under Warren, whose force consisted of the 2nd division under General (Sir) Francis Clery [q.v.], the mounted brigade under Lord Dundonald [q.v.], and the 5th division less one brigade. The Tugela was crossed on 18 January, and heavy fighting took place from 20 to 23 January. Dundonald advanced along the road to Acton Homes, and Clery made some progress to the north-west. Major-General (Sir) Neville Lyttelton in command of the 4th brigade, who had crossed the Tugela some five miles to the east of Trichardt's Drift, co-operated, although not under Warren's direct command.

On 23 January Warren decided that it was impossible to carry out the flanking movement to the north of Spion Kop for lack of supplies, so it was determined to advance by the more direct road leading north-east. On that day Buller came to Warren's head-quarters, and it was decided to attack Spion Kop that night. Spion Kop was occupied and held during the whole of 24 January, but late in the evening Colonel Alexander Thorneycroft, who was in command, decided on his own responsibility that the position was untenable and evacuated it. On 25 January Buller again visited Warren's head-quarters, and resuming direct command, decided to withdraw his forces and retire south of the Tugela. Spion Kop was a reverse, but although Warren was in direct command of the operations, Buller was often present and exercised occasional control. There was divided responsibility,

and Warren's report with the comments of Buller and Lord Roberts led to much subsequent recrimination.

Warren remained in command of the 5th division during the main operations for the relief of Ladysmith, shortly after which a rebellion broke out (April 1900) in North-West Cape Colony, Griqualand West, and British Bechuanaland. On the advice of (Lord) Milner, Warren was placed in command of an expedition to quell this rebellion. He cleared the country between the Orange River and the Vaal, captured Douglas, and defeated a Boer force at Faber's Put (30 May), after which he advanced without further difficulties. In July the rebellion was quelled, the force withdrawn, and peace restored. Warren returned to England in August 1900. He was promoted general in 1904, and colonel commandant of the Royal Engineers in 1905.

Warren was deeply interested in the Boy Scout movement which was founded in 1908; he was an original member, and for many years the oldest member. He gave a very large proportion of his time during the last nineteen years of his life to active work with scouts in the Ramsgate, Canterbury, and Weston-super-Mare districts successively. He maintained his interest in scientific matters—he had been elected F.R.S. in 1884—and in archaeology, and published several books and articles, notably on questions of early weights and measures. He was an enthusiastic freemason, and devoted much time to masonic research. He was also deeply interested in, and a prolific writer upon, religious questions. He also published a volume of reminiscences, *On the Veldt in the Seventies* (1902).

Warren married in 1864 Fanny Margaretta (died 1919), daughter of Samuel Haydon, of Guildford. They had two sons and two daughters. He died at Weston-super-Mare 21 January 1927, and was buried near to his wife's grave at their old country home at Westbere, Kent, after a military funeral in Canterbury Cathedral.

ONSLOW.

WARREN, SIR THOMAS HERBERT (1853-1930), president of Magdalen College, Oxford, scholar, and man of letters, was born at Cotham, a suburb of Bristol, 21 October 1853, the second son of Algernon William Warren, a business man in Bristol, who held a leading position in the city as town councillor, alderman, and J.P. His mother, Cecil, was the daughter of Thomas Thomas, of Llangadock, Carmarthenshire, and sister of Christopher Thomas, mayor of Bristol in 1878; to her family Warren owed his first christian name. His father had literary and artistic interests, his mother both practical capacity and something of the Welsh imaginative temperament. Herbert—he was always known by his second name—was educated at Manilla Hall school, Clifton, until he was fifteen, when he entered Clifton College, then recently founded with John Percival [q.v.] as its first headmaster. He quickly made his mark both in work and games, and left in 1872 as head of the school and scholar-elect of Balliol College, Oxford, captain of football and fives champion.

When Warren came up to Balliol, Jowett had been two years master and the college was at the height of its reputation. Among the contemporaries whom Warren came to know well were H. H. Asquith and his brother, W. W. Asquith (afterwards a master at Clifton), Charles Lucas, Thomas Raleigh, and Alfred Milner; W. P. Ker and A. D. Godley were his juniors by two years. In this distinguished society Warren more than held his own; he obtained first classes in classical moderations (1873) and in *literae humaniores* (1876), and won the Hertford scholarship (1873), the Craven scholarship (1878), and the Gaisford prize for Greek verse (1875). He was occasionally chosen to represent the university at Rugby football, maintained his supremacy at fives, a game which he continued to play with skill and vigour even after he became president of Magdalen College, and held the office of librarian at the Union in 1875-1876. Francis de Paravicini helped to put the finer edge on his scholarship, and Milner, his closest friend, introduced him to German learning and did much to form his mind and interests. But probably the main influence was that of Jowett himself, whose ideal of a college as not merely a home of learning but a training ground for public life, was destined to guide Warren's policy in his direction of Magdalen.

In October 1877, a year after he had

taken his degree, Warren was elected to a prize fellowship at Magdalen and succeeded in the following term to a classical tutorship. The college in the later years of the presidency of Frederic Bulley had already ceased to be a close corporation and was coming to the front, but Warren himself made the greatest contribution to its remarkable development in the next twenty years. Not only was his brilliant scholarship a stimulus to his pupils' success, but he set himself to know and help them as a personal friend. He also cultivated acquaintance with the public schools, and made every effort to improve the quality of the scholars and commoners who entered the college.

On the death of Dr. Bulley in 1885 Warren, at the unusually early age of thirty-two, was elected president, and held the office until 1928, a period of forty-three years. He threw himself even more vigorously than before into the task of developing the college, gathering round him a distinguished staff of teachers, including H. W. Greene, C. R. L. Fletcher, C. C. J. Webb, and Christopher Cookson—A. D. Godley was already a classical tutor—and welcoming as a new strength to the college the professorial fellows added by the royal commission of 1878. At the same time he increased the numbers of the undergraduates and raised the standard of the college, both intellectually and in other ways. It was sometimes said by outside critics that Warren was over-anxious about the social standing of his undergraduates; if so, this was only a part of his desire to secure for Magdalen the best in every way. It was a marked tribute to the position which the college held in the university and outside it that King George V in 1912 chose it for the Prince of Wales.

Meanwhile Warren was coming to hold a prominent position in university affairs. He was for many years a member of the Hebdomadal Council, a delegate of the University Museum, and a curator of the Taylor Institution. In these capacities he did much to promote the studies of natural science and of modern languages in Oxford, and his courtesy, tact, and good judgement made him a valued member of any body on which he served. He spoke often in Congregation and, if he was sometimes prolix and over-conciliatory, he always gave the impression that he knew his subject thoroughly and carried weight accordingly. From 1906 to 1910 he was vice-chancellor. Lord Curzon [q.v.], as

chancellor, was then engaged in drawing up his programme of university reform; Warren supported him whole-heartedly and, if at the time the results appeared meagre, many of the ideas then promoted were adopted by the royal commission of 1919.

Outside the university Warren's services were employed on several government commissions and committees; he was a member, and later chairman, of the governing body of Clifton College, a councillor of the university of Bristol, and for a time a governor of St. Paul's School. Politically he was a liberal of the old school, and preferred gradual reform to hasty change. Brought up as a nonconformist, he was confirmed in the Church of England while a fellow of Magdalen, and proved himself a staunch churchman.

All these practical activities never swamped Warren's devotion to literature. Although his only contribution to classical scholarship was a useful though unpretentious edition of the first five books of Plato's *Republic* (1888, seven times reprinted), his scholarship showed itself in other ways. The two great literary enthusiasms of his life were for Virgil and for Tennyson. In his two published volumes of poems, *By Severn Sea* (1897) and *The Death of Virgil* (1907), he is seen as an eager disciple of both poets, and an attractive, if sometimes rather laboured, writer of verse. His wider literary interests found expression in his lectures as professor of poetry at Oxford (1911-1916), which exhibit his range of reading, his taste, and his mature powers of criticism. The Creweian orations, which it fell to his lot to deliver at the Eneadenia, proved also that his fine scholarship and 'Attie wit' remained unimpaired. His ability as a writer was also shown in contributions—particularly in obituary notices—which he made to *The Times*, as its correspondent for the university, and for many years to the *Oxford Magazine*, of which he was one of the founders and a constant supporter. The honorary degree of D.C.L. was conferred upon him at Lord Curzon's first Eneadenia in 1907, and he was also an honorary LL.D. of Birmingham University, an honorary D.Litt. of Bristol University, and an honorary fellow of Balliol (1924). He was created K.C.V.O. by the king when the prince left Magdalen on the outbreak of war in 1914.

The long years of Warren's presidency were a time of almost unbroken prosperity for Magdalen College and of personal

happiness to himself. As the generations passed, the number of his old Magdalen friends was always increasing, but, with the loyalty and kindness of heart which always characterized him, he kept in touch with them and followed their careers with unfailing interest. He was an ideal host both in the college common room and in his own lodgings. In all this personal side of his life he was greatly helped by his wife, Mary Isabel, youngest daughter of the chemist Sir Benjamin Collins Brodie, second baronet [q.v.], whom he married in 1886. The years of the European War, when he received almost daily the news of the death of some Magdalen man, brought him great distress, but he steered the college through this time of anxiety and through the hardly less difficult period of reconstruction which followed. In 1928 age and increasing infirmity made him decide to resign: he received many tokens of affection and gratitude, and was elected an honorary fellow of the college. He continued to live in Oxford, and died there suddenly 9 June 1930. He had no children.

Warren was naturally a fine athletic figure, tall and broad, with very dark hair, a full beard, and slightly prominent teeth, but in the last twenty years of his life he became more and more crippled by arthritis. A portrait painted by Sir W. B. Richmond in 1899, which hangs in the President's Lodgings, Magdalen College, represents him in middle life; a later portrait by Glyn Philpot, presented to him by Magdalen men on his retirement in 1928, hangs in the college hall and gives an admirable likeness of him in his later years, although the features are perhaps too grim.

A cartoon of Warren by 'Spy' appeared in *Vanity Fair* 8 April 1893.

[*The Times*, 10 and 11 June 1930; Laurie Magnus, *Herbert Warren of Magdalen*, 1932; personal knowledge.] C. BAILEY.

WATERHOUSE, PAUL (1861-1924), architect, was the eldest son of the architect, Alfred Waterhouse, R.A. [q.v.], by his wife, Elizabeth, daughter of John Hodgkin, conveyancer, and sister of Thomas Hodgkin [q.v.], the historian. He was born 29 October 1861 at Manchester, and he lived there until his father, having won the competition for the design of the new Natural History Museum in South Kensington (1865), moved with his family to London. Paul Waterhouse was sent to St. Michael's school, Aldin House, Slough, kept by the Rev. J. W. Hawtrey, and from

there to Eton. He proceeded to Balliol College, Oxford, and obtained a second class in classical moderations (1882) and in *literae humaniores* (1884). Delicate in health, he did not take any great part in games, but at Balliol he coxed the college eight, was captain of the college boat-club in 1883, and coxed one of the trial eights, though he failed to get his blue. A contemporary in the college boat speaks of his initiative, tact, and insight into character—qualities which marked his professional career.

After leaving Oxford, Waterhouse went into his father's office. He became a partner in 1891, and, after the senior partner's death in 1905, carried on the practice alone, until joined by his own son Michael in 1919. His individual, and especially his more intimate, work has a quality of its own, contrasting in character with the specialized style of the large business and public buildings for which his father had become famous—a tradition which he carried on in the continuation of his father's practice. He inherited a facility for admirable planning, described by a good judge as 'exquisite and workable'. He completed many of his father's works, among them being buildings at Liverpool for the Royal Infirmary and for the University, laboratories at Manchester and Leeds Universities, and St. Mary's Hospital, Manchester.

Among the more important of Waterhouse's own works are the chemical laboratories at Oxford University (1913), and the university Union (1921), the St. Regulus Club (1922), and the Younger commemoration hall (1925) at St. Andrews University. Hospital buildings designed by him include the medical school and the nurses' home, University College, London (1905), the offices of the Royal National Pension Fund for Nurses, Buckingham Street, Strand (1906), extensions to the Lister Institute of Preventive Medicine, Chelsea Bridge Road (1908), and new wards for the Bromley (Kent) and District Hospital (1910), the Yeovil and District Hospital (1921), and St. Leonard's Hospital, Sudbury (1922).

Alfred Waterhouse had been responsible for designing important office buildings for the Prudential Assurance and Refuge Assurance Companies, and his son continued this connexion, designing premises for the former at Stockport, Leicester, Liverpool, Manchester, Ipswich, Middlesbrough, and other towns. The Atlas Assurance Company's office at Birmingham

is also from his design. He extended the premises of the National Provincial Bank in Bishopsgate, London, and built branches for Lloyds Bank and for the National Provincial Foreign Bank in Paris, Brussels, and Antwerp.

Among examples of Waterhouse's domestic work, No. 73 South Audley Street, London, and Mount Melville, St. Andrews, with its home-farm and buildings, gardens, cottages, and bailiff's house, may be mentioned. His ecclesiastical work includes All Saints' church, St. Andrews (1918), St. Francis's church, Hammerfield, Hertfordshire, and the convent of the Incarnation at Oxford.

In 1886 Waterhouse was awarded the essay medal of the Royal Institute of British Architects. He was elected an associate of that body in 1889 by examination, with the award of a special prize, and proceeded to the fellowship in 1895. During a lifelong association with the Institute, he devoted himself to the furtherance of its objects and gave unstinted time to its committees, including the Board of Architectural Education. He took particular interest in the education and training of students and in the development of schools of architecture in London and the provinces. In 1921 and 1922 he occupied the president's chair, previously held by his father from 1888 to 1891, and during his years of office did much to promote the unification of the architectural profession. The Institute was passing through a period of difficulty, and Waterhouse's powers of firm but tactful leadership were invaluable. By means of visits and addresses in all parts of the country he succeeded in greatly strengthening the relations between the Institute and its allied societies.

Town Planning was a subject of which Waterhouse made a special study, and he was an authority on London bridges. He excelled as a draughtsman; and his line and wash drawings have much delicacy and charm. Examples of such work are his illustrations to William Sanday's *Sacred Sites of the Gospels* (1903). He was an accomplished speaker and writer. His literary work was confined mainly to professional subjects, which he treated in a style that was scholarly, humorous, and allusive. *Paul Waterhouse. A Collection of certain of his Papers and Addresses* was published by the Oxford University Press in 1930.

Waterhouse married in 1887 Lucy Grace, daughter of Sir Reginald Francis

Douce Palgrave [q.v.], clerk of the House of Commons, and had one son, who succeeded him in his practice, and two daughters. Monica Mary, the elder of his two sisters, married Robert Bridges [q.v.], the poet laureate. He died at his home at Yattendon, Berkshire, 19 December 1924.

[*The Times*, 20 December 1924; *Journal of the Royal Institute of British Architects*, 10 January 1925; private information; personal knowledge.] P. S. WORMINGTON.

WATSON, FOSTER (1860-1929), historian of education, was born at Lincoln 27 June 1860, the third in the family of five sons of Thomas Watson, of Lincoln, engaged in the agricultural machinery business, by his wife, Ann, daughter of Thomas Booth, worsted stuff manufacturer, of Little Horton, Bradford, Yorkshire. He was educated at Lincoln grammar school and at Owens College, Manchester, where he obtained the M.A. (London) degree in 1881. From 1885 to 1891 he was second master at the Cowper Street Middle Class School (afterwards the Central Foundation School, E.C.). In 1894 he was appointed lecturer on education at the University College of Wales, Aberystwyth, and in 1895 was raised to the status of professor. After resigning the professorship in 1913 he was professor emeritus and special lecturer until his death, which took place 13 February 1929, at Green Street Green, near Farnborough, Kent. From 1915 to 1929 he was professor of rhetoric at Gresham College, London.

Foster Watson's work as a writer and as lecturer at Aberystwyth, Gresham College, and elsewhere, covered a great variety of subjects in education, philosophy, and literature, and may be summarized under three heads. In the first group comes the history of education in the period 1500-1600, especially in England. His chief work under this head is *The English Grammar Schools to 1660: their curriculum and practice* (1908), to which he added a companion volume, *The Beginnings of the Teaching of Modern Subjects in England* (1909). He was engaged for many years on the collection of material (much of which he published in journals and magazines between 1892 and 1909) for a projected work on the 'English Educational Renaissance', a history of English education in the time of the Commonwealth. Secondly, he made a special study of the life and work of Juan Luis Vives, the friend and counsellor of Erasmus and More. He published *Vives on Educa-*

tion; a translation of the *De Tradendis Disciplinis* (1912), *Vives and the Renaissance Education of Women* (1912), and many articles on the subject in English, Spanish, Catalan, and Italian magazines; he also lectured at Barcelona and Valencia, and presented a tablet to Corpus Christi College, Oxford, in 1925 in memory of Vives's residence there from 1523 to 1525. Thirdly, Foster Watson contributed copiously to dictionaries and encyclopaedias. He wrote the chapter on 'Scholars and Scholarship' in volume vii of the *Cambridge History of English Literature* and a number of educational biographies in this Dictionary; he contributed the article on Vives to F. E. Buisson's *Nouveau Dictionnaire de Pédagogie* and, as departmental editor, some 150 articles to Paul Monroe's *Cyclopaedia of Education* (1911-1913). He also edited *The Encyclopaedia and Dictionary of Education* (four vols., 1921, 1922).

Had Watson lived long enough it is probable that he would have endeavoured to construct a theory of education based on the underlying causes of the success of great teachers, as well as on the evidence, positive and negative, furnished by the history of education. No one who heard him lecture will forget the vigour and conviction of his opinions or the dynamic enthusiasm of his delivery.

Watson married twice: first, in 1914 Amy (died 1918), daughter of S. Smith Kimpster, of Masbrough, Yorkshire; secondly, in 1925 Nancy, eldest daughter of L. Wynne Roberts, of Buxton. He had no children. He was a member of several learned societies at home and abroad, and in recognition of his work on the history of education received the honorary D.Litt. degree from the university of Wales (1922). He also obtained the D.Lit. degree of the university of London (1912).

[Private information; personal knowledge. A bibliography of Foster Watson's work in the subject of education was published by the University College of Wales, Aberystwyth, in December 1913.] C. R. CHAPPLE.

WATTS, Sir PHILIP (1846-1926), naval architect, born at Deptford 30 May 1846, was the son of John Watts, of Havelock Park, Southsea, then chief assistant to John Fincham, shipwright at Portsmouth dockyard, a famous builder of warships, and author of *The History of Naval Architecture* (1851), in the preparation of which John Watts assisted. His mother was Mary Ann Featherstone. Watts's father, grandfather, and great-

grandfather were all master shipwrights, and his great-grandfather took part in the building of Nelson's flagship *Victory*. Philip Watts was educated at the principal school at Portsmouth, and in 1860 was apprenticed as a shipwright in the royal dockyard, where he was taught mathematics and physical science in the dockyard school. He was selected to receive a 'superior course' in naval construction, and in 1866 was one of the three Admiralty students promoted to the Royal School of Naval Architecture at South Kensington. In April 1870 he left the Royal School with the title of fellow, and was appointed to assist the chief constructor's staff at the Admiralty (which in 1883 became the royal corps of naval constructors) in making calculations with regard to the design of new ships, and to act as Admiralty overseer on several ships then building by contract. In this capacity Watts made a practice of calculating on scientific principles the proper size of various parts of a ship's structure and did much to break down the determination of scantlings by rule of thumb. On completing this work he was engaged for over two years at Torquay in assisting William Froude [q.v.], who was the first to develop an accurate theory of the behaviour of ships in a sea way, in his investigations on that subject undertaken at the request of the Admiralty. This association was the beginning of a lifelong friendship between Watts and Froude and the latter's son and assistant, Robert Edward Froude (1856-1924).

In 1872 Watts became a draughtsman of the third class on the constructor's staff, and on the completion of his service with Froude he was appointed assistant constructor at Pembroke dockyard during the building of the battleship *Shannon*, launched in 1875, and while so engaged became notable as an ingenious designer of mechanical appliances and details of all sorts. On returning to the Admiralty he was entrusted with the organization and supervision of a 'calculating section' rendered necessary by the novelty and growing complexity of naval designs. Among other work the director of naval construction, (Sir) Nathaniel Barnaby [q.v.], placed in Watts's hands the calculations relating to the torpedo-ran *Polyphemus*, laid down in 1873, a vessel of novel construction with a very small reserve of buoyancy, which made extreme accuracy necessary in calculating her metacentric height, range of stability, and

increased immersion in case of damage. He was also concerned in the controversy with regard to the battleship *Inflexible*, launched in 1876 [see BARNABY, Sir Nathaniel], and in connexion with it conducted some steering experiments on the battleship *Thunderer* in Portland harbour, the results of which were afterwards issued in a blue book for the instruction of the fleet. In connexion with the *Inflexible* Watts experimented with water chambers for the purpose of moderating the rolling of ships of great metacentric height [cf. Sir Reginald Bacon, *Life of Lord Fisher*, i, 75-6, 1929]. In 1883 he was promoted to the grade of constructor, and in November 1884 appointed to the staff of Chatham dockyard; but in October 1885 he left the Admiralty's service in order to succeed Sir William Henry White [q.v.] as naval designer and general manager to Armstrong & Co. at their warship-yard at Elswick-on-Tyne, White succeeding Barnaby at the Admiralty as director of naval construction.

Watts had now spent fifteen years of very strenuous professional life in the service of the Admiralty. The greater part of his work had consisted in carrying out original investigations and in organizing sections for making and recording many kinds of calculations in the construction department. This experience prepared him for his later career, in which first at Elswick he built cruisers for the navies of the world, and subsequently at the Admiralty, on the eve of a world-wide war, he armed Great Britain with battleships. During his seventeen years at Elswick he was placed in a position of great responsibility, both as a naval designer and as a captain of labour on a large scale; he brought the Elswick ship-yard to the foremost position by designing and constructing foreign warships, and also by building several British warships designed by the Admiralty and secured for the Elswick yard in open competition. The ships designed for foreign powers were remarkable for those qualities of gun-power and speed which later were the outstanding features of Watts's additions to the British fighting fleet. He had signal success in obtaining high speed and heavy armament on abnormally small displacements. Cruisers of note designed by him for Japan, the Argentine, Brazil, Chile, Norway, Portugal, Roumania, and Turkey established his reputation as a constructor and gave him experience for his great achievements later. Nearly all the warship

fighting done by the Japanese fleet in 1904 and 1905 was carried out by Watts's ships, the battleships *Yashima* and *Hatsuse*, and the cruisers *Idzumo*, *Iwate*, *Asama*, and *Tokica*. For his services he was awarded the Japanese order of the Rising Sun. Among Watts's Elswick ships may be mentioned especially the Italian cruiser *Piemonte*, built in 1888, then for her size the most heavily armed war vessel in the world, and the Japanese *Yashima*, launched in 1896, a battleship with the speed of a cruiser, and in many respects the forerunner of his battle-cruisers of later times. From 1894 to 1910 Watts was lieutenant-colonel and honorary colonel of the first brigade of the Royal Garrison Artillery Volunteers, and while at Elswick he equipped and sent out to the South African War the Elswick battery.

In February 1902 Watts succeeded White at the Admiralty as director of naval construction. At that time two of the *King Edward VII* class of eight battleships had been begun, and three more were to be laid down before the end of the year. In this class the main armament was much the same as that of the *Collingwood* class of battleships designed in 1880, though the secondary armament was heavier. Watts considered the class not powerful enough. The immense developments in naval machinery and gun power, the increased possibilities of speed and of the conservation of fuel, all seemed to forecast the evolution of a much more powerful type of warship. But Watts was not able immediately to carry out his ideas to the full. In 1903 he produced designs for battleships of much greater gun power. The Admiralty, however, while approving what afterwards was named the *Lord Nelson* type, resolved to build first the three remaining vessels of the *King Edward* class, which were accordingly laid down in 1903, and were followed by the *Lord Nelson* and *Agamemnon*, of the new and more powerful type, in 1904 and 1905. The appointment on 21 October 1904 of Sir John Arbuthnot Fisher (afterwards Lord Fisher, q.v.) as first sea lord gave Watts the opportunity of realizing more completely his desire for powerful ships. So far back as 1881 he had accompanied the *Inflexible* in the Mediterranean when Fisher was in command, had had the opportunity of discussing with him matters of naval construction, and had brought away an outline design, evolved during the cruise, for a battleship with an 'all big gun' armament of four pairs of 16-inch

80-ton guns mounted in turrets. This design, however, Barnaby had rejected on account of the large displacement involved [*Transactions of the Institution of Naval Architects*, 1919, vol. xli, pp. 8-4]. Fisher, on becoming first lord, introduced a design for an 'all big gun' battleship having six pairs of 12-inch guns all mounted on the middle line, three pairs at each end of the ship in steps. A vessel so armed could fire six guns directly ahead and six directly astern, and all twelve guns on either broadside.

Fisher got a powerful committee of design appointed by Lord Selborne, including Prince Louis of Battenburg [q.v.], naval officers such as John (afterwards Earl) Jellicoe, (Sir) Henry Bradwardine Jackson [q.v.], (Sir) Reginald Bacon, (Sir) Charles Madden, Sir Albert John Durston, and (Sir) Alfred Winsloe, and men of expert knowledge such as Lord Kelvin [q.v.], Sir John Isaac Thornycroft [q.v.], R. E. Froude, (Sir) John Harvard Biles, (Sir) Alexander Gracie, and Watts. Fisher's proposal of a twelve-gun battleship was generally approved, but on consideration it was found too large and costly. The *Dreadnought* was as near an approach as was possible, taking into account dockyard capacity and naval estimates. The final result of the committee's aspirations, as interpreted by Watts, was the recommendation of the remarkable series of ship-types of which the *Dreadnought* battleship and *Indomitable* battle-cruiser were the chief. The principles underlying these new designs were a much more powerful armament on a given displacement, higher speed through the use of steam turbines and the water-tube boiler, unification of gun-calibre to secure gun control, greater manoeuvring power, the internal subdivision of the vessel into separate water-tight compartments, each self-contained as regards access, drainage, and ventilation, and greater protection against guns and torpedoes in the arrangement of the armoured decks, and the underwater protection of the sides. In the *Dreadnought* battleship class the main armament was raised from the four 12-inch, and four 9.2-inch guns of the *King Edward VII* class to ten 12-inch guns, mounted in pairs *en barbette*, three pairs on the centre line, and a pair on each broadside opposite each other amidships. The secondary armament disappeared and was replaced by quickfiring guns to deal with torpedo craft. But in later classes of *Dreadnoughts* the secondary armament was restored, to meet the increased menace from air and torpedo attack.

The first *Dreadnought* was laid down at Plymouth on 2 October 1905 and began her sea trials on 3 October 1906. She had a speed of over 21.6 knots, and owing to her rectangular construction amidships was comparatively free from rolling. During his ten years of office Watts improved and developed the *Dreadnought* type. He was the designer of the *Bellerophon*, *St. Vincent*, *Neptune*, *Orion*, *King George V*, *Iron Duke*, and *Queen Elizabeth* classes, each containing several battleships, and each marking an increase in armament, displacement, and speed. He himself considered that the *Orion* class, laid down in 1900-1910, practically realized Fisher's first design. In the *Elizabeth* class, 1912-1913, eight 15-inch guns were substituted for ten 13.5-inch guns. The main armament of the *Dreadnought* type set the fashion to the whole world. 'If Sir Philip's fame rested on no other basis than that of the armament of the *Dreadnought*, his name would be handed down as one of the world's great naval designers' [*Transactions of the Institution of Naval Architects*, 1926, vol. lxxviii, p. 289]. Lord Fisher wrote: 'The *Dreadnought* could not have been born but for Sir Philip Watts' [*Memories*, p. 258, 1919].

Hardly less remarkable was the creation of the battle-cruiser. At the outbreak of the European War in 1914 all the effective battle-cruisers in the royal navy were of Watts's design. The battle-cruisers *Indomitable*, *Inflexible*, and *Invincible* were launched in 1907. They were armed with eight 12-inch guns and had a speed of twenty-four knots. On account of their heavy armament and substantial armour protection they might have been classed as battleships. They were followed by the *Indefatigable* class, launched in 1909, which included besides the *Indefatigable* the Australian cruisers *Australia* and *New Zealand*. In 1910 were launched the *Lion*, *Princess Royal*, and *Queen Mary*, of greater size and a speed of twenty-eight knots, and in 1912 the *Tiger*, with a speed of thirty knots. It was the speedy arrival and intervention of the *Inflexible* and *Invincible*—wholly unexpected by the enemy—which proved the decisive factor in the action with Admiral von Spee off the Falkland Islands on 8 December 1914. Considerable improvements were also made by Watts in the designs of light cruisers and destroyers.

All these changes in design were fundamental and not merely developments of pre-existing types. As they were made in

time of peace it was not easy to explain their desirability to the public and they met with considerable opposition. In parliament in July 1906 Mr. Balfour criticized the designing and building of *Dreadnoughts*, and Sir William White, Watts's predecessor as constructor, suggested in the *Nineteenth Century* in April 1908 that England had started an unnecessary naval armament race. There were strong reasons, however, for thinking that the improvements in naval construction were making the race inevitable. It has been asserted that Germany designed more powerful ships as early as 1904 [*Navy League Annual*, 1910-1911, pp. 188-190]. If an advance was certain, it was important to have the initiative. Subsequent events showed this. Watts's work designed in time of peace stood the vital test of war. The naval developments in Great Britain, when realized, caused the continental powers to change their whole outlook on naval affairs. The Kiel canal had to be widened and harbours reconstructed, and when war broke out in 1914 the German navy with a greatly inferior weight of broadside, in the proportion of about four to seven, was not in a position to meet the demands made on it by the military chiefs in Berlin. The fact that England from the beginning was greatly superior at sea was of primary importance. At the battle of Jutland (31 May 1916) twenty-nine of the thirty-four British battleships and battle-cruisers engaged were of Watts's design.

In August 1912 Watts resigned his post as director of naval construction, but his services were retained in an advisory capacity until January 1916, when he returned to Elswick and became a director of Armstrong, Whitworth & Co. He was created K.C.B. in 1905, and in 1900 was elected a fellow of the Royal Society, of which he was afterwards a member of council and a vice-president. He received the honorary degree of LL.D. from Glasgow University and that of Sc.D. from Trinity College, Dublin. He became a member of the Institution of Naval Architects in 1873, of the Institution of Civil Engineers in 1901, and of the Institution of Mechanical Engineers in 1902. On the formation of the Society of Nautical Research in 1910 he was made a vice-president. In June 1921, at the annual meeting of that society, he called attention to the dangerous state of Nelson's *Victory* in Portsmouth harbour, and as a result of his efforts and those of Sir F. C.

Doveton Sturdee [q.v.] the famous ship was re-fitted and preserved. In restoring her to her Trafalgar condition Watts was assisted by old plans of the ship which had come down to him from his great-grandfather. He contributed an article on this subject in 1923 to the *Transactions* of the Institution of Naval Architects. Like all great organizers, he attached a high value to education. He assisted in the creation of the professorial chairs and the schools of naval architecture in the universities of Glasgow, Durham, and Liverpool.

Watts died of pneumonia at his residence, 4 Hans Crescent, London, 15 March 1926 and was buried in Brompton cemetery. He married in 1875 Elise Isabelle, daughter of Chevalier Gustave Simoneau de St. Omer, of Brussels. His wife and his two daughters survived him. His written work consists of articles, some of which may be regarded as primary sources of information for his own work. He contributed ten papers to the *Transactions* of the Institution of Naval Architects. Two of these are of particular importance, 'Warship Building (1860-1910)', published in 1911, and 'Ships of the British Navy on August 4, 1914', published in 1919. He wrote for the tenth edition of the *Encyclopædia Britannica*, and revised and extended for the eleventh edition, the articles on 'Ships' and 'Shipbuilding', which really are treatises of great value in a concise form and are of particular interest because so largely drawn from his own knowledge and experience. The particulars there given of the composition and distribution of the British navy from 1880 and the detailed information concerning foreign fleets are very useful. He also wrote several articles on naval constructors for this Dictionary.

A cartoon of Watts by 'Spy' appeared in *Vanity Fair* 7 April 1910.

[*The Times*, 10 March 1926; Watts's articles mentioned above; *Transactions* of the Institution of Naval Architects, 1926, vol. lxxviii, p. 235; *The Engineer*, 19 March 1926; *Engineering*, 19 March 1926; *Nature*, 27 March 1926; Frederic Manning, *Life of Sir William White*, pp. 464-480, 1923; E. L. Woodward, *Great Britain and the German Navy*, pp. 104-116, 1935; Lord Fisher, *Memoirs*, pp. 257-259, 1919.] E. L. CARLYLE.

WEAVER, Sir LAWRENCE (1876-1930), architectural critic, was born at Clifton 2 July 1876, the only child of Walter Weaver, by his wife, Frances Mary Taylor. He was brought up at Clifton by

his mother, and was educated at Clifton College. He left school at the age of seventeen with the intention of becoming a dentist; but he found better scope for his abilities in the occupation of commercial traveller, principally in builders' ironmongery.

Study of old leadwork in his spare time led Weaver to write for *Country Life* a series of articles which were published in 1909 as *English Leadwork: Its Art and History*. As a result, he was taken on to the staff of *Country Life* in 1910 as architectural editor, a position which he held until 1916. Here his zeal for good craftsmanship and good building, as applied, especially, to the small country house, found an outlet. His writings on this subject are collected in *Small Country Houses of To-day* (2 vols., 1910, revised 1922-1925) and *Houses and Gardens of Edwin Lutyens* (1913, revised 1925). The latter book contributed much to the recognition of (Sir) Edwin Lutyens as one of the leading domestic architects of the time.

After the outbreak of war in 1914 Weaver volunteered as an able-bodied seaman in the Royal Naval Volunteer Reserve (anti-aircraft corps). The attention of the director-general of food production, Sir Arthur Lee (afterwards Lord Lee of Fareham), was called to this waste of Weaver's ability, and he was consequently appointed in April 1917 unpaid controller of the supplies division of the newly formed Food Production Department. In this post Weaver was responsible for organizing the supply of fertilizers, feeding-stuffs, seeds, and other requirements of the agricultural industry; and the operations of his department were very effective in extending war-time allotments.

On the reorganization of the Ministry of Agriculture in 1919, Lord Lee, the minister, appointed Weaver commercial secretary, and in 1920 director-general, of the Land Department. He was made responsible for all questions relating to agricultural supplies, and, when director-general, for the development of small holdings, and especially for the settlement of suitable ex-service men on the land. Here he was again in a position to insist on sound building design and the employment of competent architects. There were no architects on the staff of the ministry until Weaver's appointment. The land settlement scheme was undertaken at a time of particular difficulty, owing to the extravagant cost of building materials.

Weaver therefore initiated experiments in the revival of traditional materials, such as cob and weather-boarding. Some of the results are published in *The 'Country Life' Book of Cottages* (1913, revised editions 1919 and 1926) and a *Manual for the guidance of County Councils and their Architects in equipment of Small Holdings* (1919, 3rd ed. 1920) dealing with the planning and construction of cottages and farms, issued by the Ministry of Agriculture under Weaver's direction. Further, his war-time experiences suggested to him the need of a single institution to co-ordinate and direct experiments in crop improvement. To this end he founded in January 1919 the National Institute of Agricultural Botany at Cambridge, with the help of funds contributed by firms interested and supplemented by a government grant, and he was chairman of its council from 1919 to 1924. He and his first wife were also instrumental in founding the Ashted Potteries for the employment of disabled ex-service men. He was also honorary treasurer of the Housing Association for Officers' Families, and of the Douglas Haig Memorial Homes. After the closing of his department in 1922 as the result of the economy scheme inaugurated by Sir Eric Geddes, Weaver became director-general of the United Kingdom exhibits section of the British Empire Exhibition at Wembley. A visit to the Gothenburg Exhibition in that year had impressed upon him the then unfamiliar ideals of industrial art, and he sought to realize these ideals in his section of the Wembley Exhibition. Subsequently he was an active speaker and writer on the subject of aesthetic ideals in industry.

After the Wembley Exhibition Weaver returned to a business career, accepting various directorships. In 1925-1926 he served under Lord Lee of Fareham on the royal commission on cross-river traffic in London, the expeditions and practical report of which owed much to his collaboration. In 1927 he succeeded (Sir) J. C. Squire, the founder, as president of the Architecture Club; and it was shortly before a meeting of the club at his office that he had a fatal seizure of *angina pectoris* and died at his house in St. John's Wood 10 January 1930.

The improvement in design and taste shown in industrial and commercial art in recent years owes much to Weaver's energetic advocacy. His character was a combination of strong religious, puritanical,

and philanthropic convictions—he was a deacon of the ‘Irvingite’ church—with hard-headed shrewdness and steadfast loyalty to friends and employers. He was an excellent debater and after-dinner speaker—enthusiastic, confident, and witty.

Weaver was created C.B.E. in 1918 and advanced to K.B.E. in 1920. He was a fellow of the Society of Antiquaries and an honorary associate of the Royal Institute of British Architects. He married twice: first, in 1908 Kathleen (died 1927), daughter of Major-General Edward Tobias Willoughby Purcell, R.A., by whom he had two sons and in whom his idealism found strong support; secondly, in 1928 Elizabeth Margaret, younger daughter of William de Caux, of Norwich.

[*The Times*, 11 January 1930; Clough Williams-Ellis, *Lawrence Weaver, A Memoir*, 1933; *Journal of the Royal Institute of British Architects*, 9 April 1921; private information.] C. HUSSEY.

WEBB, SIR ASTON (1849-1930), architect, was born in London 22 May 1849, the elder son of Edward Webb, engraver and water-colour painter, by his wife, Anna, daughter of John Evans, of Stoke Newington. His mother died the following year and his father in 1854. He was educated at Brighton. In 1867 he entered the office of Messrs. Banks and Barry, architects, of London, and in 1873 was awarded the Pugin studentship of the Royal Institute of British Architects, a travelling studentship which enabled him to study the medieval architecture of Great Britain.

About 1873, having served his articles, Webb set up in practice on his own account and from small beginnings eventually attained the highest position in his profession. In the architecture of London he was responsible for the principal block of the Victoria and Albert Museum (1891), the Royal College of Science (1900-1906), and the Imperial College of Science and Technology (1911)—all at South Kensington; the architectural surroundings of the memorial to Queen Victoria in front of Buckingham Palace, designed by Sir Thomas Brock [q.v.] in 1911; the new eastern façade of Buckingham Palace (1913); and the Admiralty Arch, designed as an entrance to the east end of the Mall (1911). Among many smaller works by Webb particular mention should be made of the French protestant church in Soho Square (1891-1893), a building with the

design of which he is said to have felt especial satisfaction.

In partnership with Edward Ingress Bell, also a very able architect, Webb competed unsuccessfully for the designs of the new Admiralty, the new War Office, and the Imperial Institute. But they won the competitions for the Birmingham Law Courts (1886-1891) and for the new Christ's Hospital near Horsham (1894-1904). In the Birmingham competition a plan was suggested to the competitors by the assessor, Alfred Waterhouse [q.v.], and Webb's courage in discarding this plan for a better arrangement was suitably rewarded by Waterhouse's magnanimity in recognizing the improvement. Webb also designed the Royal College of Science, Dublin (1906-1907), in collaboration with (Sir) Thomas Newenham Deane [q.v.]; the Naval College at Dartmouth (1899-1904); and the University of Birmingham (1900-1909). He was responsible for the restoration of Burford church, near Tenbury (1890), and of the church of St. Bartholomew the Great, Smithfield (1886-1893).

As a designer, Webb was distinguished among his contemporaries for clear-sightedness and common sense. The planning of his buildings is simple and direct, and their ornamental character is what in their day was considered appropriate. He was exceptionally skilful and conscientious in construction, almost every work of his being a model of fine and solid building. In the early part of his career his designs were not such as the leaders of architectural taste could recognize or approve; but he evolved in time a highly individual style which has had many admirers. In the buildings in which his name is associated with that of Bell, profuse detail of a *François Premier* character usually predominates, and in this class the extreme cleverness of the façade of the Metropolitan Life Assurance Company's offices in Moorgate Street (1890) attracted a great deal of contemporary notice. In his later buildings the style is severer and the scale of detail larger, although in ornament he would always prefer the piquant to the suave. The church of St. George at Worcester (1894) and Michael's court at Gonville and Caius College, Cambridge (1903), show very happily his ingenious invention at work in the Gothic idiom.

Webb received many honours, the most conspicuous of which were the royal gold medal of the Royal Institute of British Architects (1905), the presidency of the

Royal Academy (1919-1924)—the only previous architect to fill that office being James Wyatt [q.v.] in 1805—and the presidency of the Royal Institute of British Architects (1902-1904). In his earlier years he worked zealously for the Architectural Association, being president of that body in 1884; and throughout his life he was consistently a friend and helper to young architects. He was knighted in 1904 and received the C.B. in 1909, C.V.O. in 1911, K.C.V.O. in 1914, and G.C.V.O. in 1925.

Webb married in 1876 Marian, second daughter of David Everett, F.R.C.S., of Worcester, and had two sons and one daughter. His elder son is the architect, Mr. Maurice Webb; his younger son was killed in the European War. He died in London in his eighty-second year 21 August 1930.

A portrait of Webb by Solomon J. Solomon hangs in the head-quarters of the Royal Institute of British Architects in Portland Place, London. A bust executed by Sir Thomas Brock is illustrated in *Royal Academy Pictures*, 1922.

[*Builder*, 29 August 1930; *Architects' Journal*, 27 August 1930; *Journal of the Royal Institute of British Architects*, 20 September 1930.] H. S. GOODHART-RENDEL.

WEBB, MARY GLADYS (1881-1927), novelist, essayist, and poet, was born at Leighton-under-the-Wrekin, Shropshire, 25 March 1881. She was the eldest daughter of George Edward Meredith, a schoolmaster of Welsh ancestry, by his wife, Sarah Alice Scott, daughter of an Edinburgh doctor who belonged to the clan of Sir Walter Scott. From her father, the original of the charming and sympathetic character, John Arden, in *The Golden Arrow*, she inherited her passionate love of all country things. He especially loved bees, and his daughter Mary's intimate knowledge of their habits came from having lived near to hives in her childhood. She was brought up in Shropshire and was educated at home, except for two years spent at a private school at Southport. She began to write poetry and stories as a child. In 1912, at the age of thirty-one, she married Henry Bertram Law Webb, a schoolmaster, son of Thomas Law Webb, M.D. There were no children of the marriage. Mary Webb's married life was spent partly at Weston-super-Mare, partly at Lyth Hill, near Shrewsbury, and partly in Hampstead, where she settled in 1921.

The five novels upon which Mary Webb's reputation as a writer rests were published during the course of twelve years. *The Golden Arrow* appeared first, in 1916. *Gone to Earth* followed in 1917. In the same year she also published *The Spring of Joy*, a collection of essays. In 1920 came *The House in Dormer Forest*; in 1922 *Seven for a Secret*, and in 1924 *Precious Bane*. The earlier books were read and admired by a small circle of discriminating readers, but the general public did not awake for a long time to the beauty and interest of her writing, and, although several reviewers praised her work, the sale of her books was small. It was only when the sixth book, *Precious Bane*, was published that novel readers, especially lovers of the country, began to recognize in Mary Webb a writer of exceptional distinction. In 1925 the Femina Vie Heureuse prize for the best English novel published in 1924-1925 was awarded her for this novel. It came into the hands of Mr. Stanley Baldwin, then prime minister, who wrote to her, 17 January 1927, to say how greatly, as a lover of old Shropshire days, he admired her work. A facsimile of his letter is printed at the beginning of *Armour wherein he Trusted*.

Mary Webb died 8 October 1927 at St. Leonards, Sussex, after a short illness. Obituary notices in the press were brief and few, but Mr. Baldwin pronounced an *éloge* on her work at the Royal Literary Fund dinner at which he presided on 25 April 1928. Next day her name was famous. The lending libraries were beset by people demanding copies of her books, which were not easy to find, as they had only been printed in small editions. In order to meet the demand, Mary Webb's five novels were reprinted in 1928 with introductions by Stanley Baldwin, John Buchan, H. R. L. Sheppard, Robert Lynd, and G. K. Chesterton. Her poems, with an introduction by Walter de la Mare, were published along with a reprint of her essays, *The Spring of Joy*, in 1929. The same year an unfinished romance of the Crusades, *Armour wherein he Trusted*, appeared with an introduction by Martin Armstrong, together with some short stories.

Mary Webb's prose in her novels and essays has moments of great beauty, and her cadences derive from seventeenth-century models, especially Sir Thomas Browne. Her narrative style often kindles to a fiery intensity. The plots of her novels are nearly always sombre, although *The*

Golden Arrow and *Seven for a Secret* have happier endings. She was acutely conscious of the cruelties of human life, but curiously insensitive to the cruelty of Nature. In her essays, in which she describes aspects of the country, her knowledge is complete, and her observation minute and unerring. Both in prose and poetry subtlety of observation is combined with a remarkable beauty of thought and phrasing. 'All that she wrote is suffused with poetry,' Walter de la Mare wrote of her [Introduction to *Poems*]. She created in her novels a world of love, hatred, cruelty, beauty, and magic, seen through the medium of an intensely poetic and romantic temperament. Her taste is not always perfect: she is inclined to be didactic, and her style is sometimes a little over-coloured. Her work will always find readers, for she is a true interpreter of the English countryside, especially of that borderland where Celt and Saxon are intermingled.

SUSAN TWEEDSMUIR.

WESTON, FRANK (1871-1924), bishop of Zanzibar, born at Roupell Park, South London, 13 September 1871, was the fourth son and fifth child of Robert Gibbs Weston, a tea-broker in Mincing Lane, by his wife, Amelia, daughter of Dr. Robert Valentine. His father came of a Leicestershire family, but three of his grandparents were Scots, and he was proud of his descent from two seventeenth-century bishops of Brechin—stalwart episcopalians in dark days. He was educated at Dulwich College and Trinity College, Oxford, where he obtained a first class in the honour school of theology in 1893. He was ordained deacon in 1894 and priest in 1895. His first curacy (1894-1896) was at the Trinity College mission in Stratford, East London, his second (1896-1898) at St. Matthew's, Westminster.

In 1898 Weston joined the Universities' Mission to Central Africa, and for nine years was stationed at Zanzibar. His work there was chiefly educational—from 1901 to 1908 he was principal of St. Andrew's Training College, Kiungani—and he lived an ascetic life, almost entirely with Africans, learning, as few have done, what was in their minds. He found time, however, to write *The One Christ* (1907), dealing with the *Kenosis* of Our Lord, a book which won the approval of Professors Sanday and Swete, of Bishop Gore, and of

Canon Scott Holland. In 1908 Weston was consecrated bishop of Zanzibar on the resignation of Dr. J. E. Ifine. He at once set to work, organizing and reorganizing mission stations throughout his diocese, walking hundreds of miles each year on the mainland, settling vexed questions of morals and administering discipline. In Zanzibar he superintended work among Mohammedans, and did much for the spiritual life of his diocese by founding the Order of the Divine Compassion in 1910.

In June 1913, without consulting Weston, the bishops of Mombasa and Uganda concluded at Kikuyu a concordat with certain protestant denominations, which, in Weston's view, compromised the Church of England, and he denounced the scheme to the archbishop of Canterbury. At the same time he was much concerned about certain modernist teaching in England, and wrote a pamphlet—*Ecclesia Anglicana—For what does she stand?* (1913). Both Weston's action and his pamphlet occasioned a stir; bishops and scholars wrote pamphlets for and against the author, while the newspapers were deluged with correspondence. Archbishop Davidson [q.v.] summoned Weston to come home, referred the one subject to the standing committee of the Lambeth Conference, and the other to Convocation. Finally in 1915 he published a decision on the Kikuyu question which was a very diplomatic document. Weston defended his views on the Church in *The Fulness of Christ* (1916), but the book was too original for most theologians and too abstract for the general public. Against the modernists he wrote *The Christ and His Critics* (1919), which was not persuasive.

Meantime the European War had broken out, and Weston returned to his diocese to find all his staff on the mainland interned by the Germans. He wrote a little book which had a wide circulation, *Conquering and to Conquer* (1918), based on the sufferings of Our Lord, with the object of consoling mourners and sustaining combatants in the Faith. He next made an offer to the embarrassed government of Zanzibar to raise a corps of carriers for the conveyance of supplies up country. Six hundred volunteered at once in Zanzibar, and crossing with them to the mainland, he commanded, with the rank of major, first and last, 2,500 men. He led them up country, and did not lose a single case. There was some sickness, but no one died, although previously the mortality among

the carriers had been terrible. For this service he received the O.B.E.

In 1920 Weston came to England for the Lambeth Conference. The bishops who did not know him expected a wild fanatic; they found a great orator, full of sweet reasonableness. The appeal for unity which they issued was partly drafted by Weston and owed much to his inspiration. While at home he was indignant at the circular which was issued by Lord Milner, the secretary of state for the Colonies, on forced and 'encouraged' labour in Africa. His *Serfs of Great Britain* (1920) was fierce, but Mr. J. H. Oldham, of the World Missionary Conference, prevailed on him to moderate his attitude, and the memorandum drawn up by both of them was signed by leading politicians of all parties. The circular was ultimately withdrawn by Lord Milner's successor, Mr. Winston Churchill. In 1923 Weston paid another short visit to England, and presided at the second Anglo-Catholic Congress. For a week his personality dominated great audiences in the Albert Hall; and with his usual impulsiveness he sent greetings from the congress to the archbishop of Canterbury, the ecumenical patriarch, and the pope. He maintained quite correctly that this was in accord with the Lambeth resolution, but it was misunderstood both at Rome and in England. On returning to Africa in August 1923, he started once more on a visitation of his diocese, walking several hundreds of miles. In October 1924 he contracted blood poisoning through having a carbuncle cut by his cook-boy. He managed to reach his palace, a hut which he had built for himself at Hegongo, and died 2 November 1924.

Weston might have been a great theologian if he had stayed on in Oxford after taking his degree, as Professor Sanday wished him to do; but he was a born leader of men with a magnetic influence over individuals. His eloquence could hold 10,000 people in the Albert Hall enthralled; he could also fascinate little African boys in a remote village. He was equally at home in England and in Africa, and his sympathy was such that Africans regarded him as one of themselves. He devoted all his great powers to building up an African Church in native African communities and providing them with a stern discipline which they were to be encouraged to enforce themselves. He thought that only in this way could the race slowly develop on its own lines, and be

preserved from the disintegrating force of an alien civilization.

H. MAYNARD SMITH.

WET, CHRISTIAAN RUDOLPH DE (1854-1922), Boer general and politician. [See DE WET.]

WEYMAN, STANLEY JOHN (1855-1928), novelist, the second son of Thomas Weyman, a Ludlow solicitor, by his wife, Mary Maria, daughter of Samuel Black, was born at Ludlow 7 August 1855. He was educated at Ludlow grammar school, at Shrewsbury School, and at Christ Church, Oxford, where he obtained a second class in modern history in 1877. He showed no literary precocity, and wrote nothing save a few trilling sketches of university life and character, more than one of them published in *Chambers's Journal*, until overmuch leisure and scanty income compelled more serious efforts. He had been called to the bar by the Inner Temple in 1881, and had gone on the Oxford circuit, with so little material result that when challenged by the Income Tax authorities he could produce a fee-book showing an annual income of only £130. Some short stories were accepted by the *Cornhill Magazine*, and its editor, James Payn, suggested to him work on a larger scale. The chance of picking up in his club Henry White's *Massacre of St. Bartholomew* led to his writing *The House of the Wolf* (1890). This ran serially in the *English Illustrated Magazine* during 1883, but, as a book, could find no publisher for seven years. *The New Rector* (1891) already revealed what was long afterwards to be amply manifested, Weyman's admiration for Trollope. But for some years he was lured into the writing of highly popular historical romances, in some of which he made admirable use of his knowledge of the by-ways of French history. *A Gentleman of France* (1893) hung fire for three months after publication, and then came into immense demand. Among its successors were: *The Man in Black* (1894), *The Red Cockade* (1895), *Under the Red Robe* (1896, afterwards dramatized at the Haymarket Theatre), *The Castle Inn* (1898), *The Long Night* (1903). *Chippinge* (1906), its author's favourite, well showed his ability to use an English setting and dispense with cloak and sword. *Ovington's Bank* (1922), his second work after a self-imposed silence

from 1908 to 1919, is perhaps the most solid proof that Weyman was not dependent on the mere accessories of romance.

The earlier Weyman was regarded by every one as first-rate reading for boys, and by Oscar Wilde, who wished to procure his romances for the inmates of Reading gaol, as first-rate reading for convicts; the later Weyman, although popular, hardly received what was due to his developed power of historical imagination and skill in representing social conditions and broad movements.

Weyman's estimate of himself was modest enough, and he was under no illusions as to his good luck in finding a waiting public. Though fortunate in the moment of his debut, and not least in the misunderstanding which ranked him with R. L. Stevenson, Quiller-Couch, and other masters or popularizers of the 'new' romance—in part as old as Scott or Dumas—Weyman would probably at any time have won recognition for his sense of a situation. The higher gifts which enabled him—in *Chippinge*, for example—to reproduce the atmosphere of a period, not simple nor obviously romantic, were perceptible chiefly by readers who were not much attracted by the picturesque simplicities of his earlier tales.

Weyman made a habit of travelling over any foreign country which was to be the scene of one of his books, often in the company of the novelist, Henry Seton Merriman. At the end of 1885, when his companion was a younger brother, and he was travelling in the south of France, he was arrested on an absurd suspicion of being a spy, an incident which evoked the intervention of the British ambassador, Lord Lyons, a protest in the British press, and some notice in parliament. Switzerland yielded him a pleasanter experience, when the municipal authorities of Geneva made him a presentation as a tribute to the historical accuracy of his romance, *The Long Night*.

For the last thirty years of his life Weyman lived at Ruthin, Denbighshire, where he was chairman of the bench of magistrates and did other useful service in local affairs. He married in 1895 Charlotte, daughter of the Rev. Richard Panting; they had no children. He died at Ruthin 10 April 1928.

T. E. WELBY.

WHEATLEY, JOHN (1869-1930), labour politician, was born at Bonmahon,

co. Waterford, 24 May 1869, the eldest child of Thomas Wheatley, a labourer, by his wife, Johanna Ryan. When he was nine years old his family migrated to the mining village of Bargeddie, Lanarkshire, where the father found employment in a local coal pit; and from Bargeddie John travelled daily to the Roman Catholic school at Baillieston. The extreme poverty and miserable housing conditions of his childhood—the future minister of health was reared with ten brothers and sisters in a single-apartment house with neither drainage nor water supply—left him with bitter memories and coloured much of his political activity in later years. At the age of eleven he had to leave school and go down the coal-mine to assist his father, but he attended evening classes, read omnivorously, especially the political prints of the United Irish League, and taught himself shorthand. At the age of twenty-four he left the coal-pits and secured employment as a shop assistant, later engaging in a small grocery venture of his own, which, however, did not prosper. In 1896 he married Mary, daughter of Bernard Machan, publisher, of Glasgow.

After his grocery venture Wheatley in 1902 secured employment for a short period as a reporter, and then as an advertisement canvasser for the *Glasgow Observer and Catholic Herald*; but in 1912 he conceived the idea of engaging in partnership with another employee and setting up a publishing business in Glasgow dealing chiefly with shopkeepers' advertisement calendars. This project rapidly developed under Wheatley's guidance into a limited company (Hoxton and Walsh Ltd.), with widespread ramifications and agencies, freeing him from financial anxiety, and enabling him to give his two children a university education.

As a young man Wheatley was a keen adherent of the politics of the United Irish League, at that time an all-powerful organization among the Irish emigrants and their descendants in the West of Scotland; and it was not until 1908, when he was thirty-nine years old, that he joined the independent labour party. Thenceforward he was an active and influential figure in the labour and socialist movement. He made a special study of local government problems, and attracted large audiences by his speeches and addresses on housing, health, and finance. He formed and became first chairman of the Catholic Socialist Society, an organization which did much to win over Irish voters to

the labour party; he engaged in spirited disputations with Catholic clergy, and when he was first elected to the Lanarkshire county council in 1909, by the narrow majority of two votes, it was against a sitting Catholic moderate member. When the Shettleston district of Lanarkshire was incorporated in the city of Glasgow in 1910 he held his seat. He became chairman of the Glasgow town council labour party, a magistrate, and a leading exponent of the policy of municipal housing at rents within the competence of the poor. He urged the erection of cottages by government loan, free of interest charge, arguing that such cottages could then be rented at £8 per annum.

In 1918 Wheatley stood for parliament for the Shettleston division of Glasgow, and was defeated by 72 votes. In 1922 he captured the seat, holding it at the next four elections until his death. In parliament he was soon recognized as a powerful force in debate, and so rapidly came to the front that within two years of his appearance at Westminster he was appointed minister for health in the labour ministry. During his nine months of office (his activities occupy 30 columns in the index to the *Official Report* of the House of Commons) Wheatley was responsible for the Housing (Financial Provisions) Act, commonly referred to by housing reformers and administrators as the Wheatley Act. This Act was designed to assist the local authorities in a fifteen-year programme for building two and a half million houses to be let at rents which the average working-class family could afford to pay; a national subsidy was fixed, by agreement with the local authorities, for a trial period, at £9 per house; the building trades were induced to co-operate by permitting more apprentices, and a supplementary measure to prevent profiteering in building materials was promised.

After the general election of October 1924 Wheatley drifted away from his former government colleagues and, declining to sit with them on the front opposition bench, joined the left wing independent labour party group on the back benches. To a considerable extent he lost his influence in the labour party, and when another labour government was formed in 1929 he was not invited to take office. He became more and more identified with revolutionary socialist views and with left wing criticism of the labour government; but his activities were impaired by indifferent health. He died at

Shettleston 12 May 1930, and was survived by his wife and a son and daughter.

[*The Times*, 13 May 1930; files of the *Forward* newspaper 1909-1930; *The Book of the Labour Party*, vols. i-iii, 1926; *The Encyclopedia of the Labour Movement*, vol. iii, March 1928.] T. JOUNSTON.

WHIBLEY, CHARLES (1859-1930), scholar, critic, and journalist, born at Sittingbourne, Kent, 9 December 1859, was the eldest son of Ambrose Whibley, merchant, by his second wife, Mary Jenn Davey. Whibley was educated at Bristol grammar school and at Jesus College, Cambridge, where he won a scholarship in 1879, and obtained a first class in the classical tripos of 1883. He was always attached to his college, and kept in touch with it by frequent visits to Cambridge. In 1912 he was elected an honorary fellow of Jesus College, a distinction which he greatly prized.

On taking his degree Whibley at once adopted the profession of letters. For about three years he was in the editorial department of Cassell & Co.; but salaried work was not congenial to one who prized independence as he did. It was his association with literary friends of like tastes with himself which mainly determined the course of his life. In 1880 he published *In Cap and Gown: Three Centuries of Cambridge Wit*, a collection of Cambridge verses for which he wrote an introduction and notes. The most important of his early connexions was with W. E. Henley [q.v.], whom he assisted in the conduct of the *Scots Observer* (afterwards called the *National Observer*), one of the leading critical and political publications of its day. Whibley found in Henley a kindred spirit, a high tory, a poet and scholar of the finest taste, and a fierce denouncer of all that was pretentious and insincere. When Henley projected 'The Tudor Translations', a series of reprints, with critical introductions, of the best-known translations of classical and other authors into English of the Elizabethan and Jacobean periods, Whibley was responsible for many of the introductions, including those to Philemon Holland's Suetonius (1899) and Urquhart and Motteux's Rabelais (1900). At a later date (1924) he himself edited a second series, and wrote the introduction to Thomas Heywood's Sallust.

In 1893 Henley resigned the editorship of the *National Observer*, and Whibley allied himself with H. J. C. Cust [q.v.], then editor of the *Pall Mall Gazette*,

which was at that time the most brilliant of the London evening newspapers. He also wrote for the *Neco Review*. In 1894 Whibley went to Paris as correspondent for the *Pall Mall Gazette*, and there spent some of his happiest days in the society of French poets and *littérateurs*, particularly of Stéphane Mallarmé (of whom in later life he would tell many delightful stories), of Marcel Schwob (the great authority on François Villon), and of Paul Valéry. There also, in 1896, Whibley married his first wife, Ethel, daughter of the sculptor John Birnie Philip [q.v.] and a sister-in-law of J. M. Whistler.

Soon afterwards Whibley returned to England and formed an association with *Blackwood's Magazine* which remained unbroken during most of the rest of his life. Month by month for more than twenty-five years he contributed to that magazine the articles headed 'Musings without Method'. They were anonymous, but Whibley's authorship of them was an open secret; and he was justly proud of the fact that during a quarter of a century he had only failed to contribute to two or three numbers of *Blackwood*. The articles ranged over a great variety of subjects. He dealt with current politics from the standpoint of the highest Toryism, and with ethical and literary matters as a critic whose equipment of wit and learning rendered him formidable in the castigation of all which seemed to him to fall short of his own high standard of manners and sincerity.

Between 1897 and 1904 Whibley published *A Book of Scoundrels* (1897), *Studies in Frankness* (1898), *The Pageantry of Life* (1900), and *Literary Portraits* (1904). These were volumes of critical and historical essays, many of which had appeared before, either in magazines or as contributions to such works as the *Cambridge History of English Literature* or as introductions to books which he had edited. He also wrote brief studies of *Thackeray* (1903) and of *William Pitt* (1906), as well as introductions to Edward Hall's *Henry VIII* (1904), Disraeli's *Life of Lord George Bentinck* (1905), Sir Thomas Browne's *Religio Medici* (1906), and selected poems of Byron (1907). During these years Whibley formed a warm friendship with Lord Northcliffe [q.v.], and at his instance contributed for some years to the *Daily Mail* the 'Letters of an Englishman' (collected and published in 1915), full of vigorous and often ironical comments on the affairs or the follies of the day. With

Lord Northcliffe he paid a visit in 1907 to the United States, which led to his writing his *American Sketches*, published in 1908. In these he recorded his observations and impressions of a people who, in his judgement, were to be regarded not as a young but as an old nation.

In 1914 Whibley published *A Call to Arms*, and in 1917 an essay on Hazlitt and a volume of *Political Portraits*. In the same year he gave the Leslie Stephen lecture at Cambridge on *Swift*, subsequently published. About this time he built for himself at Great Brickhill, near Bletchley, a pleasant country house, with a large library to house the books which his successful literary labours had enabled him to collect. After the European War Whibley published *Literary Studies* (1919), an edition of George Wyndham's *Essays in Romantic Literature* (1919), a second series of *Political Portraits* (1923), *Lord John Manners and his Friends* (1925), and an introduction to *Robinson Crusoe* (1925), besides editing the *Collected Essays* (1925) of his old friend, Professor William Paton Ker [q.v.]. He also worked for many years as reader for the publishing firm of Macmillan and Co., the head of which, Sir Frederick Macmillan, was another friend to whom he was bound by strong ties and who bore testimony to the great value to his firm of Whibley's keen judgement.

In 1927 Whibley, whose first wife had died in 1920, married Philippa, daughter of Sir Walter Raleigh [q.v.], professor of English literature at Oxford. But his health was now beginning to fail. For some years he suffered from acute neuralgia, the weakening effect of which undoubtedly shortened his life. He died at Hyères 4 March 1930, at the age of seventy. He had no children.

A bare record of his work can give but little idea of Whibley's place in the estimation of his contemporaries, which is attributable at least as much to the effect of his personality on those who came into contact with him as to his literary eminence. The warmth of his human sympathies, his brilliant wit, his love of good cheer, of good talk, and of all that was vital and sincere made him the best of companions. He had his prejudices, to which he would sometimes give alarming expression; but his impeccable intellectual honesty and the courageous vigour of mind and spirit which shone out in his conversation made him an acknowledged leader among his intimates. In this, as in some of his other qualities, including his unbend-

ing toryism, he resembled Dr. Johnson; and it may well be that like Johnson he will rather live through the influence which he exerted on those who were privileged to know him than through the written word. Nevertheless, he was a great master of the written word. He maintained throughout his life the loftiest standards of his craft: his literary style was in the highest degree chaste and austere. His most ephemeral work—and much of it was ephemeral—was always that of a scholar; and although as a writer he was critical rather than constructive, he was a power in his time.

[*The Times*, 5 March 1930; private information; personal knowledge.]

D. O. MALCOLM.

WHITEING, RICHARD (1840-1928), journalist and novelist, was born in London 27 July 1840, the only child of William Whiteing, a clerk in the Stamp Office, by his wife, Mary Lander, who died when her son was an infant. Richard Whiteing lived with his father in Norfolk Street, Strand, until he was nearly eight years of age, when he was sent to a school which was conducted in the old palace at Bromley-by-Bow, and then 'as too young to be without a woman's care', he went to live with foster-parents in St. John's Wood, and finished his schooling there under a French refugee. He was then apprenticed for seven years to Benjamin Wyon [q.v.], medallist and engraver of seals. In the evenings he attended art classes, first at the Department of Science and Art at Marlborough House, then at Leigh's Art School in Newman Street, and, for a short time, at the Working Men's College in Great Ormond Street, where he came into contact with F. D. Maurice, John Ruskin, and F. J. Furnivall. Furnivall and his rowing-club for working girls figure in Whiteing's novel, *Ring in the New* (1906).

When he had finished his apprenticeship, Whiteing set up for himself as an engraver, 'with parental aid, and with varied fortunes, mostly bad'. About 1866 he undertook the secretaryship, at a salary of £2 a week, in Paris, of an Anglo-French working-class exhibition. He was 'without a word of French, but with plentiful pigeon-German', learned from a fellow engraver of seals, 'and by good hap they served'. At a later period he came to know Jules Simon officially, Yves Guyot personally, Hilaire Degas by sight, and the brothers Élie Reclus (the ethnologist) and Elisée Reclus (the geographer) intimately. Élie appears as Azrael, a Russian anarchist, in *No. 5 John*

Street (1890). Having thus broken with seal-engraving, and made acquaintance with continental life, Whiteing in 1866 made his first essay in journalism with a series of satirical articles on political and social subjects, in the *Evening Star*. These were published in book form in 1867 under the title of *Mr. Sprouts—His Opinions*. Mr. Sprouts is 'a costermonger who gets into parliament and becomes one of the most practical members, rivalling Bernal Osborne in his wit and Roebuck in his satire'. In 1866 Whiteing joined the staff, under the editorship of Justin McCarthy, of the *Morning Star*, for which he wrote articles on the Paris Exhibition of 1867. He then became the Paris correspondent of both the London *World* and the New York *World*. He lived in Paris, travelling as correspondent to Geneva (for the *Alabama* arbitration, 1871-1872), to Spain (1873), to Vienna, to Berlin, to Russia, and to Rome. In 1876 and 1878 he visited the United States of America.

In 1876 Whiteing published his first novel, *The Democracy*, under the pseudonym of 'Whyte Thorn'. This was 'a book of promise, but not of much positive merit', nor was it followed up until after twelve years—by *The Island* (1888), which in its turn was succeeded after another eleven years by *No. 5 John Street* (1899). From January 1874 to May 1875 Whiteing was serving on the staff of the *Manchester Guardian*, but he soon returned to Paris, where he was contributing to that paper in 1880. He did not leave Paris until about 1886, when he went back to London in order to join the staff of the *Daily News*, from which he resigned in 1890. His long settlement in Paris resulted, in 1886, in the publication of *Living Paris and France* (under the pseudonym of 'Alb') and, in 1900, of *The Life of Paris*. Three other novels and one book of essays followed Whiteing's retirement from journalism at the age of fifty-nine: *The Yellow Van* (1903), *Ring in the New* (1906), *All Moonshine* (1907), and *Little People* (essays on 'the world's nobodies and failures', 1908). In 1915 he published a pleasant volume of autobiography, *My Harvest*, in which he mentions neither his marriage, nor, apart from mere passing allusions to two of them, any of his novels.

Whiteing would not be thought of as a novelist had it not been for the success of *No. 5 John Street*. This was in some degree a sequel to *The Island*, in which Pitcairn Island is imagined as an unsophisticated polity, its inhabitants innocently proud

of their membership of a British Empire of which they know nothing. The 'Person of Quality', who depicts their happy state in 1888, dies and leaves it to the narrator of *No. 5 John Street* to send them reports of Queen Victoria's diamond jubilee in 1897. No. 5 John Street is a tenement-house, with a horrible basement and worse cellar. The narrator, himself a 'person of quality', lives there in disguise, for the purposes of his report to the Pitcairn Islanders, and introduces the reader to the other inmates—a flower-girl (a virtuous Amazon, reminiscent of Borrow's Isopel Berners), a consumptive factory-girl, an amiable ruffian, a Russian anarchist, and an old Chartist, who is also a survivor of the charge of the Light Brigade. There is a story, for the consumptive girl is to die, as a protest against conditions in a rubber factory. The flower-girl is to die, too, in an heroic attempt to prevent the anarchist from bombing the house of the factory-owner. The book, as a work of art, suffers from the tendentious character of the story, while the reports of the state of England to the Pitcairn Islanders aim at a humour akin to *Gulliver's Travels* and *Sartor Resartus*. Whiteing's novel, *All Moonshine*, is likewise a fantasy.

Whiteing's autobiography, by its style, suggests that a fine mind had been in part sacrificed during a long life to anonymous journalism. His novels bear witness to a kind heart. He was granted a civil list pension in 1910, and he died at Hampstead 29 June 1928 in his eighty-eighth year. He married in 1869 Helen (who predeceased him by many years), niece of Townsend Harris, the first United States minister to Japan. They had one son.

Among Whiteing's writings not previously mentioned are: *Wonderful Escapes* (revised . . . and original chapters added by R. Whiteing, &c., 1870), *Drawing from Delight* (1912), and *Both Sides of the Curtain* (in collaboration with the Countess Geneviève de Guerbel, née Ward, 1918). In addition to these he wrote introductions to Emerson's *Essays*, first series (1909), Thoreau's *Walden* (1906), F. Loti's *Women of the Second Empire* (1907), and V. V. Vereshchagin's '1812': *Napoleon I in Russia* (1899).

[*The Times*, 30 June 1928; Richard Whiteing, *My Harveyl*, 1915 (this gives very few dates).] F. PAGE.

WILCOCKS, Sir JAMES (1857-1926), general, was born 1 April 1857 at Baraut in the Delhi district, India, the

fourth son of Captain William Willcocks, of the East India Company's service, by his wife, Mary Martin. He was educated privately in England, chiefly at Easton in Somerset. Like not a few famous soldiers he failed more than once in the entrance examination for the army. He was twice unsuccessful for the Royal Military College, Sandhurst, and was nearly twenty-one when he left the College and was gazetted in January 1878 to the 100th Foot, which he joined at Jullundur in the Punjab. Owing to an epidemic of cholera his regiment was not able to take part in the second Afghan War; but when the second stage of it began after the murder of Sir Louis Cavagnari [q.v.] in September 1879, young Willcocks determined to get to the front. He took the audacious step of telegraphing direct to head-quarters at Simla, offering his services. In ninety-nine cases out of a hundred such irregular action would have led to a severe official reprimand. In this case, however, Willcocks received a telegram directing him to proceed to the front at once and to report at Peshawar.

In this second phase of the Afghan War Willcocks served as a transport officer and learned many lessons which were later to stand him in good stead. Early in 1881 he was again on active service as transport officer in the Mahsud Waziri expedition, rejoining the 100th Foot at Umballa in the following year. In 1884 he accepted an appointment in the newly formed Army Transport Department in India, and was soon put in charge of army transport in the Eastern Frontier districts with headquarters at Assam. India was now called upon to provide a contingent for service in the Sudan, and Captain Willcocks, as he had now become, was selected for transport duties. Returning in due course to Assam, he was once more selected for transport duties in the Burmese Frontier expedition of 1886. At the conclusion of the expedition in December 1887 he was offered a permanent appointment in the amalgamated Commissariat-Transport Department, and at the same time he received a letter from his regimental commanding officer offering him the appointment of adjutant of the 100th Foot, which had now become the 1st battalion Prince of Wales's Leinster Regiment (Royal Canadians).

Although it entailed a pecuniary loss, Willcocks wisely rejoined his battalion. He arrived with five 'ribbons', including the D.S.O., a remarkable number for a

comparatively junior officer of those days. Willcocks's tenure of the adjutancy was not of long duration, for in 1889 he was again ordered on active service, this time as intelligence officer in the Chin-Lushai expedition, and this was followed by a further spell of active service in the Manipur expedition of 1891.

For the next five years leave, polo, big-game shooting, and staff appointments in India were Willcocks's lot until, on 18 June 1897, he received a telegram from Simla informing him that he had been selected as assistant adjutant-general of the field force then being formed in the Tochi valley in Baluchistan on the North-West Frontier. On the conclusion of that campaign in November Willcocks was offered by the War Office the post of second-in-command of the new force about to be raised by Major F. J. D. (afterwards Lord) Lugard on the Niger in West Africa. Accepting the appointment, Willcocks proceeded to England and thence to West Africa, arriving at Sierra Leone in March 1898.

In that year Willcocks took part in the Borgu campaign, and became in 1899 colonel-commandant of the West African Frontier force. Then came his first real chance as a commander, when he was appointed to command the Ashanti field force for the relief of Kumassi. In spite of appalling difficulties Willcocks duly relieved the place on 15 July 1900, and for his services he was created K.C.M.G., was mentioned in the king's speech at the opening of the first parliament of King Edward VII, and given the freedom of the City of London.

In 1902 Willcocks joined the field force in South Africa, but he had no opportunity of displaying his genius for organization. Returning to India, he was promoted major-general in 1906 and commanded two expeditions on the North-West Frontier in 1908—such was his rapidity of action that *Punch* began to talk of 'Willcocks's Week-End Wars'. The same year he was promoted lieutenant-general. Two years later (1910) he was appointed to the command of the Northern army in India.

Willcocks reached the zenith of his military career when, in 1914, he was ordered to proceed to France in command of the Indian Army Corps, then on its way to take part in the European War. Everything pointed to his ultimate appointment to the high position of commander-in-chief in India. But it was not to be. Although at

the end of the first year's fighting in France Willcocks was awarded the G.C.M.G., friction had developed between him and Sir Douglas (afterwards Earl) Haig [q.v.], who had been promoted general in November 1914 and commander of the newly formed First Army at the beginning of 1915. Hitherto Haig had been junior to Willcocks. Now the situation was reversed, and Willcocks felt compelled to suggest to the general officer commanding the First Army that, as his services apparently no longer met with the army commander's approval, he might be relieved of command of the Indian Corps. Accordingly, having been promoted full general in May, he resigned in September.

Willcocks's military career was now at an end, and a dignified retirement was found for him as governor of Bermuda from 1917 to 1922. He died at Bharatpur 18 December 1920.

Willcocks was the author of three very readable books: *From Kabul to Kumassi* (1904), *With the Indians in France* (1920), and *The Romance of Soldiering and Sport* (1925).

Willcocks married in 1889 Winifred, second daughter of Colonel George Augustus Way, 7th Bengal Infantry, and had one son.

[Official records; Willcocks's own writings; *The Prince of Wales's Leinster Regiment*, 1911; *Frederick Edwin, Earl of Birkenhead, by his son* (the Earl of Birkenhead), vol. i, 1933; private information; personal knowledge.]

F. E. WHITTON.

WILLS, SIR GEORGE ALFRED, first baronet, of Blagdon (1854-1928), president of the Imperial Tobacco Company, philanthropist, was born at Bristol 3 June 1854, the eldest son of Henry Overton Wills, of Kelston Knoll, near Bath, by his wife, Alice Hopkinson, of Manchester. He was educated first at Dr. Hudson's private school, Manilla Hall, Clifton, where he was contemporary with T. H. Warren (afterwards Sir Herbert Warren, president of Magdalen College, Oxford), with whom he retained a lifelong friendship. From about 1868 to 1872 he was at Mill Hill School, where he developed an interest in history which was maintained throughout his life. It was not customary at that time to send to the university boys who were intended for a business career. Wills always regretted his lack of a university education, a subject in which in later life he took the keenest interest.

In October 1874, at the age of twenty,

Wills entered the Bristol tobacco firm of W. D. and H. O. Wills. This firm had had a continuous history from the early eighteenth century. Wills's father, Henry Overton Wills, had retired from the business and took no further part in the management. Wills quickly proved his capacity. He was trained in every department of the business, and in 1888 was made manager of the head-quarters and factory at Bedminster, near Bristol. In 1904 the tobacco trade in Great Britain was seriously threatened by American interests. George Wills and his cousin, William Henry Wills (afterwards Baron Winterstoke, q.v.), were together responsible for conducting the intricate and difficult negotiations which resulted in the foundation of the Imperial Tobacco Company of Great Britain and Ireland in 1901. This industrial 'combine', typical of many formed about that time, had, unlike many others, remarkable success from the beginning; and this was largely due to the personality and ability of Wills. On the death of Lord Winterstoke in 1911 he became chairman of the company, and he remained actively in business until 1924, when he retired on account of failing health; he continued, however, to act in an advisory capacity, with the title of president of the company, until his death.

Wills took no part in politics, and never stood for municipal office, although he was sheriff of Bristol from 1899 to 1900; but throughout his life he took a keen interest in Bristol charitable institutions, particularly the General Hospital. After long association with it he became president of the hospital in 1913. He not merely contributed munificently to its development and maintenance, but he was active and constant in administration, and also in visitation of the wards. He was a generous supporter of other hospitals and institutions. In 1909 he purchased the Leigh Woods, on the banks of the Avon, and presented them to the National Trust, in order to preserve them for the public.

Wills's greatest public work was done for the university of Bristol, of which his father was the founder and first chancellor. The University College of Bristol had been opened in 1870. In the early years of the twentieth century a movement was set on foot to erect the college into a university, but little progress was made with the scheme, in spite of the labours of an energetic committee under the chairmanship of Lewis Fry. In 1908 Wills was president, for the year, of the Colston

Society, a local body for the encouragement of research; and at the annual dinner of the society in that year he announced the gift of £100,000 from his father, towards the establishing of a university in Bristol. Wills himself purchased the Coombe Dingle estate, and equipped it as playing fields for the University. A charter for the University was granted in 1909. Four years later, in February 1913, Wills wrote to Lewis Fry, chairman of the council, stating simply that he and his brother, Henry Herbert Wills, considered the time to be due for extending the University and ensuring to it a building worthy of the city; accordingly, they offered the sum of £150,000. The European War supervened when the work of building had made only a little progress, and costs rose enormously; but Wills, who always saw through to completion every project which he had initiated, gave continued support, notwithstanding that the total expenditure on the new building—great hall, reception and lecture rooms, tower, and offices—amounted to £600,000. Wills always made it a rule to give funds for maintenance as well as for construction, and thus the University was relieved of very considerable charges in the future. He purchased the Victoria Rooms, Clifton, and equipped them as a University union, with a fund for maintenance. His final gift was to purchase an estate on the downs, at Stoke Bishop, and to build and endow a magnificent hall of residence for men. This was completed in 1929, the year after his death.

Besides his princely generosity to the university of Bristol, Wills devoted much time and energy to its affairs. He was a governor of the old University College, and treasurer of the University from its foundation in 1909 until 1918. He became a pro-chancellor in 1911; and in 1913 he succeeded Lewis Fry in the onerous position of chairman of the council.

Wills was a man of retiring but lovable nature, and he exercised a wide personal influence. Sympathetic, and with a keen sense of humour, he was always approachable. He knew his tobacco business thoroughly, being a great judge of leaf, and an unsurpassed manager of men. He was opposed to all forms of speculation or gambling. He was favourable to his workmen joining a trade union, although he felt that no union could offer them benefits equal to those which they already enjoyed in his works. He was personally well known to very large numbers of the

workers in the tobacco factory and was on the best possible terms with them; it was a source of satisfaction to him that there was never a strike in the factory in his time.

Wills lived chiefly at Burwalls, Leigh Woods, outside Clifton, and at Blagdon, Somerset, but he usually went with his family for three or four weeks each year to Scotland, or to a farm which he owned at Aale, in Ramsdalen, Norway. Fishing and walking were his chief recreations. He was also keenly interested in music and pictures.

Wills married in 1878 Susan Britton, daughter of Robert Proctor, of Clifton, and had one son and four daughters. He was created a baronet in 1923, and received the honorary degree of D.C.L. from the university of Oxford in 1923: as he was unable to travel, the vice-chancellor visited Bristol and conferred the degree on him in his own house—a signal honour. He died at Burwalls 11 July 1928, and was succeeded as second baronet by his son, George Vernon Proctor (born 1887).

There is a portrait of Wills by Hugh Riviere in the University buildings, Bristol, and another by Glyn Philpot in the offices of the Imperial Tobacco Company, Westminster.

[Private information.] R. B. MOWAT.

WILMOT, Sir SAINTHILL EARDLEY-(1852-1929), forester, was born at Hobart, Tasmania, 17 July 1852, the third son of Augustus Hillier Eardley-Wilmot, police magistrate in Hobart, and after 1855 resident in London, by his wife, Matilda Jessie, daughter of John Dunn, banker, of Hobart. He was educated at East Budleigh, Devon, and after a forestry training in Germany joined the Indian Forest service in December 1873, and was posted assistant conservator of forests in the old North-West Provinces and Oudh, Dr. (afterwards Sir) Dietrich Brandis [q.v.] being at the time inspector-general of this new service, inaugurated in 1864.

Eardley-Wilmot spent sixteen years as an executive officer in the province. In 1890 he was promoted to administrative rank. The following eight years he passed as conservator in Oudh, and it was there that his organizing ability, driving power, and great professional knowledge attracted the attention of the local government and marked him out for subsequent preferment. After further service in the north of the province, Eardley-Wilmot was transferred in 1900 to Burma, where he

spent three years. It was considered at the time that an officer who might be chosen for the head of the service must possess an acquaintance with the very valuable Burmese forests. He was never at home in Burma, and made no secret of his dislike of service in that country. Early in 1903 he was about to ask for the charge of the forest school and circle at Dehra Dun in the Meerut division of the United Provinces; failing this appointment he proposed to retire. At this juncture Mr. H. C. Hill, the inspector-general of Indian forests, suddenly died, and Eardley-Wilmot was appointed to the vacancy in February 1903.

As inspector-general, apart from his activity in administrative matters, notably in effecting improvements in the emoluments of the staff and in the forestry education of the subordinate grades, Eardley-Wilmot's greatest achievement was connected with the inauguration of the Imperial Forest Research Institute at Dehra Dun. The viceroy, Lord Curzon, was keenly interested in the introduction of the scientific expert into India, and had already established an Agricultural Research Institute. The Forest Institute, the officers of which were selected from the Indian Forest department, came into being in 1906. From this small beginning—for buildings and equipment had to be gradually obtained—was built up the magnificent Forest Research Institute, the largest of its kind in the world, which was formally opened by the viceroy, Lord Irwin, in 1929, only six days before Eardley-Wilmot's death—evidence of the great value of the step taken in 1906.

Eardley-Wilmot retired from the service in 1909, and in 1910 was appointed one of the commissioners of the newly formed Development Commission. He served as a commissioner for five years, and was then appointed forestry adviser to the commissioners, a post which he held until 1919 when, on the passing of the Forestry Act, 1911, the Forestry Commission was formed; he then retired into private life. During his service on the Development Commission the improvement of forestry education at the universities and in the agricultural colleges was a chief aim, as was also, where possible, the encouragement of afforestation amongst private proprietors. Grants with these objects in view were made by the commission.

It was during his service as conservator in the North-West Provinces and Oudh that Eardley-Wilmot began writing a

series of papers on the silviculture of Indian trees, comprising *Notes on the Regeneration of Sal (Shorea robusta)*, *Notes on Sal Forests*, *Notes on Improvement Follings, Sal Coppice Forests of Oudh*, *Notes on the Treatment of Shisham (Dalbergia Sissoo) and Khair (Acacia Catechu) in the Sub-Himalayan Tracts*. These were published by the Government of India in the *Appendix Series of the Indian Forester* and formed an important contribution to the meagre silvicultural knowledge of Indian trees of that day. When inspector-general he published *Notes on the Influence of Forests on the storage and regulation of the Water Supply* (1906). In 1910 appeared his *Forest Life and Sport in India*, a book which has considerable literary merit and, from the point of view of forestry as well as of natural history and sport, is regarded as a classic. Two other works followed, *The Life of a Tiger* (1911) and *The Life of an Elephant* (1912), both of which give evidence of a close study of the lore of the jungle.

Hardley-Wilmot was created C.I.E. in 1908 and K.C.I.E. in 1911. He was twice married: first, in 1884 to Emma Elizabeth (died 1890), daughter of George Casey, of Winterbourne St. Leonards; secondly, in 1891 to Mabel Boisragon, daughter of William Henry Winter, head of the telegraph department, General Post Office. There was one daughter of each marriage. He died at Henley-on-Thames 13 November 1929.

[*The Times*, 14 November 1929; *Nature*, 21 December 1929.] E. P. STENNING.

WILSON, SIR HENRY HUGHES, baronet (1804-1922), field-marshal, the second son of James Wilson, of Currygrane, Edgeworthstown, co. Longford, by his wife, Constance Grace Martha, eldest daughter of James Freeman Hughes, of The Grove, Stillorgan, co. Dublin, was born at Currygrane 5 May 1804. In 1877 he was sent to Marlborough College, where he worked for entrance into the army. Failing twice to gain admission into Woolwich and three times into Sandhurst, in December 1882 he obtained a commission without examination in the Longford Militia (then 6th battalion, Rifle Brigade); through this channel he gained admission into the 18th Royal Irish Regiment, but was immediately transferred to the Rifle Brigade, being gazetted into it in November 1884. The 1st battalion, which he joined in India, proceeded to Burma soon after in order to take part in the trouble-

some operations for the suppression of armed brigandage. While engaged on this duty in 1886, Wilson received a severe wound over the right eye and, as a result of the injury, returned home late in 1887. Whilst on sick leave he set to work for entrance to the Staff College, and, after passing the entrance examination in 1891, joined the College at Camberley in January 1892. At the Staff College he made no particular mark as a student but he made many friends. Meanwhile he had married, in 1891, Cecil Mury, youngest daughter of George Cecil Gore Wray, J.P., of Ardnamona, co. Donegal.

On leaving Camberley, after having been promoted captain in December 1893, Wilson remained at home until, early in 1894, he received a temporary appointment in the Intelligence Department at the War Office, at the head of which was his friend, another Irishman, Sir John Ardagh [q.v.]. There he was employed in dealing mainly with South African questions. But he did not complete the normal tenure of his appointment, being transferred in 1897, at the instance of the director of the department, as brigade-major to the 3rd Infantry brigade. On the outbreak of the South African War, Wilson's brigade was sent to the Cape under the command of Major-General (Sir) Neville Lyttelton, as the 4th brigade of the 2nd division. On arrival the troops were ordered to Natal, where the 4th brigade took part in the unfortunate battle of Colenso (15 December 1899). After this failure a deadlock arose until Sir Redvers Buller [q.v.] tried to turn the Boer position by moving westwards and then crossing the Tugela river. The attempt, in which Wilson took a full share, ended in the reverse at Spion Kop (24-25 January 1900). After these operations Lyttelton was promoted to command a division and left the 4th brigade, having formed a high opinion of his brigade-major and conceived a friendship for him which later proved to be greatly to Wilson's advantage.

After the relief of Ladysmith on 1 March the Natal field force, Wilson with it, eventually made its way into the Transvaal. After visiting Pretoria in order to see Lord Roberts, whose only son, killed at Colenso, had been one of Wilson's Irish friends, he was selected for service on the head-quarters staff, first as deputy-assistant-quartermaster-general and then as assistant-military-secretary. In the latter capacity he returned to England with Lord Roberts in January 1901. For

his South African service he received the D.S.O. in June and was promoted brevet-lieutenant-colonel on 3 December, the day following his attaining the rank of major in his own regiment. This early promotion, combined with the support of such influential patrons, was certain to lead to further advancement.

Anxious to secure a home appointment, Wilson, in February 1902, obtained command of the 9th provisional battalion at Colchester, and held that position for exactly one year. Having thus qualified for fresh staff appointment, he was made a deputy-assistant-adjutant-general in the military training branch of the War Office in April 1903, being advanced to assistant-adjutant-general in the following June. His work was connected with the training of the auxiliary forces, and in that capacity he often accompanied Lord Roberts on official tours. In 1904 there began the reorganization of the War Office and the formation of the new general staff; during the unsettled period which ensued Wilson was busily engaged on tasks that were after his own heart. Largely as the result of these he was promoted brevet-colonel in December 1904, and finally appointed by Sir Neville Lyttelton, now chief of the general staff, to be commandant of the Staff College, with the rank of brigadier-general, in January 1907.

At Camberley Wilson soon displayed many attributes of the successful teacher, and, thanks to a vivid personality, a remarkable facility for public speaking, a never-failing humorous turn of expression, and a penchant for the dramatic, he achieved great popularity among the students, while his reputation as a lecturer spread throughout the army. In addition, he soon made himself the leading exponent of the policy of close co-operation with France in the event of a continental war. Here he found a virgin field for his talent for lecturing, and he availed himself of the opportunity to the full. More pregnant with fateful consequences was the friendship which at this period he formed with General (afterwards Marshal) Foch, then head of the French *École Supérieure de Guerre*. As time went on Wilson became more and more possessed by the idea of placing the British army at the disposal of France in the event of war.

In 1910 Wilson was chosen for the post of director of military operations at the War Office, and on leaving Camberley in August of that year he was made the subject of unusual demonstrations of

popularity. He had been created a C.B. in 1908. In his new position he rapidly acquired great influence, and concentrated his energies on elaborating schemes for the instant support of France by the entire armed resources of Great Britain in the event of an outbreak of war with Germany. He often visited France, sometimes in company with Sir John French (afterwards Earl of Ypres, q.v.), and thereby still further committed the British government to the policy of armed support of France. But his plans, admirably worked out in detail, were largely based on two faulty premisses: first, they relegated to a merely secondary place any potential intervention of the British fleet; secondly, they entirely subordinated the action of the British army to French plans, with inadequate advantages to, or regard for, British military needs. Moreover, insufficient thought was paid to many practical details of command. The Franco-German crisis of 1911 passed off, and Wilson accelerated his plans for the warlike action which he now advocated in public utterances, while in the meantime his relations with General Foch grew still more intimate. In November 1913 he was promoted major-general. Then, in the spring of 1914, occurred the Curragh incident, the result of the British government's apparent intention of coercing Ulster by armed force to participate in the grant of Irish Home Rule. The cavalry officers at the Curragh declared that they would resign their commissions rather than take action against Ulster, and the episode led to the resignation of Sir John French, then chief of the Imperial General Staff, and of Sir John Spencer Ewart [q.v.], the adjutant-general. Throughout the crisis Wilson, as a protestant Irishman, was active behind the scenes in his support of the Ulster cause. The state of tension, both in Ireland and in the general European situation, continued with little abatement until the sequel to the murders at Sarajevo in July 1914 led up to the British declaration of war against Germany in support of France on 4 August. Lord Kitchener [q.v.] thereupon became secretary of state for war. Of his views on matters both of strategy and of raising the 'new armies', Wilson strongly and openly disapproved.

The British Expeditionary Force landed in France under the orders of Sir John French, with Sir Archibald Murray as chief, and Wilson in the entirely new position of sub-chief, of the general staff. The whole scheme of mobilization, which

Wilson had inspired, worked admirably. On 14 August British head-quarters crossed to France; the troops followed, and on 23 August were attacked by the German First Army at Mons. The French plan of campaign already showed signs of collapse, whilst co-operation between French and British armies proved faulty. The retreat began, General Murray's health broke down, and Wilson became largely responsible for the work of general head-quarters. In spite of an assumed air of light-heartedness he could do little to retrieve the situation; indeed, at one moment he seemed to be filled with such forebodings that he sent instructions to the troops to burn their baggage and retreat at full speed; but both corps commanders, Sir Douglas Haig and Sir Horace Smith-Dorrien [q.v.], declined to issue such orders. The tide turned at the River Marne on 6 September; the inconclusive battle of the Aisne followed, until, at the beginning of October, the British army was transferred to Flanders. Throughout this period Wilson performed the work of his office interrupted by frequent visits to French head-quarters. The battle of Ypres was next fought to the bitter end (October-November), but it was scarcely possible for the high command to influence the result, except by a display of remarkable tenacity. In November the question arose whether Wilson should not succeed General Murray as chief of staff. The final decision, however, was not taken until 25 January 1915, when Sir William Robertson became chief of staff, while Wilson was appointed chief liaison officer with French head-quarters, receiving the temporary rank of lieutenant-general, the latter distinction being gazetted on 19 February. He now ceased to exercise any direct influence over the course of events in the field, and busied himself with the political conduct of the War. In June he appears to have become less hostile to the formation of the new armies by Lord Kitchener, a fact which smoothed down the acrimony subsisting between the secretary of state and himself. He was created K.C.B. in the spring.

In August 1915 Wilson received from Sir John French the offer of the command of an army corps; it was also intimated to him privately that his refusal of that offer would not be unacceptable to the secretary of state. In the end the IV Army Corps was entrusted to him in December 1915. During his tenure of command throughout 1916, he was not called upon to participate

in any noteworthy action, although on 19 May, after taking over some poorly constructed and sited trenches from the French at the northern end of Vimy Ridge, the Germans developed a heavy surprise attack at that point, which drove the British back a considerable distance with some loss. Wilson thereupon made plans to retake the lost ground, but was ordered to desist, as the attempt promised to be too costly. The IV Corps was gradually denuded of troops for the battle of the Somme, and on 1 December Wilson himself was selected as head of a mission which was to proceed to Russia in order to discuss the supply of war material. After his return in March 1917 he went back to France in order to act as chief liaison officer with French head-quarters, his rank of lieutenant-general being then made permanent. After General Nivelle had been succeeded as commander-in-chief of the French armies by General Pétain on 15 May, the latter informed British head-quarters that he considered Wilson to be a *persona non grata*. Wilson thereupon returned to England.

After a spell of unemployment Wilson, at the instance of Sir William Robertson, was appointed to the Eastern command at home in September 1917, a position which suited him well since it enabled him to reside in London and keep in close touch with military and political authorities alike: it was in these circumstances that Wilson came into close contact with the prime minister, Mr. Lloyd George. Soon afterwards, on 24 October, occurred the serious defeat of the Italian army, initiated by an Austro-German surprise attack at Caporetto. By threatening the complete collapse of Italy, this event produced a grave crisis in the Allied conduct of the War. A conference of the Powers was accordingly summoned at Rapallo, and thither Wilson hastened in an entirely unofficial capacity, in company with the prime minister on 7 November. As pre-arranged by Mr. Lloyd George and M. Painlevé, the French premier, there was created at this meeting a 'Supreme War Council', designed to co-ordinate the various war policies and military plans of the Allied countries. This council, which was to meet as required, comprised two leading ministers from Great Britain, France, Italy, and the United States respectively, and these statesmen were supported by a group of permanent military representatives who were to work out all military plans on their behalf. One

representative was selected by each Power, and, as the chiefs of staff were not eligible, the choice of British representative fell upon Wilson, who might indeed be considered as one of the chief instigators of the creation of the council. He was then given the temporary rank of general. At Versailles, the seat of the new council, Wilson and the other Allied military representatives set up their offices, surrounded by numerous staffs, on 1 December. For the next ten weeks the military representatives compiled a number of joint notes for the benefit of the council, the fourteenth and last of which alone acquired much importance, since it adumbrated the formation of a general reserve of troops for the entire Western front, inclusive of Italy. The use of this reserve was to be controlled by an executive War Board, of which Wilson was to be the British member. But numerous obstacles at once arose, mainly owing to the disinclination of the various national commanders-in-chief to part with their troops, of which they had all too few; still more, perhaps, owing to the difficulties involved in the command of such a body. The consequent discussions dragged on for many weeks, indeed long after Wilson had left Versailles for London.

For some time it had been apparent that Mr. Lloyd George preferred Wilson's facile personality and his pungent modes of expression to the uncompromising attitude and blunt opinions of Sir William Robertson, then chief of the Imperial General Staff. Supported by Lord Milner [q.v.] alone in the Cabinet, Mr. Lloyd George finally decided that Wilson should supersede Robertson, and the change took place on 18 February 1918. As chief of the Imperial General Staff Wilson found full scope in the political sphere for the exercise of his particular abilities; but he had scarcely settled down in his new office when, on 21 March, the Germans launched their great onslaught against the British Fifth Army. The offensive, although long expected, fell at a point which had not been foreseen by the Versailles Council. Heavily outnumbered, the British gave ground until it seemed as though the Allied front might break. The general reserve, as proposed by the Supreme War Council, not having come into existence, it was clear that some drastic remedy was needed to save the situation. Wilson hastened to France, whither Lord Milner had already proceeded, and on 26 March, after a conference of Allied statesmen and commanders at Doullens, north of Amiens,

it was decided to confer the control of the combined Allied armies on General Foch. As the direction of the military operations of the Allies now virtually passed into Foch's hands, Wilson's work became merged in the results of the numerous committees and conferences which grew to be synonymous with the higher conduct of the War. In France the next three months continued to be full of anxiety, as the Germans, after being checked before Amiens, renewed their attacks at other points. At length on 18 July the tide turned, the Allied advance began, and the Germans slowly gave way until they were eventually compelled to accept the Allied terms of armistice on 11 November.

The months which elapsed between the Armistice and the signing of the Peace Treaty at Versailles on 28 June 1919, were spent by Wilson mostly in Paris. During that time he began to drift away somewhat from his close association with Mr. Lloyd George. Eventually he made no secret of his dissatisfaction both with the terms of peace and with the whole management of the political situation by the Allied statesmen. He opposed any British participation in the League of Nations, expressed himself against a pro-Greek policy in Asia Minor, and was an advocate of strong British rule in the East generally; whilst he continued to urge the enforcement of rigorous measures in Ireland. In July 1919 he was promoted field-marshal, and in August was created a baronet, receiving the thanks of parliament and a grant of £10,000.

Affairs in Poland, at Constantinople, and in Mesopotamia occupied Wilson in his official capacity very fully during the next two and a half years. He persisted in recommending vigorous measures, not hesitating to advise military action in each minor crisis as it arose; but the main objects of his deepest antipathy remained the Bolshevik governors of Russia and still more the leaders of Sinn Féin in Ireland; against the latter he never ceased to recommend a system of drastic coercion. Throughout 1921 the breach which was growing between Wilson and Mr. Lloyd George widened, and he became ever more preoccupied with Irish affairs and with the intricacies of party politics. Eventually, on 21 February 1922, he was elected unopposed as conservative member of parliament for North Down (Ireland). At the same time he took leave of the War Office on completing his four years as chief of the Imperial General Staff, Mr.

Lloyd George having declined to extend his tenure of that office, and retired from the army.

In the House of Commons Wilson delivered a maiden speech, on 15 March, in the debate concerning the state of the army. The subject had long been a favourite theme with him; his manner and delivery were perfectly suited to the occasion. He was loudly applauded, and although strongly attacked by the labour party in opposition, was welcomed as a great accession to the conservative party and as an opponent of Mr. Lloyd George. In May he visited Northern Ireland, and made public speeches on the Irish problem in a manner which could not fail to arouse violent hostility in the ranks of Sinn Féin. The leaders of that movement thereafter regarded Wilson as an implacable enemy, and fears began to be entertained in London for his personal safety. That these were justified was proved when in the following month he was assassinated by two Sinn Féiners on the doorstep of his London House, No. 36 Eaton Place (22 June). Rumour was prevalent to the effect that his murder was the outcome of an organized conspiracy. But that was never proved, even at the trial of his murderers. He was granted a public funeral and buried in the crypt of St. Paul's Cathedral.

Opinions as to Wilson's talents and as to his place among the great figures of the European War have varied greatly. Even before 1914 some of his own colleagues had looked with growing distrust on his rapid advancement to highly responsible positions. Many saw in him a very great soldier; in that respect his personality and his facility for public speaking served him well; while a whimsical turn of expression and never-failing geniality brought him many friends and admirers. Others were concerned at his perpetual avoidance of responsibility, his lack of any real experience of military command, and his love of intrigue. The publication of his diaries in 1927, full of violently expressed prejudices and mistaken opinions, was followed by the appearance of further literature which went a long way to shatter belief in the superiority of his military talents. It was recognized that he was at heart a politician rather than a soldier.

Wilson left no child, and the baronetcy became extinct on his death. He received honorary degrees from the universities of Oxford and Cambridge and from Trinity College, Dublin; he was colonel of the

Royal Irish Rifles (1915) and a colonel commandant of the Rifle Brigade (1919).

There is a portrait of Wilson by Sir William Orpen in the Imperial War Museum, South Kensington; another, by Oswald Birley, appears in *Royal Academy Pictures*, 1922; he also figures in J. S. Sargent's picture 'Some General Officers of the Great War', which hangs in the National Portrait Gallery.

[*The Times*, 23 June 1922; Sir J. E. Edmonds, (Official) *History of the Great War. Military Operations. France and Belgium, 1914-1916* and 1918, 1922-1935; Sir C. E. Callwell, *Field-Marshal Sir Henry Wilson, his life and diaries*, 2 vols., 1927; Sir Andrew Macphail, *Three Persons*, 1929; John Charteris, *At G.H.Q.*, 1931; Army Lists; personal knowledge.] H. DE WATTEVILLE.

WILSON, JOSEPH HAVELOCK (1858-1929), founder of the National Union of Seamen, was born at Sunderland 16 August 1858, the third son of John Wilson, foreman draper of that town, by his wife, Hannah, daughter of John Joseph Robson. Both his parents were descended from seafaring families. After intermittent attendance at a local school, Wilson in 1867 was unwillingly apprenticed to a lithographic printer, but hereditary instincts led him in 1870 to run away to sea. His experiences of life before the mast during the succeeding fifteen years decided the course of his future career.

In 1887 Wilson founded the National Amalgamated Sailors' and Firemen's Union, afterwards known as the National Union of Seamen. He determined to obtain recognition of his union by ship-owners, and to secure generally improved conditions, especially as regards accommodation, food, and wages, for all seamen. After an inauspicious beginning the Union grew rapidly in strength: the ship-owners thereupon formed in 1890 the Shipping Federation. Violent antagonism between the two organizations prevailed until, in 1912, the recognition of Wilson's union by the Federation brought about a mutual desire for the solution in conference of outstanding questions. Wilson meanwhile had frequently been involved in legal proceedings, and he served a short term of imprisonment for unlawful assembly in 1891. In that year he came under the influence of Samuel Plimsoll [q.v.], the 'Sailors' Friend'. Plimsoll deprecated aggressive industrial action and urged Wilson to bring his cause before

liament. Wilson represented Middlesbrough in the liberal interest from 1892 to 1900, and again from 1906 to 1910; he returned to parliament as coalition liberal member for South Shields in 1918. Defeated in 1922, he did not seek re-election: he reforms for which he had laboured, including the amendment of the Merchant Shipping Act in 1907 and the extension of the Workmen's Compensation Act to seafarers, had already been enacted. In 1922 he was made C.H.

Wilson was never a revolutionary socialist, but zeal unqualified by experience caused him as a youthful leader to adopt extreme rather than conciliatory methods. Eventually he became an advocate of peaceful negotiation, and in his uncompleted autobiography entitled *My Stormy Voyage through Life* (1925) he made commendably frank confession of early mistakes. Wilson was at all times a patriot. During the European War British seamen under his leadership boycotted German nationals and cargoes suspected of an ultimate German destination; similarly, passages overseas were refused to certain political leaders then credited with defeatist intentions. For his services in connexion with recruiting Wilson received the C.B.E. in 1918. The General Strike of 1926 was declared by him to be a 'revolutionary plot', and was condemned by his union. He held that the trades union movement, rightly directed, must be industrial and not political, and to trades unionism thus conceived he remained faithful.

Despite ill-health Wilson was persuaded to remain president of the National Union of Seamen until his death, which occurred in London 16 April 1929. He married in 1879 Jane Anne, only child of Thomas Whatham, of South Shields. She survived him with two sons and one daughter.

[*The Times*, 17 April 1929; J. Havelock Wilson, *My Stormy Voyage through Life* (with an introduction by Lord Runciman), 1925; private information.] A. E. WATKIN.

WOLLASTON, ALEXANDER FREDERICK RICHMOND (1875-1930), naturalist and explorer, born 22 May 1875 at Clifton, was the second son of George Hyde Wollaston. His parents came of gifted families. His mother, Sarah Constance, daughter of Thomas Richmond and granddaughter of Thomas Rich [q.v.], miniature painters, and [q.v.], the portrait-painter, George [q.v.], was a very talented w.

father, George Hyde Wollaston, was a man of wide culture and one of the most outstanding figures at Clifton College during the headmastership of John Percival. He was a direct descendant of William Wollaston [q.v.] and of Francis Wollaston [q.v.]; Francis John Hyde Wollaston [q.v.] and William Hyde Wollaston [q.v.] were his great-great-uncles, while the entomologist Thomas Vernon Wollaston [q.v.] was more distantly related. No other family name occurs more often in the annals of the Royal Society.

From a private school Wollaston entered Clifton College as a day-boy. He was a born naturalist, caring little for school life and games, but delighting in the study of birds and wild life. In 1893 he went up to King's College, Cambridge. Throughout his life his feelings for his college amounted to devotion. He was one of the select few who attended the zoology lectures of Alfred Newton [q.v.], whose life he wrote in 1921. During a long vacation he began a career of travel by walking from Hammerfest through Lapland to the Baltic. He took only a poll degree in 1896, but stayed up at King's for another two years. Having early made up his mind to be an explorer, he decided to obtain a medical qualification in order to facilitate his chances of travel, and accordingly went to the London Hospital, taking his 'conjoint' in 1903 and his B.Ch. at Cambridge in 1913.

Finding life as a medical student in London very irksome, Wollaston took every opportunity to escape into the country. Mountain country attracted him greatly, and he spent many holidays climbing in Great Britain and in the Alps, but he was stirred rather by a love of exploration and of natural beauty than by the gymnastic side of mountaineering. He was elected to the Alpine Club in 1903 and served on its committee 1922-1924. In 1901 and 1904 he visited the Sudan with N. C. Rothschild in order to collect birds and animals, and later travelled round the world, visiting New Zealand, the Malay States, and Japan.

In 1906 Wollaston took part, as doctor and collector of plants and insects, in the British Museum expedition, led by R. B. Woosnam, to the Ruwenzori mountains in Central Africa. He climbed what was then supposed to be the highest peak (15,286 feet), afterwards named Wollaston Peak by the Duke of Abruzzi, and returned home down the Congo with Douglas Carruthers, publishing a charming account of his

travels and observations in *From Ruwenzori to the Congo* (1908). A marked trait in his character was his sympathy with the outlook of primitive native peoples, but his consistent regard for accuracy forced him on this occasion to protest strongly against the calumnies then prevalent in England concerning the Belgian administration on the Congo.

In 1900 Wollaston joined the expedition to Dutch New Guinea organized by the British Ornithologists' Union under the leadership of Walter Goodfellow. The expedition, of which Cecil Godfrey Rawling [q.v.] was surveyor, failed to reach the Nassau range, and there was much sickness; but Wollaston made a valuable collection of natural history specimens, and an extremely interesting study of the very primitive pygmy Tapiro tribe, discovered by the expedition. At the request of the committee of the expedition he wrote an account of it in *Pygmies and Papuans* (1912).

Wollaston was so much disappointed at the failure of this expedition to reach the snows that in 1912-1913 he returned to New Guinea, taking C. B. Kloss as his only white companion. Working up the Utakwa and Setakwa rivers, he succeeded after four months in reaching the glaciers of Mount Carstensz (15,700 feet) and in attaining a height of 14,860 feet. The expedition was very arduous: great physical difficulties of access were accentuated by dense vegetation, bad climate, noxious insects, and complete absence of any local food supplies; but all Wollaston's arrangements were excellent, and by means of suitable diet beri-beri was entirely avoided. His sympathy with the hitherto unknown stone-age natives ensured a friendly reception. He secured a valuable collection of ethnological and natural history specimens, and described the journey in a delightful lecture [*Geographical Journal*, March 1914]. For this expedition, organized by himself, and for his part in former expeditions, he was awarded the Gill memorial by the Royal Geographical Society in 1914. He was planning a third expedition to New Guinea when the European War broke out.

Wollaston volunteered as a surgeon in the royal navy, and was attached to the northern patrol on 4 August 1914 and later to H.M.S. *Agincourt*. In 1915 he joined the East African Expeditionary Force, and served in it for two years. During 1918 he served in a monitor off the Belgian coast, and in 1919 joined

the British force sent to Murmansk, the Russian port on the Kola peninsula. He was mentioned in dispatches and awarded the D.S.C. for conspicuous devotion to duty throughout operations in East Africa. He was demobilized in October 1919.

In 1921 Wollaston took part as doctor and naturalist in the first Mount Everest expedition, led by Lieutenant-Colonel C. K. Howard-Bury. His medical services both to members of the expedition and to native Tibetans were highly appreciated; he made excellent collections containing specimens of animals and plants new to science, and also brought back some of the finest photographs in a collection remarkable for its beauty. He wrote a paper in the *Geographical Journal* (July 1922) and two excellent chapters and an appendix in *Mount Everest, the Reconnaissance* (1921).

Wollaston married in 1923 Mary, daughter of Daniel Meinertzhagen, head of the banking house of Frederick Huth. In the same year, with his wife, Wollaston visited the unexplored Sierra Nevada of Santa Marta, in Colombia, a region very difficult of access. He described the venture in a paper read to the Royal Geographical Society [*Geographical Journal*, August 1925]. In 1925 he received the Patron's medal from the Royal Geographical Society, and in 1928 was appointed honorary secretary.

In view of his lack of scholastic achievements, Wollaston's election to a six-years' fellowship at King's College in 1920 was a signal tribute to his character. In 1925 he settled at Uley in Gloucestershire, but in 1928 he was re-elected fellow and appointed tutor to his college and went to live at Cambridge. Despite an extreme personal reticence, he had the gift of inspiring friendship; this, combined with his sense of humour, astonishing insight, and broad outlook, made him remarkably successful with undergraduates. After his death, Mr. J. M. Keynes wrote of him that 'he could unlock hearts with a word and a look, and break down everyone's reserves, except his own', while Mr. Stanley Baldwin as chancellor of the University spoke of Cambridge 'mourning a prince among men'. The affection with which he was regarded intensified the horror and indignation aroused amongst a very wide circle of friends when on 3 June 1930 he was shot dead in his college rooms by a demented undergraduate, who took his own life at the same time. His ashes lie in the chapel of King's College. He left a widow and one son and two daughters.

Wollaston was a distinguished naturalist, ethnologist, and explorer of tropical mountain regions, a geographer in the widest sense, with a marked understanding of primitive races. His writing was distinguished by a notable sensitiveness, and in accuracy of detail and avoidance of error he exhibited the characteristic merit of the scientist William Hyde Wollaston. He was a man of wide knowledge and noble character. He was master of himself in a rare degree: a great adventurer and a wonderful friend.

[*The Times*, 4, 6, and 7 June 1930; *Cambridge Review*, 6 June 1930; *J. M. Keynes in The Nation*, 14 June 1930; *Alpine Journal*, August 1914 and November 1930; *Geographical Journal*, June and November 1906, March 1914, August 1925, and July 1930; *Ibis*, January 1902 and July 1930; Wollaston's writings and diaries (*Letters and Diaries of A. P. R. Wollaston*, selected and edited by Mary Wollaston, 1933); private information; personal knowledge.] T. G. LONGSTAFF.

WOOD, CHARLES (1866-1926), composer, was born at Armagh 14 June 1866, the third son and fifth child of Charles Wood, lay vicar of Armagh Cathedral and diocesan registrar of the diocese of Armagh, by his wife, Jemima Taylor. He was educated at the Cathedral School, Armagh.

In 1883 Wood came to London, having won a scholarship for composition at the Royal College of Music, which in that year began its great and in some ways risky experiment in musical education with fifty scholars and a few students. (Sir) Charles Villiers Stanford [q.v.] and (Sir) Hubert Parry [q.v.] were its two teachers of composition. To Stanford came Wood as a pupil, an unassuming youth not quite seventeen years of age. He at once made his mark. At an epoch of attenuated technique, false sentiment, deliberate showiness, he appeared as one who, by instinct, had kept to the straight, classical line, thorough, sincere, correct; undeveloped, of course, but already, perhaps through his training at Armagh Cathedral, possessing a knowledge of counterpoint and a sense of vocal style beyond his teacher's power to improve. Stanford taught him how to expand his instrumental style; how to make use of the more modern harmonies which Brahms and, in another school, Wagner were developing; how to manage musical forms; but wisely left him alone, for the most part, to achieve his own manner of expression. His other teachers were (Sir) Frederick Bridge [q.v.], harmony and counterpoint, Franklin

Taylor, pianoforte, and Thomas Mann, French horn, which instrument Wood played adequately, if not brilliantly, in the College orchestra.

Greater perhaps than the influence of Wood's teachers—though he could have had no more skillful and appreciative guide than Stanford—was that of his environment. He had, even then, an astonishing, self-acquired knowledge of the classical composers; but Brahms, Dvořák, Wagner, and probably most of Schumann were unknown to him. At the College he had access to their works, and could hear them played. Not only that, did he himself write a song, or a violin sonata, or a string quartet he could quite easily get it performed *con amore* by his fellow students. Sir George Grove [q.v.], then director of the College, a passionate if not always discriminating lover of music and literature, quickly recognized the power and promise of Wood, and took an important part in the moulding of his literary tastes. He can be said to have made the poets known to Wood, but in return had Beethoven made known to himself through the medium of Wood's illuminating knowledge.

Wood stayed at the Royal College until 1888. By that time he had written, with much besides, the first of his string quartets and his setting of Shelley's *Ode to the West Wind* for chorus and orchestra. He then went as an undergraduate to Selwyn College, Cambridge, and shortly afterwards as organist scholar to Gonville and Caius College, his Royal College scholarship being made tenable at the University. In 1889 he was appointed to the staff of the Royal College of Music as a teacher of harmony and counterpoint (subjects which were soon understood to include composition), and in 1891 he was made organist of Caius College. Both these appointments he held until his death. He made his home in Cambridge, and settled down to a valuable and influential life of routine. He was made a fellow of Caius College in 1894, took the degree of Mus.D., Cambridge, in 1895 (he had graduated B.A., Mus.Bac. in 1890), and received the honorary degree of LL.D. from the university of Leeds in 1904, and that of D.Mus. from the university of Oxford in 1926. Having been for many years lecturer in harmony and counterpoint to the university of Cambridge, he was made professor of music in that university in 1924, in succession to Sir C. V. Stanford, his former teacher.

Wood's busy and ordered life had two main interests, teaching and composition.

As a teacher he worked in two centres, the Royal College of Music and Cambridge. His most evident characteristic was a sort of natural authority, as of one whose taste and judgement were almost as unquestionable as a law of nature. The most modest of men, he was quite unconscious of his own wisdom; but all who knew him and learned from him felt that he had a curious quality of finality. He knew, and his pupils knew that he knew, right from wrong, good from bad. It was not merely that he could and did teach admirably how music should be shaped and presented; he could make good music live and bad music die in the heart and mind of the student. Something instinctively true and perceptive in his nature enabled him to separate grain from chaff without effort. He hated ostentation, rhetoric, pretentiousness, whether in music, in literature, or in conduct. The wholesomeness and sanity of approach to be found in the music of Handel, Haydn, Beethoven, and Schubert perhaps appealed to him most vitally. It is no exaggeration to say that Wood had a more beneficent and far-reaching effect on contemporary musical production than any other teacher. Most of the present English composers have come under his influence either directly or at one remove, and the result is to be seen in the thoroughness of workmanship and dignity of style which inform the work of the best of them, however far they may have developed or departed from Wood's idiom.

Much of Wood's more ambitious creative work was done in his youth and early manhood: the *Ode to Music* (a setting of a poem specially written by Swinburne for the opening of the new Royal College of Music) in 1890; the music to the *Ion* of Euripides in 1890, and that to *Iphigenia in Tauris* in 1894; his beautiful *Dirge for two Veterans* and his neglected but fine *Ballad of Dundee* for the Leeds festivals of 1901 and 1904 respectively; his *Song of the Tempest* for the Hovingham festival, 1903. He wrote, in addition, eight string quartets at various periods, a set of variations for orchestra on the Irish air *Sir Patrick Sarsfield*, two *Opera Scenes from Dickens*, sixteen preludes for the organ, a very large number of songs, part-songs, services, and anthems, and a setting of the *Passion according to St. Mark*. His music is remarkable for the flawless ease, certainty, and ingenuity of its workmanship, and the purity and nobility of its imaginative quality. At its best it rises very high, by force of its simple

dignity and beauty. Wood was no conscious reformer, no shouter of new messages. His aim was to make music as he felt it ought to be, sincere, unextravagant, expressive of the best that was in him. These being the qualities which most endure and grow, his work is steadily advancing in the esteem of musicians and of the discriminating section of the general public. His vocal music and his string quartets in particular are now accepted as models. Of both mediums he had a command which students cannot afford to leave unstudied. His church music can already be regarded as classical. It is performed regularly and frequently in all the cathedrals and in many churches.

As a man Wood was shy and retiring, but he had a great sense of humour and a fundamental common sense which made him quite indifferent to things which seemed to him not to matter. Psychological problems and philosophical speculations left him quite unmoved. Many of his sayings are still repeated. He died at Cambridge 12 July 1926.

Wood married in 1898 Charlotte Georgina, daughter of Captain William Robert Wills Sandford, Scots Greys, of Castlereagh House, co. Roscommon, and had two sons, the elder of whom was killed on active service in 1918, and three daughters.

[Private information; personal knowledge.]
S. P. WADDINGTON.

WOOD, FRANCIS DERWENT (1871-1920) sculptor, was born at Keswick 15 October 1871, the son of Alpheus Bayliss Wood, a native of Philadelphia, by his English wife, Anne Mary, daughter of John Hornby Maw. At a very early age he was sent to school at Lausanne, and subsequently for two years studied art at Karlsruhe under Otto Weltring and Hermann Götz. In 1889 he returned to England, and worked as a modeller first in the potteries of Messrs. Maw & Co. at Jackfield, Shropshire, and later for the Coalbrookdale Co., iron-moulders, in the same county. He was meanwhile continuing his artistic education in the local art school, whence he proceeded to the National Art Training Schools at South Kensington (afterwards the Royal College of Art) and there studied sculpture under Professor Edouard Lanteri and gained a national scholarship. In 1890 he became assistant to Professor Alphonse Legros [q.v.] at the Slade School of Art, and held this post until the resignation of Legros at the end of 1892.

At the age of twenty-one Wood could thus look back upon a course of training which had brought him considerable experience: in 1894 he nevertheless entered upon a three years' course at the Royal Academy Schools, continuing to gain many student distinctions; in 1895 he was awarded the gold medal and travelling scholarship for his group 'Daedalus and Icarus'. In the same year he contributed a relief, in plaster, entitled 'Circe', to the Academy exhibition. During his years of study at the Academy Wood acted as assistant to (Sir) Thomas Brock [q.v.], and he continued to do so after a stay in Paris, where he gained the *mention honorable* at the Salon of 1897 for his group 'Maternity'. Shortly afterwards he was appointed modelling master at the Glasgow School of Art, but in 1901 he returned to London and settled in Globe Place, Chelsea. In 1910 he was elected A.R.A. and in 1920 R.A., his diploma work being a bronze statuette 'The Dancer'. He succeeded his teacher, Lantéri, as professor of sculpture at the Royal College of Art in 1918, resigning the post in 1923; he also taught sculpture in the Royal Academy Schools. During the European War of 1914-1918 he enlisted in the Royal Army Medical Corps in 1915, receiving a commission in the following year.

Wood was gifted with great facility of artistic expression; his work as a sculptor reflects his cultured personality and, as regards style, is perhaps best described as being of a neo-baroque character in its fullness, flexibility, and realism of form. He was an expert at many techniques of craftsmanship and also a draughtsman and water-colour painter of no mean ability. Notable examples of his work in London are the Machine Gun Corps memorial at Hyde Park Corner (1925), one of his best performances, and the pair of groups symbolizing Australia on two of the gate piers of the Queen Victoria memorial in front of Buckingham Palace. The Tate Gallery possesses his life-size bronze statue 'Psyche' (exhibited at the Royal Academy in 1919 and purchased by the Chantrey trustees) and three portrait busts, namely, of Henry James (exhibited at the Royal Academy in 1914 and purchased by the Chantrey trustees), of Colonel T. E. Lawrence, and of Miss Bess Norris (a Chantrey Fund purchase, 1926). Wood was much employed as a sculptor of portrait busts, and in this connexion it should be mentioned that during and after the War he gave devoted service when in

charge of the department of masks for facial wounds. Other important examples of his work are the statue of William Pitt, in marble, commissioned by the women of the United States of America living in England in celebration of one hundred years of peace between the two countries, and set up in the National Gallery of Art at Washington in 1920; the war memorial at Ditchingham, Norfolk; statues of General Wolfe at Westerham, of Lord Nunburnholme at Hull, and of Lord Ripon in the spa gardens at Ripon; and a number of public monuments in India, including those of Queen Victoria and King Edward VII at Patiala, of King Edward VII at Rangoon, of Lord Ripon at Madras and at Calcutta, and of the Maharajah Gaekwar of Baroda, this last an equestrian statue. Several works at Glasgow (forming part of the decorations of the Art Galleries, Kelvingrove, the Mercantile Buildings, Bothwell Street, and the Caledonian low level railway station) were the result of Wood's association with the Glasgow School of Art. Among his numerous individual works of statuary reference should also be made to the group 'Dante at Ravenna' (1899) and 'Atalanta' (1909, now in the Manchester Art Gallery).

Wood died in London after an operation 19 February 1928. He married in 1903 the Australian singer, Florence Schmidt, and had one son. A selection of his works was shown at the Burlington House Winter Exhibition in 1927.

[*The Times*, 20 February 1928; Algernon Graves, *The Royal Academy of Arts, a complete dictionary of contributors and their work*, vol. viii, 1906; subsequent Academy exhibition catalogues, including that of the Memorial Exhibition, 1927.] T. BORENIUS.

WOOD, MATILDA ALICE VICTORIA (1870-1922), music-hall comedian, professionally known as MARIE LLOYD, was born at 36 Plumber Street, Hoxton, 12 February 1870, the eldest of the eleven children of John Wood, artificial flower-maker, by his wife, Matilda Mary Caroline Archer. In childhood she formed a troupe of little girls, the Fairy Bell Minstrels, who sang and acted in schoolrooms and mission halls. At the age of fourteen she appeared on the stage of the Grecian music-hall, which was attached to the Eagle public-house in the City Road; her salary was fifteen shillings a week and her stage name Bella Delmare, which she soon changed to Marie Lloyd. Before she was sixteen she was performing in the West

end of London, and in 1886 she was earning £100 a week.

In 1801, 1802, and 1803 Marie Lloyd was engaged by Sir Augustus Henry Glossop Harris [q.v.] for his pantomimes at Drury Lane Theatre; she also appeared in a few other pantomimes in suburban and provincial theatres. But her real bent was for the music-halls, which during her career were developing into imposing theatres of variety. Her songs were all written and composed for her by others; but she moulded them as she pleased by means of look, gesture, and tone of voice, making most of them openly and joyfully improper; yet, attractive as she was with her golden hair and blue eyes, she kept her performance free from any personal display or invitation, and appealed to the women as much as to the men. Her power lay in her cheery vitality, her thorough knowledge of vulgar English—and especially Cockney—manners and humour, and her highly cultivated skill in swift and significant expression, which won praise from judges so good as Ellen Terry [q.v.] and Sarah Bernhardt. Tours in Australia, South Africa, and the United States of America showed that her very English humour could be enjoyed outside England.

Marie Lloyd's work fell into three periods. In the first she was girlish, almost childish, as when she made her first great hit with the song 'The boy I love sits up in the gallery'. Next came a long series of songs which she sang as a grown woman dressed in, and beyond, the height of fashion, such as 'Oh, Mr. Porter', 'Everything in the garden's lovely', and 'When you wink the other eye'. Last came certain studies of shabby and broken-down women, in which she mingled sadness and humour, and showed considerable skill in the impersonation of character.

Over the music-hall public Marie Lloyd held undisputed dominion. Some of the affection for her was due to her notorious generosity. She lavished both money and care on the poor and the unhappy; and in 1907 in a music-hall strike on behalf of the minor performers, she came out on strike with the rest and took her turn as picket. Overwork and domestic trouble hastened her end. She was taken ill on the stage of the Alhambra (the audience loudly applauding what they took for a very realistic piece of acting) and died at her home at Golders Green 7 October 1922, aged fifty-two.

Marie Lloyd married three times: first,

in 1887 Percy Charles Courtenay, general dealer, by whom she had her only child, a daughter; secondly, in 1906 Alexander (Alec) Hurley, comedian; and thirdly, in 1914 Bernard Dillon, jockey.

[*The Times*, 3 and 6 October 1913, 23 February 1914, 16 July 1920, and 9 October 1922; Naomi Jacob, *Our Marie*, 1936.]

H. H. CHILD.

WOOD, THOMAS McKINNON (1855-1927), politician, was born 20 January 1855 at 22 Leslie Street, Stepney, London. His father, Hugh Wood, the son of an Orkney farmer, was in business first in Kirkwall, then in Leith, and afterwards moved to London, where he set up as merchant and ship-owner at 141-142 The Minories.

Thomas, the only son of Hugh Wood by his second wife, Jessie, daughter of the Rev. Thomas McKinnon, of Sauchieburn, Kincardineshire, was educated at the Brewers' Company grammar school, Mill Hill School, and University College, London. He won many prizes at school and college, and graduated with honours in English, logic, and moral philosophy. His ambitions were literary, and for a short time he worked on the staff of the *Encyclopædia Britannica* at Edinburgh. In 1878 his father lost his sight, and Thomas returned to London and joined the business as a partner, developing it, and adding a branch in Liverpool and interests in other companies. When he afterwards entered politics he ceased to take an active part in business; but he resumed his interest on leaving the government, and was chairman of three companies at the time of his death.

The Wood family were active members of the King's Weigh House chapel, and through its minister, Alexander Sandison, Thomas Wood met and married in 1883 Isabella (died 1927), sister of the minister and daughter of Alexander Sandison, J.P., of Unst, Shetland. Under these influences, and not primarily as a politician, Wood entered the London County Council as a progressive, representing Central Hackney from 1892 until 1907, when he became an alderman (1907-1909). He soon made his mark, becoming vice-chairman of the parliamentary committee (1893-1895) and chairman (1895-1898 and March to July 1906). He was chairman of the Council (1898-1899), chairman of the water committee (1900-1904), chairman of the general purposes committee (1904-1906),

and for a long period leader of the progressive party.

Wood entered parliament in 1906 as liberal member for the St. Rollox division of Glasgow, after unsuccessful attempts at East Islington (1895), St. Rollox (1900), and Orkney and Shetland (1902). He retained the seat without a break until 1918. In April 1908 he was appointed by Mr. Asquith parliamentary secretary to the Board of Education, and in that position found himself chiefly concerned with the progress of Mr. Reginald McKenna's (abortive) Elementary Education Bill. In October 1908 he was appointed under-secretary of state at the Foreign Office. Here, while doing all his work with conscientious ability, his chief interest, natural in his case though by no means usual, was the effect of foreign affairs on trading and commercial conditions.

In 1911 Wood was appointed financial secretary to the Treasury, and in 1912 secretary for Scotland, with a seat in the Cabinet. His first task in the latter capacity was to bring into operation the Small Land-holders (Scotland) Act passed by his predecessor, Lord Pentland [q.v.], in 1911. He himself secured the passing of the Mental Deficiency and Lunacy (Scotland) Act in 1913, skilfully overcoming much opposition to the new system of treating mental defectives. In the same year he passed the Temperance (Scotland) Act, the Highlands and Islands (Medical Service) Act, and the Bankruptcy (Scotland) Act; and, in 1914, the Milk and Dairies (Scotland) Act. In the application to Scotland of the many legislative and administrative measures necessitated by the European War, he showed skill and tact. In July 1916 Wood again became financial secretary to the Treasury, succeeding E. S. Montagu [q.v.] in that post, which was of peculiar importance in war-time, and also in that of chancellor of the duchy of Lancaster. These posts he held until December 1910, when the government was reconstituted and the War Cabinet formed. He was defeated at St. Rollox in the election of 1918, and was also unsuccessful in 1924 at Central Hackney. He died in London 26 March 1927.

Wood was appointed a deputy lieutenant for the county of London in 1899, received the honorary degree of LL.D. from St. Andrews University in the same year, and was admitted a privy councillor in 1911. He had six sons and two daughters, two sons and one daughter dying before him.

A portrait of Wood by Leonard Watts, painted about 1899, hangs in the offices of the London County Council.

[*The Times*, 28 March 1927; official records; private information.] M. F. HEADLAM.

WRIGHT, JOSEPH (1855-1930), philologist, born 31 October 1855 at Thackley, near Bradford, was the second son of Dufton Wright, a weaver and later a quarryman, whom Joseph Wright described as 'a cheerful, good-tempered chap' who 'was fond of poaching . . . but never wanted to work'. Dufton's wife, Sarah Anne Atkinson, had thus to depend largely on her own efforts in bringing up her four children. At the age of six Joseph Wright began work as a donkey-boy, carrying quarrymen's tools to the blacksmith's, for which he received eighteenpence a week from the smith and a penny a week from each quarryman. At seven he became a 'doffer' at the mill belonging to (Sir) Titus Salt [q.v.] at Saltaire, where his duties consisted in removing the full bobbins from the spindles and replacing them with empty ones. His wages here amounted after a time to three and sixpence a week; and it was at the factory school that he received the first elements of education. At thirteen Wright moved to Wildman's mill at Bingley, where his wages rose to nine shillings a week. He then became a wool-sorter, and as his work was now more exacting and paid by the piece, his earnings rose to between twenty and thirty shillings a week. After the death of his father in 1866, Wright was the main support of his mother and his two younger brothers; he became, as he put it, 'father, husband, son, and companion . . . plunged, when a mere child, into the severest battles of life.'

The first incentive to acquire education came to Wright when he heard the men in the mill talking about the Franco-Prussian War. He then taught himself to read and to write. After attending local evening-classes, where he learned some French and German, he studied arithmetic, Euclid, algebra, and shorthand at the Mechanics' Institute at Bradford. He also organized classes of his own, which were held in the evenings in the two bedrooms of his mother's cottage and attended by about a dozen lads, each paying twopence a week. By this time he had saved £40, and, as in 1876 the mill was temporarily closed, he went to Heidelberg, where he studied for eleven weeks. On his return he obtained a post as teacher at Springfield

School, Bradford, at a salary of £40 a year. He worked there from September 1876 to April 1879, at the same time attending classes at the Yorkshire College of Science at Leeds. In 1878 he passed the London matriculation examination, and in April 1879 received an appointment at Grove School, Wrexham. About two years later he became an under-master at a school at Margate, where he remained for a few months.

In 1882, having passed the London intermediate examination, Wright determined to study in Germany, and matriculated in the spring at Heidelberg. Mathematics had so far been his chief study, but under the stimulus of Professor Hermann Osthoff he transferred his interest to comparative philology. In the examination for the Ph.D. degree, which he obtained *insigni cum laude* in 1885, Wright offered, as principal and subsidiary subjects respectively, comparative philology, with a detailed study of the Germanic languages, and Anglo-Saxon language and literature; and presented a dissertation on 'The Qualitative and Quantitative Changes in the Indo-Germanic Vowel System in Greek'. While at Heidelberg he earned a small income by teaching mathematics at Neuenheim College, kept by the Rev. Frederick Armitage, previously a master at Clifton College, and by revising educational books published by Julius Groos, of Heidelberg. He was also commissioned to prepare, under the supervision of the author, an English translation of Karl Brugmann's *Grundriss der vergleichenden Grammatik der indo-germanischen Sprachen*, which appeared in 1888.

After spending a short time at Leipzig, where he became interested in Lithuanian, Wright went to London in 1887, and in the following year, on the recommendation of Friedrich Max Müller [q.v.], was appointed lecturer to the Association for the Higher Education of Women in Oxford, to teach Gothic, Old English, and Old German. In the same year he was appointed deputy lecturer in German at the Taylor Institution for four terms at £50 a term. When this period expired the curators offered him a special lectureship in Teutonic philology at a salary of £25 a term; this he later described as his first real start in life and the reason for his lifelong devotion to the Taylor Institution. His first task was to prepare a number of grammars necessary for the teaching of medieval languages. In 1888 the Clarendon Press

published his *Old High German Primer* and *Middle High German Primer*, and in 1892 his *Gothic Primer*; and in the same year the Dialect Society published his *Grammar of the Dialect of Windhill in the West Riding of Yorkshire*.

Wright's great achievement was the compilation of *The English Dialect Dictionary*; and fortune favoured him in providing him just at this juncture with the necessary leisure for his formidable task, as in February 1891 he was appointed deputy to the professor of comparative philology at Oxford in succession to the Rev. A. H. Sayce. A dialect dictionary had been projected by the English Dialect Society soon after its foundation in 1873; but after some time Professor Walter William Skeat [q.v.], who was 'the father and originator' of the scheme, became convinced that the work could be successfully carried out only by 'an accomplished phonetician', and declared Wright 'the only man capable of undertaking the task'. Accordingly, in 1891 Wright took over the material which had been collected—about a million slips, weighing a ton; and when the Dialect Society came to an end in 1896, Wright became responsible not only for the actual work on the *Dictionary*, but also for the business side of the undertaking. New material was required, and in the first five months he estimated that he had sent out 50,000 prospectuses and had written 3,000 letters, besides addressing meetings wherever there was a likelihood of obtaining subscribers. His entire savings, amounting to £2,000, went into the undertaking; dictionaries and glossaries alone, which were necessary for the preparatory work, cost £600. He found 1,000 contributors in various parts of the country, who furnished information which could only be obtained on the spot; and to these some 6,000 queries were issued annually from the 'workshop' at Oxford. When publication had to be seriously considered, it was found that no publisher was prepared to face the risk; and Wright decided to publish it himself. The first volume appeared in July 1896, and by February 1905, the work, which it was estimated had cost £25,000, was finished. The *English Dialect Grammar*, which serves as an introduction to the whole *Dictionary*, was published in the latter year, and was, in Wright's opinion, 'philologically far more important than the *Dictionary*'. The six volumes of the *Dictionary* contain 5,000 pages and include about 100,000 words, explained by some

500,000 quotations. The work was undertaken none too soon; as early as 1895 Wright wrote: 'Pure dialect is disappearing, even in the country districts, owing to the spread of education and to the modern facilities of intercommunication,' and some thirty years later, in 1926, he complained: 'It is very difficult to find people who can speak a dialect without being seriously mixed up with the so-called standard language.'

In 1901 Wright was elected to succeed Max Müller as Corpus Christi professor of comparative philology at Oxford, and after the completion of the *Dictionary* he was able to take a greater share in the ordinary activities of the university. From 1908 to 1914 he was a member of the Hebdomadal Council; as professor of comparative philology he became *ex officio* a curator of the Taylor Institution; and from 1909 to 1926—he retired from the chair in 1924—he acted as secretary to the Board. These years saw the real growth of modern language studies in Oxford. In 1908 an honour school of modern languages had been founded; soon new chairs, readerships, and lecturerships were instituted, the library of the Taylor Institution was increased, and provision made for the future. In all this development Wright was the moving spirit. He also turned to his first love, the writing of educational books, for Wright was a born teacher. In 1906 he published a revised edition of the *Old High German Primer*, which was followed by a third edition in 1917. His 'Students' Series of Historical and Comparative Grammars' was opened by the *Historical German Grammar* in 1907. In 1908 the *Old English Grammar* appeared, in 1910 the *Grammar of the Gothic Language*, and in 1912 a *Comparative Grammar of the Greek Language*. A Latin Grammar, at which he was working about this time, was almost finished before his death, but was never published. The *Middle High German Primer* was revised and enlarged in 1917, and, after a serious illness in 1920, he set to work on a series of English grammars: the *Elementary Old English Grammar* and *Elementary Middle English Grammar* appeared in 1923, and the *Elementary Historical New English Grammar* in 1924.

In 1896 Wright married Elizabeth Mary, eldest daughter of the Rev. Frederic Simcox Lea, rector of Tedstone Delamere, Herefordshire, formerly perpetual curate of Trinity Church, Stepney. Mrs. Wright was a student at Lady Margaret Hall

(1887-1890) and had attended Wright's lectures. Under his supervision she prepared a grammar of the Northumbrian dialect, and, after their marriage, not only undertook much of the secretarial work of the *Dialect Dictionary*, but also shared in the work of the grammars. There were two children of the marriage, a son and a daughter, who both died in childhood. Wright died at his home in Oxford 27 February 1930, of an attack of pneumonia, the strain of which his robust constitution, undermined by years of failing health and incessant labour, was unable to bear.

Wright was a man of sterling qualities. He was gifted with a vast amount of practical common sense, enormous self-reliance, and almost ruthless determination. 'Necessity', he said, 'taught me at a very early age to trust myself.' If the latter qualities of the self-made man sometimes jarred in common-room circles, he could nevertheless be a good and faithful friend. His actions were inspired by a noble, generous simplicity. His humour and good spirits were infectious: 'I have never been depressed in my life,' he used to say. He was a lover and a buyer of books, and had the scholar's love of learning for its own sake; and he used his vast learning for the advancement of others.

Wright's scholarship was recognized by several universities and learned societies. He received honorary degrees from the universities of Durham (1898), Aberdeen (1902), Leeds (1904), Dublin (1906), and Oxford (1926). He was made an honorary member of the Royal Flemish Academy (1910), of the Utrecht Society (1920), of the Modern Language Association of America (1920), and of the Royal Society of Letters of Lund (1928). In 1904 he was elected a fellow of the British Academy, and in 1925 was awarded its first biennial prize for English studies.

In 1927, as the result of a subscription raised among his many friends and admirers, Wright's portrait was painted by Ernest Moore and was presented to the Taylor Institution, where it now hangs.

[Elizabeth Mary Wright, *The Life of Joseph Wright*, 2 vols., 1932; Sir Charles Firth, *Joseph Wright, 1855-1930*, in *Proceedings of the British Academy*, vol. xviii, 1932; personal knowledge.] J. B. B. V.

WYNDHAM-QUIN, THOMAS WINDHAM, fourth EARL OF DUNRAVEN (1841-1926), Irish politician. [See QUIN.]

WYNN-CARRINGTON, CHARLES ROBERT, third Baron Carrington and Marquess of Lincolnshire (1843-1928), politician, was born in Whitehall, London, 16 May 1843. He was the eldest son of Robert John Carrington (formerly Smith), second Baron Carrington, by his second wife, Charlotte, younger daughter of Peter Robert, twenty-first Baron Willoughby de Eresby. He was educated at Eton, where Mrs. de Rosen was his dame and the Rev. William Wayte his tutor. In 1861 he proceeded to Trinity College, Cambridge, and after taking his degree entered the Royal Horse Guards. He was promoted captain in 1869, and retired in 1878. At the general election of 1865 he was returned unopposed as liberal member of parliament for the borough of High Wycombe. In 1868 he succeeded his father as third Baron Carrington.

When the Prince of Wales (afterwards King Edward VII) visited India in 1875-1876, Lord Carrington was in attendance as aide-de-camp. He was an intimate friend of the royal family, and in 1881, during Gladstone's second ministry, he received the post of captain of the corps of the Gentlemen-at-Arms. From 1885 to 1890 he was governor of New South Wales, where both he and his wife made themselves popular. He held the office of lord chamberlain of the household from 1892 to 1895, and also sat for a time on the London County Council as a progressive member. In 1893 he was appointed chairman of Lord Rosebery's Welsh land tenure commission, and in 1901 he went as special envoy to France, Spain, and Portugal in order to make formal announcement of the accession of King Edward.

On the formation of Sir Henry Campbell-Bannerman's ministry in 1905, Lord Carrington was appointed president of the Board of Agriculture and Fisheries, with a seat in the Cabinet. His term of office was marked by the passing of two important measures, the Agricultural Holdings Amendment Act and the Small Holdings and Allotments Act, both in 1908. Neither measure was popular with landowners, and Carrington had a difficult task in answering those who criticized the displacement of men farming under sound economic conditions by a class without experience and working at a disadvantage as regards capital and equipment. He showed his interest in stock-breeding by appointing, in the later years of his presidency, two committees to inquire

into the exportation of stock and into swine-fever respectively.

When the liberal ministry was partially reconstructed in 1911, Lord Carrington became lord privy seal, but he resigned in the following year. On the accession of King George V (1910), he exercised the office of lord great chamberlain. His hereditary right to act for a reign in turn with two other representatives, the Earl of Ancester and the Marquess of Cholmondeley, the latter of whom he succeeded, had been determined by the Court of Claims which sat before the coronation of King Edward VII. It was derived through his mother as one of the co-heirs to the barony of Willoughby de Eresby.

Lord Carrington was always a sturdy liberal of an extreme type, but his geniality made him popular with many friends who disapproved of his political views. He was created Viscount Wendover and Earl Carrington in 1895, and Marquess of Lincolnshire in 1912. He received the G.C.M.G. in 1885 and the K.G. in 1906. He was sworn of the Privy Council in 1881, and was lord-lieutenant of Buckinghamshire from 1915 to 1923. He died at Daw's Hill House, High Wycombe, 13 June 1928.

Lord Carrington married in 1878 the Hon. Cecilia Margaret Harbord, daughter of Charles, fifth Baron Sudfield, and had one son and five daughters. His son, Lord Wendover, died in 1915 of wounds received in action. The marquessate therefore became extinct in 1928, but the barony descended to Lord Lincolnshire's younger brother, Rupert Clement George (born 1852).

[*The Times*, 14 June 1928.]

A. COCHRANE.

YOUNG, SIR GEORGE, third baronet, of Formosa Place (1837-1930), administrator and author, born at Formosa Fishery, Cookham, Berkshire, 15 September 1837, the eldest of the five sons of Sir George Young, second baronet, came of naval and literary stock. His great-grandfather, Admiral Sir George Young, F.R.S. [q.v.], was present at the capture of Louisbourg and Quebec; his grandfather, Sir Samuel Young, the first baronet, also an F.R.S., began his career in the navy; his father retired from the service as a captain; and the family house, Formosa Place, opposite Cliveden woods on the Thames, was constructed by the admiral to resemble his quarters on the poop of a man-of-war. Young's mother was Susan, daughter of William Mackworth Praed, serjeant-at-

law, of Bitton, Teignmouth, and sister and favourite correspondent of Winthrop Mackworth Praed [q.v.], the poet.

Young and his brothers, one of whom was Sir William Mackworth Young [q.v.], governor of the Punjab, were all educated at Eton, where they were conspicuous both for scholarship and games, he himself winning the Newcastle medal in 1855. At Trinity College, Cambridge, he obtained only second classes in classics and mathematics in 1859, but this set-back merely served to strengthen his precocious powers of self-analysis and his determination to make the fullest use of his remarkable capacity for dogged work. 'I sat down after my failures to obtain a first class either in mathematics or classical honours,' he wrote in some autobiographical notes found among his papers, 'to consider what chance I had of a Trinity fellowship, which must cost me two-and-a-half years of renewed labour at learning of no direct use to me in life'; and, after making an elaborate analysis of his own and his possible rivals' chances, he decided to drop mathematics and to concentrate on classics and philosophy during the next three years. He obtained the Le Bas prize for an essay on *The History of Greek Literature in England* (published 1862), and recorded on the eve of his third and final attempt for a fellowship in 1862: 'I had learned the lesson that my powers of study were not, as I had assumed, physically inexhaustible. I read very hard, but resolved not to look at a book for a whole month before the examination.' His judicious industry was rewarded by the first of the Trinity fellowships on the list for that year. Nothing illustrates better the course of his future life, his tenacity and thoroughness, with a certain narrowness of scope, than the reflections which he jotted down on the results of his education: 'The course of my studies was not that of the usual good boy, nor yet of the boy who was not good. I studied hard, preferring what was a little beyond my powers, detesting abridgements, despising too much the established routine of grammar and arithmetic, enjoying the romance of history and the rhythm of good verse, greedy of knowledge, too apt to think I was gaining it by poring over what was in appearance learned, even if dull. . . . The best bit of out-of-the-way knowledge I assimilated was the 'Theory of Induction, as expounded by Whewell . . . I feel the better able, for it, to retain a balance between acceptance and reservation as to,

for instance, the "origin of species", and to refuse even a momentary attraction to the "theory of relativity".'

Young's Trinity fellowship, the baronetcy inherited from his father in 1848, the presidency of the Union (1860)—held previously by his uncle, W. M. Praed, and subsequently by his third son, (Sir) Hilton Young—and the friendships which he had formed at Eton and Cambridge with A. C. Swinburne, G. O. Trevelyan, Henry Jackson, Henry Sidgwick, Richard Jebb, Edward Bowen, and Leslie Stephen, smoothed his path in the larger world of affairs. Although called to the bar by Lincoln's Inn in 1864, he never practised as a barrister, but at first devoted himself to active politics, vainly contesting Plymouth three times (1874, 1880, 1881) in the liberal interest. His political enthusiasm brought him to the notice of Mr. Gladstone, who, in 1870, gave him his first opening in the field of public work as a member of the royal commission on coolie immigration to British Guiana. This appointment was followed by those of assistant-commissioner on the Friendly Societies commission (1871), secretary to the Factory and Workshop Acts commission (1874), and secretary to the Bessborough commission on the Irish Land Acts (1880). Young was entirely responsible for drawing up the report on the Irish Land Acts, characterized by Gladstone as the 'very ablest' he had read. Shortly after the issue of this report he was pressingly invited by Lord Frederick Cavendish, on the latter's appointment as Irish secretary, to join him as his private secretary, with the prospect of succeeding T. H. Burke as permanent under-secretary: Young's telegram gladly accepting the offer was in Lord Frederick's pocket when he and Burke were murdered in Phoenix Park, Dublin, on 6 May 1882.

Three months later Gladstone appointed Young a charity commissioner under the Endowed Schools Acts, a post in which he found work exactly suited to his great legal and historical knowledge and which gave full scope to his genius for taking decisions based on the most exhaustive consideration of evidence. The duty of the charity commissioners was to form schemes for the better employment of time had become diverted from, or excessive for, their original purposes, and at the same time to diverge as little as possible from the broad intentions of the pious donors. For a long time Young's office was only 'temporary', and his

activities were looked at askance by a Treasury unfavourable to 'temporary' appointments, a conservative government tender to ancient endowments, and radicals like Joseph Chamberlain who accused the Commission of being 'robbers of the poor'. Young's difficulties were also, it must be admitted, to some extent of his own making; for his very merits of logical integrity and a just conviction of his exhaustive impartiality made him a difficult colleague and an uncompromising adversary. Nevertheless, his decisions proved so unassailable in principle—'No scheme in my personal charge', he wrote with pride, 'was ever defeated or modified on a point of law'—and so generally acceptable to the persons chiefly concerned that he became indispensable; and in 1903, after being confirmed as third and then as second commissioner on a permanent basis, he was made chief charity commissioner for England and Wales.

In 1900 Young retired, spending the rest of his long life at his beautiful Cookham home, but not ceasing his labours; for to the end he took a prominent part in the public affairs of the country, especially in educational matters. The interests of education, apart from his Charity Commission work, had always been dear to him. He took a large part in the abolition of tests and in promoting the university education of women at Cambridge. From 1881 to 1886 he was president of the senate of University College, London, and he was prominent in helping to establish London as a teaching university.

With all his public work Young always found time to do 'something', as he wrote in his notes, 'to lighten the numerous griefs of life by excursions on the lower slopes of Parnassus'. His original verse was scanty, but he was notable as a translator of poetry. His best-known work of translation is *The Dramas of Sophocles rendered in English Verse, Dramatic and Lyric* (1888); another pleasing volume is *Poems from Victor Hugo in English Verse* (1901). Both are remarkable for their ease and beauty without the sacrifice of accuracy, and for skill in the choice of metre most fitting to the originals. *An English Prosody*, published in his ninety-second year (1928), and *Homer and the Greek Accents* (1930) were a fitting crown to his lifelong devotion to scholarship and literary criticism. An earlier publication, however, *The political and occasional Poems of Winthrop Mackworth Praed*

(1888), is the most likely to survive, since by its pithy and lucid explanation of out-of-date allusions it has helped to keep fresh the interest in his uncle's famous verses. Always a man of singular athletic prowess, after leaving Cambridge Young bade fair, like his second son, Geoffrey, to become one of the most intrepid of Alpine climbers; but, after the death by his side in 1866 of his youngest brother on Mont Blanc [see *Alpine Journal*, ii, 382] he never again climbed the Alps. He shared (Sir) Leslie Stephen's delight in long walks at a tremendous pace, was a good oar, and till after his eightieth year retained his love of swimming in the Thames.

Young married in 1871 Alice Eacy, daughter of a noted Irish physician, Evory Kennedy, M.D., of Belgard, co. Dublin, and widow of Sir Alexander Hutchinson Lawrence, first baronet. A beautiful, witty, and most lovable woman, she with her charm and he with his distinguished presence, his mellow knowledge, and his decided opinions made Formosa Place, and later the smaller Formosa Fishery to which they retired, stimulating centres of attraction, not only for the ablest men and women of the time but also for the young, for whom she especially had a warm corner in her heart. She died in 1922, leaving three sons: the only daughter died young. Sir George Young, who in his ninety-third year wrote to *The Times* that he was not dead, as had been announced, but, though slightly deaf, still capable of work, died at Formosa Fishery 4 July 1930. He was succeeded as fourth baronet by his eldest son, George (born 1872).

A portrait of Young by C. N. Kennedy and two pencil drawings by John Brett hang at Formosa Fishery.

[*The Times*, 5 July 1930; autobiographical notes; private information; personal knowledge.]

B. WILLIAMS.

YOUNG, SIR WILLIAM MACKWORTH (1840-1924), Anglo-Indian administrator, the third son of Captain Sir George Young, second baronet, B.N., of Formosa Place, Cookham, Berkshire, and younger brother of Sir George Young, third baronet [q.v.], was born at Cookham 15 August 1840. Through his mother, Susan, daughter of William Mackworth Praed, serjeant-at-law, of Bilton, Teignmouth, he was nephew to Winthrop Mackworth Praed [q.v.], the poet. He was a scholar of Eton and of King's College, Cambridge, and in 1863 was elected, under the old statutes, a fellow of King's, a posi-

tion which he held until his marriage in 1869.

Young passed the examination for the Indian civil service in 1862, and was posted to the Punjab, where he took up his first appointment in December 1863. In 1878 he acted as superintendent of the Kapurthala State, and two years later became secretary to the Punjab government, a post which he held for seven years and in which he made his mark. After occupying administrative positions as commissioner and financial commissioner, he was chosen in October 1893 to be president of a commission appointed to inquire into the consumption and control of hemp drugs in India. Two years later (1895) he was made resident at Mysore in Southern India, and in March 1897 was appointed lieutenant-governor of his old province, the Punjab, being created K.C.S.I. in the following June.

Young's official career had been very successful, but the labour, to which his success was largely due, had taken its toll of a constitution naturally delicate, and there were doubts—to be extraordinarily falsified by his subsequent longevity—as to his physical capacity to stand the strain of the lieutenant-governorship. His tenure of that office proved to be in some respects unquiet, but it brought out the tenacity both of his physical and of his mental equipment. The general characteristics of his rule were the steady development of the province, the efficiency of the steps taken to meet occurrences of famine, and the maintenance of good relations with the people; but the official opinion of the day was distracted from these outstanding features by the interest attaching to the emergence of strained relations between his government and that of the viceroy, Lord Curzon [q.v.].

In 1900 Lord Curzon had taken up the question of the administration of the North-West Frontier, which was at that time under the control of the Punjab government, and in December of that year the secretary-of-state approved of his proposal to remove the frontier districts from the Punjab and place them directly under the government of India. Young much resented the proposed dismemberment of the province with which he had so long been associated, the strictures which had been passed on the previous administration of the Frontier under the Punjab government, and certain features of the manner in which Lord Curzon had conducted the correspondence. The disregard

of his known opinions in the matter tended to embitter the feelings both of Young and of some of his leading officers during the remainder of his tenure of office.

After holding the lieutenant-governorship for the usual period of five years, Young retired in 1902, and shortly afterwards settled at Silverhill, St. Leonards-on-Sea. Here he employed himself in local affairs, but was able also, in spite of his increasing age and indifferent health, to meet with considerable regularity the calls of his various interests in London during the next twenty years. He had throughout his life been a supporter of missionary work, and before leaving India he had been elected vice-president of the Church Missionary Society. On his return to England he threw himself whole-heartedly into missionary activity in London. The Church Missionary Society made him chairman of its India committee, and he also became chairman of the Church of England Zenana Missionary Society, in which he took special interest, as well as chairman of the Church Education Corporation, and a member of the Central Board of Missions.

Shortly before his death Young had moved from St. Leonards to Weybridge, where he died 10 May 1924. He was twice married: first, in 1869 to Isabel Maria (died 1870), daughter of the Rev. Charles Boileau Elliott, rector of Tattingstone, Suffolk, by whom he had one daughter; secondly, in 1881 to Frances Mary, daughter of Sir Robert Eyles Egerton, who was at that time lieutenant-governor of the Punjab: by her he had four sons and a daughter.

Young was endowed with a remarkably acute and well-ordered mind, and was able to express himself, especially on paper, with a terseness and lucidity which few of his contemporaries in India could rival. Although tenacious of his views and involved at times in official disputes of some consequence, he was not by nature a controversialist and his disposition tended rather towards peace and conciliation. As an administrator, he was sage and business-like in procedure, following, as a rule, prescribed official lines; and he treated his subordinates with unvarying courtesy and patience. In private life he was a man of charming manners and refined tastes, possessing a scholarly mind and a remarkably fine ear for music. His spare, almost ascetic frame, bearded face, and expressive eyes reflected in no small

degree the spiritual qualities of his character and life.

[*The Times*, 12 May 1924; official records of service; personal knowledge.]

E. D. MACLAGAN.

YOUNGER, SIR GEORGE, first Viscount Younger of Leekie (1851-1929), politician, was born 13 October 1851 at the Brewery House, Bank Street, Alloa, Clackmannanshire, the eldest son of James Younger, head of the brewing firm of George Younger & Son, by his wife, Janet, eldest daughter of John Melwan, of Alloa. The youngest son, Robert, was created Baron Blanesburgh in 1923. The firm had been founded by his great-great-grandfather, George Younger (1722-1788), and the management continued in the direct line of the family. Thus when James Younger died in August 1868, George, who had been educated at the Edinburgh Academy and had proceeded to Edinburgh University, took charge of the business when he was not yet seventeen. He entered politics by way of the county council of Clackmannan, to which he was first elected in 1890 and of which he was convener 1895-1906. He was president of the County Councils Association of Scotland 1902-1904, and president of the National Union of Conservative Associations of Scotland in 1904. But it was only in 1906 that he entered the House of Commons, having contested Clackmannan and Kinross unsuccessfully in 1895, 1899, and 1900, and Ayr Burghs in 1904. He was returned by the latter constituency in 1906, and continued to represent it until 1922.

In the House of Commons Younger was prominent in the small conservative opposition as a clear and forcible speaker, and took an active part in the attack on Mr. Lloyd George's budget for 1909-1910. But he was popular with both liberals and conservatives, and received a baronetcy in 1911 from his political opponents. His great talent, however, lay in party management rather than in detailed organization; and in 1917, on the invitation of Mr. Bonar Law [q.v.], he became chairman of the unionist party organization, then not showing much activity owing to the European War and the formation of the Coalition government. He was thereby mainly responsible for the success of the Coalition in the 'coupon' election of December 1918; this device he adopted in order to avoid the sacrifice of seats to labour and independent liberalism. One of Younger's chief aims was the reform of the

House of Lords and the establishment of a strong second chamber—a policy to which the Coalition was pledged. Hence, in 1922, he joined (Sir) Leslie Orme Wilson, then chief Coalition whip, in opposing, successfully, two attempts made to hold a fresh general election. But the feeling in the conservative party against the Coalition was growing strong, and, as Younger considered that party to be the best instrument for furthering the country's interests, he supported Mr. Bonar Law at the meeting held at the Carlton Club on 19 October 1922 which brought the Coalition to an end. In Younger's own words, 'this brought the party together with a snap'; and the conservatives were successful in the ensuing general election, without the help of certain of the conservative leaders, notably Lord Birkenhead [q.v.], who had stigmatized Younger's activities in his capacity as chairman of the party as the insubordination of 'the cabin-boy'.

In February 1923 Younger was raised to the peerage as Viscount Younger of Leekie, but he remained treasurer of the unionist party from that year until his death, which occurred suddenly in London 29 April 1929 after a seizure in the Prince of Wales's Theatre. Younger married in 1879 Lucy (died 1921), daughter of Edward Smith, M.D., F.R.S., of Harley Street, and Eleanor Pall House, Heanor, Derbyshire, and had three sons. He was succeeded as second viscount by his eldest son, James (born 1880). His two younger sons were both killed in action, the second in the South African War, and the third in the European War.

Lord Younger, who was an excellent man of business, retained the chairmanship of the family brewery until his death. He was also a director of Lloyds Bank, the Southern Railway, the National Bank of Scotland, and the North British & Mercantile Insurance Co. He was a member of the royal commission on the licensing laws (1896); and he was a J.P. and D.L. for the county of Stirling, lord-lieutenant of Stirlingshire (1925), and vice-lieutenant of Clackmannanshire (1922).

There is a portrait of Lord Younger by Sir William Orpen at Leekie, and a replica is at the Carlton Club. A cartoon appeared in *Vanity Fair* 6 January 1910.

M. F. HEADLAM.

YOXALL, SIR JAMES HENRY (1857-1925), educationist, was born at Redditch,

Worcestershire, 15 July 1857, the eldest son of Henry Houghton Yoxall, manufacturer of fishing-tackle, by his wife, Elizabeth, daughter of James Smallwood. The family were earnest Wesleyans. Before he was fourteen, their circumstances compelled Yoxall to leave the Wesleyan elementary school in Redditch and become a pupil-teacher at Sheffield in the Bridge-houses Wesleyan school. From 1876 to 1878 he was at the Westminster Training College for Teachers, where he was examined by Matthew Arnold and told that he had an ear for the pronunciation of verse. He prosecuted this acquaintance and profited by it.

As a certificated teacher Yoxall served in Sheffield in his old school among others, and in 1887 became headmaster of the Sharrow Lane board school, where he soon became known for his enterprise in encouraging the interest of the pupils in pictures, music, and poetry. He wrote articles on education, was an active member of the local branch of the National Union of Teachers, and in 1889 was elected to its executive council. There followed 'four years of intense labour in school by day, at the writing-desk by night, and on Union duty every week-end'. After being president of the Union for 1891 he was next year appointed its general secretary and gave up teaching.

In the same year (1892) Yoxall stood for parliament as a liberal, in the Bassett-law division of Nottinghamshire, unsuccessfully; but in 1895 he was returned for Nottingham West, which he represented until he retired in 1918. He did not speak often in the House of Commons except on the education estimates and on education bills, when he made his points clearly and vigorously. During Yoxall's time as general secretary the membership of the National Union rose from 23,000 to 120,000, its organization was improved and developed, its social, political, and educational activities grew in number and variety, and its financial position became very strong. In 1909 Yoxall took over the editorship of *The Schoolmaster*, the weekly magazine and official organ of the Union.

Both before and after the Education Act of 1902, the Union was much concerned about the status of teachers in public elementary schools and the conditions of their service, as regards, for example, the duties of head teachers in church schools, the employment of uncertificated teachers and other less qualified persons, the size of classes, and the

state of school-buildings. As the chief permanent official of the Union, Yoxall exercised great influence over its policy and was largely responsible for carrying it into effect. He was thus continually in communication with the Education Department and its successor, the Board of Education, on questions of policy, and with local education authorities and school managers about their practice in administration. Of his handling of such matters it was said that, although formidable in controversy, he never shut his eyes to the arguments on the other side or to the practical difficulties of conceding all that he claimed. 'This made him invaluable to his Union in establishing good working relations with Whitehall and in conciliating the new local authorities, who at first were suspicious of teachers' organizations. It was his ambition 'to make the teaching profession an honoured one and to lift education out of the ruck of faction'. He held that the interests of teachers and their schools were interdependent. So long as the teacher's financial, and consequently his social, position remained depressed, the school in which he worked would be looked down upon and not be fairly treated. Improvement of conditions of service, especially in pay and pension, would attract better-qualified persons to the profession; difficulties in the supply of candidates gave Yoxall opportunities to press this point.

In 1898 Yoxall had advised his council to agree to the Teachers' Superannuation Bill of that year because it would enable all certificated teachers to get some pension, however small, at the age of sixty-five. The passage of the Superannuation Bill of 1918, which gave great benefits to teachers, was assisted by the Union; the Bill of 1922, which required contributions from teachers, met with less approval. Before the Bill of 1925 Yoxall had retired. In the work upon pensions he was closely associated with another past president of the Union, Charles W. Crook, and on the educational side of his duties with Sir Ernest Gray, past president, and secretary to the educational committee of the Union.

After the European War the question of teachers' pay became acute, and disputes in some areas interrupted the work of the elementary schools. Yoxall was thus engaged in a series of negotiations between the Union, the Local Education Authority, and the Board of Education for the settlement of individual cases. His conduct of

such cases and the loyalty which he evoked made him the obvious leader of the teachers upon the standing joint committee on the salaries of teachers in public elementary schools which was set up in 1919 under the chairmanship of Lord Burnham. On the one side were the representatives of the associations of Local Authorities and the London County Council; on the other those of the Union, which had successfully claimed to represent all teachers in the schools in question. Here Yoxall's control of his 'panel' and ability in presenting its case were very remarkable. That the results in 1920 and 1921 were, on the whole, very favourable to the teachers was largely due to his tact, firmness, and good sense.

In 1918 Yoxall retired from parliament, and in 1924 from his secretaryship and editorship, and he died 2 February 1925 at Kew.

Yoxall was a member of the royal commission on secondary education (1894-1895), and of the committee on the teaching of modern languages (1916). He received the honorary degree of M.A. from Cambridge University in 1890 and from Oxford in 1907, when the annual conference of the Union was held in those places. In 1911 he was knighted, being, it was believed, the first certificated teacher to receive that honour. In his professional writings he aimed at making the subject of education more attractive to ordinary people and thus creating more sympathy for teachers. In editing *The Schoolmaster* he tried to combine its primary objects with matters of general interest, and himself wrote in it regularly on travel, books, and art. He spent many holidays in France, and was a collector of old Wedgwood and of the English water-colours of 1810 to 1840. Besides magazine articles, he published a number of novels, including *The Courtier Stoops* (1911), several books about collecting, *The A.B.C. about Collecting* (1910), *Collecting Old Miniatures* (1916), and *Collecting Old Glass* (1916), and two volumes of essays, *The Wander Years* (1909), and *The Villa for Coelebs* (1914).

Short, good-looking, with a small beard, Yoxall was to the end of his life a trim, alert, and interesting figure. He married in 1886 Elizabeth, daughter of Lieutenant-Colonel William Coles, R.E., and had one son and two daughters.

E. B. PIPPS.

YPRES, first EARL OF (1852-1925), field-marshal. [See FRENCH, JOHN DENTON PINKSTONE.]

ZANGWILL, ISRAEL (1864-1926), author and philanthropist, was born in London 14 February 1864, the eldest son of Moses Zangwill by his wife, Ellen Hannah Marks. His father was a Russian refugee, who had come to England as a lad in 1848, alone and friendless, in order to escape the severe decree of Jewish child-conscription instituted by the Tsar, Nicholas I. Israel Zangwill showed great promise at the school to which he was sent in Bristol, where his parents were then residing; they moved to London in 1872 in order to provide the boy with more advanced education at the Jews' Free School at Spitalfields. There he quickly distinguished himself, winning all the available scholarships. In due course he was articled as a teacher and appointed master of the senior form, having in the meanwhile graduated at London University with triple honours.

Zangwill's father was a very pious man, who throughout a laborious career as a small trader retained his connexion with the synagogue as a scripture-reader. Israel Zangwill soon discarded dogma, although he still clung almost passionately to his race, and to the end of his days exercised a very great influence on his co-religionists. He gave up teaching after a year or two, and took to journalism, a profession in which he quickly made his mark. In 1888 he wrote a fantastic novel, *The Premier and the Painter*, in collaboration with a friend, following this with a couple of witty, light-hearted stories, *The Bachelors' Club* (1891) and *The Old Maids' Club* (1892), which appeared in *Ariel*, a comic journal of which he was for some time the editor. There was much spiritual unrest at this period, and it had extended to Jewry. Zangwill was invited to write a Jewish novel for the newly founded Jewish Publication Society of America. He accepted the invitation, and the result was *The Children of the Ghetto* (1892), a work which at once, and solidly, established his reputation. In this book Zangwill gave the real Jew to the world, revealing him as he had never been revealed before; minimizing nothing, extenuating nothing, exaggerating nothing, handling him with profound knowledge and with affection, but also with justice. *Ghetto Tragedies* followed in 1893, and *Dreamers of the Ghetto* in 1898; both works of high quality, which

powerfully influenced cultured Jews in every country of the world.

Zangwill wrote other novels, *The King of Schnorrers* (1894), *The Master* (1895), *The Mantle of Elijah* (1900), *The Grey Wig* (1903), *Jinny the Carrier* (1919), all of which had distinction and achieved a fair measure of success. A small volume of poems, *Blind Children*, appeared in 1903, and in 1910 a collection of essays, *Italian Fantasies*, in which he displayed both erudition and wit. But it is primarily and essentially as a depicter of Jewish life, Jewish ideals and aspirations, that Zangwill has secured his place in literature. He wrote many comedies and tragedies, all, or nearly all, works of merit; but a certain formlessness that was apparent in his novels bulked more largely in his plays and detracted from their value. *The Melting Pot* (1908), which dealt with the life of the Jewish emigrant in America, created almost a sensation in that country and ran for many years; and there were others, notably *The War God* (1911), *The Cockpit* (1921), *The Forcing House* (1922), which, although they possessed no element of popularity, revealed high dramatic gift and penetrating insight.

When Dr. Theodor Herzl came to London in 1896 to plead the Zionist cause, to which he was devoting his life, Zangwill was immediately attracted, and threw himself heart and soul into the movement. It was a time of pogroms in Russia, of persecution in Rumania and Galicia, and the need was urgent. Palestine was the passionately desired haven of refuge; but Herzl and Zangwill were soon compelled to realize that this was then an unattainable dream, and that the salvation of the Jews, their land of liberty, must be sought elsewhere. The great mass of ardent religionists, however, clamoured for Zion; and at the seventh Zionist congress, in 1904, Herzl was shouted down, and his burning eloquent appeal fell on deaf ears. He died a few months later, broken-hearted, worn out by the struggle against hopeless odds. Zangwill at once took up

the leadership, founded the Jewish Territorial Organization, and for the next seven years devoted all his power, energy, and time to the cause. The result was disappointing. Vast labours were undertaken, exploring expeditions sent out, masses of statistics compiled, potentates interviewed all over the world; but the difficulties were overwhelming. Zangwill addressed countless meetings and poured forth tracts and pamphlets, but at last had to acknowledge himself beaten. There was the achievement at least that the stream of Jewish emigration had been diverted from New York to Galveston, and that officials of the International Jewish Territorial Organization accompanied the wanderers on their journey, and reduced the hardships which they had to encounter.

Zangwill was a man of unflinching courage: addressing a great American meeting in 1924 he unsparingly attacked the indolent subservience of the prosperous Jews and the American cult of money. An eloquent speaker and a master of epigram, it was he who said that to the actor the part was greater than the whole. Under a somewhat truculent exterior he was curiously unselfish and tender-hearted. His health had long been undermined by his labours, and he died of pneumonia at Midhurst, Sussex, 1 August 1926. A fiery spirit, a man who all his life followed a great idea, he was fitly apostrophized by Rabbi Wise in his funeral address: 'Flame thou wert, to flame thou hast returned.'

Zangwill married in 1903 Edith Chaplin, daughter of Professor William Edward Ayrton [q.v.], electrical engineer and physicist; they had two sons and one daughter. His wife, although not of his race, whole-heartedly shared his labours and supported his efforts.

A cartoon of Zangwill appeared in *Vanity Fair* 25 February 1897.
